ITEM NO. 6: REQUESTS FOR INFORMATION

RFI-1.

Question: **VCT-02 is spec'd as Tarkett: IQ Granit SD 12"x12" 0723, Old Bark. However, this product is not available in that size. It's is only offered in 24"x24", will this size change be accepted? Also, this product is custom from Tarkett and will have a 14-16 week lead time. Will another color or manufacturer be acceptable?**

Response: VCT-02 is permanently static-dissipative vinyl flooring for use in ESD-sensitive areas such as MDF/Server Room [024]. VCT has been revised to: 0710 - FULL MOON / LIGHT GREY. Refer to revised Finish Schedule on Drawing A-650, included in this Addendum.

RFI-2.

Question: **Drawing T-602 indicates that the Intrusion Detection System is provided by 2FM. Please confirm if 2FM will be furnish and installing the complete Intrusion Detection System.**

Response: Specifications 281000 - CITY OF CHICAGO SECURITY (2FM) SYSTEM SPECIFICATIONS & Detail 5/T-602 have been revised per Addendum No. 2. Contractor to provide: intrusion system panel, sensors, detectors, wiring, devices, and all associated work required for intrusion system.

RFI-3.

Question: **During the site visit held yesterday, 11/26/19, it appears that there are signs of possible failure of some of the skylight panel junctions, as well as broken glass. Being that it is expected that the top and bottom sides of the glass are to be cleaned, how will this possible failure be addressed? Does 2FM have any future plans for addressing this skylight?**

Response: Current skylight work scope is to remove debris and clean top and underside of skylight glass. Contractor is to notify AOR when access is available to inspect the condition of stain glass.

RFI-4.

Question: **On P-102 Room 202 It shows a mop sink but in the demo pages it shows it getting demolish so will this mop sink be replaced with new or existing to remain?**

Response: Existing mop sink to remain as-is in Room 202. However, there is a small kitchenette in the North-West Alcove of Computer Lab [227] that has a standard sink. Kitchenette and standard sink is to be demolished. Refer to Architectural Sheet AD-102.

RFI-5.

Question: **Drawing LBP-003 designates the fire escape and ladder to be a lead based paint mitigation area. It further states that the ladder (not the fire escape) was not tested for the presence of lead based paint. Furthermore, the Asbestos-Containing Material, Lead-Based Paint and Hazardous Material Survey Summary Report does not indicate the testing of the fire escape for the presence of lead.**

Please clarify whether the base bid is to include the mitigation of both the fire escape and ladder or simply scraping and painting, with any necessary testing and mitigation covered under the Owner Allowance.

1.0 EXECUTIVE SUMMARY

Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) was retained by Public Building Commission of Chicago (PBCC) to perform an asbestos-containing material, lead-based paint and hazardous material survey at Legler Regional Library located at 115 S. Pulaski Road, Chicago, Illinois. The surveys incorporated accessible interior and exterior areas of the building scheduled for renovation per proposed scope of work provided by the Public Building Commission of Chicago.

The asbestos survey was conducted in phases. The first phase included a review of available historical asbestos related documentation. The second phase included a visual inspection of interior and exterior building areas to identify accessible, suspect asbestos-containing materials, collect representative samples from each suspect material, analyze samples for the presence of asbestos, and to quantify each confirmed asbestos-containing material.

The asbestos-containing materials identified include:

- Wire Jacketing Insulation – identified on pendant lights in lobby areas

The asbestos survey identified inaccessible areas not available at the time of this survey. A majority of space located above hard ceilings and behind masonry and plaster walls are not accessible without demolition. Asbestos-containing material may be present within these inaccessible locations.

The lead-based paint survey consisted of visually inspecting the painted survey areas to determine representative paint histories and collecting measurements utilizing an X-ray fluorescence (XRF) spectrum analyzer. The lead-based paint testing was limited to major building components and locations with damaged or peeling paint. The limited lead-based paint survey assessed for potential lead-based paint in the survey areas as defined by the Department of Housing and Urban Development (HUD).

The lead painted components identified at the subject site include:

- Plaster Walls – painted white and located in Room 007
- Stone/Concrete Walls – painted white and located in Mezzanine Areas
- Cast Iron Bookcases – painted white and located in Stack Area 113
- Exterior Fire Escape and Roof Ladder – painted black and located on east elevation

Notable painted components tested and are not lead-based paint include:

- Metal fence surrounding site property

The hazardous materials survey consisted of visually inspecting the subject site to determine the presence and location of potential polychlorinated-biphenyl (PCB) containing equipment (lighting ballasts, switchgears, transformers, and hydraulic fluids), mercury containing equipment (mercury lamps, thermostats, switches, thermometers, regulators, and gauges), and other hazardous chemical wastes, including chlorofluorocarbon (CFCs) containing equipment.

CARNOW CONIBEAR

Hazardous materials identified during the survey included:

- Boiler Chemicals
- PCB containing equipment
- Mercury containing equipment
- Refrigerants
- Chemicals

Carnow Conibear recommends incorporating this information into future renovation documents regarding the presence and location of asbestos-containing materials, lead-based paint and hazardous materials. All asbestos and/or lead abatement activities shall be conducted by a licensed contractor in accordance with the Illinois Department of Public Health (IDPH), USEPA National Emissions Standards for Hazardous Air Pollutants (NESHAPS), and Occupational Safety and Health Administration (OSHA) regulations and requirements. Prior to renovation or demolition; remove, dispose, and/or recycle all regulated materials as identified in this report that may be impacted by planned renovations. All renovation/demolition work shall be performed in accordance with the requirements of OSHA's Safety and Health Regulations for Construction (29 CFR 1910 Subpart H) and all applicable local, state, and federal rules and regulations. The demolition contractor shall utilize engineering control methods to reduce or eliminate hazardous materials exposures for the site workers.

2.0 INTRODUCTION

Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) was retained by Public Building Commission of Chicago (PBCC) to perform an asbestos-containing material, lead-based paint and hazardous material survey at Legler Regional Library located at 115 S. Pulaski Road, Chicago, Illinois. Surveys incorporated accessible interior and exterior areas of the building scheduled for renovation. Surveys were conducted March 19, 2019; July 25, 2019; October 3, 2019; and December 3, 2019 by Carnow Conibear representatives Mr. Evan Christian, Ms. Lynzie Plumley, and Ms. Karen Zelzer. See Appendix A for copies of inspector licenses and certificates.

2.1 Renovation Scope

The surveys incorporated accessible interior and exterior areas of the building scheduled for renovation per proposed scope of work provided by the Public Building Commission of Chicago.

2.2 Objective

2.2.1 Asbestos Containing Material Survey

The purpose of the asbestos survey was to identify the location of asbestos-containing materials within the planned renovation areas at Legler Regional Library in Chicago, Illinois. To achieve this purpose, the following procedures were performed:

- Historical Document Review – to gain an understanding of previous asbestos activities and locate structural, electrical, and mechanical elements of the building.
- Visual Inspection – to determine the location of suspect materials.
- Bulk Sampling – samples are taken in random locations, to provide representative sampling for each suspect material.
- Sample Analysis – to determine the type and percent of asbestos in the material. Materials containing greater than one percent (>1%) asbestos are considered asbestos-containing.
- Reporting – to prepare a summary report documenting the inspection findings and providing recommendations as warranted.

Because a destructive survey was not performed, the possibility exists that some asbestos-containing materials were not included in this survey if they were concealed behind walls and/or ceilings, within inaccessible pipe chases, or had restricted access. However, Carnow Conibear made every reasonable effort to locate hidden mechanical systems or other inconspicuous materials despite constraints.

2.2.2 Lead-Based Paint Survey

The objective of the lead-based paint survey was to identify painted building components to determine the existence, condition, and location of lead-based paint as defined by HUD. To achieve this objective, the following procedures were performed:

- Visual Inspection – to determine location of painted surfaces.

- Sampling – lead-based paint sampling to determine the presence of these constituents.
- Reporting – to prepare a summary report documenting the inspection findings.

2.2.3 Hazardous Materials Survey

The objective of the hazardous material survey was to determine the presence of PCBs, mercury containing equipment and any other chemicals that could present health hazards to site workers and/or require special disposal. To achieve this objective, the following procedures were performed:

- Visual Inspection – to determine the presence, quantity and location.
- Reporting – to prepare a summary documenting the inspection findings and providing recommendations as warranted.

The quantities provided in this report only represent the materials found on the day of inspection based upon the scope of proposed work. Additional chemicals and equipment may be brought onto the property after the date of the inspection or consumed and/or disposed prior to the report issue date. Hazardous materials that are not anticipated to be impacted in the proposed scope of work were not inventoried.

2.3 General Facility Description

Legler Regional Library was constructed in 1919 consists of two floors and a basement. Floors are predominantly stone, carpet, and vinyl floor tile with walls of concrete, brick, plaster, and gypsum.

3.0 SITE INSPECTION

3.1 Asbestos-Containing Material Survey

3.1.1 Historical Document Review

Available building construction documents were reviewed to gain an understanding of previous asbestos activities and locate basic building systems.

3.1.2 Asbestos Survey Methodology

The asbestos survey consisted of several phases. The first phase of the survey consisted of the historic document review. Next, a walkthrough inspection of the subject site to identify homogeneous areas (materials which are uniform in composition throughout) and to assess material condition was conducted. The final phase consisted of collecting representative bulk samples from the suspected asbestos-containing materials. Materials may have been assumed to contain asbestos due to inaccessibility of the room or area where the materials were located or if sampling of the material would damage or compromise the integrity of the building component and may render it inoperable.

3.1.3 Suspect Asbestos Containing Material Sample Collection

All bulk samples were collected based on methods described in USEPA guidelines. The samples were collected and stored in sample bags with a unique sample identification number prior to delivery to STAT Analysis Corporation (STAT) for analysis. A chain of custody (COC) form was signed and dated by the inspector, the delivering representative, and the laboratory representative who received the samples.

3.1.4 Asbestos Sample Analysis

STAT's laboratory is accredited for bulk asbestos fiber analysis by the National Voluntary Laboratory Accreditation Program (NVLAP) through the National Institute of Standards and Technology (NIST). STAT utilized dispersion staining and polarized light microscopy (PLM) techniques for analyzing the samples consistent with National Institute for Occupational Safety and Health (NIOSH) methods. PLM is the EPA's recognized method for determining bulk asbestos content.

The results of the laboratory analysis revealed the presence of asbestos-containing materials. Table I summarize the results of the bulk sample analysis, material description, location, and estimated quantity. See Appendix B for approximate locations of all identified asbestos materials and Appendix C for the bulk sample laboratory report and chain of custody documentation.

3.2.1 Lead-Based Paint Survey Methodology

The lead-based paint survey consisted of visually inspecting the painted survey areas to determine representative paint histories and to collect random samples utilizing an X-ray fluorescence (XRF) spectrum analyzer. The lead-based paint testing was limited to major building components and locations with damaged or peeling paint only. Sampling of suspect lead-based paint (LBP) components and/or surfaces was conducted following the U.S. Department of Housing and Urban Development (HUD) guidelines of June 1995 for single family housing, Chapter 7, Lead Based Paint Inspection, 1997 Revision, and the EPA and HUD's Performance Characteristics Sheet for the RMD LPA-1 XRF lead paint analysis system. There may be materials that were not identified, because they were located in inaccessible areas and not available at the time of inspection.

Paint sampling was conducted utilizing an X-Ray Fluorescence spectrum analyzer (XRF), manufactured by Radiation Monitoring Devices, Inc. (RMD) located in Watertown, Massachusetts. The RMD model LPA-1 uses a Cobalt 57 (^{57}Co) radioactive source and an advanced, solid-state radiation detector to generate an X-Ray fluorescence spectrum of a painted surface. The spectrum is then analyzed by a microprocessor to eliminate the effects of substrate and other factors such as scattering to allow an accurate determination of the amount of lead on a surface.

Portable XRF lead-based paint analyzers are the most common method for inspections in buildings, because of their accuracy, high speed, and ability to measure the paint without destructive sampling.

See Appendix D for a complete testing log of all XRF measurements collected for this survey.

Table II presents the lead-based paint components and/or surfaces identified during this sampling.

3.3 Hazardous Material Survey

The survey consisted of a visual inspection to determine the location and quantity of hazardous and potentially hazardous materials that may require special disposal considerations. Areas proposed for renovation were surveyed for polychlorinated-biphenyl (PCB) containing equipment and materials (lighting ballasts, switchgears, transformers, and hydraulic fluids), and mercury-containing equipment and materials (mercury lamps, thermostats, switches, thermometers, regulators, and gauges), as well as other potentially hazardous chemicals. Hazardous materials identified during the survey are summarized on Table III.

All high intensity discharge (HID) light and fluorescent light ballasts are assumed to potentially contain PCBs. All non-digital thermostats and gauges are assumed to contain mercury and should be handled with caution. Cleaning chemicals mainly consisted of multipurpose surface cleaners.

In addition to the materials listed in Table III, easily transportable devices potentially containing hazardous materials such as fire extinguishers, refrigerators, freezers, mini refrigerators, microwaves, TVs and containers of standard cleaning chemicals were observed in many of the

proposed renovation areas. These mobile components appeared to be in use at the time of the survey and/or are expected to be preserved and relocated prior to work. Therefore, these items have been recorded, but were omitted from the hazardous materials survey.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) was retained by the Public Building Commission of Chicago to perform an asbestos-containing material, lead-based paint and hazardous material survey at Legler Regional Library in Chicago, Illinois. The survey incorporated accessible interior and exterior areas of the building scheduled for renovation.

Based on the survey results, Carnow Conibear recommends the following:

- Incorporate the data from this report into future renovation documents regarding the presence of asbestos-containing materials, lead-based paint and hazardous materials.

- All future lead-based paint or hazardous material removal and/or demolition/renovation work shall be conducted by a licensed contractor in accordance with IDPH, NESHAPS, IEPA, and OSHA regulations and requirements.

- Dispose of all lead-based paint and hazardous materials in accordance with all applicable local, state, and federal regulations.

- A majority of space located above hard ceilings and behind masonry walls are not accessible without demolition. Asbestos-containing material may be present within these inaccessible locations. If unidentified materials are found in these areas, these materials shall be assumed to be asbestos-containing.

Carnow Conibear has applied prevailing industry standards and reasonable judgment and effort within the scope of work outlined in Carnow Conibear's proposal, while conducting the asbestos-containing material, lead-based paint and hazardous material survey. The standards, judgment, and effort used by Carnow Conibear personnel to investigate, assess, and determine the presence of potential environmental hazards and liabilities associated with the subject building are consistent with requirements outlined in federal and state guidelines. Carnow Conibear makes no warranty, express or implied, that the findings and interpretations in this report are a complete representation hazards and liabilities, associated with the building. Findings presented in this report are only indicative of conditions present during the time of the investigation and cannot be used to predict potential future or previous health effects on building occupants. The services performed by Carnow Conibear on this project have been conducted in a professional manner consistent with industry standards at the time of testing. There may be materials that were not identified, because they were located in inaccessible areas and not available at the time of inspection. Carnow Conibear made every reasonable effort to locate mechanical systems and other inconspicuous materials.

The information contained in this report was prepared based upon specific test parameters requested by the Public Building Commission of Chicago and regulations in force at the time of the report. The information herein is only for the specific use of the Public Building Commission of Chicago, Chicago Public Schools, and Carnow Conibear. Carnow Conibear accepts no responsibility for the use, reuse, interpretation, or reliance by other parties on the information contained herein, unless written authorization has been obtained from Carnow Conibear. Carnow Conibear bears no responsibility for the implementation of recommendations included in this report unless specifically requested to do so by the Public Building Commission of Chicago.
