

ADDENDUM

Public Building Commission of Chicago | Richard J. Daley Center | 50 West Washington Street, Room 200 | Chicago, Illinois 60602 | (312) 744-3090 | pbcchicago.com

ADDENDUM NO.: 01
PROJECT NAME: Emergency Medical Services (EMS) Addition
PROJECT NO.: 07215
CONTRACT NO.: C1611
DATE OF ISSUE: July 12, 2024

NOTICE OF CHANGES, MODIFICATIONS, OR CLARIFICATIONS TO CONTRACT DOCUMENTS

The following changes, modifications, or clarifications are hereby incorporated and made an integral part of the Contract Documents. Unless clearly expressed otherwise by this Addendum, all terms and conditions defined in the original Contract Documents shall continue in full force and effect and shall have the same meaning in this Addendum. Issued Addenda represent responses/clarifications to various inquiries. Contractors shall be responsible for including all associated labor/material costs in its bid. Drawings/specifications corresponding to inquiry responses will be issued with the Issue for Construction Documents, upon issuance of building permit.

ITEM NO. 1: CHANGE TO KEY DATES

Change 1 Pre-Award Meeting Date and Location are **REVISED** to **Thursday, August 8, 2024**, at 11:00a.m. via Microsoft Teams (invitation to follow).

ITEM NO. 2: REVISIONS TO BOOK 1 – PBC INSTRUCTIONS TO BIDDERS

Change 1 **Book 1 – DELETE** Section II(A)(3) and **REPLACE** with the following:

Construction Budget for Base Work Only: \$26,500,000.00 to \$27,000,000.00 (EXCLUDING Allowances and Commission's Contract Contingency Funds).

Change 2 **Book 1 – DELETE** Section III(J)(3) and **REPLACE** with the following:

*Community Hiring Requirement. At least **15%** of the project labor must be performed by "Project Community Residents" as defined in Section II.A.6 and included on the "Project Community Area Map" in Exhibit #3. The aggregate hours of Work to be performed by the Contractor and Subcontractors under this Contract may be complied through residents who are trade or non-trade workers. These positions may include but are not limited to trade workers, field engineer, superintendent, project manager, security, data entry clerks, schedulers, traffic monitoring personnel, and site administrative support staff. In order to comply with the Community Hiring requirement, the Contractor must hold a minimum of (2) application intake sessions in the designated Project Community as depicted on Exhibit (3) and compile an applicant database.*

ITEM NO. 3: REVISIONS TO BOOK 2 – PBC STANDARD TERMS AND CONDITIONS

None.

ITEM NO. 4: REVISIONS TO BOOK 3 – TECHNICAL SPECIFICATIONS

Change 1 **Book 3 – Volume 1 – REVISED** – Table of Contents Specification Section 00 01 02

Change 2 **Book 3 – Volume 1 – REVISED** – Specification Section 01 10 00 – Summary: Revised lines 1.9C and 1.10F. Removed line 1.12N.

Change 3 **Book 3 – Volume 1 – REVISED** – Specification Section 01 50 10 – Commission Representative Field Office: Removed Book 1 and Book 2 samples.

Change 4 **Book 3 – Volume 1 – REVISED** – Moved Division 05-22 Specification Sections from Volume 2 into Volume 1.

Change 5 **Book 3 – Volume 2 – REVISED** - Moved Division 05-22 Specification Sections from Volume 2 into Volume 1.

Change 6 **Book 3 – Volume 2 – ADDED** – Specification Section 32 31 00 – Ornamental Metal Fencing.

Change 7 **Book 3 – Volume 2 – ADDED** – Specification Section 32 31 11 – Gate Operators.

ITEM NO. 5: REVISIONS TO DRAWINGS

- Change 1** **REVISED** Drawing No. G001
 - a. Updated index to reflect new and deleted drawings.
- Change 2** **REVISED** Drawing Nos. C010, C100, C200, C300, C500
 - a. Added plan note to identify area of work for new gate system.
- Change 3** **ADDED** Drawing Nos. C012, C102, C202, C302, C503, C909
- Change 4** **REVISED** Drawing No. L200
 - a. Included an additional tree species in plant schedule to note the replacement tree on sheet L301
- Change 5** **ADDED** Drawing Nos. L301, L302, L303, and L304
 - a. Added a layout for the new gate system, and relevant detail sheets
- Change 6** **REVISED** Drawing No. S101
 - a. Removed the north door and concrete stoop from the guard house.
- Change 7** **REVISED** Drawing No. S105
 - a. Added a partial plan for the retaining wall foundation near the Chicago Ave Gate. Plan in progress.
- Change 8** **REVISED** Drawing No. S404
 - a. Added a detail for the retaining wall near the Chicago Ave gate showing reinforcement and other information. Detail in progress.
- Change 9** **REVISED** Drawing Nos. A101, A121, A151, A403, A801
 - a. Revised layout and storage equipment for Weapons Storage Room. Removed exterior door.
- Change 10** **REVISED** Drawing No. A202
 - a. Removed reference to canopy work.
- Change 11** **REVISED** Drawing No. A320, A321, A322
 - a. Wall Sections: Revised Exterior Wall Type 4 (WT-4) note.
- Change 12** **REVISED** Drawing No. A680
 - a. Removed exterior door.
- Change 13** **REVISED** Drawing No. E002
 - a. Updated keynotes.
- Change 14** **REVISED** Drawing No. TS101
 - a. Updated plan to include scope for new gate system.

ITEM NO. 6: REQUESTS FOR INFORMATION

None.

This Addendum No. 1 and all attachments below can be found at the following Link:

[PBC Emergency Medical Services \(EMS\) Addition C1611](#) by clicking on: Addendum No. 1

This Addendum includes the following attached Specifications and/or Documents:

1. Book 3 – Volume 1 Technical Specifications
2. Book 3 – Volume 2 Technical Specifications

This Addendum includes the following attached Drawings:

1. G001 – ABBREVIATIONS, LEGENDS, & SHEET INDEX, dated 07/12/2024
2. C010 – OVERALL EXISTING CONDITIONS PLAN, dated 7/12/2024
3. C012 – EXISTING CONDITIONS, dated 7/12/2024
4. C100 – OVERALL DEMOLITION PLAN, dated 7/12/2024
5. C102 – DEMOLITION PLAN, dated 7/12/2024
6. C200 – OVERALL SITE PLAN, dated 7/12/2024
7. C202 – SITE PLAN, dated 7/12/2024
8. C300 – OVERALL GRADING PLAN, dated 7/12/2024
9. C302 – GRADING PLAN, dated 7/12/2024

10. C500 – OVERALL SOIL EROSION AND SEDIMENT CONTROL PLAN, dated 7/12/2024
11. C503 – SOIL EROSION AND SEDIMENT CONTROL PLAN, dated 7/12/2024
12. C909 – DETAILS, dated 7/12/2024
13. L200 – SITE DETAILS, dated 07/12/2024
14. L301 – SLIDING GATE PLAN, dated 07/12/2024
15. L302 – SLIDING GATE REQUIREMENTS, dated 07/12/2024
16. L303 – SLIDING GATE DETAILS, dated 07/12/2024
17. L304 – PEDESTRIAN GATE DETAILS, dated 07/12/2024
18. S101 – SECOND FLOOR FOUNDATION PLAN, dated 07/12/2024
19. S105 – PARTIAL PLANS, dated 07/12/2024
20. S404 – SECTIONS & DETAILS, dated 07/12/2024
21. A101 – SECOND FLOOR – REFERENCE FLOOR PLAN, dated 07/12/2024
22. A121 – SECOND FLOOR – CONSTRUCTION FLOOR PLAN, dated 07/12/2024
23. A151 – SECOND FLOOR – CEILING PLAN, dated 07/12/2024
24. A202 – EXTERIOR ELEVATIONS, dated 07/12/2024
25. A403 – ENLARGED FLOOR PLANS & ELEVATIONS, dated 07/12/2024
26. A680 – DOOR & CASED OPENING SCHEDULES, dated 07/12/2024
27. A801 – SECOND FLOOR – INTERIOR FINISHES PLAN, dated 07/12/2024
28. A320, A321, A322 – WALL SECTIONS, dated 07/12/2024
29. E002 – CAMPUS SITE PLAN, dated 07/12/2024
30. TS101 – TECHNOLOGY SITE PLAN, dated 07/12/2024

SECTION 00 01 11 - SUPPLEMENTAL PROJECT INFORMATION**PART 1 - GENERAL****1.01 EXISTING CONDITIONS**

- A. Certain information relating to existing surface and subsurface conditions and structures is available to bidders and is referenced as an attachment to the Project Manual, including:
 - 1. EMS Addition Geotechnical report.
 - 2. Phase I Geophysical Survey
 - 3. Phase I Environmental Reports: Phase 1, Phase 2
 - 4. Phase I Traffic Study
- B. The Contractor is responsible for coordination of information within the Supplemental Project Information with the applicable scope of work for this Project.
- C. The Client and the Architect/Engineer of Record do not guarantee the accuracy or validity of the data, nor do they assume any responsibility for the Contractor's interpretation of the data.
- D. Verification of data and existing conditions is the Contractor's responsibilities. At Contractor's option, perform additional investigations at own expense.

1.02 CLASH COORDINATION

- A. Before the start of building construction, the contractor and subcontractors shall provide clash detection coordination with provided LOD100 Revit models utilizing clash detection software (i.e. Navisworks) to identify potential areas of conflict. General contractor to coordinate with AOR with RFIs to identify resolution to conflicts.

1.03 GEOTECHNICAL REPORT(S)

- A. The following are the geotechnical reports prepared for the project site and are as follows:
 - 1. By Flood Testing Laboratories; dated February 20, 2024; titled "Joint Public Safety Training Campus – EMS Addition Geotech Report".
 - 2. By Geo Services; dated June 27, 2019, titled "Structure Foundation Boring Log"

1.04 GEOPHYSICAL SURVEY

- A. The following are the geophysical survey prepared for the Phase I project and are as follows:
 - 1. By American Surveying & Engineering, P.C.,; titled "Geophysical Survey"

1.05 ENVIRONMENTAL REPORT(S)

- A. The following are the environmental reports prepared for the Phase I project and are as follows:
 - 1. By Amec, Foster, Wheeler; dated December 6, 2017; titled "Phase I Environmental Site Assessment"

2. By Amec, Foster, Wheeler; dated January 12, 2018; titled “Phase II Environmental Site Assessment”

1.06 TRAFFIC STUDY

- B. The following are the traffic study report prepared for the Phase I project and are as follows:
 1. By AECOM; dated June 11, 2020; titled “Joint Public Safety Training Campus (JPSTC) Traffic Impact Study”

Re: Preliminary Geotechnical Investigation Report
JPSTC – EMS Addition
4443 W Chicago Avenue, Chicago, IL

Ms. Joo:

Enclosed are the results of the Geotechnical Investigation performed in October 2023 at the above project site. As we understand, an addition will be constructed for the existing JPSTC building. 3 borings were performed to depths ranging from 65' to 67' below grade, and this boring information is supplemented with 3 borings done by others, previously performed on the site to depth of 50ft for the construction of the existing building. The investigation included Pressuremeter testing (PMT) and Vane Shear Testing (VST) for the design of a deep foundation system. Caisson loads were obtained from the design team and used to confirm adequate bearing and differential settlement.

Geotechnical recommendations for foundation types, depths, and construction are provided. The straight shaft and belled caissons shown on the attached Structural Drawings comply with the results of this investigation and the geotechnical aspects of the Chicago Building Code. An allowable capacity of 40,000 psf can be used for the design of deep elements bearing at an elevation of -6 ft CCD. Caissons along the existing structure shall bear at an elevation of +5 ft CCD to match the elevation of existing caisson elements for the existing structure and use an allowable capacity of 12,000 psf.

Yours Very Truly,

Walt Flood IV, M.S., P.E.
Vice President

Walter H. Flood, P.E.

I. Location

The Project is located at the property address of 4443 W Chicago Avenue in Chicago, Illinois. The site is located south of W Chicago Avenue between Kilbourn Avenue to the west, N Pulaski to the far east. As of writing this report, the immediate site is undeveloped and has much of the vegetation removed. The site will be an addition to the existing building to the north, completed in 2020.

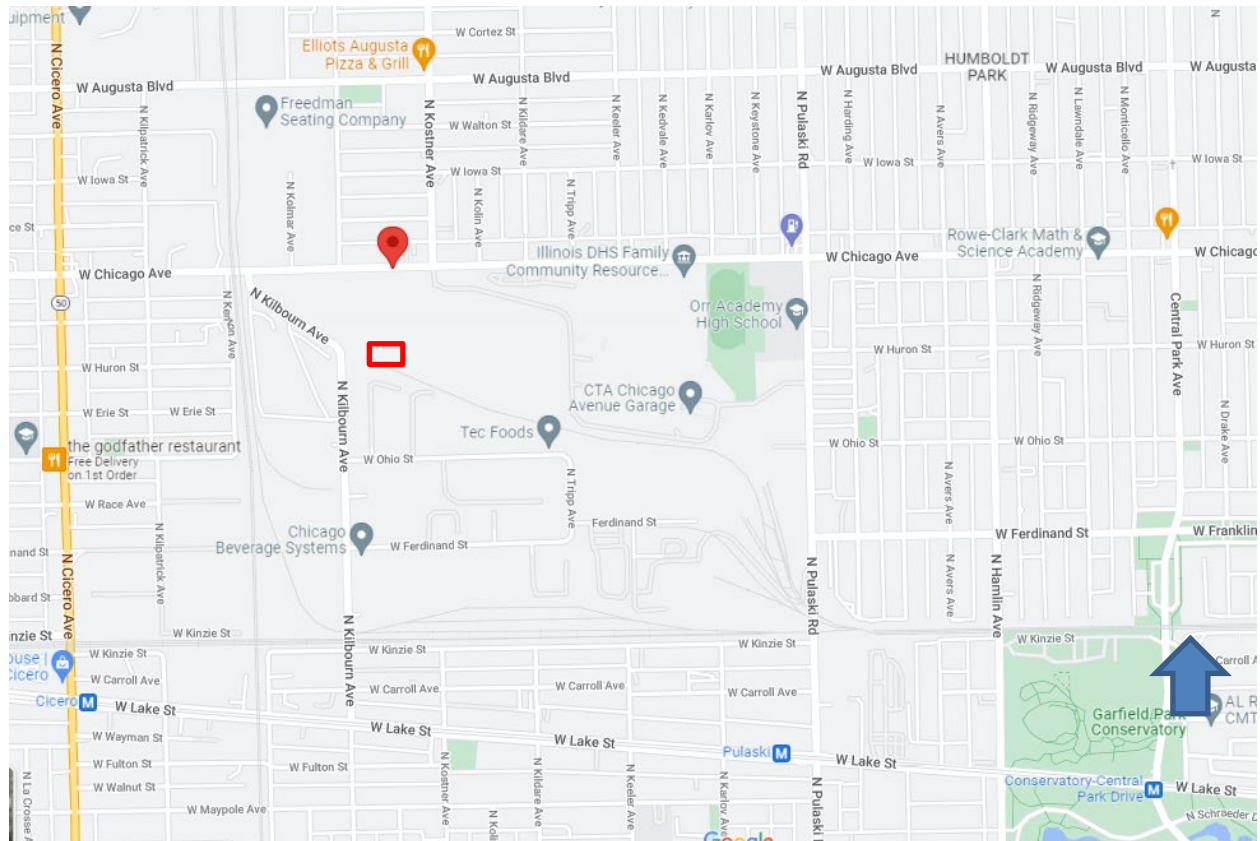

Figure 1: Site Location

20 February 2024

II. Summary of Borings

The subsurface investigation for this exploration consisted of 3 borings, performed in October 2023. Boring locations were discussed with the design team AECOM. In addition, AECOM has requested that FTL utilize 3 (three) borings from their previously performed investigation (GSI report dated 10/05/2020) in order to provide soil information to meet OUC/DOB requirements for the proposed structure improvements.

Flighted hollow stem augers were used at the surface; once sufficient embedment (approximately 10 to 15ft) into the surficial soils was accomplished, drillers switched to a rotary wash method. No investigation was performed for infiltration or the ability of the soils to meet IEPA CCDD requirements for disposal, and environmental observations are outside the scope of this investigation. Soil samples were taken by means of split spoon sampling procedures in general accordance with ASTM D-1586 specifications with an auto-hammer. Sampling was at two and one-half foot intervals for the first ten feet and every five feet thereafter. SPT N-values in this report have not been adjusted - samples were taken with autohammer equipment with a measured efficiency of 82%. A summary of the borings performed are shown in the following table.

Borings were marked out in the field with permission by the onsite contractor, Berglund Construction. Elevations are marked on the logs and boring locations are approximated in the back of the appendices in the Boring Location Plan.

Boring	Depth (ft)	Surface Elevation (CCD, ft)	Performed By	PMT Testing Performed	Date Performed
B-01	65.0	+38.6	FTL	Attempted	10/13/23
B-02	65.0	+37.6	FTL	Yes	10/12/23
B-03	67.0	+38.1	FTL	Yes	10/11/23
SB-10	30.0	+35.1	GSI	No	06/27/19
SB-11	30.0	+33.7	GSI	No	06/27/19
SB-41	30.0	+34.8	GSI	No	08/10/20

Table 1: Summary of Boring Investigations

All samples were identified and sealed in the field and returned to our laboratory for further identification and testing. During the field operation, the drilling crew maintained a log of

20 February 2024

drilling procedures and subsurface conditions including changes in soil stratigraphy and ground water levels. The boring holes were grouted after completion.

III. Laboratory Testing

The laboratory testing program consisted of hand penetrometer tests on portions of the cohesive soils recovered from the borings. Water content tests were also performed on representative portions of the material obtained. The results of all laboratory tests are indicated on the enclosed boring logs. Detailed water contents for each borehole can be found within the corresponding boring logs.

The retrieved soil samples were examined in our laboratory and classified on the basis of texture and plasticity in accordance with the Unified Soil Classification System (ASTM D2487). The soil descriptions on the boring logs are in conformance with this system and estimated group symbol according to this system is included in parenthesis following each soil description in the boring logs. Stratification lines, as indicated on the boring logs, are in some cases estimated *in-situ*. The transition between soil types may be gradual.

IV. Site Conditions

The surface elevation on the boring logs represents the existing ground surface at the time of the investigation, referenced to the topographic survey performed several weeks prior to boring operations. In general, the site was flat and level. The majority of the property consisted of demolished landscaping and granular fill. Directly to the north, a caisson-supported structure was present; however, the surrounding sites to the east are currently in development.

No evidence of other structures such as foundation walls or basement slabs were encountered within the boring areas; however, it is common to encounter previous development during construction and suspected fills were present to a depth of 8.5'. Potholing should be performed prior to foundation installation to avoid costly obstruction time during caisson installation.

20 February 2024

V. Soil Profile

A description of the soil stratigraphy findings follows, but for more detailed information, refer to the boring logs attached to this report.

The surface was generally composed of granular fill. Varying thickness of stone fills were encountered across the site to a depth of 6ft to 8.5ft. Generally, once fill materials stop, brown, medium dense silty sands were encountered to an approximate depth of 13 to 18ft, overlying gray stiff to very stiff silty clays. These stiff to very stiff clay soils generally are encountered to depth of 18ft to 28ft, where soils transitioned to harder/denser silty and clayey materials. These silty clays and/or clayey silts continue to where weathered bedrock was encountered between -64ft to -65' below grade, depending upon location on the site. It should be noted that B-1 encountered sand, gravel and rock fragments from a depth of 53.5ft to 65.0ft before encountering weathered bedrock. Further, a sand layer was identified in B-2 from a depth of 43.5 to 48.5ft below grade.

In general, the borings from the GSI investigation yielded similar results with the respective closest borings from this investigation, though those borings showed greater variability in clay and silt strata.

VI. Expansive Soil or Fill on Site

No expansive soils were identified in the geotechnical investigation.

VII. Ground Water

Ground water levels were estimated based on the soil characteristics and previous experience in the area. The borings did not encounter sustained ground water within the depth range of 15ft, before switching to mud rotary techniques. However, based on the color change of gray to brown, the long-term groundwater level is estimated at approximately 12ft to 15ft (+25ft CCD) below the surface. This generally agreed with other reports performed for the JPSTC project. This elevation aligns closely with the top of clay in two of the borings – in these and similar locations the presence of perched groundwater

20 February 2024

in the overlaying sandy soils is likely. Please note that water will move quickly through the granular natural soils and granular fills. Traditional pumping operations will likely be sufficient to maintain a dry working area for shallow excavations if no basement or deep excavations are expected for the site. For excavations deeper than +26 ft CCD, this will likely not be true and larger scale de-watering efforts will need to be considered. As always, fluctuations in ground water levels will likely occur depending on fluctuations in precipitation, evaporation, and surface run-off.

VIII. Foundations

Based on Structural Drawings dated 5 February 2024, a caisson deep foundation solution has been selected for the support of the new structure. Both belled and straight-shaft caissons are anticipated. The following table includes a summary of the general soil profile that can be used for modeling purposes; however, each of the following sections should be referenced for specifics and details. As we understand, shallow foundations are not planned to be needed or included in this project.

Elevation (CCD,ft)	Class	Description	Su (psf)	Consist/ Density	Net Allowable (psf) ¹	Lateral Bearing Pressure (psf) ²	Lateral Sliding Coeff.	Lateral Sliding Cohes. (psf)
To +30	7	Gran. Fill	NA	Medium	500	4.0 z	0.35	-
+30 to +24	4	Sand	NA	Medium	2,000	12.0 z	0.35	-
+24 to +13	5	Silty Clay	2,000	Stiff	4,000	107	-	130
+13 to +7.5	5	Silty Clay	4,500	Hard	4,000	107	-	130
+7.5 to +0	3	Hardpan	5,000	Hard	12,000	107	-	130
+0 to -27	3	Hardpan Silt	NA	V Dense	40,000	8.0 z	0.35	-

1) Considering spread footing or deep foundation for

2) Based on 3.5 diameter shaft

Table 2: Summary of Soil Profile Bearing

Deep Foundations

Deep foundations could be used to support concentrated loads. Pressuremeter testing (PMT) was performed in the hard gray clayey silts (B-02 and B-03) and attempted in the sand, gravel, and weathered rock (B-01) at elevations from 39ft to 55ft below grade in order to perform a caisson design. A summary of pressuremeter results can be found in the appendix. A caisson design was performed, and caissons may be designed with an

20 February 2024

allowable bearing capacity of 40,000 psf bearing at -6 ft CCD (42 ft below grade). Bell and shaft sizes from 3' to 15' were confirmed with this value. No evidence of water-bearing silts or unstable granular materials were encountered during drilling but input from local caisson contractors, especially those having participated in the installation of deep foundations for JPSTC Phases 1 and 2 may be helpful in considering potential constructability issues at this elevation and location.

Along lines 18.1 and 18.2, where caissons are within 15 ft of existing deep foundation structures, new elements will need to match the elevation of the existing. From as-built documents, the existing foundations were built with a bottom elevation of +4 to +5 ft CCD with a design bearing of 12,000psf. Pressuremeter tests were too deep to be used for inclusion in a bearing elevation of +5 ft CCD; because of this, allowable bearing capacity of caissons will default to the code-permitted value from Table 1806.2(2).

(E) CAISSON LOCATION	MARK	DIAMETER	BOTTOM EL
I-17.6	(E) DS48	4'-0"	76.72' = +4.32' CCD
I-17.6	(E) DS48	4'-0"	76.46' = +4.06' CCD
H-17.6	(E) DS48	4'-0"	77.48' = +5.08' CCD
G-17.6	(E) DS48	4'-0"	77.29' = +4.89' CCD
F-17.6	(E) DS48	4'-0"	76.56' = +4.16' CCD
E-17.6	(E) DS60	5'-0"	77.15' = +4.75' CCD

Figure 2: Existing Caisson elevations

It is recommended that caisson bells be inspected in order to avoid oversizing of holes; the City of Chicago requires oversizing of caisson bells by 15% to a maximum of 12" when no downhole inspection is performed. FTL would be happy to provide a proposal to perform these and other inspection and material testing services.

Minimum shaft diameters of 2.5' are recommended and caisson bells should have a base angle of at least 60 degrees from the horizontal. Caisson settlement will be limited to less than 1" total, with less than 0.5" differential settlement, though this does not include elastic shortening. Dramatically different loading may result in changes to the allowable capacity and settlement. Allowable capacities may be increased by 1/3 for transient live loads such as wind.

A horizontal modulus of subgrade reaction, k_h , can be used for lateral analysis of caissons. The moduli are representative for horizontal deflections at the top of the shaft of approximately 1/4 to 1/2 inch. Resistance in the top 3 feet of the shaft is typically ignored if the soil will be subjected to freeze-thaw cycling or changes in moisture content from

20 February 2024

weather. Additionally, a height of B (caisson diameter) is also ignored above the top of the caisson bell. For granular materials, such as the deep granular fills, the modulus values increase linearly with depth (z). Conservative values for a simplified soil profile are presented below as ksf/ft. A relationship of $67S_u/D^{0.5}$ is used for cohesive soils, and $n_h(z)/D^{0.5}$ is used for cohesionless soils.

It is recommended that temporary casing and/or permanent liners be installed for the caissons due to the granular materials as indicated in the logs; it is recommended they be embedded sufficiently into the clay soils to ensure that the granular soils will not compromise caisson integrity. In general, the clay soils were encountered near a depth of 13.5ft, with some areas deeper up to 18.5ft based on the logs. However, B-02 encountered sandy soils at a depth of 43.5ft; caissons are designed to bear several feet above this elevation, but care must be taken not to penetrate further in this area to avoid potential destabilization of the foundation bottom. Of further note, the north caissons along the existing structure will be within 5' of the existing deep foundation structure. For this reason, we require that the caissons within 15' of the existing structure utilize permanent casings to prevent squeeze of the open caisson excavation or lateral movement of the existing structures during the removal of typical temporary casings. It is also important that new caissons bear at the same elevation as neighboring caissons so that loads are not imparted onto the existing structure.

Deep Foundations: Settlement and Group Effect

In general, caissons should be spaced 3X the (larger of the closest) bell diameter in order to alleviate concerns for group effects. Several caissons unfortunately do not meet this criteria and are denoted on Structural drawing S100DS with an asterisk. Settlement of individual elements has been analyzed and results in total settlement less than 0.20". Due to the extreme stiffness of the bearing strata, the enlarged area of the caissons further decrease the settlement when analyzed as a group. Specific cases can be further explored where necessary. As mentioned above, total settlement will be kept to less than 1.0" with no more than 0.5" differential.

Uplift Capacity

As shown on Structural Drawing S201, 0 uplift capacity is needed and Uplift loading is only due to transient wind and seismic events.

20 February 2024

Squeeze Analysis for Caissons

Vane shear and potential squeeze of the clays has been considered for shaft sizes of 2.5 to 5.0 ft. The shear strength of the soils and moisture contents appear to indicate that squeeze is generally unlikely for this range in shaft diameters. Clay soils on this site are exceptionally strong, with only one in-situ vane shear test being completed; all other clays encountered were too strong to test. Squeeze is dependent upon the strength of the materials encountered, the size of the excavation, and the length of time the materials are exposed. No caisson should remain open overnight. If squeeze becomes apparent, longer casing should be pushed through the problematic zone to prevent additional squeeze and settlement of the surrounding area. It is still recommended that the first several caissons drilled should be used as test cases to observe for squeeze and evaluate with actual onsite conditions; it is possible that weaker clays may exist on the site in locations where borings were not performed. Additional squeeze can be caused by the influence of surrounding structures. In this case, as mentioned above, the caissons and the existing structure must be protected within 15' of existing caissons with permanent casing. Additional discussion on this topic is included in the "Potential effect of excavations on existing structures" section of this report.

Figure 3: Vane Shear of clays, in-situ

20 February 2024

The table in the appendix shows the results of this analysis. Potential squeeze was analyzed using an empirically modified overburden pressure to s_u ratio for temporary casing from Budiman, Keifer, and Baker, 2005, ASCE Geotechnical Special Publication 132, Advances in Deep Foundations (Budiman, 2005).

IX. Seismic Design

Based on our shear strength and SPT data, the site has a Seismic Site Class of C. The proposed structure has been designed with a SDC of A. As such, a liquefaction analysis has not been completed.

X. Slabs on Grade and Pavements

The sandy silts and clays encountered are suitable for support of slabs on grade and pavement; however, organic materials and topsoil are not permitted. If encountered during excavation it must be removed and replaced with competent compacted material. The fill material is also acceptable for backfill and support of slabs, if necessary.

The subsoil should be compacted and then proofrolled using a heavy vehicle such as loaded dump truck with an axle weight exceeding 15,000 lbs. or a roller exceeding 12 tons. Soft areas or voids encountered should be removed and replaced with a granular material compacted in accordance with section XI: Placement and Compaction of Fill Material. Concrete placed onto compacted stone subgrade would utilize a friction coefficient of 0.40. Use of a vapor barrier below the slab would reduce the coefficient to 0.20.

XI. Placement and Compaction of Fill material

The on-site materials are suitable for backfill; however, it should be noted that these materials have a very narrow moisture range for acceptable compaction results. The silts will likely not be able to be used unless the material is mixed with another material. Any fill debris larger than a half brick will need to be removed or reduced in size by crushing. Any fill operations should be monitored full time by a qualified soil technician. Any organic material encountered is unsuitable and must be removed.

20 February 2024

If a granular backfill material is needed, closed-graded materials such as CA-6 may be utilized. Gap-graded materials such as CA-7 are also acceptable. However, where gap-graded fills will be in contact with sand, a layer of fabric must be used between them to prevent migration of fines into the open-graded backfill materials. Regardless of the type of material used it still must be placed and compacted in lifts. There is no such thing as “self-compacting” fill. Alternatively, to eliminate backfilling in lifts, a lean concrete fill could be used.

All fill should be placed in maximum loose lifts of 8” to 12” and compacted to a minimum 95% of ASTM D-1557 below footings, 90% below the slabs and paving, and 85% in the lawn and landscaped areas. Proper compaction of fill material can be confirmed by means of ASTM D-6938. Where thick fill areas are present, such as in historic basements, 95% compaction may be necessary in order to prevent large long-term settlements, even though a footing may not be present over the area. Proofrolling should be substituted for non-moisture sensitive gap-graded materials. Unless required otherwise in specifications or elsewhere, compaction of fill materials must be checked at least once per lift and at a rate of once per 150 ft along trenches or foundations. As always, fill materials must not be frozen and may never be placed on a frozen subgrade. Undercuts, when performed for footings, must be extended laterally 6 inches on each side for every 12 inches in depth. For example, a 12” undercut for a 48” wide footing would result in a prepared foundation area 60” in width.

XII. Potential Effect of Excavation on existing Structures and Utilities

Where the miscellaneous fill or granular material is present, excavations will likely need to be cut to a 1.5:1 slope to maintain stability for depth less than 8ft; however, under the influence of wet weather even gentler slopes may be required. For shallow excavations 4’ in depth or less, the City of Chicago allows a 1:1 cut. Good materials will degrade with exposure to weather – excavations should be open only as long as necessary to minimize impact and prevent costly, needless cutting and replacement.

Large and extensive excavations are not expected if no basement is being considered below the structure. Pressures for lateral loading of elevator pits and other subsurface

20 February 2024

structures can be determined from the following chart. Approximately ¼” of movement is required to mobilize the full active pressures, and over 2” of movement is required to mobilize the passive pressures. Because of this, full passive pressures should rarely be used in design, as they will rarely be fully mobilized. Surcharge loading would utilize the at rest pressure applied uniformly throughout the height of the structure.

Material	Equivalent Fluid pressure, pcf		
	Active (Ka)	Passive (Kp)	At Rest (Ko)
Onsite urban fills ($\gamma=120$)	40 (.36)	305 (2.77)	60 (.53)
Natural Silty Sands ($\gamma=120$)	40 (.36)	305 (2.77)	60 (.53)
Natural Clay ($\gamma=130$)	74 (.57)	225 (1.76)	95 (.72)
CA-6 Stone ($\gamma=130$)	29 (.22)	500 (3.85)	55 (.42)
CA-7 Stone ($\gamma=105$)	28 (.27)	375 (3.57)	45 (.43)
Modulus of Sub. reaction (urb. fill)	$K_s=150$ psi/inch		

Table 3: Equivalent fluid pressures

A permanent structure adjoins the site to the north and could be impacted by construction in close proximity. Caution must be exercised with excavation in this area. S100DS-F and S201 drawings dated 3/16/21 from the construction of the adjacent structure were reviewed in preparing this report. In many cases, existing caissons will be within 10ft of new structures. Open dialogue will be needed between the entire project team to best address the northern building and any possible utilities or unknown/unmarked underground structures and the optimal approach to construction based on actual site conditions. In order to most avoid detrimentally impacting the existing structures, permanent casings as discussed in the Deep Foundation section will be necessary and caisson excavation depths will need to match those of the existing structures. If suitable bearing materials are not present at that elevation, the Geotechnical Engineer of Record should be notified.

If deemed necessary, the project team may receive a Damage Monitoring Letter from the City of Chicago, possibly requiring inclinometers, settlement indicators, or vibration monitors to protect adjacent structures and utilities. If so, we would be happy to review the letter and provide a proposal to provide those services.

Design and details of any ERS must be performed by a Registered Structural Engineer in the State of Illinois. This report provides information to ease the design assessment but in no shape, part or form this section should be considered as Earth Retention System

20 February 2024

design. Completed ERS and EX drawings will need to be submitted for review in order to confirm soils assumptions and for use in the analysis of slopes and adjacent structures required for permit submittal.

XIV. General Qualifications

The recommendations presented within this report are based upon the small-diameter soil borings performed at the site. Soils, bedrock depth, and natural deposits are variable in nature and some strata or variances may not have been detected in our investigation. All the elevations are approximate and generally rounded to the nearest 6", and actual elevations may vary.

Calculation: Allowable Bearing of Deep Foundation.

The allowable bearing for the deep foundations consisting of caisson will be evaluated using the bearing capacity equation by Briaud, "The Pressuremeter".

PMT values are shown on the profiles and the PMT table

$$q_{all} = (K) (P_i - P_o) / (FS)$$

where: K = PMT bearing capacity factor = 1.4 (typical for Chicago clays)

P_i = PMT limit pressure

P_o = PMT at rest pressure

FS = Factor of safety = 2.5 for a caisson

The geometric mean will be used to determine the value of P_i within 1.5B of the caisson.

Caisson bells are founded at -6ft CCD and bedrock approximately around -27ft CCD. Caisson bearing surfaces range in diameter from 3ft to 4ft in diameter. The PMT results show the lowest values at -12 ft CCD, so the lowest q_{all} will be with the largest bell of 4 ft diameter. Thus, 1.5B reaches from -6 ft CCD to -12 ft CCD.

$$P_i = (156.6 * 140.8 * 106.5)^{(1/3)} \text{ ksf} = 132.9 \text{ ksf}$$

P_o = Largest P_o value within influence depth = 3.8 ksf

$$q_{all} = (1.4) (132.9 \text{ ksf} - 3.8 \text{ ksf}) / (2.5) = 72.3 \text{ ksf} \gg 40,000 \text{ psf}$$

The allowable value of this report is ok at 40,000 psf for caissons bearing at -6 ft CCD. Keep recommendation from report.

Calculation: Caisson Settlement and Differential Settlement

Settlement has been calculated using the approach method by Louis Menard by using pressuremeter data, using a RocTest Texam Model E with Type N probes, from borings all the borings collected at the site. As previously shown in the bearing calculation, we will consider the PMT values from a depth of -6 feet CCD. The following Caisson Schedule can be found in the Structural Plans page S201.

TYPE - NOTE 6	SHAFT DIAMETER	BELL DIAMETER	VERTICAL BARS	TIES	TOP OF SHAFT ELEVATION VARIES - SEE PLAN	BOTTOM OF SHAFT ELEVATION	ALLOWABLE SOIL BEARING PRESSURE	UPLIFT - NOTE 7	REMARKS

CCD DATUM ELEVATION 27.60' = 100'-0"

Figure 1 – Caisson Schedule from S201

Using the provided loads from the SE for applied pressure (based on caisson end bearing area), our calculation will be using the Menard equation for settlement. See bearing calculation at the beginning of this package. The highest loaded caisson has a 48" diameter bell, at WestMat I3-18.4 with an applied load of 436.2 kips.

$$q_{app} = P/A = 436.2 / \pi (4^2 / 4) = 34.7 \text{ ksf}$$

$$S(\text{total}) = \frac{(1.33)(q_{app})}{(3)(E_d)} [(\lambda d)B/2]^\alpha + \frac{(\alpha)(q_{app})}{(4.5)(E_c)} (\lambda c)(B/2)$$

We will look at the scenario where B (diameter) of 4ft wide will be used, with actual loads . We will be using the following parameters:

Load (ksf)	Pressuremeter Modul		Mendard Shap		Width (ft)	Menard Comp Factor
	Ec	Ed	λc	λd		
q _{app}	Ec	Ed	λc	λd	B	α
34.7	2,400.0	2,271.0	1.1	1.1	4	0.5

Table 1 – Settlement parameters summary

Where E is the layer thickness equal to approximately 0.5B

- Ec = E1 = 2,400.0 ksf = 2,400.0
- E2 = 2,193.1 ksf = no test, use lower value of E3
- E3 = 2,193.1 ksf = 2,653.8 + 1,732.4 / 2
- E4= No test ksf = No PMT's in this range
- E5= No test ksf = No PMT's in this range
- E345= 2,193.1 ksf = average of E3, E4 and E5

Ed =

$$\frac{3.2}{(1/E1) + (1/0.85E2) + (1/E345)} = \frac{3.2}{0.0004 + 0.0005 + 0.0005}$$

= 2,271.0 ksf

S(total)

$$= \frac{(1.33)(q_{app})}{(3)(Ed)} [(\lambda d)B/2]^{\alpha} + \frac{(\alpha)(q_{app})(\lambda c)(B/2)}{(4.5)(Ec)}$$

$$= \frac{46.15}{6,813} \cdot 1.483 + \frac{(17.35)(1.1)}{10,800}$$

Client: AECOM

Project: JPSTC EMS Addition

Date: 20 February 2024

Prepared By: WF4

Checked By: WF3

$$= 0.0100 + 0.0018$$

$$= 0.0118 \text{ ft}$$

$$= 0.14 \text{ inches}$$

So, approximately 0.14 inches settlement for 4ft diameter bell with 34.7 ksf applied load. Doing the same methodology for the other belled diameters, we have the following summary for settlement, considering using **max** loading.

EXECUTIVE SUMMARY

American Surveying & Engineering (ASE) was commissioned by AECOM to perform certain professional services for the proposed Joint Public Safety Training Campus (JPSTC) located at 4301 W. Chicago Ave., Chicago, Illinois. The requested scope of work included performing an ALTA Survey, Topographic Survey and a Geophysical Survey consisting of Electromagnetic (EM) detection (QL B), Ground Penetrating Radar (GPR) and Magnetometer Survey (MAG). The 30-acre site at 4301 W. Chicago Ave., was used as a railroad yard or industrial site with RR sidings from around 1900 through the late 1980s. It is in an industrial and commercial area in West Garfield Park.

This report addresses the Geophysical portion of the scope of work. The below exhibit details the areas where GPR and MAG surveys were performed.

The Site was subsequently razed of all surface features at some point in the 1980s or later. Varying years of aerial photography were examined to assist in the surveillance of potential remnants, articles or targets that might prove disruptive to construction of the proposed facility. The areas requested for the geophysical surveys consisted of proposed areas where buildings would be built.

The area as it existed at the time of the proposed survey was severely overgrown with trees and brush. No work could be conducted in that condition. Clearing and mowing was necessary for the work to be performed. The GPR work was substantially not informative. There were numerous small returns, but depth was limited due to poor soil conditions. No identifiable targets of interest were discovered in the survey area.

The MAG survey was performed and located hundreds of anomalies of small magnitude. As might be expected the anomalies followed the general alignment of previous RR sidings at the site.

INTRODUCTION

The Geophysical surveys were performed in three distinct areas throughout the 30-acre site, from the West to the East Area 1, Area 2 and Area 3. The three areas were visually inspected after the clearing and mowing. The GPR and MAG surveys were performed as two separate surveys over the three separate survey areas. The Exhibit attached shows the approximate limits of the three areas in red.

Figure 1 – Google Earth exhibit of Survey Site

The areas, while cleared, were left in a rough condition with piles of debris, holes where tree stumps and roots were removed and other debris that impaired the collection of data. However, the surveys were carried out at a slower pace and with difficulty. GPR, in particular, requires a smoother ground surface to maintain a close proximity to the ground surface with the antenna.

The size of the three areas are approximately 260' by 120' for Area 1, 525' by 490' for Area 2 and 260' by 100' for Area 3. The areas requested for the geophysical surveys consisted of proposed areas where buildings would be built. Therefore the focus of the Geophysical Survey was to locate objects (targets) that might hamper construction of a building such as Railroad Rails, buried tanks (UST) or drums and other large objects.

There are several monitoring wells on the site. We do not know the origin of the Monitoring Wells nor the purpose. Searching numerous online sources provided no information. The client was unable to furnish any information that would allow us to obtain what might be critical information with respect to the location of underground storage tanks (UST) that may have existed and was the focus of the monitoring wells.

Figure 2 - Photo of site conditions after clearing and mowing

Figure 3 - Photo of site conditions after clearing and mowing

INSTRUMENTATION

The following equipment was used on this project: Trimble R10 GPS unit, GSSI UtilityScan (GPR) unit and a Ferex Foerester 4.032 magnetometer (mag). The FEREX is a vertical gradient fluxgate magnetometer that measures the deformation of the earth's magnetic field evoked by ferromagnetic objects. Magnetometers are suitable for the detection of ferromagnetic metals like iron, steel, or nickel. Normally the detection depth of magnetometers is larger compared to active EMI detectors, but it varies and depends on the object's mass and its magnetic properties. The Ferex magnetometer has an accuracy of +/-2% nanotesla (nT). The Ferex has a sensitivity of -10,000 nT to +10,000 nT . The Ferex will measure and display all results in nT .

Our GSSI Utility Scan GPR unit operates at 350 MHZ with a 1 HZ cycling rate. The GPR produces a visual indication of underground facilities. Unlike other survey methods, signals corresponding to ground penetrating radar (GPR) depend on a multitude of physical properties. The most important physical property to GPR is the dielectric permittivity ($\epsilon\epsilon$), as it greatly influences the velocity, attenuation, reflection, refraction and transmission of radio waves. Dielectric permittivity is considered the diagnostic physical property for GPR. In addition to the dielectric permittivity, the propagation of radio waves through the Earth may depend significantly on the electrical conductivity ($\sigma\sigma$); provided the electrical conductivity of the Earth is sufficiently large. Radio waves will also reflect off of very conductive objects buried in the Earth.

FIELD DATA COLLECTION

The three areas were surveyed to establish the exterior boundaries of the sites and grids were laid out to act as transects or track lines for the collection of both the GPR and the MAG. The grid interval is different for GPR than it is for MAG data collection. Grids were staked in the field. MAG data was collected at ten ft. (10') intervals while GPR was collected at five ft. (5') intervals.

GPR data collection

Field collection for the GPR survey began on September 2nd, 2020 by laying out a five-foot grid along the survey areas. A five-foot grid was staked out for the GPR as suggested by the user manual and personal experience to achieve best results. Poor soil conditions at the site limited the GPR data acquisition to less than a 6-foot depth. Site conditions prevented a perfect grid from being followed. Remaining holes, debris piles, and vegetation had to be avoided so the grid was adjusted accordingly. Rain on September 8th, 9th, and 10th further reduced the depth to only two-and a half foot in many areas. The GPR survey was completed on September 10th, 2020. Only a few small anomalies were observed primarily around the area of the old railroad tracks. Given the shallow depth the GPR unit was able to acquire, the results of the survey are inconclusive.

MAG data collection

MAG data collection began on September 9th, 2020 with the Ferex Magnetometer. Each of the three areas was laid out with parallel transecting lines every ten feet. As suggested by the user manual and personal experience for best results. The survey areas were reviewed for external magnetic interference and noted. The operator also ensured that magnetic influences under our control were removed from the site and the operator is "magnetically clean." Zippers, watches, eyeglass frames, boot grommets, keys, and mechanical pencils can all contain steel or iron. The Magnetometer was compensated daily in a neutral area to correct for daily diurnal changes. The Magnetometer data collection was completed September 15th, 2020.

PROCESSING

GPR processing

The data measured by the GPR system is the amplitude of the signal as a function of its two-way travel time. However, interpretation can be made easier if the information can be represented in terms of depth. Because of this, an apparent depth axis is frequently added to the right-hand side of the radargram (profile). GPR does not measure depths. Rather, it measures time with a very precise clock. The depth is dependent on the speed of the signal through the medium in which it is travelling, the propagation velocity. The signal travels through air at the speed of light, roughly 0.30 meter per nano second. As shown in the figure below.

Figure 4 - Typical radargram showing depth by time converted to distance, not from this project

The radargrams are all processed then viewed for artifacts (targets) of interest. Normally pipes, tanks and other manmade objects appear as hyperbolas in the data, as shown below.

Figure 5 – Radargram of buried tanks, not from this project

Sample Radargrams from this project follow below.

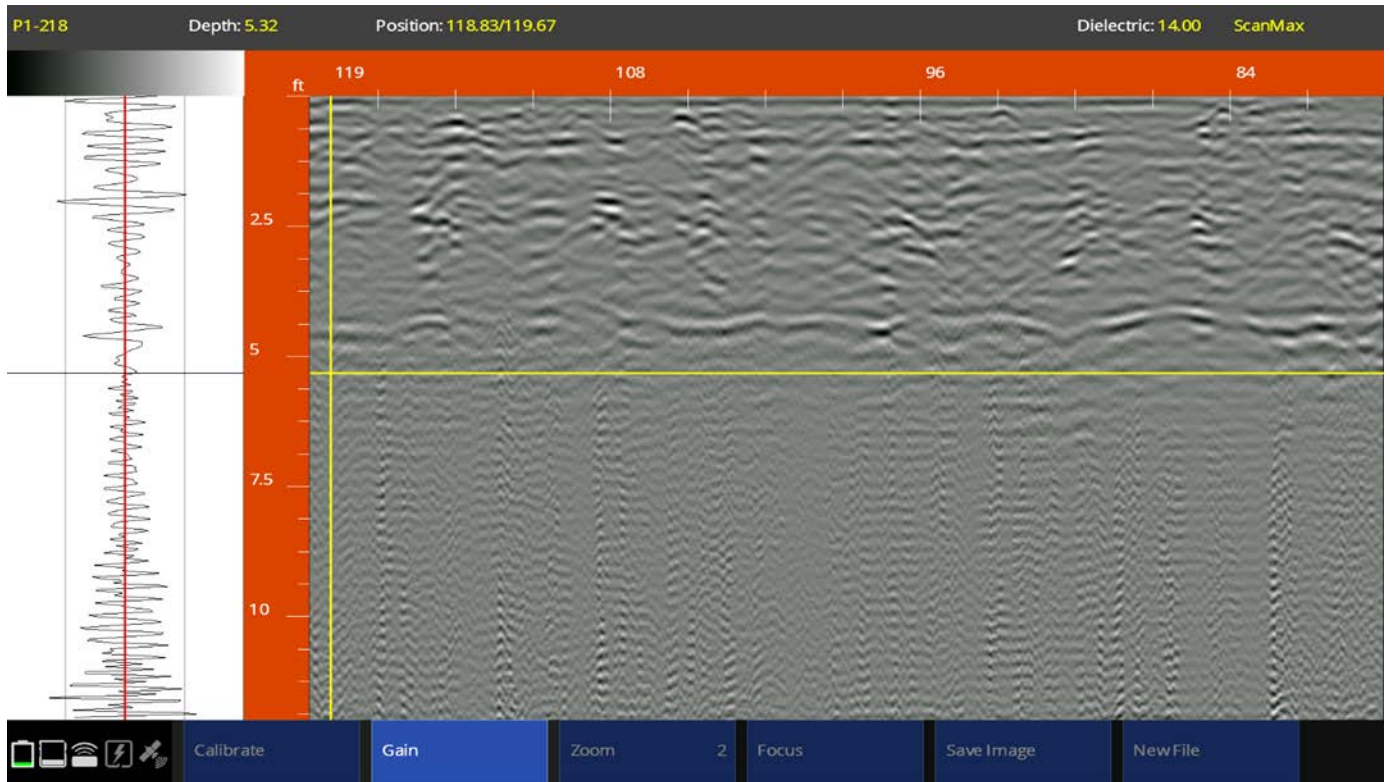

Figure 6 – Radargram from this project to a depth of 5.3 ft. Below that is noise

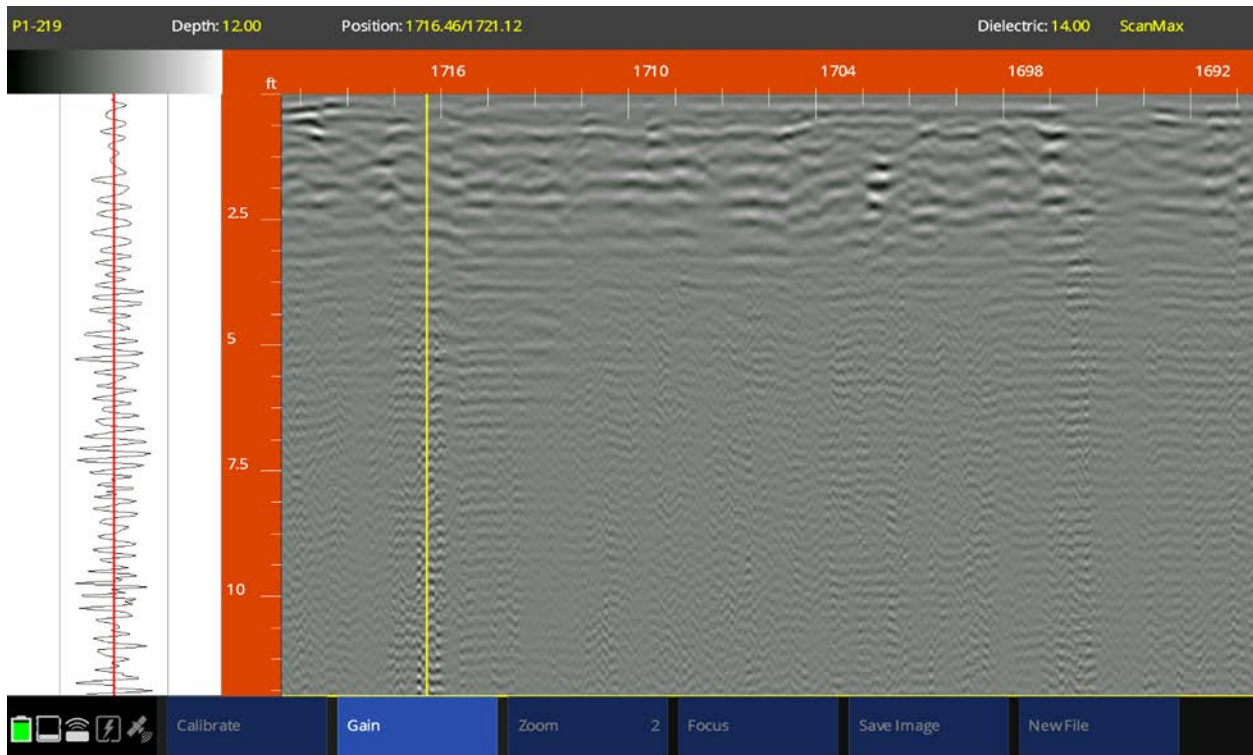

Figure 7 – Radargram from this project showing depth to 2.5 ft. Below that is noise

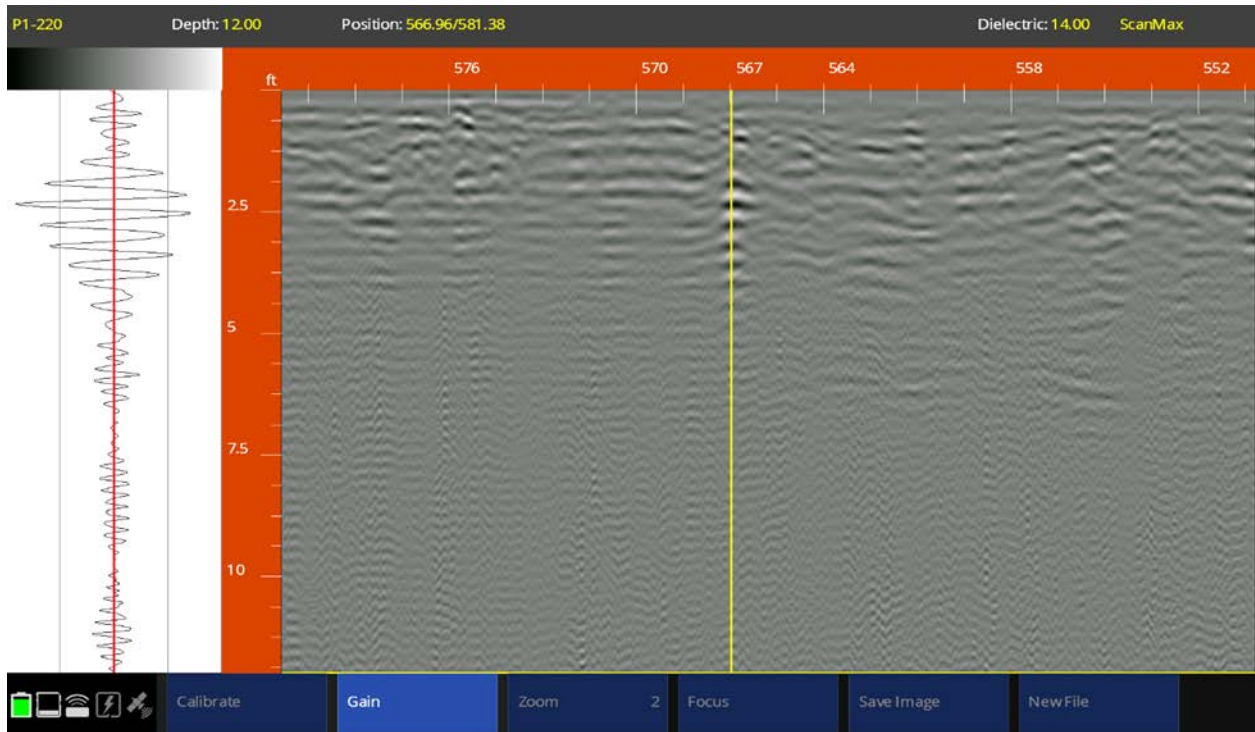

Figure 8 - Radargram from this project showing depth to 4 ft. Below that is noise

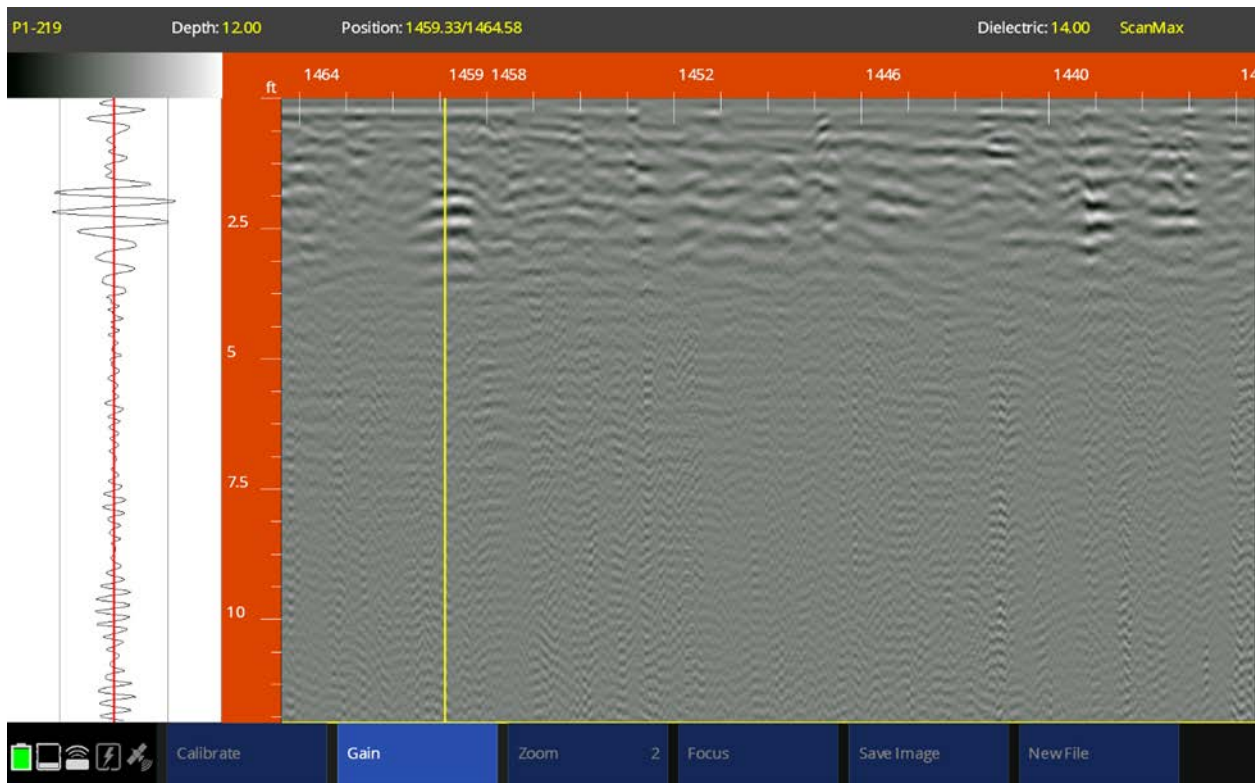

Figure 9 - Radargram from this project showing depth to 3.5 ft. Below that is noise

Careful examination of the radargrams both real time in the field and during processing revealed no tell-tale hyperbolas or other shapes indicative of the targets that we were commissioned to locate. It is clear that there are many small artifacts underground as evidenced by the radargrams, but most are clearly geologic in nature not anthropogenic. It is also clear that small artifacts are abundantly present given the industrial nature of the site. The office processing and review was completed on October 9th, 2020. Radan 7 is the preferred software for processing the GPR data.

The lack of GPR depth throughout the site is due in most part to the subsoils prevalent in this part of Illinois. See Figure 10 below.

Figure 10 – GPR Soil Suitability Map for Illinois. Very Low GPR Index for the project area. Poor likelihood of satisfactory results is prevalent in this area

Magnetometer (MAG) Processing

Data recorded during the field acquisition phase were processed in Geosoft Oasis Montaj Geophysics software. The data was carefully checked and is free from significant interference such as RF (radio frequencies) that would impair the quality of the signals. Field strength is the magnitude of the geomagnetic field, and therefore is a scalar quantity; it is commonly referred to as the 'total field.' The total field is the most commonly and easily measured quantity in surface magnetic surveys. The readings recorded for MAG are measured on a grid. The readings are then assembled into the area for the site survey and recorded in amplitude (also magnitude) of the readings. The technical name for this measure is flux density. The unit of the measurement is nanotesla (nT). The grid of readings is not easy to interpret as a line of readings but make sense when joined with others. The best way to portray the readings are customarily done in contours. There are other means of portraying the results, such as wire frames (3D), color contours, and greyscale contours. For this project we have selected color contours since they are more easily read by the end user. They can also be overlaid on other drawings with less confusion in line work.

Readings that are high indicate artifacts that are ferrous in nature and likely represent a manmade target. As can be seen the survey located hundreds of anomalies of small magnitude. For the most part the readings of greater magnitude follow the areas where railroad sidings were located. When this data is overlain on the topographic map that becomes abundantly clear.

Magnetometers have been used for decades to perform magnetic surveys. Both geologic and anthropogenic features are surveyed. Nearby metal objects may cause interference. Some items, such as automobiles, are obvious, but some subtle interference will be recognized only by the experienced magnetics operator and in careful design of the magnetic survey.

The full presentation of the MAG Color Contour Maps will be presented in full size sheets superimposed over the topographic survey for clarity.

This sample scale of magnitude measured in nanoteslas (nT) is representative of the spread of values for the particular survey area. The scale will vary for each site.

Figure 11 – Sample scale for Area 1 showing Magnitude of magnetic readings in nanoteslas (nT)

Figure 12 – Area 1 Color Contour Map

Figure 13 – Area 3 Color Contour Map

CONCLUSION

The best analysis of the data comes from viewing the results of both the Ground Penetrating Radar and the Magnetometer survey together. This provides a more complete understanding of the subsoil conditions on the site and the potential for anomalies that are the subject of this survey.

From examining the GPR survey the site is unremarkable. The MAG survey reveals an area rich in targets. When considered together it is evident that in the area of the survey, we were unable to find significant sized remnants, targets of manmade origin that would hamper the construction of building footing and foundations.

Remote sensing is not a clear-cut science and not without its faults. Please review the Appendix for limitations and comments on the two sources of geophysical survey.

APPENDIX

AMERICAN SURVEYING & ENGINEERING

GROUND PENETRATING RADAR (GPR) LIMITATIONS

Ground Penetrating Radar transmits pulses of high-frequency radio waves down into the ground through a transducer or antenna. Various antennas with various frequencies are used for different applications. The transmitted energy is reflected from various buried objects or distinct contacts between different materials. The antenna receives the reflected waves back and stores them in the digital control unit.

GPR waves reach variable depths depending on antenna frequency and the medium through which it passes. Depths up to 70 feet or more in low conductivity materials such as dry sand or granite is possible. However, clays, shale, and other high conductivity materials, may attenuate or absorb Ground Penetrating Radar signals, greatly decreasing the depth of penetration to 3 feet or less. Depth is a function of the Earth's conductivity in the area tested. The lower the conductivity the deeper the depth of penetration.

The performance capability of this type of radar is strongly dependent on the soil electrical conductivity at the site. If the soil conductivity is high, attenuation of the radar signal in the soil can severely restrict the maximum penetration depth of the radar signal. Whereas maximum penetration depth achievable with these radars can be many feet in favorable conditions, these numbers can be reduced to a few feet or less at many sites in Illinois due primarily to moisture and soil type. The best results are obtained during dry seasons. As such, significant rain events 24 hours prior to or during the GPR survey will impede the work.

There can also be interference, noise, in the signals caused by a variety of underground objects, debris. The specific targets that are the subject of the study can be masked by these objects since the signal can be scattered as the soils are more heterogenous than homogeneous. In addition, the vertical accuracy can often be suspect when there is no means of calibrating the data. That is taking readings on targets of known or verified depths within close proximity to the study area.

We have performed GPR studies in Illinois many times for several years very successfully. However, GPR is not a guaranteed science due to these limitations. Even test pilot areas can be misrepresented by differing soil types or moisture content. No guarantees can be made in advance of performing the work as to its functionality or usefulness. Unfortunately, the risk must be borne solely by the client should you decide to have us perform a GPR Study.

AMERICAN SURVEYING & ENGINEERING

FLUXGATE MAGNETOMETER/ GRADIOMETER LIMITATIONS

To make accurate anomaly maps, temporal changes in the Earth's field during the period of the survey must be considered. Normal changes during a day, sometimes called diurnal drift, are a few tens of nT, but changes of hundreds or thousands of nT may occur over a few hours during magnetic storms. During severe magnetic storms, which occur infrequently, magnetic surveys should not be made. The correction for diurnal drift can be made by repeat measurements of a base station at frequent intervals. The measurements at field stations are then corrected for temporal variations by assuming a linear change of the field between repeat base station readings. However, many external factors will impact the effectiveness of Magnetometer surveys.

Intense fields from man-made electromagnetic sources can be a problem in magnetic surveys. Most magnetometers are designed to operate in intense 60-Hz and radio frequency fields. However, extremely low frequency fields caused by equipment using direct current or the switching of large alternating currents can be a problem. Pipelines carrying direct current for cathodic protection can be particularly troublesome. Although some modern ground magnetometers have a sensitivity of 0.1 nT, sources of cultural and geologic noise usually prevent full use of this sensitivity in ground measurements. Nearby metal objects may cause interference. Some items, such as automobiles, are obvious, but some subtle interference will be recognized only by the experienced magnetics operator and in careful design of the magnetic survey. Old buried curbs and foundations with rebar, scrap iron, buried cans and bottles, power lines, fences, and other hidden factors can greatly affect magnetic readings.

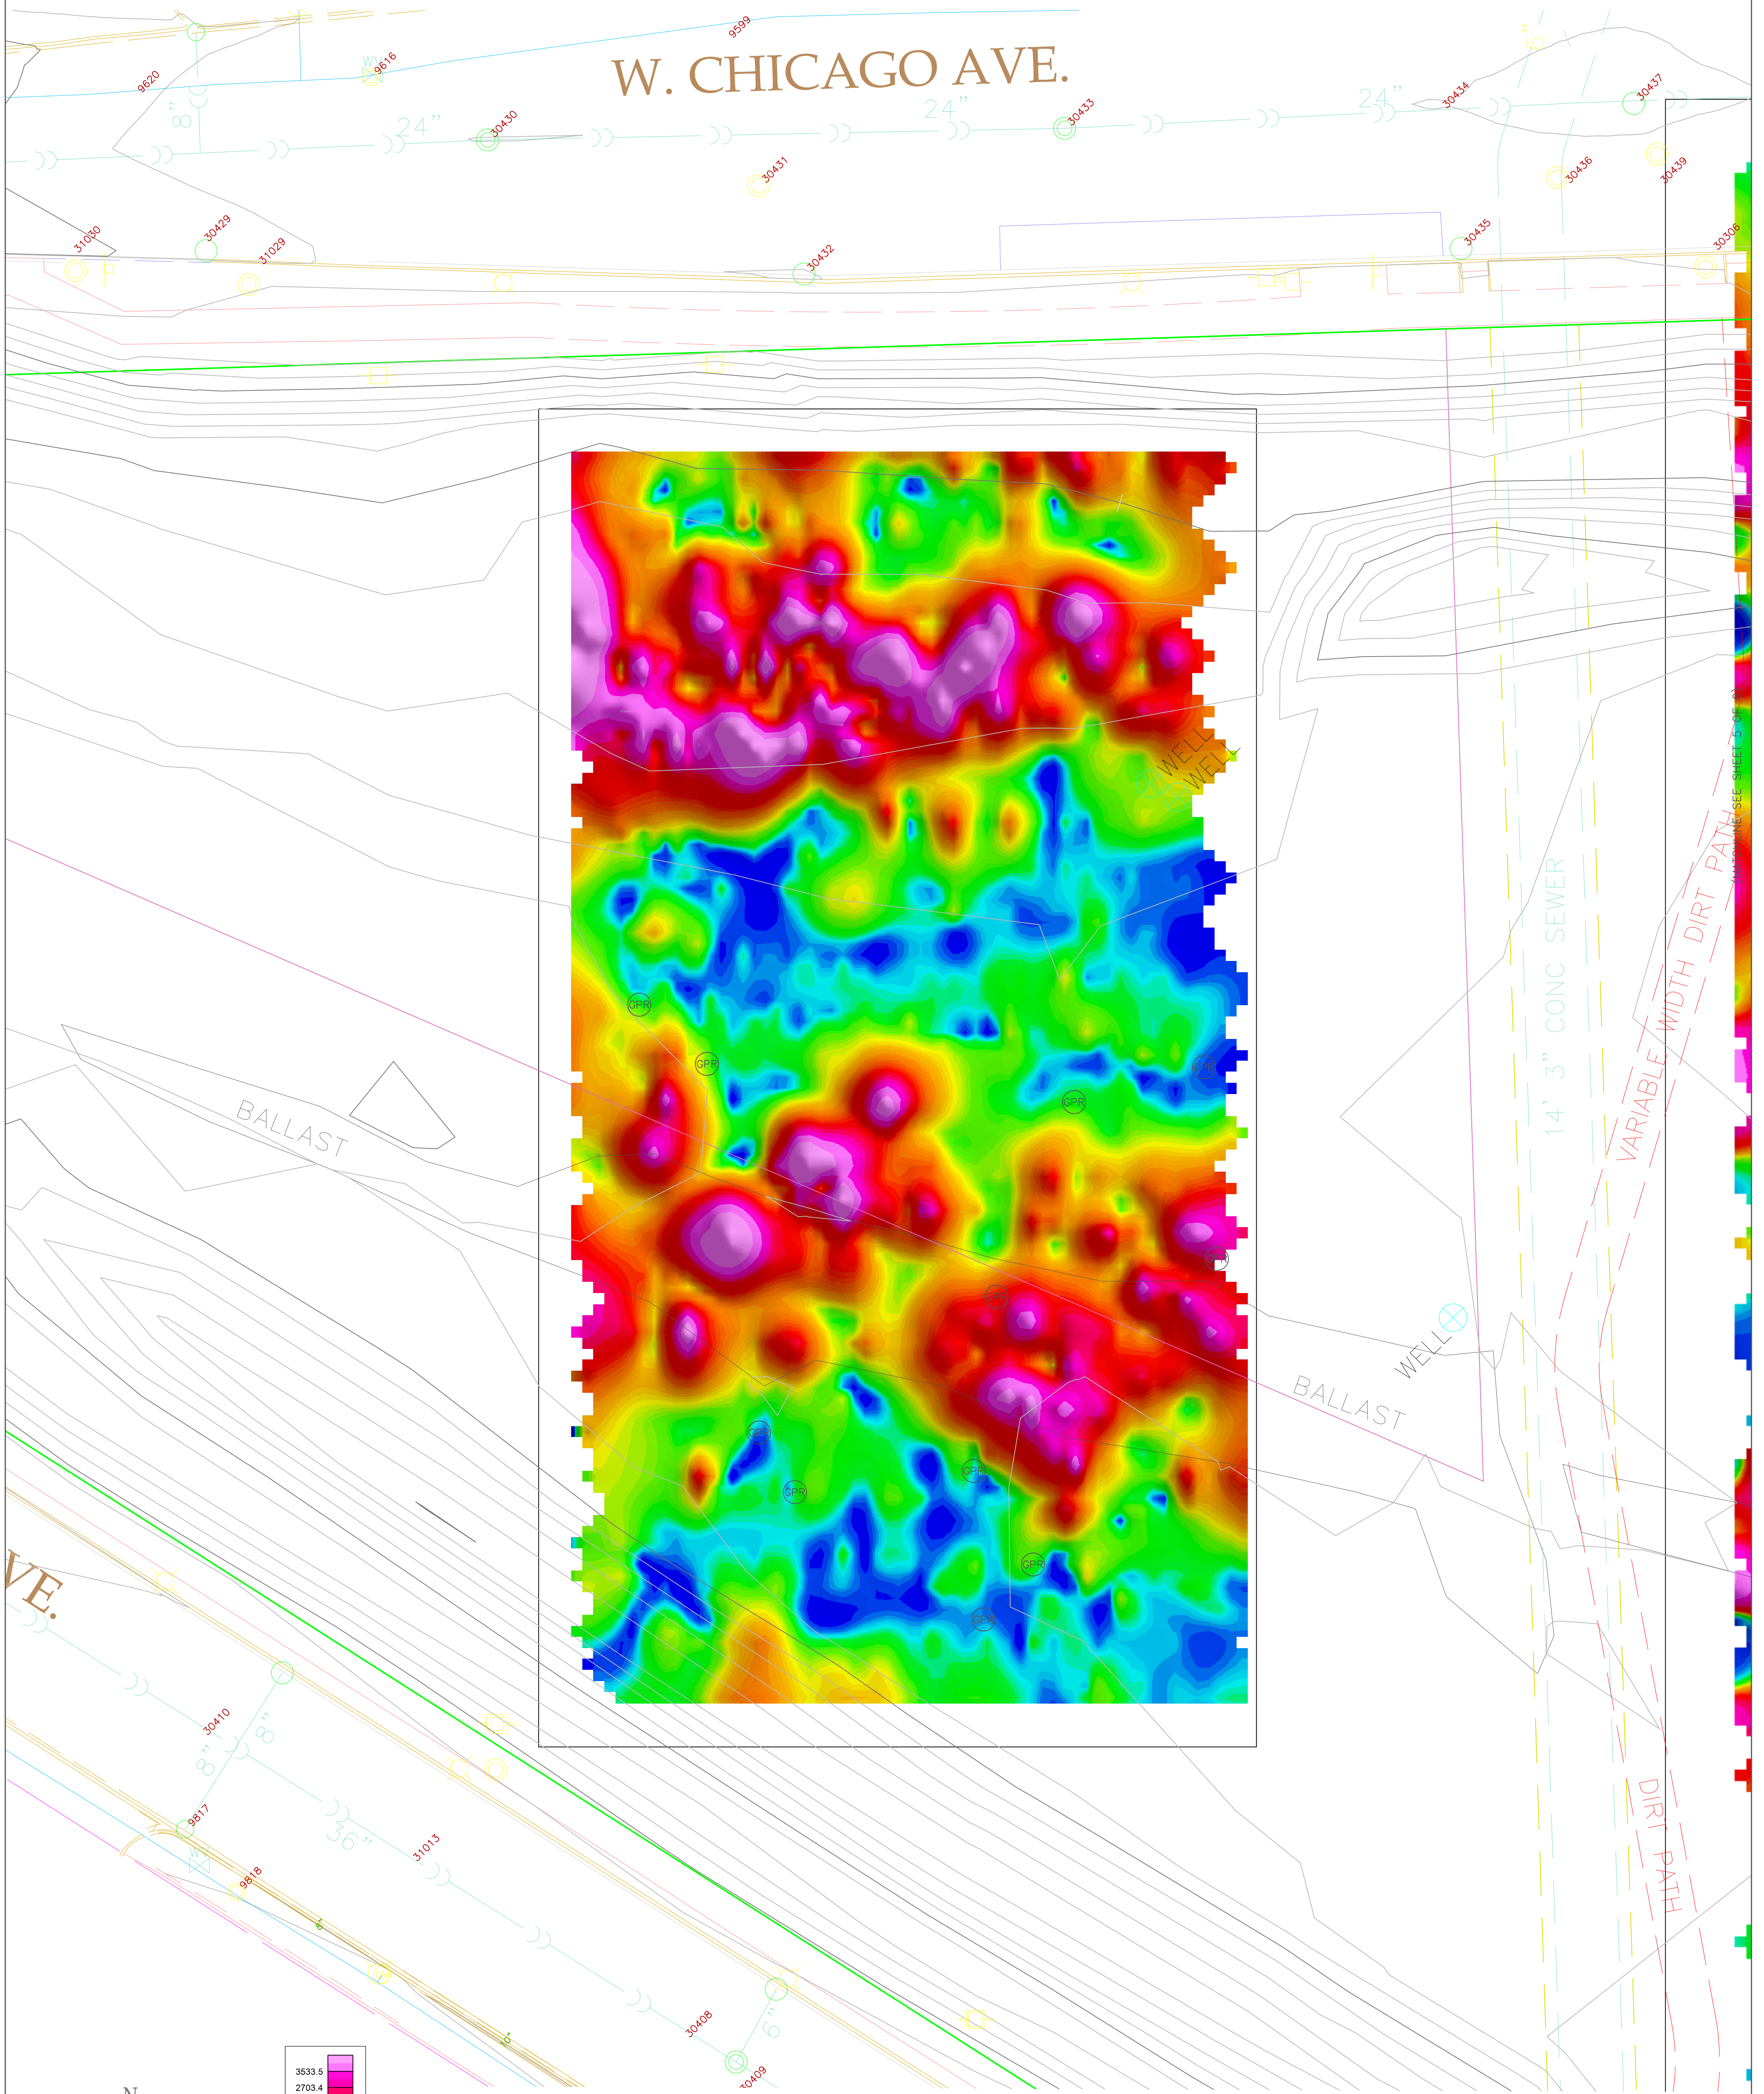

From a geologic standpoint, magnetite and its distribution determine the magnetic properties of most rocks. There are other important magnetic minerals in mining prospecting, but the amount and form of magnetite within a rock determines how most rocks respond to an inducing field. Iron, steel, and other ferromagnetic alloys have susceptibilities one to several orders of magnitude larger than magnetite. However, the importance of magnetite cannot be exaggerated. Some tests on rock materials have shown that a rock containing 1% magnetite may have a susceptibility as large as 10^{-3} , or 1,000 times larger than most rock materials.

Many urban areas or industrial sites are littered with the presence of ferrous materials. These materials in ordinary municipal trash and in most industrial waste does allow the magnetometer to be effective in direct detection of landfills. Other ferrous objects, which may be detected, include pipelines, underground storage tanks, buried storage barrels and in areas where military operations have been performed ordnance. However, in areas of considerable surface anomalies, more important targets may be masked from interpretation by their presence.

Project No. 3205171606

Dear Ms. Mazza:

Amec Foster Wheeler Environment & Infrastructure, Inc. is pleased to present this Phase I Environmental Site Assessment (ESA) report for the above-referenced site in Chicago, Illinois. Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase have been updated in this, the final Phase I ESA report.

We have appreciated the opportunity to serve you on this project. If you have any questions or desire further information, please feel free to contact us at 773-693-6030.

Sincerely,

Amec Foster Wheeler Environment & Infrastructure, Inc.

EXECUTIVE SUMMARY

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler), was retained by the City of Chicago Department of Fleet and Facility Management (2FM) to conduct a Phase I Environmental Site Assessment (ESA) for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois (the site) in general accordance with the scope and limitations of ASTM International (ASTM) E 1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase have been updated by our subcontractor, Yung Environmental, Inc. in this final Phase I ESA report.

The site is a 30.4-acre parcel that is currently vacant. This Phase I ESA was performed in conformance with the scope and limitations of ASTM International (ASTM) Standard E 1527-13.

The purpose of this Phase I ESA was to identify known environmental conditions or concerns associated with the site, which include any recognized environmental conditions (RECs) associated with the site. RECs do not include *de minimis* conditions that generally do not present a material risk of harm to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. The results of our Phase I ESA are summarized below.

Site History

Based on a review of reasonably ascertainable records, the site was vacant prior to its first developed usage. The site was developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

Site Reconnaissance

At the time of Yung Environmental, Inc.'s site reconnaissance on November 15, 2017, the site was observed to be vacant. Yung Environmental, Inc. did not observe evidence of aboveground storage tanks (ASTs), underground storage tanks (USTs), odors, pools of liquid, drums, containers storing potentially hazardous substances or petroleum products, stains or corrosion, pits, ponds, or lagoons. Significant amounts of debris and mounded soil were present and a small demolished building structure was noted in the northwest.

Environmental Records

Review of the federal, state, and tribal (if appropriate) records, including a proprietary records summary provided by Environmental Data Resources, Inc. (EDR), a third-party provider of environmental and land use records, indicates that properties of environmental concern are located within the respective ASTM standard search distances for each category. The property itself has environmental concerns with regard to an UST which may have been present on the property and has no closure documentation (No Further Remediation or NFR letter) and contaminants consisting of metals and polynuclear aromatic hydrocarbons discovered in previous site investigations.

Amec Foster Wheeler has screened the identified properties for significance with respect to their potential impact on the site based on reasonably ascertainable information obtained from the records review, site reconnaissance, and interviews. Based on distances from the site boundary, the types of listings, and the assumed direction of groundwater flow, none of the properties listed is likely to have a negative impact on the site except:

- CTA at 4401 West Chicago Avenue, due to USTs installed in 1992, and because it is a former rail yard and may have fill similar to the site.
- Rail IT Property, 733 North Kilbourn Avenue, due to an UST that was not closed. It is unclear if this is the site or adjacent, as Rail IT at one time owned the site and the street number identified in the EDR report could potentially put it near the southeast corner of Chicago and Kilbourn Avenues, which would be the site.
- Department of Streets and Sanitation, 750 North Kilbourn Avenue, adjacent across North Kilbourn Avenue, due to USTs removed but not closed and since it is a transfer station and incinerator which may have resulted in airborne particulates reaching the site.
- City of Chicago, 715 North Kilbourn Avenue, due to an UST that was not closed. The initial incident report for #940242 lists 715 N. Kilbourn Avenue and then subsequent documentation on the Illinois EPA website for this incident changed to 750 N. Kilbourn Avenue. Amec Foster Wheeler believes the address was mis-identified in the original report and subsequently corrected. Although an incident was reported, a subsequent Illinois EPA letter indicates the site is a non-LUST site, which could indicate there was no confirmed release, or that the incident was from a non-regulated tank.

Phase II Assessment 2017

A Draft Phase I ESA report was prepared in June 2017, and based on that report, a Phase II investigation was completed which included the installation of twenty-four (24) soil borings and two (2) temporary wells. Twenty-six soil samples were obtained and four (4) groundwater samples (2 groundwater samples were from wells already present on the site). Samples were compared to TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater. Based on the

Phase II and previous site investigations, concentrations of PNAs, arsenic, and antimony were detected in soils at concentrations above the objectives. No detected concentrations in groundwater exceeded the objectives. A TACO Tier 2 assessment concluded that the groundwater pathway could be excluded for antimony and benzo(a)anthracene above the soil component of groundwater ingestion objective and that averaging of PNAs and arsenic above the soil ingestion objective would result in three (3) locations which would require remediation or the use of engineered barriers for site closure.

Conclusions

No significant data gaps were identified that affected Amec Foster Wheeler’s ability to identify RECs for the site, except overgrown vegetation which prevented viewing all of the ground surface.

Amec Foster Wheeler has performed this Phase I ESA in conformance with the scope and limitations of ASTM Standard E 1527-13. This assessment has revealed no evidence of RECs in connection with the site, except for the following:

Table 9: On-Site RECs

PIN#	Address	Acreage	Current/ Historic Land	RECs	COCs	Pathways
16-10-200-061-0000	4301 W Chicago Ave	30.4	Vacant/ Former Railyard	USTs	BTEX, Lead, PNAs	Groundwater, Soil Ingestion, Soil Inhalation, Vapor Intrusion
				Fill, Debris	PNAs, Metals	
				Rail Ties	Arsenic, Cresols	
				Previous Contaminants	PNAs, Metals	

Off-site sources of contamination that have the potential to migrate onto the site have been identified as a REC(s), as follows:

Table10: Off-Site RECs

Address	Distance	Current/ Historic Land	RECs	COCs	Pathways
CTA 4401 West Chicago Ave	Adjacent North EDR: 477 ft North	Bus Garage/ Rail yard	USTs	BTEX, Lead, PNAs	Groundwater Ingestion Inhalation, Vapor Intrusion
			Rail yard	Arsenic, Cresols	
			Fill	PNAs, Metals	
RAIL IT Property 733 N Kilbourn Ave	AdjacentWest or Property EDR: 910 ft West	Vacant/ Rail yard	UST	BTEX, PNAs	Groundwater Ingestion Inhalation Vapor Intrusion
Department of Streets and Sanitation 750 N. Kilbourn Ave	Adjacent West EDR: 1044 ft West	Transfer Station and Incinerator/ Rail yard	USTs	BTEX, Lead	Groundwater Ingestion Inhalation Vapor Intrusion
			Air Particulate from Former Incinerator	Metals, PNAs	
City of Chicago 715 N. Kilbourn Ave (750 N. Kilbourn Ave.)	Adjacent West EDR: 800 ft West	Vacant/ Rail yard	UST with Release	BTEX, PNAs	Groundwater Ingestion Inhalation Vapor Intrusion

ft = feet

Based on the results and conclusions of the Phase I ESA, Amec Foster Wheeler recommended further evaluation of soil and/or groundwater quality beneath the site.

Limitations

This Executive Summary is provided as a summary only, and should be used only in conjunction with a full review of the complete Phase I ESA report. Amec Foster Wheeler completed this work under the contract terms and conditions presented in Amec Foster Wheeler’s proposal dated May 18, 2017 as updated on September 26, 2017.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

4301 West Chicago Avenue
Chicago, Illinois

1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler), was retained by the City of Chicago Department of Fleet and Facility Management (2FM) to perform a Phase I Environmental Site Assessment (ESA) for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois (the site) in general accordance with the scope and limitations of ASTM International (ASTM) E 1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase have been updated by our subcontractor, Yung Environmental, Inc. in this final Phase I ESA report.

Amec Foster Wheeler prepared this Phase I ESA in accordance with a proposal dated May 18, 2017 as updated on September 26, 2017.

1.1 PROJECT OVERVIEW

This Phase I ESA is intended to satisfy one of the requirements to permit 2FM to qualify for the innocent landowner, adjoining property owner, or bona fide prospective purchaser limitations on liability under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (landowner liability protections). This Phase I ESA conforms to standards for "*all appropriate inquiries*"¹ into the previous ownership and uses of the site as specified by the US Environmental Protection Agency (EPA) in 40 CFR Part 312, and in accordance with good commercial or customary practice.

The goal of the Phase I ESA process is to identify recognized environmental conditions (RECs). The term *REC* means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a site:(1) due to any release to the environment, (2) under conditions

¹As defined at 42 U.S.C. Section 9601(35)(B) and 40 CFR Part 312.

indicative of a release to the environment, or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not RECs. A *de minimis* condition generally does not present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

Separate and distinct from a REC are two other types of conditions that may be noted in a Phase I ESA: a controlled REC (CREC) or an historical REC (HREC).

A CREC is a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the current satisfaction of the applicable regulatory authority (for example, as evidenced by a no further action [NFA] letter or the equivalent, or meeting risk-based criteria established by the regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls, such as site use restrictions, activity and use limitations (AULs), institutional controls, or engineering controls.

An HREC is a REC from a past release of any hazardous substances or petroleum products that has occurred in connection with the site and has been addressed to the satisfaction of the applicable regulatory authority (using current criteria) or meets the unrestricted residential use criteria established by the regulatory authority and applicable at the time of this Phase I ESA without subjecting the site to any required controls.

1.2 PROPERTY DESCRIPTION

The site consists of 30.4 acres located on the southeast corner of the intersection of Kilbourn and West Chicago Avenue. The Parcel ID (Tax ID) number for the site is 16-10-200-061-0000. The site is located in a mixed land use area. The site is partially fenced and no buildings or other improvements are present on the site.

1.3 SCOPE OF WORK

The scope of services for conducting a Phase I ESA is outlined in ASTM E 1527-13. This Phase I ESA report should not be used for any purposes outside the scope.

Significant additions, deletions, or deviations to ASTM E 1527-13 are noted below or in corresponding sections of this report. To complete the scope of services, the following tasks were performed:

A physical site reconnaissance to identify likely RECs in connection with the site;

Visual observation of adjoining properties or facilities to assess conditions that may indicate RECs on the site or on an adjoining property;

Review of historical land use of the site back to the first developed use or 1940, whichever is earlier;

Review of existing published information related to geology, hydrology, and topographical information for the site;

Review of reasonably ascertainable records and regulatory agency file database searches to identify federal and state-listed properties of known potential environmental concern located within the minimum search distances from the site, as specified in ASTM E 1527-13;

Lien/AUL search

Interviews with present and past site owners or occupants;

Interviews with representatives of the state, county, or local regulatory agencies with knowledge of the site;

Evaluation of compiled information and documentation; and

Preparation of this report.

This Phase I ESA does not address non-scope considerations as defined in Section 13 of ASTM E 1527-13. The scope of work does not include items considered to be beyond the scope of an ASTM Standard Phase I ESA, such as the collection and testing of groundwater samples, surface and drinking water samples, air samples (including radon), or building material samples for hazardous materials (including polychlorinated biphenyls [PCBs], asbestos, and lead-based paint). It also does not include the identification of wetlands, endangered or protected plant and animal species, or historical or archeological sites; geotechnical studies; geologic hazards; potential noise or air quality impacts; or concerns related to the Americans with Disabilities Act.

1.4 LIMITATIONS, EXCEPTIONS, SPECIAL TERMS AND CONDITIONS

This report summarizes work performed to fulfill the process specified under ASTM Standard E 1527-13. The ASTM standard is intended to permit a user to satisfy one of the requirements to qualify for the federal CERCLA liability exemptions. Reasonable efforts were limited to observation of accessible areas, review of referenced public records, and interviews. Amec Foster Wheeler was allowed full access to the site; however, overgrown vegetation limited our visual review of the site, as noted in this Phase I ESA.

This report was prepared by Amec Foster Wheeler exclusively for the City of Chicago Department of Fleet and Facility Management. The quality of information, conclusions, and estimates contained herein is consistent with the level of effort involved in Amec Foster Wheeler services and based on: (1) information available at the time of preparation, (2) data supplied by outside sources, and (3) the assumptions, conditions, and qualifications set forth in this report. This Phase I Environmental Site Assessment is intended to be used by the City of Chicago Department of Fleet and Facility Management for the 4301 West Chicago Avenue, Chicago, Illinois site only, subject to the terms and conditions of its contract with Amec Foster Wheeler. Any other use of, or reliance on, this report by any third party is at that party's sole risk.

Environmental impairment of a property may result from many activities, such as illegal or unreported dumping, or the spilling of hazardous wastes or materials. The presence of contaminants at a particular property may not always be apparent, and the completion of a Phase I ESA in accordance with ASTM E 1527-13 cannot provide a guarantee that hazardous wastes or materials do not exist. The scope of services executed for this project does not include an audit for regulatory compliance, ecological resources, endangered species, cultural and historic resources, indoor air quality, industrial hygiene, health and safety, or high-voltage power lines. It also does not include a detailed condition survey for asbestos, lead, radon, lead in drinking water, or other potential hazards or for wetlands, naturally occurring materials, or other items not outlined in Amec Foster Wheeler's scope of services.

The findings contained herein are relevant to the dates of Amec Foster Wheeler's site reconnaissance and should not be relied upon to represent conditions at later dates. In the event that changes in the nature, usage, or layout of the property or nearby properties are made, the conclusions and recommendations contained in this report may not be valid. If additional information becomes available, it should be provided to Amec Foster Wheeler so the original conclusions and recommendations can be modified as necessary.

Regardless of findings stated in this Phase I ESA, Amec Foster Wheeler is not responsible for consequences of conditions arising from facts that were withheld or not fully disclosed to Amec Foster Wheeler during this Phase I ESA.

This report does not address permit compliance or safety concerns, if any, associated with the site. It is the responsibility of the user of this Phase I ESA to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

Amec Foster Wheeler has completed this work under the contract terms and conditions presented in Amec Foster Wheeler's proposal dated May 18, 2017 as updated on September 26, 2017.

1.4.1 Significant Assumptions

Amec Foster Wheeler has prepared this Phase I ESA using reasonable efforts to identify RECs associated with hazardous substances or petroleum products at the site. Findings in this Phase I ESA are presented as professional judgments expressed herein and are based on the facts currently available to Amec Foster Wheeler within the limits of the existing data, scope of work, budget, and schedule.

An independent data research company, Environmental Data Resources, Inc. (EDR), of Milford, Connecticut, provided Amec Foster Wheeler with the government agency database search report referenced in this Phase I ESA. The information provided to Amec Foster Wheeler from the government agency database search was assumed to be correct unless obviously contradicted by Amec Foster Wheeler's observations or contradicted by another credible referenced source reviewed by Amec Foster Wheeler.

Similarly, Amec Foster Wheeler has assumed that responses to questions during interviews have been truthful, and that information contained in previous reports for the site or adjoining properties (for example, earlier Phase I ESAs or consultants' reports on tank removals or spill response) is accurate (pursuant to Section 4.7 of ASTM E 1527-13), unless contradicted by Amec Foster Wheeler's observations or contradicted by other credible referenced sources reviewed by Amec Foster Wheeler.

1.4.2 User Reliance

This Phase I ESA is intended to be used by the City of Chicago Department of Fleet and Facility Management subject to the terms and conditions of its contract with Amec Foster Wheeler. This Phase I ESA may not be relied upon by other parties without the express written consent of Client and upon written acceptance of our Terms and Conditions through Amec Foster Wheeler's Third Party Reliance Agreement.

In accordance with ASTM E 1527-13, this report is valid for one year from the date of the intended transaction, assuming interviews, a search for environmental liens, a review of government records, the visual reconnaissance of the site and surrounding properties, and the Environmental Professional declarations are updated within 180 days prior to the intended transaction.

Provided that the report is still valid and reliable, as per the limitations and exceptions listed above, Amec Foster Wheeler will issue a third-party reliance letter to parties that the City of Chicago Department of Fleet and Facility Management identifies in writing, upon payment of the then-current fee for such letters. All third parties relying on Amec Foster Wheeler's report, by such reliance agree to be bound by our proposal and Amec Foster Wheeler's reliance agreement. Amec

Foster Wheeler's standard reliance letter indicates that in no event shall Amec Foster Wheeler be liable for any damages, howsoever arising, relating to third-party reliance on Amec Foster Wheeler's report.

1.5 DATA GAPS

No significant data gaps or data failures were identified that affected Amec Foster Wheeler's ability to identify RECs for the site, except that heavy vegetation was present over much of the site. Amec Foster Wheeler has performed this Phase I ESA in conformance with the scope and limitations of ASTM Standard E 1527-13.

2.0 PROPERTY OVERVIEW

The following is a description of the location, general setting, and usage of the site and adjoining properties, based on information provided by the City of Chicago Department of Fleet and Facility Management and observations during the site reconnaissance.

2.1 PROPERTY LOCATION AND LAND USE

The current site address is 4301 West Chicago Avenue, Chicago, Illinois. The site location is shown on Figure 1, and the general site layout is shown on Figure 2.

2.1.1 Property Location

The site is located in Chicago, Cook County, Illinois.

According to the City of Chicago, the site is zoned PMD9 (special purpose district 9). The Parcel ID (Tax ID) number for the site is 16-10-200-061-0000. A copy of the legal site description is located in **Appendix E**.

At the time of the site reconnaissance, the site was vacant. The site is situated at an elevation of approximately 610 feet above mean sea level (msl). Based on our review of the local topography, it appears that groundwater would generally flow toward the east to Lake Michigan.

2.1.2 Current Uses of the Adjoining Properties

Table 1 summarizes the adjoining properties and their uses that Amec Foster Wheeler identified on the day of the site reconnaissance.

Table 1: Adjoining Properties

Direction	Property Description
North	West Chicago Avenue, commercial buildings
Northeast	N. Kostner Avenue, concrete construction materials yard then Falcon Transportation
East	N. Kostner Avenue, Chicago Transit Authority
Southeast	Railroad tracks, then Grand Warehouse and Distribution, Tec Foods, Inc
South	Railroad tracks, then Grand Worldwide Logistics and 4444 W Ohio-bldg for lease
Southwest	Railroad tracks, then City of Chicago Transfer Station
West	Kilbourn Avenue, industrial properties

2.1.3 Utilities

Table 2 details the utilities provided to the site.

Table 2: Site Utilities

Service	Provider
Electricity	Not applicable, property is vacant
Potable Water	Not applicable, property is vacant
Sanitary Sewer	Not applicable, property is vacant
Storm Sewer	Not applicable, property is vacant
Natural Gas	Not applicable, property is vacant

2.2 PHYSICAL SETTING

Amec Foster Wheeler reviewed reasonably ascertainable sources to assess the physical setting of the site, including the topographic, geologic, hydrogeologic, and hydrologic characteristics of the site. The results of Amec Foster Wheeler’s review are presented below.

2.2.1 Topography

The 7.5-minute Chicago Loop, Illinois, United States Geological Survey (USGS) quadrangle, published in 2012, was examined. Review of the topographic map indicates that the site is located between 600 and 605 feet above msl. The topography of the area is generally flat with a slight slope to the east.

2.2.2 Geology/Hydrogeology

The EDR Radius report provides soil composition information in the general area of the site, provided by the United States Department of Agriculture (USDA) Soil Conservation Service (SCS). EDR indicates the site soils consist primarily of the Urbanland soil type, and consists of fine sand, sandy loam or clay loam.

The region is located in the central portion of the Central Lowlands Physiographic Province, a broad, relatively low area that roughly outlines the glaciated area and extends from the Appalachian Plateaus on the east to the Great Plains on the west, and from the Superior Upland on the north to the Interior Low Plateaus and the Ozark Plateaus on the south. The local relief in the Central Lowlands seldom exceeds a few hundred feet. The Central Lowland Province is divided into two sections, the Till Plains Section and the Great Lakes Section. The Great Lakes Section, which includes the Site, contains surficial features of the youngest part of the Wisconsin Stage glacial drift, and is characterized by its many lakes, and rough surfaced moraines.

Near surface geology in the southeastern Chicago area consists primarily of glacially derived fluvial, lacustrine, and ice-contact sediments. The property is underlain by these glacial deposits which overlie Silurian Dolomite bedrock. The underlying glacial deposits in the area are predominantly the Pleistocene-aged Wadsworth Till Member of the Wedron Formation. Overlying the till in parts of the area is the Carmi Member of the Equality Formation, which is composed primarily of quiet-water, well-bedded silts. In northeastern Illinois, the Wadsworth Till ranges from clay to clayey silt to sandy, clayey silt. All tills of the Wadsworth are characterized by their high clay content and abundance of black shale fragments. The high clay content produces medium to high plasticity and low hydraulic conductivity in the till unit.

The geologic rock stratigraphic unit underlying the site is a Paleozoic Middle Silurian (Niagoaran) dolomite.

Four regional aquifers are present within the Chicago area. The first two are shallow aquifer systems that provide groundwater for domestic and municipal use. The first of these is the sand and gravel located within glacial deposits. These deposits of sand and gravel may occur as shallow, unconfined surficial aquifers or as confined aquifers buried beneath clay till. Groundwater flow within the clay till is expected to be downward toward underlying aquifers.

The upper 50 feet of bedrock forms the second shallow aquifer system in northeastern Illinois. Prior to glaciation, the bedrock was at or near the ground surface and was subject to chemical and physical weathering processes. As a result, the shallow weathered bedrock is generally more permeable and water-bearing than deeper sections of bedrock. The Silurian Dolomite, which is the upper bedrock in much of northeastern Illinois, has historically been used as a water source for municipalities. However, most municipalities in northeastern Illinois, including Chicago, now obtain water from Lake Michigan.

The Silurian Dolomite is underlain by the Maquoketa Shale which is approximately 170 feet thick and is a regional aquitard. An aquitard may be defined as any saturated geologic formation not capable

of yielding useable quantities of groundwater to a well. Sandstone and dolomite formations beneath the Maquoketa Shale form two deep regional aquifer systems capable of yielding large groundwater supplies.

Based on Amec Foster Wheeler's review of topographic maps and observations of the site vicinity, the groundwater flow direction was inferred to be generally to the east toward Lake Michigan. It should be noted that actual groundwater hydraulic gradient and flow direction(s) do not always follow topography, especially in areas influenced by heavy pumping from municipal or agricultural wells, irrigation and/or recharge projects. Additional regional research and/or site-specific groundwater studies would be required to reliably establish groundwater flow direction in the vicinity of the site.

2.2.3 Surface Water Bodies

The closest apparent surface water bodies are small ponds in Garfield Park about 1 mile southeast of the site. Lake Michigan is about 6 miles to the east, the Chicago River is about 4.4 miles to the east and the Des Plaines River is about 5 miles west of the site.

2.2.4 Wetlands

A detailed wetland evaluation is beyond the scope of this investigation. Areas that may be wetlands or nearby surface water bodies were not observed on the site. The closest wetlands appear to be small areas near the ponds in Garfield Park, about 1 mile southeast of the site. National Wetland Inventory data was obtained by EDR from the US Fish and Wildlife Service and Illinois Wetland Inventory Data was obtained by EDR from the Illinois State Geological Survey.

2.2.5 Flood Maps

The property and surrounding properties are not within 100-year and 500-year flood zones as defined by the Federal Emergency Management Agency (FEMA) and obtained by EDR. The information includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

3.0 PROPERTY BACKGROUND/OPERATING HISTORY

3.1 INTERVIEWS

During the course of the June 2017 Phase I ESA activities, Amec Foster Wheeler interviewed two knowledgeable people to obtain information about the site, particularly regarding possible RECs in connection with the site. The information obtained from the interviews is presumed to have been provided in good faith, and to the full extent of the knowledge of the individual responding. Table 3

lists those people who were interviewed and those for whom an unsuccessful attempt to interview was made. An interview questionnaire was completed and is included in **Appendix G**.

As an update, Amec Foster Wheeler contacted both persons listed below by e-mail in November 2017 to inquire if they knew of any changes to the property or their historical knowledge of the property. Both indicated that no new information was available.

Table 3: Summary of Interviews

Name	Title	Affiliation	Interview Conducted
Matthew J. Grusecki	Senior Vice President Northern Builders, Inc.	Property Owner	Via conference call and e-mail
Ed Garske	Vice President Carlson Environmental, Inc.	Property owner's environmental consultant	Via conference call and e-mail

3.1.1 Interview with Property Owner

Interviews with Mr. Matt Grusecki of Northern Builders, Inc and his environmental consultant, Mr. Ed Garske of Carlson Environmental regarding site information and history were conducted in June 2017. As an update, Amec Foster Wheeler contacted both persons listed below by e-mail in November 2017 to inquire if they knew of any changes to the property or their historical knowledge of the property. Both indicated that no new information was available. Mr. Grusecki and Mr. Garske provided the following information about the site.

Mr. Grusecki has been involved with the site for about 19 years. Northern Builders is part of an entity called Chia LLC which owns the property. Mr. Garske has been their environmental consultant for the property for a number of years. They indicated that the property is vacant and was formerly a railyard. They indicated that two small structures may have formerly stood near the middle of the property when it was a railyard.

They spoke of previous investigations have occurred at the site. Amec Foster Wheeler indicated that we were aware of and had a report of a Phase II completed by Warzyn and a Phase I and Phase II completed by Carlson, as well as a geotechnical investigation report from Testing Service Corporation. They indicated that at least two Phase IIs were performed (one by Warzyn and another by Carlson Environmental) and there may have been another investigation by Carlson Environmental. Polynuclear aromatic hydrocarbons and metals were detected and some concentrations exceeded Illinois remediation objectives from the Tiered Approach to Corrective Action Objectives (35 IAC 742, referred to as TACO). The Phase I indicated that fifteen monitoring wells are present on the site. They were placed at the site when the site was going to be developed as a solid waste transfer station and are still there. The Phase I by Carlson identified

nearby properties with releases. They were going to check on additional reports (another Phase I and another Phase II) that they thought might exist, but that Amec Foster Wheeler did not have. A later e-mail indicated that they found no other reports. They also indicated that there was a site survey which may show utility lines and a storm sewer easement. They indicated that they were not aware of any fill material being brought to the site. They were aware of a potential transformer offsite to the west.

3.1.2 Attempted Interviews

No other interviews were attempted for this assessment.

3.2 AERIAL PHOTOGRAPHS

Aerial photographs are photographs taken from an aerial platform with sufficient resolution to allow identification of development and activities of areas encompassing the site. Amec Foster Wheeler reviewed available aerial photographs of the site and surrounding area dated 1938, 1951, 1962, 1972, 1978, 1980, 1988, 1994, 1999, 2005, 2007, 2009, 2010, 2011, and 2012. Table 4 summarizes the information obtained from review of the topographic maps. It should be noted that site features may not be discernable on the aerial photographs due to the scale or degree of clarity of a given photograph. Copies of the aerial photographs are included in **Appendix A**.

Table 4: Aerial Photograph Search Results

Date	Scale	Property	Adjoining Properties
1938, 1951	1"=500'	Site is western and northern portion of large rail yard. Trains and tracks visible over much of the site	East is more rail yard, south is apparently part of the yard with what appear to be many associated structures and tracks, west appears to be residential/commercial, northeast is residential and northwest is large industrial building on northeast corner of intersection
1962	1"=500'	Site is western and northern portion of large rail yard. Trains and tracks visible over much of the site	Northeast, northwest and south appear similar to previous. Kostner Ave is present to east, where the rail yard is no longer present and across Kostner, commercial buildings
1972	1"=500'	Site is large rail yard. Trains and tracks visible over much of the site	East, northeast and northwest appear similar to previous. To the west, Kilbourn Ave is present and a large facility is present on the southwest corner of Kilbourn and W Chicago. Other buildings which do not appear to be part of the rail yard are now present to the south
1978	1"=500'	Site is large rail yard. Some tracks appear to have been removed	Similar to previous, more non-rail yard development south and east. Ohio Street and other east-west streets off of Kilbourn south of site are visible

Date	Scale	Property	Adjoining Properties
1980, 1988	1"=500'	Site is mainly vacant – rail tracks run through middle of site	Similar to previous, tracks are present only through middle of portion of rail yard southeast of site
1994	1"=500'	Site is vacant	Similar to previous, southeast portion of rail yard now separated from site by extension of Kostner Ave to the south and a new facility (CTA) is east of the extension of Kostner
1999	1"=500'	Site is vacant	Similar to previous
2005, 2007, 2009, 2010, 2011	1"=500'	Site is vacant; bare patch with no vegetation visible on south side, appears to be due to runoff from adjacent parking lot	Similar to previous
2012	1"=500'	Site is vacant; bare patch no longer visible	Similar to previous

Amec Foster Wheeler’s review of the aerial photographs has identified historical usage as a rail yard as a REC in connection with the site and the east adjacent CTA property.

3.3 HISTORICAL TOPOGRAPHIC MAPS

Historical topographic maps of the site and surrounding area were reviewed from the years 1889, 1891, 1900, 1901, 1928/1929, 1953, 1963, 1972, 1978/1980, 1993, 1997/1998 and 2012. Table 5 summarizes the information obtained from review of the topographic maps. Copies of the topographic maps are included in **Appendix B**.

Table 5: Historical Topographic Map Search Results

Date	Scale	Property	Adjoining Properties
1889, 1891	1:62500	Vacant	Surrounding area is generally gridded with streets, except in site vicinity
1900, 1901	1:62500	Site covered with rail tracks	Immediate site vicinity covered in rail tracks and associated buildings, surrounding area gridded with streets, another rail yard is to the north
1928/1929, 1953, 1963	1:24000	Site covered with rail tracks	Immediate site vicinity covered in rail tracks and associated buildings, surrounding area gridded with streets, rail yard is to the north
1972, 1978/1980	1:24000	Site covered with rail tracks	Property west, south and north east of the site has little to no rail tracks, has buildings, area southeast still has tracks

Date	Scale	Property	Adjoining Properties
1993, 1997/1998	1:24000	Site vacant, 1-2 sets of tracks cross center of site northwest to southeast	Most railroad tracks in site and vicinity are gone Property west, south and north east of the site has buildings; southeast appears like site – vacant with 1-2 sets of tracks
2013	1:24000	Vacant	Surrounding property shown as vacant, gridded city streets away from site area

Amec Foster Wheeler’s review of the historical topographic maps identified historical usage as a rail yard as a REC in connection with the site and the east adjacent CTA property.

3.4 FIRE INSURANCE MAPS

EDR provided Sanborn fire insurance maps for the years 1908, 1950, 1975, 1988, 1991, 1993, 2002 and 2004. Table 6 summarizes the information obtained from review of the Sanborn fire insurance maps. Copies of the Sanborn fire insurance maps are included in **Appendix C**.

Table 6: Sanborn Fire Insurance Map Search Results

Date	Scale	Property	Adjoining Properties
1908	1"=300'	Railroad tracks	North, beyond W Chicago Ave, is subdivided into lots with no structures visible; south is railyard with railcar repair shops, erecting shed, etc. West (separate map, also year 1896) railroad tracks, N 46 th Ave, subdivided, residential. East (separate map) is part of yard and full of rail tracks except northeast by W Chicago Ave has separate building
1950	1"=300'	Railroad tracks	North, beyond W Chicago Ave, is industrial: tool and die, metal stamping, scrap steel, pattern shop, steel spring factory and metal finishing; south is railyard with railcar repair shops, erecting shed, etc.; West (separate map) railroad tracks, N Kenton Ave, subdivided, residential/commercial. East (separate map) is part of yard and full of rail tracks except northeast, on same side of W Chicago Ave, is storage, a dairy and a garage

Date	Scale	Property	Adjoining Properties
1975 1988 1991 1993	1"=300'	Railroad tracks; small structure present in northwest corner	North, beyond W Chicago Ave, is industrial as before and some commercial; south developed with industrial buildings; West (separate map) is N Kilbourn Ave, railroad tracks and residential; Southwest is N Kilbourn Ave, then Chicago Northwest Incinerator East (separate map), on the west side of which is a filling station, is part of yard and full of rail tracks except northeast, on same side of W Chicago Ave, storage, a dairy and a garage have expanded south
2002 2004	1"=300'	Vacant	North more commercial, some parking lots, still some industrial; south developed with industrial buildings; West (separate map) is N Kilbourn Ave, railroad tracks and residential; Southwest is N Kilbourn Ave, then Chicago Northwest Incinerator; East (separate map) is part of yard and full of rail tracks except northeast, on same side of W Chicago Ave, storage, a dairy and a garage; south of the dairy is now CTA

Amec Foster Wheeler’s review of the Sanborn fire insurance maps identified historical usage of the site and the east adjacent CTA property as a rail yard as a REC in connection with the site, and use of west adjacent property (across N Kilbourn Ave) as an incinerator as a REC for the site.

3.5 LOCAL STREET DIRECTORY

Amec Foster Wheeler obtained a City Directory Abstract from EDR dated June 15, 2017 for the site and surrounding properties. A complete list of the results is included in EDR’s City Directory Abstract included in **Appendix D**. The site is listed in the EDR local street directory search for 2005 and 1999. The 2005 listing identifies the site as CTA, which is actually on the adjacent southeast property. No other information is provided.

3.6 USER PROVIDED INFORMATION

For the purposes of this assessment, the City of Chicago Department of Fleet and Facility Management is the user of this Phase I ESA report. In accordance with Section 6 of ASTM E 1527-13, the user of this Phase I ESA was informed that they were responsible for providing the following information to Amec Foster Wheeler’s environmental professional for consideration during the assessment:

Reasonably ascertainable title or judicial records related to environmental liens and AULs for the site;

Actual knowledge of the user of any environmental liens or AULs;

Specialized knowledge or experience of the user with regard to the site and activities thereon that may be material to any potential RECs;

Commonly known (within the local community) or reasonably ascertainable information regarding past releases, conditions indicative of releases, or threatened releases of hazardous substances or petroleum;

Information as to whether the purchase price of the site is lower than the fair market value due to contamination; and

The reason why the user wants to have the Phase I ESA performed.

Amec Foster Wheeler provided the user with a questionnaire, and the type of information obtained from the questionnaires summarized in Table 7. The user questionnaire was completed and is included in **Appendix G**.

Table 7: Information Obtained from User Questionnaire

User-Provided Information¹	Was Information Provided to Amec Foster Wheeler? (Yes/No)	Was Amec Foster Wheeler Contracted to Procure the Information? (Yes/No)
Title Records (3.6.1)	Yes	Yes
Environmental Liens and Activity and Use Limitations (3.6.1)	Yes	Yes
Specialized Knowledge (3.6.2)	No	No
Commonly Known or Reasonable Ascertainable Information (3.6.2)	Yes	Yes
Valuation Reduction for Environmental Issues (3.6.3)	Yes	No
Reason for Performing Phase I ESA (1.1)	Yes	No
Other (3.6.2)	Previous Reports	No

1. Numbers in parentheses reflect the report section in which the information is discussed.

3.6.1 Environmental Liens or Activity and Use Limitations

The user is not aware of any environmental liens or AULs, such as engineering controls, land-use restrictions, or institutional controls, that are in place at the site and/or have been filed or recorded in a registry under federal, state, or local law. There is a restrictive covenant on the property which requires It requires financial payment if the site is used as a transfer station (see Appendix E).

The LienSearch™ Report provided by EDR (attached in Appendix E) included a search for title documents for the Site. Review of the EDR LienSearch™ Report (included in Appendix E) for the

site indicates that environmental cleanup liens are not present on the Site. The Lien Search™ Report also indicated no AULs were found for the site. The lien search indicated that the property was most recently (October 2000) transferred from Chicago Avenue Development LLC to BK Chicago Avenue, LLC & Chia LLC by special warranty deed. The lien search document and a copy of the deed are included as **Appendix E** of this report.

3.6.2 Specialized Knowledge

The user does not have specialized knowledge or experience related to the chemicals and processes used at the site or nearby properties.

The user had copies of prior environmental site assessment reports, documents, or correspondence concerning the site and its environmental conditions, that may be deemed pertinent to the assessment by the environmental professional. The following reports were provided for Amec Foster Wheeler review:

- Phase II ESA, Prepared by Warzyn Inc., dated August 1991 – this was a separate report, but was also in Appendix A of the Carlson Phase I ESA
- Preliminary Report of Soils Exploration, Prepared by Testing Service Corporation, April 29, 1998 - this was in Appendix A to the Carlson Phase I
- Phase I ESA, prepared by Carlson Environmental, dated May 11, 1998
- Limited Phase II, prepared by Carlson Environmental, dated October 17, 2007
- Property Screen Summary Report, prepared by 2FM, dated April 10, 2017

The Phase II ESA by Warzyn was performed for RAIL-IT Limited partnership and included what is described as the western half of the 40th Street Yard of the Chicago Northwestern Railroad (CNWR). It references throughout a prior report titled “Environmental Assessment Report”, by Huff and Huff, Inc. dated 1990. The Warzyn report indicates that the Huff and Huff report has information indicating that the rail yard was constructed in about 1896 on previously undeveloped and unfarmed land. There were structures and rail tracks on the land by 1935, but many of these structures were removed by 1936 and additional train tracks were added. From 1936 to 1985, the parcel was used for the storage and movement of trains and there was one small office building in the southeastern corner. Repairs, fuel storage and maintenance activities took place on another parcel south of the site. Most of the tracks were removed by 1985 and at the time of the Warzyn Phase I, two tracks crossed the site. Surrounding land was part of the rail yard until 1950 when it was sold for commercial development. According to the Warzyn report, there were two abandoned buildings in the northeast portion of the site and numerous piles of debris throughout the site,

composed mainly of construction and demolition debris, although industrial materials may also have been present.

The Warzyn investigation consisted of the installation of ten (10) soil borings and three (3) temporary wells in three (3) of the borings. Twenty (20) soil samples were collected and analyzed for volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PNAs), Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) and total cyanides. Total xylene was detected in two (2) samples from one (1) boring and trichlorofluoromethane was detected in samples from two (2) other borings. PNAs were widespread, but generally below 1 mg/kg concentration, although some locations were higher. Metals were detected but at concentrations considered to be background or naturally occurring. Cyanides were not detected. Groundwater flow in the shallow soils was thought to be to the north, but could not be determined based on the temporary wells. No VOCs were detected and low concentrations of PNAs, metals and cyanide (one sample) were detected in the water samples. The Warzyn report concluded that no significant concentrations of VOCs, PNAs, metals or cyanide were present in soil or groundwater at the site; although localized hot spots may exist.

The Carlson Phase I ESA, performed for Northern Builders, Inc., determined that natural drainage was in an easterly direction to the North Branch of the Chicago River, 4.4 miles east of the site. Two sets of train tracks were still present on the site. No structures were present on the site. Numerous piles of construction debris and railroad ties were noted on the site. No wetlands were observed on the site. Fifteen (15) monitoring wells were noted on the site. The Carlson report indicates that at one time, plans were to use the site as a solid waste transfer station and the wells were installed for required monitoring. The report recommended the proper disposal of the railroad ties on the property. The Carlson report notes that all of the analytical results for the Warzyn report are below TACO Tier 1 Remediation Objectives for Industrial/Commercial sites with Class I groundwater (applicable Illinois objectives). Based on their review, they indicate that the site has not been significantly impacted by its previous use as rail yard. No RECs are identified and the risk for impact from surrounding properties is identified as low.

The Testing Service Corporation report provides information on geotechnical testing performed at the site. Nineteen (19) soil borings were drilled to 20 to 24 feet below ground surface. According to the boring logs in the report, the soils consisted mainly of fill material at the surface to up to 20 feet below the surface, underlain by stiff grey and brown silty clay. The fill materials consisted mainly of sands, silty sands and/or clayey sands with cinders and cobbles. No odors or staining were noted. Groundwater was found at depths ranging from 3 to 23 feet below the ground surface.

The 2007 Phase II by Carlson was performed for Northern Builders. Nineteen (19) soil borings were completed and fill was encountered in borings at depths of 0 to 16 feet, below which was silty

clay. Moist soils were noted at 2 to 4 feet below surface, but groundwater was not encountered in any of the borings. Staining was noted in some soil borings. Twenty-four soil samples were analyzed. Analyses included VOCs, semivolatile organic compounds (SVOCs), priority pollutant metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc), pH, pesticides, polychlorinated biphenyls (PBCs) and chlorinated herbicides. Results were compared to TACO Tier 1 soil screening objectives (35 IAC 742).

No VOCs were detected at concentrations exceeding the TACO objectives; although VOCs were detected at some locations. PNAs and carbazole were detected at concentrations that exceeded the TACO Tier 1 screening objectives. Antimony, arsenic, chromium, lead and mercury were detected at concentrations above their TACO Tier 1 objectives. PCBs, pesticides and herbicides were not detected in the two (2) samples analyzed for these parameters. The report concluded that concentrations of five (5) PNAs, one (1) SVOC and five (5) metals were present at concentrations exceeding the most stringent TACO Tier 1 residential screening levels. However, these soils could be managed during construction and no active remediation would be required to address soils on the site.

2FM also provided a Property Screen Report and associated documentation for the site and nearby properties. This was a 436-page document which consisted of a review of records from various databases including City of Chicago Department of Public Health (inspection, complaint investigation and UST records), OSFM, Illinois EPA, and USEPA. The Property Screen concluded that seven USTs of unknown contents were associated with the site; however, a subsequent review of the Property Screen documentation determined that the seven USTs are associated with 4401 W. Chicago and not the site. In addition, the 550-gallon fuel oil UST associated with the site was described as installed in 1959 and containing fuel oil. While the record does list this UST as being at 4301 W. Chicago, it should be noted that the facility name is listed as the Chicago Transit Authority and the contents are actually listed as gasoline. As discussed above, an adjacent site at 4401 W Chicago Avenue had seven flammable product USTs installed in 1992. The document indicated that a 550-gallon heating oil UST was removed in 2004 from a nearby site at 4155 W Chicago Avenue. It also indicated the following for another nearby site (4201 W Chicago Avenue): one 20,000 heating oil UST and one 20,000 diesel UST removed in 1993; two 4,000-gallon gasoline USTs installed in 1947; one 8,000-gallon fuel oil UST installed in 1949; one 10,000-gallon gasoline UST inspected in 1965, fuel oil USTs were sandfilled in 1967; two 12,000 gallon USTs installed in 1979; one 6,000 gallon UST sandfilled in 1979; one 10,000 gallon UST and one 4,000 gallon UST gravel filled in 1979; and two 12,000-gallon gasoline USTs and one 5,000-gallon fuel oil UST removed in 1992. At 4457 W Chicago Avenue, a 1,000-gallon fuel oil UST was installed in 1958. Contaminated fill material was removed from 733 N Kilbourn Avenue in 1995. The document also includes a search of both the OSFM and Illinois EPA databases for the site and nearby properties. Installation and removal of USTs for nearby properties is documented.

3.6.3 Valuation Reduction for Environmental Issues

The user has indicated that the purchase price being paid for the site reasonably reflects the fair market value of the site, and has not been reduced due to contamination.

3.7 VAPOR MIGRATION/INTRUSION EVALUATION

Potential vapor contamination sources on the site or on nearby properties can represent vapor encroachment concerns through the indoor air exposure pathway. The exposure pathway is complete if soil gas has the potential to migrate from a nearby subsurface source into an occupied building foundation. As the site has no structures, the indoor air inhalation exposure pathway is currently incomplete. Also, no identified contaminants on the site would be a vapor intrusion threat. An UST was reported to previously be present at the site and low levels of chlorinated solvents were detected in soils during a previous investigation and a recently completed Phase II ESA. Buildings may in the future be constructed on the site, so further evaluation is recommended.

Nearby properties have also had releases which may affect the site. There are 15 properties within 1/3 mile of the site which have had past releases and one property (CTA, adjacent) within 1/10 mile of the site. CTA had a LUST release of gasoline, and a NFR letter was received on April 27, 2000. However, Chicago building department records indicate that 7 USTs containing flammable material were installed on the CTA property in 1992 and there is no indication that they were removed.

4.0 REGULATORY REVIEW

This section presents the results from the environmental records review. Section 5.1 discusses results from the search of standard environmental databases. These records were reviewed to assess potential environmental concerns for the site, and, when applicable, surrounding properties. Section 5.2 discusses results from additional environmental record sources that were reviewed for this Phase I ESA.

4.1 REGULATORY DATABASE SEARCH AND SIGNIFICANT FINDINGS

Amec Foster Wheeler reviewed the results of a search of standard environmental records sources as required by ASTM Standard E 1527-13. EDR provided results of a regulatory agency database search in their report dated November 15, 2017. Amec Foster Wheeler reviewed that report for information pertaining to storage and/or reported releases of hazardous substances and petroleum products on the site and on surrounding properties that may affect the site. The EDR search report is included in **Appendix F**.

4.1.1 EDR Identified Sites

Amec Foster Wheeler reviewed the EDR report for databases that indicate potential releases or environmental impacts to soil, groundwater or soil vapor. Review of the federal, state and proprietary records summary provided by EDR of sites of potential environmental concern located within the respective ASTM standard search radii are summarized in the table below. Based on distances from the site, the types of listings and the assumed direction of groundwater flow, none of the properties listed is likely to have a negative impact on the site except for the properties described below the table.

4301 West Chicago Ave, Chicago, Illinois
Phase I Environmental Site Assessment

- * Distances and direction from EDR search. Additional information provided below regarding actual proximity to site

The 4301 West Chicago entry is for City of Chicago permit and UST records. According to information from the City of Chicago Fire Department in response to Amec Foster Wheeler's request under FOIA during the June 2017 Phase I ESA, one UST was identified onsite: a 550-gallon heating oil tank installed in 1959. However, the installation permit on file with the City of Chicago Department of Public Health indicates that the Chicago Transit Authority was the owner having the tank installed. The Illinois Office of the State Fire Marshal does not identify USTs as present on the site. Since no further information is available, this would be an REC for the site.

Chicago Transit Authority, 4401 West Chicago, adjacent to the southeast, is listed in City of Chicago environmental records as having seven flammable USTs installed in 1992, as a generator of ignitable RCRA waste in 1993, and on the FINDs, SPILLs and ECHO databases, probably as a result of its generator and LUST status. A LUST incident 923534 is recorded in 1992 for a gasoline release. The incident was closed with an NFR letter on April 27, 2000. Since no information is available indicating the 1992 installed tanks were removed, this would be an REC for the site.

Florence Macaroni, 4346 West Chicago, located to the north and northeast of the site, across Chicago Avenue, is listed as a UST and LUST site. One 1,000-gallon heating oil tank is listed as exempt. A LUST incident was reported in 1998 (LUST incident 982757). Based on its distance and cross to downgradient location, this would not be an REC.

City of Chicago, 700 N Kilbourn Ave, upgradient and west of the site, is listed as a LUST site. One tank was removed in 1993 and a NFR letter was received on 5/15/1995. Based on its current regulatory status, this would not be an REC.

City of Chicago, 715 N Kilbourn Ave, upgradient and adjacent west of the site, is listed as a LUST site. The initial incident report for #940242 lists 715 N. Kilbourn Avenue and then subsequent documentation on the Illinois EPA website for this incident changed to 750 N. Kilbourn Avenue. Amec Foster Wheeler believes the address was mis-identified in the original report and subsequently corrected. Although an incident was reported, a subsequent Illinois EPA letter indicates the site is a non-LUST site, which could indicate there was no confirmed release, or that the incident was from a non-regulated tank. Since it is adjacent, upgradient and no sampling was performed, this would be an REC for the site.

US Art, 4400 West Ohio Street, adjacent to the south, is listed as a former large quantity generator of F-code solvents, ignitable and listed wastes. It appears to be at the same location as American Envelope discussed below and the generator listing is for American Envelope. It has violations

which were resolved. Based on its current regulatory status (see below) and cross gradient position with regard to the site, this would not be an REC.

American Envelope, 4440 West Ohio Street, adjacent to the south, is listed as a Site Remediation Program (SRP) site, that is closed with a Comprehensive NFR dated 12/21/2010. There are restrictions indicating that the site is restricted to industrial/commercial use, a construction worker caution and engineered barriers of asphalt and concrete. However, there is no groundwater use restriction on the property. Based on its regulatory status and cross gradient position with regard to the site, this would not be an REC.

PPG Industries Inc, 4350 W Ohio St, is listed as a former large quantity generator of ignitable and U-Listed waste, and on the FINDs and ECHO databases, and is adjacent to the south. No violations were noted. Based on its regulatory status and cross gradient position with regard to the site, this would not be an REC.

RAIL IT Property, 733 N Kilbourn Avenue, west and upgradient of the site, is listed as having a 2000-gallon heating oil UST, which according to the OSFM database was removed in May 1995. It is unclear if this is the site or adjacent, as Rail IT formerly owned the 4301 W Chicago property and the street number identified in the EDR report could potentially put it near the southeast corner of Chicago and Kilbourn Avenues, which would be the site. Since it is adjacent, upgradient and no sampling was performed, this would be an REC for the site.

Colovos Co, 4444 W Ohio St, is listed as a SEMS-ARCHIVE, CORRACTS RCRA-SQG and LQG, LUST site and SRP site. It was evaluated under the National Priority List (NPL), archived and deferred to RCRA. As a CORRACT site, it was assigned a low corrective action priority. The LUST listing is for a fuel oil tank removed in 1992 and a NFR letter was received in June 1993. It was entered into the SRP in 1994 and a focused NFR letter was received on 7/3/1996. There are restrictions indicating that the site is restricted to industrial/commercial use, a construction worker caution and an engineered barrier of concrete. There is no groundwater use restriction on the property. Based on its regulatory status and cross gradient position with regard to the site, this would not be an REC.

Department of Streets & Sanitation, Northwest Sorting Center, 750 N Kilbourn Ave, west of the site, is listed as a UST site, a RCRASQG and on the ICIS (air), FINDS, ECHO, NY MANIFEST (PCB disposal) databases. It operates as a City of Chicago waste sorting and transfer facility, and is a SQG of ignitable waste. Six petroleum product tanks were removed in 1994. Since it is adjacent, upgradient and no sampling was performed, this would be an REC for the site.

4.1.2 Orphan sites List

EDR also provides a second category of sites, referred to as the “orphan site list,” which includes sites without adequate location information to be mapped precisely in the EDR system. No unmappable sites were identified in the EDR report.

4.2 ADDITIONAL ENVIRONMENTAL RECORD SOURCES

Additional environmental record sources were reviewed to enhance and supplement the standard environmental record sources. This section provides information obtained based on review of information obtained from local departments to assist in ascertaining potential environmental risks associated with the site.

4.2.1 City of Chicago

Fire Department

The site is located in the jurisdiction of the City of Chicago. On June 19, 2017, a Freedom of Information Act (FOIA) request was submitted to the department’s FOIA coordinator requesting any files available for the site. A response was received on June 26, 2017. Documentation was provided for installation of a 550-gallon gasoline UST by ‘Chicago NW Rlway’ in January 1959 and the removal of a 550-gallon gasoline UST on June 1, 1965.

On November 19, 2017, a Freedom of Information Act (FOIA) request was submitted to the department’s FOIA coordinator requesting any files available for the site. At the time of this report, no response has been received. If environmental concerns are identified based on our request by the City of Chicago Fire Department, an addendum to this report will be prepared.

Department of Public Health

On June 19, 2017, a FOIA request was submitted to the Chicago Department of Public Health (CDPH) FOIA coordinator requesting any available information that may be on file. On 6/21/2017, an email was received referring Amec Foster Wheeler to an online database. The database was queried and provided the same information as the EDR report

On November 19, 2017, a FOIA request was submitted to the Chicago Department of Public Health (CDPH) FOIA coordinator requesting any available information that may be on file. On November 21, 2017, an email was received referring Amec Foster Wheeler to an online database. The database was queried and provided the same information as the EDR report.

Department of Buildings

On June 19, 2017, a FOIA request was submitted to the Chicago Department of Buildings FOIA coordinator requesting any available information that may be on file. At the time of the original Phase I report, no response had been received.

On November 19, 2017, a FOIA request was submitted to the Chicago Department of Buildings FOIA coordinator requesting any available information that may be on file. At the time of this report, no response has been received. If environmental concerns are identified based on our request by the City of Chicago Department of Buildings, an addendum to this report will be prepared.

4.2.2 Illinois Environmental Protection Agency

On June 19, 2017, a FOIA request was submitted to the Illinois Environmental Protection Agency (Illinois EPA) FOIA coordinator requesting any available information that may be on file. On June 21, 2017, the Illinois EPA indicated that no information was located for the site.

On November 19, 2017, a FOIA request was submitted to the Illinois Environmental Protection Agency (Illinois EPA) FOIA coordinator requesting any available information that may be on file. On November 20, 2017, an email was received from the Illinois EPA indicating that the Illinois EPA had no information on file for the site.

4.2.3 United State Environmental Protection Agency

On June 25, 2017, a FOIA request was submitted to the United States Environmental Protection Agency (USEPA) requesting any available information that may be on file. At the time of the original Phase I report, no response had been received.

On November 19, 2017, a FOIA request was submitted to the United States Environmental Protection Agency (USEPA) requesting any available information that may be on file. On November 22, 2017, an email was received from the USEPA indicating that the USEPA had no information on file for the site.

4.2.4 Illinois Office of the State Fire Marshal

On June 19, 2017, a FOIA request (request no. 21399) was submitted to the Illinois Office of the State Fire Marshal FOIA coordinator requesting any available information that may be on file. At the time of the original Phase I report, no response had been received.

On November 19, 2017, a FOIA request was submitted to the Illinois Office of the State Fire Marshal FOIA coordinator requesting any available information that may be on file. On November 21, 2017, an email was received from the Office of the State Fire Marshal indicating that the Illinois Office of the State Fire Marshal had no information on file for the site.

5.0 PROPERTY INSPECTION

Mr. Salvatore Consalvi of Yung Environmental, Inc. completed the site reconnaissance on November 15, 2017, observing the general site conditions on the site. Mr. Consalvi was unaccompanied during the site reconnaissance. This section presents the findings of the site reconnaissance. These observations pertain to the general conditions of the physical land, including location and presence of ponded water, wetlands, stained and stressed vegetation, monitoring wells, wastewater, and solid or liquid waste. Due to the presence of vegetation, visibility of ground features was restricted.

5.1 SITE RECONNAISSANCE

On the day of the site reconnaissance, the weather conditions were cloudy and very cold. It was possible to walk the entire site. Photographs were taken of notable site features and are included in **Appendix I**.

The exterior of the site was visually and/or physically observed from the periphery, including adjacent public thoroughfares, and then systematically traversed to view the site. Observations of the site were in places obstructed by vegetation.

At the time of the site reconnaissance, the site was used as a vacant lot. The site is located on the southeast corner of the intersection of North Kilbourn Avenue and West Chicago Avenue. No structures are currently present on the site. No hazardous substance or petroleum products were observed.

Unpaved pathways with no apparent outlet randomly throughout the site that may have been used as an avenue for dumping of hazardous materials or petroleum products were observed during site reconnaissance.

5.1.1 Hazardous Substances and Petroleum Products Storage Containers

No containers identified as containing hazardous substances or petroleum products were observed on the site during the site reconnaissance.

5.1.2 Aboveground Storage Tanks/Underground Storage Tanks

No ASTs and associated dispenser and piping were observed on the site. No USTs or associated dispensers and piping were observed on the site.

5.1.3 Buildings and Structures

No buildings or structures were present on the site. Building debris indicating the possible past presence of a structure was noted in the northwest corner of the site.

5.1.4 Odors/Staining

No unusual odors or staining were noted at the site on the day of the site reconnaissance.

5.1.5 Drums/Unidentified Substance Containers

No drums were observed on the site during the site reconnaissance. No unidentified containers containing unidentified substances suspected of being hazardous substances or petroleum products were observed on the site during the site reconnaissance.

5.1.6 Debris

Several areas with debris were noted during the site reconnaissance. The building debris in the northwest corner noted above, a pile of stone in the northwest corner near Chicago Avenue, mounded soil near the north central, north west and north-east corner of the site, a clay pipe pile near the northeast corner, piled railroad ties in two locations on the southern portion of the site, and an abandoned rail spur near the southern boundary of the site.

5.1.7 Asbestos Containing Materials

No potential asbestos containing materials were noted on the site during the site reconnaissance.

5.1.8 Transformers

No transformers were noted on the site during the site reconnaissance. No electrical or hydraulic equipment known to contain PCBs or likely to contain PCBs was visually observed

5.1.9 Stressed Vegetation

No stressed vegetation was observed on the site during the site reconnaissance

5.1.10 Other Notable Features

Standing surface water was not observed on the site during the site reconnaissance. Pools, catchment structures, or sumps containing liquids or oily sheen likely to be hazardous substances or petroleum products were not observed on the site during the site reconnaissance.

Areas that have been filled or graded suggesting trash, construction debris, demolition debris, or other solid waste disposal were observed on the site during the site reconnaissance. A large long

mound of soil is present along the north and west portions of the site. Stacked railroad ties, a pile of clay pipe, mounded stone and an abandoned rail spur are present on the site.

A few monitoring wells were observed on the site during the site reconnaissance. Previous interviews with the site owner and his environmental consultant and review of a previous Phase I indicated that 15 monitoring wells were placed on the site. The wells were designed to monitor the site when its development as a solid waste transfer station was planned.

5.2 ADJACENT PROPERTIES RECONNAISSANCE

5.2.1 Hazardous Substances and Petroleum Products Storage Containers

No containers identified as containing hazardous substances or petroleum products were observed on adjacent sites during the site reconnaissance.

5.2.2 Aboveground Storage Tanks/Underground Storage Tanks

No ASTs were observed on adjacent sites. No UST- associated dispensers and piping were observed on adjacent sites.

5.2.3 Buildings and Structures

Buildings were present on adjacent sites.

5.2.4 Odors/Staining

No unusual odors or staining were noted at adjacent sites on the day of the site reconnaissance.

5.2.5 Drums/Unidentified Substance Containers

No drums were observed on adjacent sites during the site reconnaissance. No unidentified containers suspected of being hazardous substances or petroleum products were observed on adjacent sites during the site reconnaissance.

5.2.6 Debris

No debris was observed on adjacent sites during the site reconnaissance.

5.2.7 Transformers

No transformers were noted on adjacent sites during the site reconnaissance.

5.2.8 Stressed Vegetation

No stressed vegetation was observed on adjacent sites during the site reconnaissance.

5.2.9 Other Notable Features

No other notable features were observed on adjacent sites during the site reconnaissance.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Amec Foster Wheeler was retained by the City of Chicago Department of Fleet and Facility Management (2FM) to conduct a Phase I ESA for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois in general accordance with the scope and limitations of ASTM International E 1527-13, "Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process." Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase have been updated by our subcontractor, Yung Environmental, Inc. in this final Phase I ESA report.

Amec Foster Wheeler prepared this Phase I ESA in accordance with a proposal dated May 18, 2017 as updated on September 26, 2017.

This Phase I ESA is intended to satisfy one of the requirements to permit 2FM to qualify for the innocent landowner, adjoining property owner, or bona fide prospective purchaser limitations on liability under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (landowner liability protections). This Phase I ESA conforms to standards for "*all appropriate inquiries*" into the previous ownership and uses of the site as specified by the US Environmental Protection Agency (EPA) in 40 CFR Part 312, and in accordance with good commercial or customary practice.

Site History

Based on a review of reasonably ascertainable records, the site was vacant prior to its first developed usage. The site was developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

Site Reconnaissance

At the time of Yung Environmental, Inc.'s site reconnaissance on November 15, 2017, the site was observed to be vacant. Amec Foster Wheeler did not observe evidence of aboveground storage tanks (ASTs), underground storage tanks (USTs), odors, pools of liquid, drums, containers storing potentially hazardous substances or petroleum products, stains or corrosion, pits, ponds, or

lagoons. Significant amounts of debris and mounded soil were present and a small demolished building structure was noted in the northeast.

Environmental Records

Review of the federal, state, and tribal (if appropriate) records, including a proprietary records summary provided by Environmental Data Resources, Inc (EDR), a third-party provider of environmental and land use records, indicates that properties of environmental concern are located within the respective ASTM standard search distances for each category. Amec Foster Wheeler has screened the identified properties for significance with respect to their potential impact on the site based on reasonably ascertainable information obtained from the records review, site reconnaissance, and interviews. Based on distances from the site boundary, the types of listings, and the assumed direction of groundwater flow, none of the properties listed is likely to have a negative impact on the site except those listed in Table 10 below.

Conclusions

No significant data gaps were identified that affected Amec Foster Wheeler's ability to identify RECs for the site, except overgrown vegetation which prevented viewing all of the ground surface.

Amec Foster Wheeler has performed this Phase I ESA in conformance with the scope and limitations of ASTM Standard E 1527-13. This assessment has revealed no evidence of RECs in connection with the site, except for the following:

Table 9: On-Site RECs

PIN#	Address	Acreage	Current/ Historic Land	RECs	COCs	Pathways
16-10-200-061-0000	4301 W Chicago Ave	30.4	Vacant/ Former Railyard	USTs	BTEX, Lead, PNAs	Groundwater, Soil Ingestion, Soil Inhalation, Vapor Intrusion
				Fill, Debris	PNAs, Metals	
				Rail Ties	Arsenic, Cresols	
				Previous Contaminants	PNAs, Metals	

Off-site sources of contamination that have the potential to migrate onto the site have been identified as a REC(s), as follows:

Table 10: Off-Site RECs

4301 West Chicago Ave, Chicago, Illinois
Phase I Environmental Site Assessment

Address	Distance	Current/ Historic Land Use	RECs	COCs	Pathways
CTA 4401 West Chicago Ave	Adjacent North EDR: 477 ft North	Bus Garage/ Rail yard	USTs	BTEX, Lead, PNAs	Groundwater Ingestion Inhalation, Vapor Intrusion
			Rail yard	Arsenic, Cresols	
			Fill	PNAs, Metals	
RAIL IT Property 733 N Kilbourn Ave	AdjacentWest or Property EDR: 910 ft West	Vacant/ Rail yard	UST	BTEX, PNAs	Groundwater Ingestion Inhalation Vapor Intrusion
Department of Streets and Sanitation 750 N. Kilbourn Ave	Adjacent West EDR: 1044 ft West	Transfer Station and Incinerator/ Rail yard	USTs	BTEX, Lead	Groundwater Ingestion Inhalation Vapor Intrusion
			Air Particulate from Former Incinerator	Metals, PNAs	
City of Chicago 715 N. Kilbourn Ave (750 N. Kilbourn Ave.)	Adjacent West EDR: 800 ft West	Vacant/ Rail yard	UST with Release	BTEX, PNAs	Groundwater Ingestion Inhalation Vapor Intrusion

ft= feet

Based on the results and conclusions of the Phase I ESA, Amec Foster Wheeler recommends further evaluation of soil and/or groundwater quality beneath the site.

7.0 SIGNATURE(S) OF ENVIRONMENTAL PROFESSIONAL(S)

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in Title 40 of the Code of Federal Regulations (CFR), Part 312. We have the specific qualifications based on education, training, and experience (see **Appendix K**) to assess a site of the nature, history, and setting of the subject site. We have developed and performed all the appropriate inquiries in conformance with the standards and practices set forth in 40 CFR 312.

We appreciate the opportunity to be of service to 2FM on this project. If you have any questions or comments regarding this report, please contact the undersigned at 773-693-6030.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR Topographic Map Library has been searched by EDR and maps covering the target property location as provided by AMEC Environment & Infrastructure, Inc. were identified for the years listed below. EDR's Historical Topo Map Report is designed to assist professionals in evaluating potential liability on a target property resulting from past activities. EDR's Historical Topo Map Report includes a search of a collection of public and private color historical topographic maps, dating back to the late 1800s.

Search Results:**Coordinates:**

P.O.#	3205171606	Latitude:	41.89386 41° 53' 38" North

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by AMEC Environment & Infrastructure, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1923 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 147 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR Environmental Lien and AUL Search

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.

AGREEMENT OF RESTRICTIVE COVENANT

THIS AGREEMENT OF RESTRICTIVE COVENANT ("Restrictive Covenant") made ^{and} this
15th day of September, 1998, by CHICAGO AVENUE DEVELOPMENT L.L.C., an
Illinois limited liability company (together with its Successors, an "Owner") in favor of KILBOURN
LIMITED PARTNERSHIP, an Illinois limited partnership ("Kilbourn").

1st AMERICAN TITLE order # CC-12-3592 J.L. 24
385 82

RECITALS

A. Owner is acquiring as of the date hereof fee simple title to that certain real estate located in the City of Chicago, County of Cook, State of Illinois, and legally described in Exhibit A attached hereto and made a part hereof (the "Property").

B. To induce Kilbourn to terminate the Memorandum of Purchase Agreement and Declaration of Covenants dated as of April 8, 1992 and recorded in the office of the Cook County of Deeds as Document No. 92262005 and the Purchase Agreement and Declaration of Covenants referred to therein, and in consideration therefor, Owner has agreed to execute this agreement and submit the Property to the provisions of this Restrictive Covenant.

C. The covenants, conditions and restrictions hereunder are covenants running with the land and shall be binding upon Owner and its Successors and shall survive any sale, assignment, transfer or conveyance of the Property or any portion thereof or interest therein.

D. This Restrictive Covenant is executed and recorded for the purpose of giving notice of the existence thereof.

NOW THEREFORE, for Ten Dollars and other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, Owner, for itself and its Successors, in order to further the purposes herein expressed, hereby declares and agrees that the Property at all times is and shall be held, sold, assigned, transferred, conveyed, leased and occupied subject to the covenants, conditions and restrictions set forth herein.

1. ROYALTY PAYMENTS. In the event that the Property or any part thereof is used as a "recycling facility" or a "transfer station", as such terms are defined below, for the purpose of commercial recycling and/or waste transfer activities (including both for-profit and not-for-profit), as opposed to recycling and/or temporary waste storage of materials of the Owner of the Property or any part thereof as part of its own operations, then the following shall be applicable:

a. Owner agrees to pay to Kilbourn, or to cause Operator to pay to Kilbourn, the royalty payments (the "Royalties") described below; provided, however that Owner shall not be liable under this Agreement for the payment of Royalties or reservation of capacity by an Operator who is leasing the Property or a part thereof from Owner if (a) Owner has included a provision in the lease or other document giving such Operator possessory rights with respect to the Property (a "lease") to the effect that the Property is subject to the provisions of this Agreement of Restrictive Covenant (which shall be incorporated therein by reference with accurate recording information), and which requires, if a "recycling facility" or "transfer station" (as such terms are defined herein) is operated by Operator on the Property, that the Operator pay royalty payments and reserve capacity, and otherwise comply with the covenants, conditions and restrictions applicable to an Operator, as set forth herein, to and for the direct benefit of Kilbourn as the intended third-party creditor beneficiary of such provision of the lease, with the irrevocable right to enforce the

obligations of Operator to Kilbourn hereunder, and providing further that Kilbourn may pursue any remedies at law or in equity for default by Operator and that Operator shall be liable to Kilbourn for all damages that arise from or relate to default by Operator, as well as all costs and expenses, including attorneys' fees, incurred by Kilbourn in enforcing its remedies; and (b) in the event of default by Operator, Owner provides such information and assistance as are reasonably requested by Kilbourn in connection with such claim or suit. Royalties shall be paid quarterly to Kilbourn based upon Gross Revenues (as defined herein) and the volume of solid waste and recyclables delivered and accepted at the Facility during each calendar quarter. Each quarterly payment shall be equal to the sum of the following:

(1) 3% of the product of: (A) the Average Daily Tonnage (as defined below), or 2500 (whichever is less); (b) the Average Revenue Per Ton (as defined below); and (c) the number of Operating Days (as defined below) during such calendar quarter;

(2) 4% of the product of: (A) the Average Daily Tonnage in excess of 2500 up to a maximum of 1500 which is in excess of 2500; (B) the Average Revenue Per Ton; and (C) the number of Operating Days during such calendar quarter; and

(3) 5% of the product of: (A) the Average Daily Tonnage in excess of 4000; (B) the Average Revenue Per Ton; and (C) the number of Operating Days during such calendar quarter.

b. Definitions. The following terms used in this Restrictive Covenant shall be defined as follows:

"Affiliates" shall mean each and every corporation or other entity that is more than 50% owned or controlled, directly or indirectly, by Owner.

"Average Daily Tonnage" shall be the amount equal to (i) the total number of tons of solid waste and recyclables delivered and accepted at a Facility during a calendar quarter, divided by (ii) the number of Operating Days (as defined below) during such quarter.

"Average Revenue Per Ton" shall be the amount equal to (i) the Gross Revenues for a calendar quarter, divided by (ii) the total number of tons of solid waste and recyclables delivered to a Facility during such quarter.

"Gross Revenues" shall be defined as all revenues derived from the tipping, transfer, handling or processing of solid waste and recyclables on the Property or any portion thereof, less any fees, taxes, surcharges or host community fees imposed by any governmental entity or which are in the nature of a user or impact fee which is imposed upon the collection, transfer or disposal of solid waste or recyclables; provided, however, if and only if the revenues derived by Owner or any other person or entity which operates a Facility, including without limitation any tenant of Owner (an "Operator") and Affiliates, from the sale of recyclables processed or otherwise handled on the

Property or any portion thereof is greater than or equal to ten percent (10%) of the total revenues of the Facility, then upon such circumstance, all revenues derived by Owner and/or Operator and Affiliates from the sale of recyclables processed or otherwise handled on the Property or any portion thereof shall be included in the calculation of Gross Revenues. For purposes of determining Gross Revenues, fees for tipping, transfer, handling or processing of solid waste and/or recyclables delivered to the Facility by Affiliates shall be deemed to be no less than the Preferential Rate (as defined herein).

"Recycling facility" means a site or facility that accepts materials, including but not limited to paper, newsprint, cardboard, rags, glass, cans, and/or plastics, for "recycling" (as such term is defined below) for subsequent use in the secondary materials market.

"Recycling" means a method, technique, or process designed to remove any contaminant from waste so as to render such waste reusable, or any process by which materials that would otherwise be disposed of or discarded are collected, separated or processed and returned to the economic mainstream in the form of raw materials or products.

"Operating Day" shall mean any day during which a Facility is accepting solid waste and recyclables for disposal for at least eight (8) hours.

"Transfer station" means a site or facility that accepts waste for temporary storage or consolidation and further transfer to a waste disposal, treatment or storage facility. "Transfer station" includes a site where waste is transferred from (1) a rail carrier to a motor vehicle or water carrier; (2) a water carrier to a rail carrier or motor vehicle; (3) a motor vehicle to a rail carrier, water carrier or motor vehicle; (4) a rail carrier to a rail carrier, if the waste is removed from a rail car; or (5) a water carrier to a water carrier if the waste is removed from a vessel."

"Successors" shall mean, as to Owner, any person or entity that acquires title to the Property or any portion thereof or beneficial interest therein if title is held by a land trustee, by any means, including but not limited to, sale, assignment, transfer, conveyance or foreclosure, and, as to Kilbourn, its successors and/or assigns.

c. Royalties shall be payable to Kilbourn by Owner and/or Operator no later than the 20th day following March 31, June 30, September 30 and December 31 of each year. In the event that any Royalties are not paid when due, Kilbourn shall give written notice thereof to Owner, and to Operator if known to Kilbourn. If, after five (5) days after receipt of written notice of such non-payment, the Royalties are not received by Kilbourn, Owner and/or Operator shall be in default of its obligations hereunder and the amount not paid when due shall bear a late payment charge at a rate of 1½% per month or portion thereof from the date due until the date of payment or, at the option of Kilbourn, Kilbourn may receive a credit from Owner and/or Operator to be utilized by Designated Haulers (as defined herein), as determined by Kilbourn, which credit shall be equal to the amount of the Royalties due but not paid, and shall be applied toward the tipping fees charged to such Designated Haulers at the Facility by Owner and/or Operator. Kilbourn shall give written

notice to Owner and/or Operator of the identity of the Designated Haulers which are to utilize the credit. Owner and/or Operator shall keep complete and accurate books and records relating to Average Daily Tonnage, Average Revenue Per Ton, Gross Revenues and Operating Days. Owner and/or Operator shall deliver to Kilbourn no later than the 20th day after the end of each calendar quarter, a certificate executed by the operations manager of each Facility setting forth the amount of Gross Revenues, number of Operating Days, Average Daily Tonnage and Average Revenue Per Ton for the applicable calendar quarter. A representative of Kilbourn shall be permitted to have access to the applicable books and records of Owner and/or Operator to verify the Average Daily Tonnage, Average Revenue Per Ton, Gross Revenues and operating Days. Such access shall be limited to once every calendar quarter, upon five (5) days, prior written notice, during normal business hours and in the presence of a representative of Owner and/or Operator. In the event such verification reveals that the Royalties payable were understated, Owner and/or Operator promptly pay Kilbourn the amount of the understatement, together with a late payment charge of 9% of the understatement per annum, unless due to fraud or misrepresentation and in such case the late payment charge shall be 1½% per month or portion thereof. In the event such verification reveals that the Royalties payable for the applicable quarter were understated by more than 10%, Owner and/or Operator shall reimburse Kilbourn for the reasonable costs of such verification and any reasonable costs incurred by Kilbourn to verify the certification for the succeeding calendar quarter.

2. RESERVATION OF CAPACITY.

a. If the Property or any portion thereof is operated as a Facility and is allowed by its permits to accept up to 2,500 tons per day of solid waste and recyclables, Owner and/or Operator shall cause to be reserved for the haulers of solid waste and/or recyclables designated in writing by Kilbourn (the "Designated Haulers") the right to dispose of up to 1,000 tons of solid waste and/or recyclables per full Operating Day based upon the average daily volume of solid waste and/or recyclables delivered to the Facility during a calendar week (the "Reserve Capacity"). At least sixty (60) days prior to anticipated commencement of commercial operations at the Facility, Owner and/or Operator shall give Kilbourn written notice thereof, which notice shall also indicate the maximum Preferential Rate (as defined below) that will be charged to the Designated Haulers for the initial Commitment Period (as defined below). At least thirty (30) days prior to commencement of commercial operations at the Facility, Kilbourn shall give Owner and/or Operator written notification as to (i) the portion of the Reserve Capacity (the "Disposal Reservation") that Kilbourn, acting on behalf of the Designated Haulers, commits, in the aggregate, to utilize and (ii) a certification to Owner and/or Operator as to the identity of the Designated Haulers that will be entitled to use the Disposal Reservation and the identity of Designated Haulers that will be entitled to receive the Preferential Rate. The "Commitment Period" shall initially mean the period of time from the commencement of commercial operations of the Facility until the end of the then current calendar quarter, then each of the next succeeding eight (8) calendar quarters, and thereafter each and every six (6) month period.

b. Subject to the provisions of this Subsection 2(b), at least thirty (30) days prior to the beginning of each Commitment Period or within thirty (30) days after Kilbourn has been

notified of any change in the Preferential Rate, Kilbourn may increase (to the extent available) or decrease the Disposal Reservation, and provide to Owner and/or Operator a certificate as to the identity of the Designated Haulers that will be entitled to use the adjusted Disposal Reservation and the identity of the Designated Haulers which will be entitled to receive the Preferential Rate. Except as set forth below in Subsections 2(c), (d), (e) and (f), during any Commitment Period after Kilbourn has made its Disposal Reservation, Owner and/or Operator shall be entitled to enter into one or more binding agreements ("Disposal Agreements") with haulers under which Owner and/or Operator is bound to accept an aggregate amount of solid waste and/or recyclables that does not exceed the full capacity of the Facility, less the then current Disposal Reservation and the then current Buffer (as defined below).

c. Owner agrees that it will maintain or cause Operator to maintain a Buffer (the "Buffer") of the lesser of (i) 25% above the then current Disposal Reservation or (ii) 200 tons per Operating Day, not to exceed the Reserve Capacity. Thirty (30) days prior to each Commitment Period as set forth in (b) above, Kilbourn shall be permitted (but not obligated) to increase its Disposal Reservation up to the amount of its Disposal Reservation for the prior Commitment Period and the Buffer, but not to exceed the Reserve Capacity. Provided, however, except as set forth in Subsections 2(d), (e) and (f) hereof, to the extent that Kilbourn elects to increase the Disposal Reservation for the next succeeding Commitment Period up to the then current Disposal Reservation plus the Buffer and Owner and/or Operator is bound by the Disposal Agreements for the remaining capacity of the Facility over and above the then effective Disposal Reservation and Buffer, Owner shall not be obligated to provide Kilbourn with a Buffer for the next succeeding Commitment Period or Periods, provided further, however, that when additional capacity becomes available due to the termination of one or more Disposal Agreements as set forth in Subsection (d) below, such additional capacity shall automatically be available for a Buffer with respect to the then current Disposal Reservation (without the need for Kilbourn to exercise its option set forth in Subsection 2(d)) and the Buffer (as determined in accordance with the first sentence of this Subsection 2(c)) shall be increased to the extent of such additional capacity without reducing Kilbourn's right to increase the Disposal Reservation pursuant to Subsections 2(d) and 2(e) below.

d. Owner shall notify Kilbourn or cause Operator to notify Kilbourn of the termination of each Disposal Agreement within five (5) business days thereof and provide Kilbourn with the option to increase the Disposal Reservation, not to exceed the Reserve Capacity, by all or any portion of the amount of solid waste and/or recyclables that were subject to such Disposal Agreement. Kilbourn shall exercise this option on or before the close of business seven (7) business days after Kilbourn's receipt of Owner's notice of the termination of the applicable Disposal Agreement. This option shall not prohibit or restrict Kilbourn's ability to otherwise increase the Disposal Reservation in accordance with the terms of this Section 2 provided, however, that Kilbourn's election to exercise the option granted in this Subsection (d) shall reduce Owner's and/or Operator's obligation to provide additional capacity of 250 tons per Operating Day per year pursuant to Subsection (e) below to the extent of such additional capacity being made available upon the termination of a Disposal Agreement.

e. Notwithstanding any provision hereof to the contrary, in the event that during any calendar year less than 250 tons per Operating Day are offered to Kilbourn pursuant to Subsection 2(d), Owner and/or Operator shall make available to Kilbourn for increase of the Disposal Reservation by the end of the then current calendar year, up to 250 tons per Operating Day less the number of tons per Operating Day offered to Kilbourn pursuant to Subsection 2(d) during such calendar year; provided, however, Kilbourn shall not be entitled to increase the combined Disposal Reservation and Buffer to an amount that exceeds the Reserve Capacity. Owner and/or Operator shall give Kilbourn notice of such available capacity at least five (5) business days prior to such additional capacity becoming available and Kilbourn shall be permitted to increase its Disposal Reservation by notifying Owner and/or Operator thereof on or before the close of business seven (7) business days after Kilbourn's receipt of such notice of such available capacity.

f. Owner and/or Operator shall also notify Kilbourn of any increase in the permitted capacity of the Facility to accept, process or transfer solid waste and/or recyclables within five (5) business days of the receipt of a non-appealable permit therefore from all governmental entities having jurisdiction over the Facility and provide Kilbourn with the option to increase the Disposal Reservation in accordance with Subsection (j) of this Section. This option shall be exercisable by Kilbourn on or before the date which is seven (7) business days after Kilbourn receives Owner's notice of such increase in the permitted capacity of the Facility. This option shall not prohibit or restrict Kilbourn's ability to otherwise increase the Disposal Reservation in accordance with the terms of this Section 2. Owner and/or Operator shall notify Kilbourn of the filing of any application for a permit to increase the capacity within seven (7) business days of the date of such filing.

g. The disposal rate to be charged by Owner and/or Operator to the Designated Haulers during any Commitment Period for an amount of solid waste and recyclables up to 1000 tons per Operating Day (regardless of the Disposal Reservation), shall be no greater than the lowest rate (the "Preferential Rate") charged by Owner and/or Operator during such Commitment Period to any other customer (except as set forth below) at the Facility, taking into consideration the type of waste delivered (i.e., waste requiring special handling, recyclables, general municipal waste, etc.), but without regard to other factors, including, but not limited to, the volumes delivered and the term and type of commitment for disposal at the Facility. The Preferential Rate shall not include the rate or rates charged to customers by Owner and/or Operator pursuant to "put or pay" agreements unless Kilbourn or particular Designated Hauler shall execute a put or pay agreement with substantially similar material terms and conditions, except those pertaining to volume. Owner shall notify Kilbourn of any change in the Preferential Rate at least thirty (30) days prior to any such change. Notwithstanding anything herein to the contrary, Owner and/or Operator shall be permitted during the first two (2) years of commercial operations of the Facility to sell the greater of ten (10%) percent or 500 tons per Operating Day and thereafter ten (10%) percent of the permitted capacity of the Facility at disposal rates which do not effect the Preferential Rate provided that such rates shall be made available by Owner and/or Operator to Kilbourn, Designated Haulers and third parties, as well as the Owner and/or Operator and Affiliates, and Owner and/or Operator shall provide written notice

of the availability of such rates at least five (5) days prior to the acceptance of solid waste and/or recyclables at the Facility at such rate or rates.

h. To the extent the Designated Haulers (in the aggregate) fail to utilize at least 80% of the Disposal Reservation during the applicable Commitment Period while the Disposal Reservation is less than 1000 tons per Operating Day, Kilbourn shall be obligated to pay Owner and/or Operator 50% of the Preferential Rate for all volumes not utilized by Kilbourn up to 80% of the applicable Disposal Reservation and while the Disposal Reservation is 1000 tons or more per Operating Day, Kilbourn shall be obligated to pay Owner and/or Operator 75% of the applicable tipping fee (a portion of which may include the Preferential Rate if such volumes not utilized are less than 1000 tons per Operating Day) for the Disposal Reservation for all volumes not utilized by Kilbourn up to 80% of the applicable Disposal Reservation.

i. All solid waste delivered to the Facility hereunder shall be acceptable in accordance with all applicable federal, state and local laws and ordinances, Owner's and/or Operator's rules and regulations governing the operation of the Facility and Owner's and/or Operator's permits. Designated Haulers may include only those haulers designated by Kilbourn which are (i) those haulers listed on Exhibit B attached hereto, (ii) haulers which are more than 25% owned by an individual listed on Exhibit B attached hereto, either directly or by a trust for the exclusive benefit of such individual and/or members of his immediate family or (iii) any party that acquires at least 80% of all of the outstanding shares or all or substantially all of the assets of any such hauler (other than a publicly traded company). Owner and/or Operator shall have the right to review any documents, instruments or agreements pursuant to which a hauler shall be deemed a Designated Hauler hereunder if such Designated Hauler is a hauler other than those set forth in Exhibit B. Owner and/or Operator shall keep the information contained in such documents, instruments or agreements confidential if required by such Designated Hauler. Except as otherwise set forth in this Restrictive Covenant, no sale or brokering of disposal capacity is permitted by Kilbourn or a Designated Hauler. Failure of Kilbourn to make the payments set forth in Subsection (h) of this Section 2 or to abide by any of the above shall permit Owner and/or Operator to deny access to Kilbourn or the Designated Hauler(s) to the Facility during the period of such failure. The limited partners of Kilbourn shall be permitted to negotiate and enter into separate agreements with the Owner and/or Operator for disposal of waste at any Facility in addition to the Reserve Capacity to the extent there is additional capacity available at such Facility.

j. The Reserve Capacity shall be increased by 15 tons per Operating Day for every 25 tons per Operating Day increase in the daily permitted capacity of the Facility in excess of 2500 tons per day; provided, however, the Reserve Capacity shall never under any circumstances exceed 2500 tons per Operating Day if the daily permitted capacity of the Facility is in excess of 5000 tons per day; and provided, further however, that the Preferential Rate shall only apply with respect to a maximum of 1,000 tons per operating Day.

k. No party shall be liable for any failure to perform under this Section 2 due to circumstances beyond its reasonable control including, but not limited to, strikes or other labor

disputes, change in laws or regulations, compliance with government requirements, riots, civil disturbance or sabotage, fires, floods, explosions, accidents, weather or acts of God affecting the parties hereto. In the event of any of the circumstances listed in the preceding sentence, or if any federal, state or local court or authority takes any action which would close or otherwise restrict operations at the Facility, the Owner and/or Operator shall have the right to reduce the Reserve Capacity in proportion to the mandated reduction in the full capacity of the Facility.

i. Owner shall deliver to Kilbourn or cause Operator to deliver to Kilbourn no later than forty (40) days prior to the commencement of the next succeeding Commitment Period, a certificate executed by the operations manager of the Facility setting forth the maximum Preferential Rate for each type of waste and recyclables to be charged for the next succeeding Commitment Period, an estimate of the amount of the Reserve Capacity available to Kilbourn for the next Commitment Period and the rate or rates charged by Owner and/or Operator during the period following delivery of the prior certificate for the volumes not subject to the Preferential Rate as set forth in Subsection (g) of this Section 2. Owner and/or Operator shall keep complete and accurate records of all disposal rates charged by Owner and/or Operator. A representative of Kilbourn shall be permitted access to the books and records of Owner and/or Operator to verify the accuracy of such certification. Such access shall be limited to once every calendar quarter, upon five (5) days written notice, during normal business hours and the presence of a representative of Owner and/or Operator. In the event such verification reveals that any Designated Hauler was overcharged for the disposal of any waste, Owner and/or Operator shall promptly refund to such Designated Hauler the amount of the overcharge, together with interest thereon at the rate of 1½% per month or portion thereof from the date the overcharge was paid by such Designated Hauler to the date such refund is paid to such Designated Hauler. In the event such verification reveals that any Designated Hauler was overcharged by more than 10% for disposal of such waste and/or recyclables, Owner and/or Operator shall reimburse Kilbourn for the reasonable costs of such verification and any reasonable costs incurred by Kilbourn to verify the certification for the succeeding quarter.

m. This Subsection 2(m) is an illustration of the application of the guaranteed access provisions of this Section 2. This illustration is based upon the assumption that the capacity of the Facility is 2,500 ton/day and therefore the Reserve Capacity is 1,000 tons/day. Assuming the Disposal Reservation is 500 tons/day, the Buffer would be 125 tons/day (i.e., the lesser of (i) 25% of the 500 tons/day Disposal Reservation or (ii) 200 tons/day). Because the Disposal Reservation and Buffer total 625 tons/day, the Disposal Reservation may be increased to 625 tons/day at the beginning of the next Commitment Period. If, prior to the next Commitment Period, Owner and/or Operator enters into Disposal Agreements for 1,875 tons/day (i.e., 2,500 tons/day Facility capacity, less 625 tons/day Disposal Reservation and Buffer), Kilbourn would not be entitled to increase the Disposal Reservation prior to the end of the then current calendar year, unless additional capacity becomes available due to the termination of one or more Disposal Agreements.

Assuming Disposal Agreements for 300 tons/day terminate while the Disposal Reservation is 625 tons/day, Kilbourn would be entitled to increase the Disposal Reservation in two manners. First, Kilbourn would be entitled to a Buffer of 156 tons/day (i.e., the lesser of (i) 25% of the 625

tons/day Disposal Reservation or (ii) 200 tons/day) and could increase the Disposal Reservation to 781 tons/day as of the beginning of the next Commitment Period. Second, Kilbourn could exercise its option under Subsection 2(d) to immediately increase the 625 tons/day Disposal Reservation by 144 tons/day (i.e. the excess of the 300 tons/day available upon termination of the Disposal Agreements, over the 156 tons/day Buffer) to a total of 769 tons/day, and, in such case, Kilbourn would be entitled to a Buffer of 192 tons/day (i.e., the lesser of (i) 25% of the 769 tons/day Disposal Reservation or (ii) 200 tons/day). However, since the total additional capacity is only 300 tons/day and 156 is used as a Buffer and 144 tons/day is utilized by Kilbourn for Disposal Reservation as set forth above (i.e., 2,500 tons/day Facility capacity, less 1,575⁺ tons/day subject to Disposal Agreements, less the Disposal Reservation of 769 tons/day and the Buffer of 144 tons/day), the Buffer would be limited to 156 tons/day. Therefore, the 769 tons/day Disposal Reservation could be increased at the beginning of the next Commitment Period to 925 tons/day.

Based on the assumptions of the first paragraph of this Subsection 2(m) and assuming none of the Disposal Agreements that cover a total of 1,875 tons/day terminate during the calendar year, the Disposal Reservation will be limited to 625 tons/day. Pursuant to Subsection 2(e), by the end of the then current calendar year, Kilbourn would be entitled to increase the Disposal Reservation by up to an additional 250 tons/day to a total of 875 tons/day. However, if Disposal Agreements for 300 tons/day terminate during the then current calendar year and Kilbourn is entitled to increase the Disposal Reservation by 144 tons/day pursuant to Subsection 2(d), the number of tons that must be made available to Kilbourn by the end of the then current calendar year pursuant to Subsection 2(e) would be reduced to 106 tons/day (i.e., 250 tons/day minimum offer under Subsection 2(e), less 144 tons/day offer under Subsection 2(d)).

3. COVENANT RUNNING WITH THE LAND. The obligations under this Restrictive Covenant shall be perpetual and shall run with the land. The obligations under this Restrictive Covenant shall survive any sale, assignment, transfer or conveyance of the Property or any portion thereof or interest therein. However, notwithstanding the foregoing, nothing herein shall prohibit or otherwise prevent Owner from selling the Property or any part of the Property or any Facility constructed on the Property for any purpose or for any use. Thereafter, a prior Owner that has sold, assigned, transferred or conveyed all its right, title or interest in the Property or any part thereof to a Successor of which such prior Owner has no ownership or control, directly or indirectly, shall be relieved of its obligations under this Restrictive Covenant accruing from and after such sale, assignment, transfer or conveyance with respect to the Property or portion thereof sold, assigned, transferred or conveyed.

The provisions of this Restrictive Covenant with respect to the payment of Royalties and providing disposal rights as set forth in paragraphs 1 and 2, shall be suspended for any period during which no Facility is being operated on the Property, and if a Facility is being operated on a portion of the Property, this Restrictive Covenant shall be applicable only to such portion and shall remain suspended as to all other portions until such time, if any, as a Facility shall be operated on such portions. This Restrictive Covenant is a covenant that runs with the land and shall not be interpreted or construed in any manner as a restrictive use covenant.

4. NOTICES. Any Royalties, notices or other communications which any party hereto may be required or may desire to give hereunder shall be delivered personally or if mailed, postage prepaid, by United States registered or certified mail, return receipt requested, or by overnight express courier, addressed:

In the case of Kilbourn to: Kilbourn Limited Partnership

or at such other addresses or to the attention of such other persons as may from time to time be designated by the party to be addressed by written notice to the other in the manner herein provided. Notices, demands and requests given in the manner aforesaid shall be deemed sufficiently served or given for all purposes hereunder when received or when delivery is refused or when the same are returned to sender for failure to be called for. In the event that Kilbourn changes its address and fails to inform Owner of a changed address, and Owner is unable, using reasonable efforts, to locate Kilbourn, or if Kilbourn is voluntarily or involuntarily dissolved or otherwise terminates its existence, then Owner shall send all Royalties, notices, and other communications hereunder c/o Jim DeWitt, 1201 Greenwood Avenue, Maywood, IL 60153 or c/o Kenneth Hoving, 363 Trinity Lane, Oak Brook, IL 60521 or c/o Butler, Rubin, Saltarelli & Boyd, Three First National Plaza, Suite 1800, Chicago, Illinois 60602.

5. CONTINUING COVENANTS. Each and all of the covenants, conditions and restrictions contained herein shall be deemed and construed to be continuing. No waiver of a breach of any of the covenants, conditions and restrictions contained herein shall be construed to be a waiver of

any other breach of the same or any other of such covenants, conditions or restrictions, nor shall failure to enforce any one of such covenants, conditions or restrictions be construed as waiver of any other such covenants, conditions or restrictions.

6. PRIORITY AND TITLE THROUGH FORECLOSURE. This Restrictive Covenant shall be executed and recorded before any mortgage or deed of trust that may be executed and recorded in connection with Owner's acquisition of the Property. Owner agrees that all liens, encumbrances or other security interests that exist or may exist against the Facility or the Property shall be subject and subordinate to the Restrictive Covenant. Owner further agrees that it will maintain sufficient assets and capital to make the payment of Royalties hereunder, to the extent due, during any period in which Gross Revenues are generated. Should any mortgage or deed of trust with respect to the Property be foreclosed, then the title acquired by such foreclosure, and the person or persons who thereupon and thereafter become the owner or owners of the conveyed premises, shall be subject to and bound by all the covenants, conditions and restrictions contained herein.

7. CHANGE IN CIRCUMSTANCES. No change in circumstances, including, but not limited to, changes in surrounding land uses or applicable zoning ordinances, shall have any effect whatsoever upon the applicability, validity or enforceability of the covenants, conditions and restrictions contained herein; provided, however, that any of the covenants, conditions and restrictions contained herein, at any time and in any manner, may and shall only be changed by and with the written mutual consent of Kilbourn or its Successors and the then Owner or Owners of the Property.

8. RULE AGAINST PERPETUITIES. If and to the extent that any of the covenants, conditions or restrictions would otherwise be unlawful or void for violation of (a) the rule against perpetuities, (b) the rule restricting restraints on alienation or (c) any other applicable statute or common law rule analogous thereto or otherwise imposing limitations upon the time during which such covenants, conditions or restrictions may be valid, then said covenant, condition or restriction shall continue and endure only until the expiration of twenty-one (21) years after the death of the last to survive of the class of persons consisting of all of the lawful descendants of George H. W. Bush, former President of the United States, living at the date of this Restrictive Covenant.

9. BINDING ON SUCCESSORS OF OWNER AND SUCCESSORS OF KILBOURN. Each Successor of Owner, by taking title to the Property or any portion thereof, and each purchaser under any contract for a deed of conveyance pursuant to which said grantee will take title, accepts such title subject to all covenants, conditions and restrictions, and the jurisdiction, rights and powers created or reserved by this Restrictive Covenant. All rights, benefits and privileges of every character hereby granted, created, reserved or declared, and all covenants, conditions and restrictions hereby imposed, shall be deemed and taken to be covenants running with the land, and shall bind any person having at any time any interest or estate in said land as if such person were the Owner, and shall inure to the benefit of Kilbourn and its Successors in like manner as though the provisions of this Restrictive Covenant were recited and stipulated at length in each and every deed of conveyance, or in any mortgage or trust deed or other evidence of obligation, and the obligations

described in this Restrictive Covenant shall be sufficient to bind the respective grantees, transferees, mortgagees, trustees, tenants, successors and assigns of the Property as fully and completely as though such rights were recited fully and set forth in their entirety in any such documents. This Restrictive Covenant shall inure to the benefit of, and be specifically enforceable by, Kilbourn and its Successors.

10. ENFORCEMENT. Kilbourn from time to time shall have the right to sue for and obtain a prohibitive or mandatory injunction, or other equitable relief, to prevent the breach of, or to enforce the observance of, the covenants, conditions and restrictions set forth in this Restrictive Covenant, in addition to the right to bring an action in law or in equity seeking any other appropriate remedy. In no event shall the failure of Kilbourn to enforce any of the covenants, conditions or restrictions herein provided due to a particular violation thereof be deemed to be a waiver of the right to do so respecting any such violation or any subsequent violation.

11. MODIFICATIONS. Any revocations, modifications, amendments or supplements of this Restrictive Covenant shall be effective only if expressed in a written instrument or instruments executed and acknowledged by the parties hereto and their respective successors and recorded in the Office of the Recorder of Deeds of Cook County, Illinois.

12. TRUSTS. In the event title to all or any portion of the Property is conveyed to a title holding trust, under the terms of which all powers of management, operation and control of all or any portion of the Property remain vested in the trust beneficiary or beneficiaries, then the beneficiaries thereunder from time to time shall be responsible for payment of all obligations, liens or indebtedness and for the performance of all covenants, conditions and restrictions chargeable or created under this Restrictive Covenant against the Property. No claim shall be made against any such title holding trustee personally for payment of any lien or obligation hereunder created, and the trustee shall not be obligated to sequester funds or trust property to apply, in whole or in part, against such lien or obligation. The amount of such lien or obligation shall continue to be a charge or lien upon the Property and the beneficiaries of such trust, notwithstanding any transfers of the beneficial interest of any such trust or any transfers of title to all or any portion of the Property.

13. SEVERABILITY. It is expressly agreed that, if any covenant, condition or restriction herein contained, or any portion thereof, is held or otherwise found to be invalid or void by any court of competent jurisdiction, such invalidity or voidness shall in no way affect this Restrictive Covenant or any other covenant, condition or restriction contained in this Restrictive Covenant, which shall remain in full force and effect.

14. CAPTIONS. The captions in this Restrictive Covenant are inserted for convenience of reference only and in no way define, describe or limit the scope or intent of this instrument or any of the provisions thereof.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 07/11/2017 has revealed that there are 2 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

<u>Lower Elevation</u>	<u>Address</u>	<u>Direction / Distance</u>	<u>Map ID</u>	<u>Page</u>

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 09/13/2017 has revealed that there are 3 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 09/13/2017 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 09/13/2017 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

State and tribal leaking storage tank lists

IL LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Illinois Environmental Protection Agency's LUST Incident Report.

A review of the IL LUST list, as provided by EDR, and dated 07/24/2017 has revealed that there are 27 IL LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

IL UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Illinois State Fire Marshal's STC Facility List.

A review of the IL UST list, as provided by EDR, and dated 07/24/2017 has revealed that there are 13 IL UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 09/13/2017 has revealed that there are 7 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Environmental Interest/Information System

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

- . Waste name: TAR STORAGE RESIDUES FROM COAL TAR REFINING.

- . Waste code: K148
- . Waste name: RESIDUES FROM COAL TAR DISTILLATION, INCLUDING, BUT NOT LIMITED TO, STILL BOTTOMS.

- . Waste code: K149
- . Waste name: DISTILLATION BOTTOMS FROM THE PRODUCTION OF ALPHA (OR METHYL-) CHLORINATED TOLUNES, RING-CHLORINATED TOLUNES, BENZOYL CHLORIDES, AND COMPOUNDS WITH MIXTURES OF THESE FUNCTIONAL GROUPS. [THIS WASTE DOES NOT INCLUDE STILL BOTTOMS FROM THE DISTILLATION OF BENZOYL CHLORIDE]

- . Waste code: K150
- . Waste name: ORGANIC RESIDUES EXCLUDING SPENT CARBON ADSORBENT, FROM THE SPENT CHLORINE GAS AND HYDROCHLORIC ACID RECOVERY PROCESSES ASSOCIATED WITH THE PRODUCTION OF ALPHA (OR METHYL-) CHLORINATED TOLUNES, BENZOYL CHLORIDES, AND COMPOUNDS WITH MIXTURES OF THESE FUNCTIONAL GROUPS.

- . Waste code: K151
- . Waste name: WASTEWATER TREATMENT SLUDGES, EXCLUDING NEUTRALIZATION AND BIOLOGICAL SLUDGES, GENERATED DURING THE TREATMENT OF WASTEWATERS FROM THE PRODUCTION OF ALPHA (OR METHYL-) CHLORINATED TOLUNES, BENZOYL CHLORIDES, AND COMPOUNDS WITH MIXTURES OF THESE FUNCTIONAL GROUPS.

- . Waste code: K156
- . Waste name: ORGANIC WASTE (INCLUDING HEAVY ENDS, STILL BOTTOMS, LIGHT ENDS, SPENT SOLVENTS, FILTRATES, AND DECANTATES) FROM THE PRODUCTION OF CARBAMATES AND CARBAMOYL OXIMES.

- . Waste code: K157

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

AIR EMISSIONS CLASSIFICATION UNKNOWN

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Description: RCRA Deferral Audit
Description: RCRA Deferral - Lead Confirmed

CERCLIS-NFRAP Assessment History:

Action: ARCHIVE SITE
Date Started: / /
Date Completed: 12/11/95
Priority Level: Not reported

Action: PRELIMINARY ASSESSMENT
Date Started: / /
Date Completed: 01/18/94
Priority Level: Deferred to RCRA (Subtitle C)

Action: DISCOVERY
Date Started: / /
Date Completed: 05/18/93
Priority Level: Not reported

CORRACTS:

EPA ID: ILD005122163
EPA Region: 05
Area Name: ENTIRE FACILITY
Actual Date: 20090501
Action: CA070NO - RFA Determination Of Need For An RFI, RFI is Not Necessary
NAICS Code(s): 339931 339932
Doll and Stuffed Toy Manufacturing
Game, Toy, and Children's Vehicle Manufacturing
Original schedule date: Not reported
Schedule end date: Not reported

EPA ID: ILD005122163
EPA Region: 05
Area Name: ENTIRE FACILITY
Actual Date: 19930930
Action: CA075LO - CA Prioritization, Facility or area was assigned a low
corrective action priority
NAICS Code(s): 339931 339932
Doll and Stuffed Toy Manufacturing
Game, Toy, and Children's Vehicle Manufacturing
Original schedule date: Not reported
Schedule end date: Not reported

EPA ID: ILD005122163
EPA Region: 05
Area Name: ENTIRE FACILITY
Actual Date: 19940331
Action: CA225NR - Stabilization Measures Evaluation, This facility is, not
amenable to stabilization activity at the, present time for reasons

Handler Activities Summary:

U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: F001
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F002
. Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2, TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

. Waste code: F003
. Waste name: THE FOLLOWING SPENT NONHALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NONHALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NONHALOGENATED SOLVENTS, AND A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

TSCA SUBMITTER

AIR EMISSIONS CLASSIFICATION UNKNOWN

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 05/30/2017	Source: EPA
Date Data Arrived at EDR: 06/09/2017	Telephone: N/A

Number of Days to Update: 98	Next Scheduled EDR Contact: 01/15/2018
	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 05/30/2017	Source: EPA
Date Data Arrived at EDR: 06/09/2017	Telephone: N/A

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016	Source: Environmental Protection Agency

Number of Days to Update: 92	Next Scheduled EDR Contact: 01/15/2018
	Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/13/2017	Source: Environmental Protection Agency

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

Date of Government Version: 02/01/2017	Source: Environmental Protection Agency
Date Data Arrived at EDR: 02/09/2017	Telephone: 202-564-8600

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing

A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HWAR: Hazard Waste Annual Report

Each year, Illinois hazardous-waste generators tell the Illinois EPA the amounts and kinds of hazardous waste they produced during the previous year. Generators indicate by code the types of wastes produced and the steps they took to manage these wastes. If some or all of these wastes were sent to commercial treatment, storage, and disposal facilities (TSDFs), that information and the identity of each receiving facility also are submitted.

Illinois TSDFs likewise report the types and quantities of wastes received from in-state and out-of-state generators; they also report the procedures they used to manage these wastes.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Northwest Map:	5680695 RIVER FOREST, IL
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Flood Plain Panel at Target Property</u>	<u>FEMA Source Type</u>
17031C0415J	FEMA FIRM Flood data

1700740050B	FEMA Q3 Flood data

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u>	<u>NWI Electronic Data Coverage</u>
CHICAGO LOOP	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

6G	1/2 - 1 Mile SSW	Not Reported

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Paleozoic
System: Silurian
Series: Middle Silurian (Niagoaran)
Code: S2 *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBANLAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 0 inches

Depth to Bedrock Max: > 0 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	60 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: fine sand
 fine sandy loam
 silty clay loam
 loamy fine sand

Surficial Soil Types: fine sand
 fine sandy loam
 silty clay loam
 loamy fine sand

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: sand
 fine sand
 loamy sand
 silty clay loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

APPENDIX G

Interview Documentation

USER QUESTIONNAIRE – ASTM 1527-13 STANDARD PRACTICE

Phase 1 Environmental Site Assessment

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the “*Brownfields Amendments*”), the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees.

The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that “*all appropriate inquiries*” is not complete.

(1.) Environmental liens that are filed or recorded against the property (40 CFR 312.25).

Did a search of recorded land title records (or judicial records where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law?

NOTE 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

At this time, we are not aware of any liens. The current owner will be providing a title commitment which I'll forward upon receipt. We have requested that AMEC conduct a separate AUL/lien search as part of the Phase I.

(2.) Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

At this time, we are not aware of any AULs. The current owner will be providing a title commitment which I'll forward upon receipt. We have requested that AMEC conduct a separate AUL/lien search as part of the Phase I.

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

(4.) Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

Yes, based on discussions with the Chicago Department of Planning and Development, who is handling the purchase, the price is based on fair market value.

(5.) Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,

(a.) Do you know the past uses of the property?

See previous reports provided by the owner as well as the property screen conducted by 2FM.

(b.) Do you know of specific chemicals that are present or once were present at the property?

See previous reports provided by the owner as well as the property screen conducted by 2FM.

(c.) Do you know of spills or other chemical releases that have taken place at the property?

See previous reports provided by the owner as well as the property screen conducted by 2FM.

(d.) Do you know of any environmental cleanups that have taken place at the property?

See previous reports provided by the owner as well as the property screen conducted by 2FM.

(6.) The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

See previous reports provided by the owner as well as the property screen conducted by 2FM.

INTERVIEWS WITH PAST and PRESENT OWNERS, OPERATORS, and OCCUPANTS

This worksheet should help complete of the "Interview" portion of the All Appropriate Inquiry land acquisition screening. The worksheets are not exhaustive and should be tailored based on professional judgment and site conditions.

The AAI rule requires interviews with the current owner and occupant of the subject property. If the property has multiple occupants, the inquiry of the environmental professional should include interviewing major occupants, as well as those occupants likely to use, store, treat, handle or dispose of hazardous substances, pollutants, contaminants, petroleum and petroleum products, and controlled substances, or those who have likely done so in the past. Additionally, if the current owner is a third party holding company who obtained title to the property with the sole intent of selling it to the Federal government, it is suggested that the previous owner also be interviewed. In either case, at least one of the following individuals should also be interviewed.

- Representative of the local fire department that serves the property;
- Representative of the State and/or local health agency or local/regional office of state health agency serving the area in which the property is located;
- Representative of the State and/or local agency or local/regional office of state agency having jurisdiction over hazardous waste disposal or other environmental matters in the area in which the property is located; or
- Representatives of Local agencies responsible for the issuance of building permits or groundwater use permits that document the presence of AULs that may identify issues of concern in the area in which the property is located.
- Current and past facility managers with relevant knowledge of uses and physical characteristics of the property;
- Past owners, occupants, or operators of the property; or
- Employees of current and past occupants of the property.

In the case of inquiries done at "abandoned properties," where there is evidence of potential unauthorized uses of the subject property or evidence of uncontrolled access to the subject property, the inquiry must include interviewing one or more (as necessary) owners or occupants of neighboring or nearby properties from which it appears possible to have observed uses of, or releases at, such abandoned properties.

(Separate questionnaires must be completed for each interview)

Name of person interviewed: **Matthew J. Grusecki, Sr Vice President, Northern Builders, Inc. and Ed Garske, Carlson Environmental – his environmental consultant**
Telephone number: 773-266-6438

Affiliation with Property:

Northern Builders is a part-owner of the property through an entity called Chia LLC
(E.g., Owner, operator, caretaker, previous owner, or neighbor)

He has been associated with the property for 19 years

Time frame affiliated with Property:

"To the Best of Your Knowledge..."

A. Property Use(s)

1. Do you have or know of the existence of any of the following records related to the property? If yes, please provide copies or make them available. Yes ___ No X Unknown ___

- a. Radon, Asbestos, or Lead-Based Paint Surveys No X Copy/s Attached ___ No copy avail. ___
- b. Environmental Compliance Audit Reports No X Copy/s Attached ___ No copy avail. ___
- c. Environmental Permits Related to Current or Previous Site Activities (e.g., waste disposal permits, wastewater permits, NPDES permits) No X Copy/s Attached ___ No copy avail. ___
- d. Registrations for underground and above-ground storage tanks. No X Copy/s Attached ___ No copy avail. ___
- e. Hazardous Materials Management Plans (Emergency Planning and Community

Right-To-Know Act (EPCRA)) No Copy/s Attached No copy avail.

f. Facility safety plans No Copy/s Attached No copy avail.

Unknown

g. Preparedness and prevention plans No Copy/s Attached No copy avail.

Unknown

h. Spill Prevention, Control, and Countermeasure (SPCC) plans No Copy/s Attached No copy avail.

i. Hydrogeologic and geotechnical reports on the property or surrounding area. No Copy/s Attached * No copy avail.

j. Notices or other correspondence from any government agency relating to past or current violations of environmental laws with respect to the property. No Copy/s Attached No copy avail.

k. Notices or other correspondence from any government agency relating to environmental liens encumbering the property. No Copy/s Attached No copy avail.

l. Hazardous waste generator notices or reports. No Copy/s Attached No copy avail.

Unknown

m. Risk assessments No Copy/s Attached No copy avail.

n. Recorded deed or environmental land use restrictions No Copy/s Attached No copy avail.

Unknown

o. Other environmental studies or investigations No Copy/s Attached * No copy avail.

*Information on reports provided is in the Phase I text

2. Has the property ever been used for an industrial or commercial use (e.g., official and unofficial shooting ranges; processing, handling, management, disposal, storage, manufacture, or transportation of hazardous substances or petroleum products, such as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photographic developing laboratory, methamphetamine laboratory, junkyard, bone yard, or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility). If yes, describe the activities and provide the time frame, types, location(s) and quantities of hazardous substance use and storage.

Yes No Unknown

Was a railyard

3. Has there ever been permitted or planned mining activity or oil and gas exploration or development on the property? If yes, describe the activities and provide the time frame, location(s), and scope of operations.

Yes ___ No X Unknown ___

Not to their knowledge

4. Has the property ever been used for agricultural purposes, such as livestock or crops? If yes, describe the operations and indicate the location(s) and time frames involved.

Yes ___ No ___ Unknown X

May have been before it was a railyard

If yes, did the operation involve the use or storage of chemicals such as pesticides, fertilizers, and or solvents? If yes, describe and provide location(s) and the type, quantity, duration of use, and management practices.

Yes ___ No ___ Unknown X

5. Are there, or has there been, any improvements, such as buildings, water towers, smokestacks, smelters, and old building foundations on the property? If yes, describe each improvement, including construction date for each improvement; location on the property; square footage; past and current uses; dates of major renovations, additions, modifications; number of stories; type of construction; heating and cooling sources; water sources; sewage, solid and hazardous waste disposal; and removal date (if applicable).

Yes ___ No ___ Unknown ___

Some small buildings were onsite when it was a railyard. They believe there were 2 near the middle of the site

6. Other Questions as necessary based on the records review:

Not applicable

B. Hazardous Materials and Substances

1. Do the current operations on the property involve the use and storage of chemicals? If yes, please describe the operations and indicate the location(s), type, and quantities of materials used. Describe locations of chemical storage, mixing, and loading. Discuss any use, storage, mixing, or disposal of automotive or other batteries, pesticides (e.g., insecticides, herbicides, and fungicides), paints, solvents, or other chemicals on fence lines, rights-of-way, or other structures such as airstrips, heliports, or crop duster operations.

Yes ___ No X Unknown ___

If yes, has there been a spill or release of hazardous substances, petroleum products, or other potential environmental problems on the property associated with current operations? If yes, describe the nature and location(s) of the release and the quantities and types of hazardous substances. This includes staining or soils and floors in areas utilized for the use and storage of hazardous materials.

Yes ___ No ___ Unknown ___

Not applicable

If there had been a spill or release of hazardous substances or petroleum products, did someone report the incident to the National Response Center or a local or State emergency response authority? If yes, identify the agency.

Yes ___ No ___ N/A ___X___ Unknown ___

If a spill or release of hazardous substances or petroleum products has occurred, has the release been mitigated? If yes, describe the mitigation, identify the lead regulatory agency that oversaw the mitigation and indicate if the lead regulatory agency issued a no-further action (NFA) determination.

Yes ___ No ___ N/A ___X___ Unknown ___

If remediation is completed, does the property have contamination or residual contamination? If yes, are there any institutional controls/land use restrictions in place or long term monitoring and maintenance requirements?

Yes ___ No ___ N/A ___X___ Unknown ___

2. Are there any past operations at the property that involved the use or storage of hazardous materials and substances? If yes, describe the operations and the location(s), types, and quantities of materials.

Yes ___ No ___ Unknown X

If yes, has there been a spill or release of hazardous substances, petroleum products, or other potential environmental problems on the property associated with past operations or tenants? If yes, describe the nature and location(s) of the release and the quantities and types of hazardous substances.

Yes X No ___ N/A ___ Unknown ___

PNAs and metals were detected in previous investigations

If a spill or release of hazardous substances or petroleum products had occurred, was it reported to the National Response Center or a local or State emergency response authority? If yes, identify the agency.

Yes ___ No ___ N/A ___ Unknown X

If a release of hazardous substances or petroleum products had occurred, was the release been mitigated? If yes, describe the mitigation, identify the regulatory agency that oversaw the mitigation and indicate if the lead regulatory agency issued a no-further action (NFA) determination.

Yes ___ No X N/A ___ Unknown ___

If remediation is completed, does the property now have contamination or residual contamination present? If yes, are there any institutional controls or land use restrictions in place or long-term monitoring and maintenance requirements?

Yes ___ No ___ N/A X Unknown ___

3. Have there ever been any easements, rights-of-way, pipelines, utility lines, railways, entry or exit ports and associated structures, either buried or overhead, crossing the property? If yes, please describe and indicate the location(s), approximate construction date, and the owner's identity.

Yes ___ No ___ Unknown ___

Railways - property was a railyard. Matt indicates that there are utility lines and a storm sewer easement shown on the site survey

If yes, are you aware of any spills or releases associated with these features? If yes, please describe the spills and releases and indicate the date, type and quantities of materials involved.

Yes ___ No ___ Unknown X

If a spill or release has occurred, are you aware if the release has been mitigated? If yes, who did the mitigation and what regulatory agency oversaw the mitigation? If known, indicate whether the lead regulatory agency issued a no-further action (NFA) determination.

Yes ___ No ___ N/A X Unknown ___

If remediation is completed, are you aware if there the property still has contamination or residual contamination? If yes, are there any institutional controls or land use restrictions in place or long-term monitoring and maintenance requirements?

Yes ___ No ___ N/A X Unknown ___

4. Are you aware if the property's topography has been altered or if the property has any unnatural topographic features present? If yes, please describe the topographic alterations or unnatural features. Indicate their location(s) on the property and, if known, when the alterations occurred and by whom.

Yes X No ___ Unknown ___

Historical grading occurred.

5. Has fill material ever been brought onto the property that originated from a contaminated site or that was of an unknown origin? If yes, describe the date and quantity of material brought to the property, indicate the location where the material was placed.

Yes ___ No X Unknown ___

Matt and Ed are not aware of any fill being brought to the site

If fill material came from a contaminated site, identify the fill's origin and describe the contamination.

Not applicable

6. Is there any evidence that waste materials were dumped above grade, buried, or burned, either currently or previously, on the property? Examples include hazardous materials, petroleum products, labeled or unlabeled drums or containers, pesticide containers, household and farm debris, automotive or industrial batteries, building demolition debris, or other waste materials.

Yes ___ No ___ Unknown X

7. Are there any floor drains in the on-site structures or areas where chemicals (e.g., waste oil, antifreeze, solvents, and pesticides) were used or stored? If yes, indicate the location(s) of the structures and the types, quantities, and time frames related to the associated chemical use or storage. For each area or structure, also indicate the discharge location for the floor drains.

Yes ___ No ___ Unknown ___

Not applicable

8. Do the walls, floors, or ceilings of the structures used to store hazardous materials have any chemical stains? If yes, indicate the areas in each structure that has chemical staining.

Yes ___ No ___ Unknown ___

Not applicable

9. Are there or have there been any floors, drains, walls, or ceilings stained by substances other than water or that are emitting foul or unnatural odors (e.g., mold, mildew, algae)? If yes, describe the location(s) and the nature of the past and current site operations.

Yes ___ No ___ Unknown ___

Not applicable

10. Are there electrical transmission lines, transformers, capacitors, lighting ballast, or hydraulic equipment (e.g., elevators, presses, lifts, or doors) on the property? If yes, identify the location(s) and approximate age of the equipment.

Yes ___ No ___ Unknown X

There may be a transformer offsite on Kilbourn Avenue side of property

If the site has electrical transmission lines, transformers, capacitors, lighting ballast, or hydraulic equipment, has testing been done to determine the presence of polychlorinated biphenyls (PCBs) or has any on-site equipment contained PCBs? If yes, indicate the location(s), type of equipment, and dates.

Yes ___ No ___ Unknown ___

Not applicable

If the site has or had PCBs, are you aware of any release of PCBs that have occurred? If yes, describe the release and indicate the date, location(s) and whether the release was mitigated.

Yes ___ No ___ N/A X Unknown ___

11. Has there ever been any mercury-containing equipment (e.g., switches, thermostats, thermometers, manometers, or sink traps) on the property? If yes, indicate the location(s) and type of equipment and dates.

Yes _____ No _____ Unknown X_____

12. Are you aware of any radon, asbestos-containing materials, or lead-based paint on the property? If yes, indicate the type, locations and dates.

Yes _____ No _____ Unknown X_____

If yes, has anyone done any radon, asbestos-containing materials, or lead-based paint surveys on the property? If yes, indicate whether radon, asbestos-containing materials, or lead-based paint has been identified in any on-site buildings. Identify the dates of the surveys, the structures, the results, and condition of the materials.

Yes ___ No ___ Unknown X

13. Is there current or past use of above-ground or underground storage tanks, including drums or other fuel containers, on the property? If yes, identify the tanks locations, installation dates, and the types and quantities of materials stored. If the tanks were removed, indicate the removal date and whether the lead regulatory agency issued a closure certification notice.

Yes ___ No ___ Unknown X

If above-ground or underground storage tanks are or were used on the property, was there ever a spill or release of hazardous substances associated with the tank system? If yes, indicate the date and nature of the spill or release.

Yes ___ No ___ Unknown ___

Not applicable

If a spill or release has occurred related to an on-site tank system, was it mitigated to the satisfaction of the lead regulatory agency? If no, describe further actions that must be undertaken to address the spill or release.

Yes ___ No ___ Not Applicable X Unknown ___

14. Are you aware of any hazardous substance or pollutant or contaminant spill or release, or other potential environmental problems on any adjacent or nearby properties? If yes, please describe (if known) the location(s) of the release, the type and quantities of materials involved, and the approximate dates. If known, also indicate the owner of the property where the release occurred.

Yes No Unknown

PNAs and metals detected in previous Phase IIs

If there was a release of hazardous substances, petroleum products on any adjacent or nearby properties are you aware if the release was mitigated?

Yes No Not Applicable Unknown

Phase I by Carlson identified nearby properties with known releases

15. Are you aware of contamination or residual contamination on adjacent or nearby properties that poses a threat or may pose a future threat to the property? If yes, describe the threat or potential threat.

Yes No Unknown

16. Are you aware of any institutional controls, land use restrictions, long-term monitoring, or maintenance requirements in place on adjacent or nearby properties that affect the property? If yes, please describe and identify the adjacent or nearby property and the property owner.

Yes No Not Applicable Unknown

17. Other Questions as necessary based on the records review:

Not applicable

C. Water and Wastewater

1. Does the property currently or has it ever been supplied by an on-site drinking water supply well?
If yes, provide the well location(s) and construction dates.

Yes ___ No ___ Unknown X___

None known

Have contaminants ever been identified in the on-site drinking water well or the water system that exceeded acceptable levels? If yes, describe the contamination and indicate the dates, contaminant levels and the source of the contamination, if known.

Yes ___ No ___ Not Applicable_X_ Unknown ___

If an on-site drinking water well is no longer used, has it been properly abandoned according to applicable regulatory requirements? If yes, indicate the date the well was abandoned.

Yes ___ No ___ Not Applicable_X_ Unknown ___

2. Has the property ever had an on-site wastewater treatment and disposal systems (e.g., septic systems or sewage lagoons). If yes, please describe of the system, including the location(s), size, date constructed, and which buildings discharge to the system.

Yes ___ No ___ Unknown_X_

Not to their knowledge

If the on-site wastewater treatment and disposal system is no longer used, has it been closed? If yes, describe method of closure and date closed.

Yes ___ No ___ Not Applicable___ Unknown ___

3. Does the property have any monitoring wells? If yes, explain the purpose of the wells and provide the location(s), dates of construction, and any analytical results.

Yes No Unknown

Phase I indicates 15, placed due to planned transfer station

If the monitoring wells are no longer used, were they properly abandoned according to applicable regulatory requirements? If yes, indicate the date the well was abandoned.

Yes No Not Applicable Unknown

4. Does the property have surface water (e.g., pits, ponds, lagoons, rivers, creeks, or oceans)? If yes, describe the location(s) and type of surface water.

Yes No Unknown

If the property has surface water, are you aware of any unnatural characteristics such as color, sheens, odors, or sterility? If yes, please describe and indicate whether the situation is new or pre-existing.

Yes No Not Applicable Unknown

5. Has the property ever discharged industrial or other wastewater (excluding storm water runoff or sanitary wastewater discharges from restrooms, kitchens, or other household-type uses) onto or adjacent to the property? If yes, describe the discharge and indicate the location(s) and dates.
Yes ___ No ___ Unknown X

6. Other Questions as necessary based on the records review:

Not applicable

D. Compliance/Permits

1. Have there been any environmental permits or licenses issued for current or past operations associated with the property (e.g., air quality, water discharge, or landfills)? If yes, describe the permitted operations, indicate the permitting agency, date the permit was issued, and whether the permit is still effective.

Yes ___ No ___ Unknown X

2. Are you aware of any environmental liens against the property that were filed or recorded under Federal, Tribal, State or local law? If yes, describe the lien and indicate the date and effect on the current and future use of the property.

Yes ___ No ___ Unknown X

3. Are you aware of any activity and land use limitations that are in place on the property or that were filed or recorded under Federal, Tribal, State or local environmental laws? If yes, describe the land use restrictions, identify the party that issued the restrictions and the date.

Yes ___ No ___ Unknown X

None known

4. Are you aware of any compliance/enforcement notices relating to past or current violations of environmental laws with respect to the property or any facility on the property? If yes, describe the violations and the dates involved.

Yes ___ No ___ Unknown X

None known

5. Are you aware if any environmental site assessment, or other environmental investigations, of the property, or any other property or site records ever indicated the presence of hazardous substances, petroleum products, or other potential environmental problems on the property? If yes, describe the report and findings.

Yes No Unknown

Phase I and Phase IIs - Ed Garske thinks there may have been another Phase I or Phase II by his firm - he will check and follow up - PNAS and metals detected

6. Are you aware of any environmental site assessment, or other environmental investigations, of the property, or any other property or site records that recommended further assessment of the property? If yes, identify the report and indicate if the further assessment was done.

Yes No Unknown

See above

7. Are you aware of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous substances or petroleum products on the real property? If yes, describe the action and identify the party that is initiating the action.

Yes No Unknown

None known

8. Other Questions as necessary based on the records review:

Not applicable

E. Other

1. Are you aware any past or current occurrences of anomalous vegetation (e.g., stressed or dead) on the property? If yes, indicate the location(s) and approximate dates.

Yes ___ No X Unknown ___

Have any vegetative control programs (e.g., along transmission lines, fence lines, rights-of-ways, or pipelines) been done on the property? If yes, describe the program and types of activities.

Yes___ No___ Unknown X___

2. If not mentioned above, is there anything else that could indicate the presence of hazardous substances, petroleum products or other environmental conditions that may affect the property?

Yes ___ No ___ Unknown X___

Not to their knowledge - potentially other reports, Ed will check

Sent: Wednesday, June 21, 2017 4:39 PM
To: Jank, Mary E
Subject: Re: 4301 W Chicago Avenue

Dear Mary,

I received your request below. However, please note that environmental records maintained by CDPH are available on line through the City's Open Data Portal at <https://data.cityofchicago.org/>. You may start your search in the Environmental Records Lookup Table (<https://data.cityofchicago.org/d/a9u4-3dwb>). Click on the "View Data" button, and then enter a street address (in the filter on the right of your screen) to determine whether records exist in any of the seven environmental datasets: Complaints, Asbestos/Demolition Notices, Enforcement, Inspections, Permits, Above ground/Underground Tanks, and Environmental Permit Holds. If there is a "y" for yes in the Lookup Table, then click on the "y" to go to the indicated dataset and find the information you have requested.

I hope that this is helpful. Please let me know if you have any questions.

Sincerely,

Jennifer Hesse

Carmen Yung
6855 DIDRIKSON LANE
Woodridge, IL 60517

Dear Carmen Yung,

The Office of the State Fire Marshal ("OSFM") received your request for records, pursuant to the Freedom of Information Act, on 11/19/2017. The OSFM has reviewed its files and, unfortunately cannot fulfill your request for the following reason:

The documentation and/or information you seek is not of the type prepared or maintained by the OSFM.

We have carefully searched our office records in response to your request. Unfortunately, the OSFM does not have any records that are responsive to your specific request.

Pursuant to Section 9.5 of the Act, "any person whose request to inspect or copy a public record is denied by a public body . . . may file a request for review with the Public Access Counselor established in the Office of the Attorney General not later than 60 days after the date of the final denial." Such requests must be in writing, signed by the requester and include (1) a copy of the request for access to records and (2) any response from the OSFM. Further information on such requests contact:

Sarah Pratt
Acting Public Access
Counselor Office of the Attorney General
500 S. 2nd Street
Springfield, Illinois 62706
Phone: 1-877-299-FOIA
[1-877-299-3642](tel:1-877-299-3642)
Fax: (217) 782-1396

For your added convenience, we now also offer electronic submission of FOIA requests. To use this feature please go to <http://www.sfm.illinois.gov/public/foia.aspx> and simply fill out our electronic FOIA request form.

Should you have further questions regarding this matter, please contact me at your earliest convenience.

Sincerely,

Matt Sebek
Deputy General Counsel FOIA Officer
Office of the State Fire Marshal
[217-785-1011](tel:217-785-1011)

Gray, Deidra gray.deidra@epa.gov via usepa.onmicrosoft.com

to me ▾

2:05 PM (1 hour ago) ☆

Good afternoon Ms. Yung,

This email is a follow up to my phone call, a message was left on your voicemail. My name is Deidra Gray from the U.S. EPA. In regards to your FOIA request# 001830, for the property address at [4301 West Chicago Avenue, Chicago, Illinois](#). Our database searches have not found any Superfund Division records responsive to your request, a no response letter will be sent to you from the Superfund Division. Another division is also assigned to your request, they will send you a separate response. Do you have any additional information to add to the search? If a response to this message is not received within (3) business days, by Tuesday November 28, 2017, we will assume that you are no longer interested in pursuing your FOIA request, and your request will be automatically closed the following business day.

Thank You.

Deidra Gray
[312 353-3240](tel:3123533240)

APPENDIX I

Photograph #5	Remarks
	West central area of the Site.

Photograph #6	Remarks
	Monitoring well at the west central area of the Site.

Photograph #7	Remarks
	<p>Building debris at the west central area of the Site.</p>

Photograph #8	Remarks
	<p>Stone pile at the northwest perimeter of the Site.</p>

Photograph #9	Remarks
	<p>Two monitoring wells at the west end of the Site.</p>

Photograph #10	Remarks
	<p>Railroad ties at the west end of the Site.</p>

Photograph #11	Remarks
	Debris at the southwest area of the Site.

Photograph #12	Remarks
	Mounded soil at the southwest area of the Site.

Photograph #13	Remarks
	<p>Railroad spur at the southwest perimeter of the Site.</p>

Photograph #14	Remarks
	<p>Abandoned railroad spurs at the south central perimeter of the Site.</p>

Photograph #15	Remarks
 A photograph showing a gravel path and railroad tracks running west. On the left, there are trees and utility poles. In the distance, industrial buildings with tall chimneys are visible under a cloudy sky.	South central perimeter of the Site looking west.

Photograph #16	Remarks
 A photograph showing a gravel path and railroad tracks running east. On the right, there is a long brick building. Utility poles and trees are visible in the background under a cloudy sky.	South central perimeter of the Site looking east.

Photograph #17	Remarks
	<p>Railroad ties at the southeast perimeter of the Site.</p>

Photograph #18	Remarks
	<p>East perimeter of the Site.</p>

Photograph #19	Remarks
 A photograph showing a pile of several large, rectangular concrete blocks or slabs lying on the ground. The blocks are surrounded by dense, tall green weeds and grasses. In the background, there is a line of trees under a bright sky.	Concrete pile at the east central perimeter of the Site.

Photograph #20	Remarks
 A photograph showing a wide view of a field filled with tall green weeds and grasses. In the background, there is a dense line of trees. The sky is overcast and grey.	Northeast corner area of the Site.

Photograph #21	Remarks
 A photograph showing a dense field of green, leafy vegetation in the foreground. In the background, there are several trees and a fence line. The ground appears to be a mix of soil and some scattered debris.	<p>Broken clay pipe pieces at the northeast corner of the Site.</p>

Photograph #22	Remarks
 A photograph showing a narrow dirt path or trail cutting through a dense thicket of green vegetation. The path is composed of loose soil and small stones. The surrounding area is filled with various types of green plants and trees.	<p>Mounded soil at the north central area of the Site.</p>

Photograph #23	Remarks
	Central view of the Site looking west.

Photograph #24	Remarks
	Two monitoring wells at the east central area of the Site.

Photograph #25	Remarks
	<p>Monitoring well at the central area of the Site.</p>

Photograph #26	Remarks
	<p>View north of the Site from the north central perimeter.</p>

Photograph #27	Remarks
 A photograph showing an industrial site. On the left, two tall, cylindrical smokestacks rise into a cloudy sky. In the center and right, there is a large, light-colored industrial building with a corrugated metal roof and a large open bay door. The foreground is a dirt and gravel lot. The top of a dark car is visible at the bottom of the frame.	<p>View to the southwest of the Site – City of Chicago Transfer Station.</p>

Photograph #1	Remarks
	Adjacent property to the north - parking lot across Chicago Avenue. Bus Stop and sidewalk.

Photograph #2	Remarks
	View of adjacent properties to the North across Chicago Avenue - Truck Parking

Photograph #3	Remarks
	<p>Adjacent properties to the north across Kilbourn Avenue - smoke stacks. A stake labeled B-7 in a grass field next to dirt road.</p>

Photograph #4	Remarks
	<p>View of adjacent properties to the south - industrial facilities across North Kilbourn Avenue.</p>

Photograph #5	Remarks
 A photograph showing a set of railroad tracks running parallel to a long, multi-story brick industrial building. The tracks are covered with gravel and some fallen leaves. To the left of the tracks is a muddy, leaf-strewn path. The sky is overcast and grey.	<p>View of Southern boundary of the southeast portion of the subject Site - rail road tracks and neighboring industrial park.</p>

Photograph #6	Remarks
 A photograph showing a perspective view of railroad tracks receding into the distance. The tracks are flanked by a muddy, leaf-covered area with sparse, low-lying vegetation. The background is hazy and overcast.	<p>Another view of Southern boundary, East to West view. Railroad Tracks and area of low vegetation.</p>

Photograph #7	Remarks

Consultant Qualifications

SALVATORE CONSALVI, P.G.

Project Geologist

EDUCATION

Purdue University: B.S. Geology

CERTIFICATION

Professional Geologist, Florida
OSHA 40-Hour HAZWOPPER Training
US Forest Service Radio Operator
Wildland Firefighter Type II
Prescribed Fire Crew Member

SUMMARY OF QUALIFICATION

Mr. Consalvi is a registered Professional Geologist and has more than 20 years experience in environmental consulting services. Mr. Consalvi has extensive field experience in performing site assessments and remediation. He has performed numerous hydrogeological studies, soil and groundwater sampling, construction and remediation oversight, remedial investigation and feasibility studies at complex industrial and RCRA sites, leaking underground storage tank sites, landfills and naval stations. In addition to environmental investigations, Mr. Consalvi's other expertise includes geotechnical investigations and concrete testing, aquifer testing, hydric soil investigations, wetland delineations, air sampling and asbestos abatements.

EXPERIENCE

Mr. Consalvi has performed numerous Phase I ESAs at commercial and industrial properties involving real estate transactions. Due to his vast environmental consulting experiences, he can identify recognized environmental issues and liabilities involved, and advise clients with problem solving solutions.

Mr. Consalvi has managed asbestos abatement projects in educational, commercial, and health care facilities.

Mr. Consalvi was the field operations leader for an extensive Remedial Investigation/Feasibility Study at the US Naval Air Station. He managed field operations, conducted subsurface soil and groundwater sampling, aquifer testing, prepared investigation reports and served as the liaison for state and federal agencies. He also conducted Remedial Investigations at Glenview naval Air Station.

Mr. Consalvi has developed Post Closure Care Plans for municipal landfills in Illinois and conducted landfill closure activities.

Mr. Consalvi has also performed numerous geotechnical investigations and concrete testing for Illinois Department of Transportation properties. Mr Consalvi's other experiences include risk-based assessments for leaking underground storage tanks sites, hydric soil investigation for wetland delineations and waste water sampling.

Craig T. Cabrera

Senior Scientist

Core skills

Project Management, Phase I ESA, Phase II ESA, Soil and Groundwater Investigation and Remediation, Solid Waste Management, UST Removal and Remediation,

Professional summary

Craig Cabrera is a Principal Scientist with 25 years of professional experience as an environmental consultant serving in a variety of technical and managerial roles for commercial and industrial clients. Craig has managed a wide variety of projects that include: soil and groundwater investigations and remediation; removal and remediation of underground storage tank systems, hydraulic lift systems and oil/water separator systems; Phase I Environmental Site Assessments and Phase II Environmental Site Assessments for due diligence purposes in support of property transfers, mergers, and acquisitions.

Employment history

Amec Foster Wheeler Environment & Infrastructure, Inc., Senior Scientist, Chicago, Illinois, 1990 to present

Representative projects

Environmental Services, Loparex Plant, UPM Kymmene Corporation, Iowa City, Iowa. Project Manager. Coordinated Phase I ESA, subsurface investigations, and groundwater monitoring, at a 15-acre paper coating manufacturing facility. Investigative activities completed to determine vertical / lateral extent of impacts detected in soil and groundwater. Evaluation included the completion of a Risk Evaluation and Response Action Plan submitted to the Contaminated Sites Section of the Iowa Department of Natural Resources (IDNR) Land Recycling Program (LRP) with the intent to receive a No Further Action designation for the property. Responsible for managing environmental services, coordinating field work and scheduling, and preparing project budgets.

Environmental Services, Nationwide Service Facilities, Sears Holdings Management Corporation, Nationwide, US. 1995-2012. Program Manager.

Provided project management on a nationwide basis for environmental services at over 200 facilities since 1995. Environmental services included: Phase I Environmental Site Assessments; Phase II Environmental Site Assessments; removal and remediation of automotive and elevator hydraulic lift systems; removal and remediation of underground storage tanks and oil/water separators; soil and groundwater investigations and remediation; and technical environmental consultation. Acted as the Program Manager for all local Amec Foster Wheeler offices providing specifications development, cost estimates, contractor bid analysis and selection, project direction, technical guidance, report review, administrative functions, and serving as the prime point-of contact with the Program Director and supporting staff.

Environmental Services, Danville Works Plant, CONFIDENTIAL CLIENT, Danville, Illinois. 08/2008-02/2009. Project Coordinator. Coordinated Phase I ESA, subsurface investigations, groundwater monitoring, and UST removal and remediation at an 86-acre industrial manufacturing complex with multiple buildings

Education

Continued.

(main plant and support facilities), onsite aboveground tanks, railroad spurs and capped waste ponds. Investigative activities completed to determine vertical / lateral extent of impacts detected in soil and groundwater. Investigation evaluated eight onsite solid waste management units (SWMUs) to determine necessary steps to meet U.S. EPA and state EPA cleanup goals. Responsible for developing scope of work, cost estimates, coordinating field work, and developing reports.

Harbor Belt Railroad Property, PCS Sales (USA), Inc., Hammond, Indiana.

02/2010-02/2012. Project Coordinator. Phase I Environmental Site Assessment of Indiana Harbor Belt (IHB) Railroad Property in Hammond, Indiana. The property is currently owned by Conrail and occupied by IHB. The IHB Railroad Property comprises approximately 93 acres south of Michigan Street between Columbia Avenue and Kennedy Boulevard in Hammond, Indiana. Based on the recommendations of the Phase 1 ESA, an invasive Phase II Environmental Site Assessment was conducted of the site. The scope of work included: completion of soil borings; installation of temporary groundwater monitoring wells; gauging water levels; purging the temporary wells prior to sampling; and collecting soil, groundwater and surface water samples for laboratory analysis. Subsequent remediation included the removal of two underground storage tanks, and associated impacted soils. Responsible for work plan development, budgeting, field work coordination, and report development and review.

Remedial Design and Implementation, Avaya, Inc., Montgomery, Illinois.

11/2003-04/2016. Project Manager. Environmental services to assist Avaya with compliance with the Illinois Environmental Protection Agency Resource Conservation and Recovery Act (RCRA) Remedial Action Plan Permit (RAPP) for Post-Closure Care for this site. Environmental Services include, quarterly groundwater monitoring, and maintenance on asphalt cap that serves as an engineered barrier over the RCRA Corrective Action Management Unit (CAMU). Responsible for managing environmental services, coordinating field work and scheduling, and preparing project budgets to control costs.

Environmental Services, United States Postal Service (USPS), Illinois Region.

1995-2000. Program Manager. Provided project management for a broad scope of USPS environmental service areas, including pre-acquisition Phase I and Phase II Environmental Site Assessments, underground storage tank removal and remediation, indoor air quality assessment and sample collection, storm water site assessments, lead-based paint inspections, and identification of asbestos containing building materials. Served as the primary contact for the USPS Great Lakes Area contract for over two years and successfully managed over 40 projects for the USPS.

Phase I and Phase II ESAs, Centrella Street and Belmont Avenue Locations, Ridge Property Trust, Franklin Park, Illinois. 06/2008-01/2009. Project Manager.

Managed Phase I ESAs and Phase II ESAs for two properties formerly used for grocery store product distribution and considered for acquisition by client. Subsurface investigation included soil boring and monitoring well installation and sampling for soil and groundwater impacts associated with former USTs, petroleum and chemical storage, underground hydraulic components, and potential offsite concerns. Responsible for developing scope of work, cost estimates, coordinating field work, report production and review, and client liaison.

Subsurface Investigation, Retail Distribution Facility, Confidential Client, Corpus Christi, Texas. 01/2005-12/2012. Project Manager. Managed

Continued.

environmental investigation of two-acre retail warehouse/distribution facility impacted by petroleum from leaking underground storage tanks (LUSTs). Ongoing investigation includes soil and groundwater monitoring, plume delineation, and close interaction with the Texas Commission on Environmental Quality (TCEQ) for remediation plan development. Managed remediation consisting of excavation and disposal of 180 tons of impacted soil and site restoration. Received a No Further Action status from the TCEQ. Also completed report reviews, and served as client liaison.

Pesticide Subsurface Investigation, Retail Distribution Facility, Confidential Client, Orlando, Florida. 10/2001-11/2012. Project Coordinator. Long-term environmental investigation and delineation at major retailer's former distribution center, including fleet vehicle maintenance and repair shop, in urban location. Services consisted of groundwater monitoring, soil sampling and remediation for pesticide impacts, which include excavation and source removal, phased chemical oxidation groundwater treatments utilizing various application techniques, and groundwater monitoring. Worked with a local Amec Foster Wheeler Project Manager to develop the scope of work and cost estimates, coordination and correspondence with the Florida Department of Environmental Protection Project Manager, report reviews, and served as client liaison.

Subsurface Investigation and Remediation, Former Retail Facility and Auto Service Center, Confidential Client, Washington, District of Columbia. 2004-2011. Project Coordinator. Site investigations and corrective actions to address two historical releases of petroleum on vacant lot formerly occupied by retailer vehicle service center. Conducted comprehensive site assessment (including soil borings and well installations), removal of two 1,000-gallon storage tanks, geophysical surveys, and excavation and removal of impacted soils. Approximately 2,000 tons of contaminated soil removed from one location and 5,000 tons from the other. Worked with a local Amec Foster Wheeler Project Manager to develop the scope of work and cost estimates, completed report reviews, and served as client liaison.

Installation and Up-Grades of Underground Storage Tanks, Village of Wheeling, Wheeling, Illinois. 01/2002-12/2002. Project Coordinator. Provided management and oversight for the installation of one 550 gallon, fiberglass UST and the up-grade of two 1,000 gallon steel USTs which included installation of an automated leak detection and inventory control system, and the replacement of access ports and underground conduit lines.

Underground Storage Tank Removal, Confidential Client, Woodstock, Illinois. 1997. Project Manager. Developed work plan and provided management and oversight for the removal of five gasoline and heating oil USTs. Coordinated soil remediation activities that included the removal and disposal of 1,425 cubic yards of soil. Prepared a closure report for the site and obtained a "No Further Action" status.

Underground Storage Tank Removal, Confidential Client, Wheaton, Illinois. 1998. Project Manager. Developed work plan and provided oversight for the removal of one-10,000 gallon fuel oil UST from an active commercial facility. Coordinated removal efforts with a no release status and completed a closure report for the site.

Underground Storage Tank Site Classification, Unimast, Inc., Franklin Park, Illinois. 1998. Project Manager. Prepared site classification work plan and budget and

Continued.

provided direction and oversight for the subsurface investigation efforts. Completed a report in accordance with IEPA reporting requirements and completed reimbursement submittal package for reimbursement from the IEPA LUST Program.

Phase I Environmental Site Assessments. 1995-2012. Project Manager. Performed Phase I ESAs associated with property transactions for industries, law firms, real estate offices and private owners throughout the country. Provided project management for additional sites throughout the country that were completed by Amec Foster Wheeler offices. Managed and coordinated multiple site portfolios for national clients with the largest portfolio consisting of 51 Phase I ESAs completed nationwide within a four week time period. Routinely utilize Amec Foster Wheeler offices, staff and resources nationwide for multiple projects simultaneously. Assessment activities included visual inspections for potential environmental liabilities such as underground storage tanks, chemical and drum storage, suspected water/wastewater contamination and hazardous materials/waste storage. Prepared final reports that included documenting findings, historical and regulatory information, and conclusions and recommendations.

Phase II Environmental Site Assessments. 1995-2012. Project Manager. Developed work plans and provided both project management and oversight for Phase II ESAs of industrial and commercial properties throughout the country. Directed field activities, evaluated the findings of the investigation, and provided interpretation and recommendations in a report of findings.

Environmental Services, United States Army Corp. of Engineering (USACE), Multiple Locations, Midwest. 1995-1997. Field Manager. Performed subsurface field investigations at a waste collection site in Indiana which included the installation of soil borings and monitoring wells. Provided direction and oversight of the removal of approximately 500 gallons of hazardous liquid product from a sump pit at a chemical plant in Willow Springs, Illinois. Performed LUST site classification investigations at an aviation facility in Joliet, Illinois. Completed sampling of monitoring wells at a site undergoing remediation in South Chicago, Illinois.

Storm Water Pollution Prevention Plans, Confidential Client. 1995-1997. Field Technician and Project Manager. Completed field investigations for the development of Storm Water Pollution Prevention Plans associated with National Pollutant Discharge Elimination System (NPDES) permitting for facilities in seven midwest states. Project development included site analysis, compliance analysis, spill identification and development of response procedures.

Air Sampling Professional, Asbestos Abatement, 30 Story Commercial Building, Chicago, Illinois. 1991-1992. Project Manager. Responsibilities included day-to-day abatement monitoring, scheduling, and coordination of activities between the abatement contractor and building management in an occupied building. Enforced contract specifications, observed project activities, performed workplace and clearance inspections, reported progress to the client, and prepared a comprehensive final report.

CARMEN Y. YUNG, LEED AP

EDUCATION

BS Geology – University of Hong Kong

CERTIFICATION

LEED Accredited Professional – Green Building Certification Institute
40-Hour OSHA HAZWOPER Training
OSHA HAZWOPER Supervisor Training
8-Hour OSHA Refresher Training

SUMMARY OF QUALIFICATIONS

Ms. Yung was a project manager of Leaking Underground Storage Tank Program with the Illinois Environmental Protection Agency. She has over 20 years experience in environmental consulting services. She has extensive technical and regulatory experiences in developing site characterization and remedial alternatives, performing risk-based assessments, performance of Phase I and Phase II environmental site assessments, compliance audits, leaking underground storage tank removals, assessments and reporting, air, land and water permitting, and obtaining site closure from the regulatory agencies. She has managed and obtained regulatory closures for numerous projects under the Leaking Underground Storage Tank Program and the Illinois Site Remediation Program. In addition, due to her prior employment with the Illinois Environmental Protection Agency, she is very knowledgeable with state and federal environmental regulations and has front-line experience working with state and federal regulatory agencies.

EXPERIENCE

Ms. Yung has performed over 100 Phase I/Phase II environmental site assessments and compliance audits at commercial and industrial facilities. She is able to identify the environmental issues and can assist the client with problem solving and solutions.

Ms. Yung was a project manager of the Leaking Underground Storage Tank (LUST) Program with the Illinois Environmental Protection Agency. In the past 15 years, she provided project management, technical report writings (45-Day Report, Site Classification Work Plan, Site Investigation Completion Report, Corrective Action Plan and Corrective Action Completion Report) and oversight of site assessment and remediation activities for numerous LUST sites owned by big oil companies. Due to her extensive regulatory and technical experiences and her ability to understand and meet clients' needs enables her to be instrumental in negotiating with regulatory agencies and achieving closure at LUST project sites. Ms. Yung also has performed risk-based assessments (TACO), Tier II and Tier III evaluations and groundwater modeling to evaluate risks related to environmental impact and negotiate site closure. Ms. Yung also specializes in preparing claims for obtaining reimbursement of site assessment and remediation costs from the LUST Trust Fund. She has thorough understanding of the

procedures and requirements for obtaining reimbursement. She has numerous successes in obtaining reimbursements for the clients in a timely manner.

Ms. Yung has provided comprehensive environmental consulting services to industrial clients including a nationwide transportation company and a major railroad company. Services provided including consulting on health and safety and compliance issues, storm water sampling, preparation of Storm Water Pollution Prevention Plans, Spill Prevention Control and Countermeasures Plans, air emission reports, site investigation and remediation for releases of petroleum and hazardous substances, technical reporting and regulatory closures for the releases. She was the clients' main contact and served as regulatory advisor for the clients.

Other experiences include site assessment and site closure activities on a variety commercial, industrial and brownfield sites under the Site Remediation Program. She has strong background in the use of conventional and innovative technologies, including soil excavation, soil vapor extraction and in situ chemical oxidation. She had extensive technical experiences in preparing site investigation reports, remedial action plans and remedial action completion reports.

Mary Jank, PG

Senior Geologist

Core skills

Phase I ESA, Phase II ESA, CERCLA, RCRA, LUST, TACO, Hazardous Waste, CCDD, Investigation and Remediation Planning, Asbestos and Lead based Paint Management

Professional summary

Ms. Jank has more than 35 years of experience as a professional geologist and project manager. Her experience has included Phase I and Phase II site assessments, well site supervision, borehole logging, soil sampling, water sampling, soil vapor surveys, dye studies in fractured bedrock, XRF of lead in soils, and UST removal and site closure. Her experience has encompassed CERCLA and RCRA projects, as well as voluntary cleanups under several state programs. Her responsibilities have included site and project management activities. Ms. Jank is experienced at hydrogeological interpretation and the mapping of constituent migration in numerous types of subsurface environments including karst and discontinuous tills. Her client and agency interface experience is extensive and Ms. Jank has been a key contributor during negotiations with the EPA, the Corps of Engineers and other state and local government agencies.

Ms. Jank has prepared quality assurance documentation under both CERCLA and RCRA for both industrial and government clients. Ms. Jank also has completed TACO Tier 2 risk assessments and has assisted in Tier 3 risk assessments at several sites. Ms. Jank has also completed CERCLA risk assessment and feasibility study documents, and participated in CERCLA community relations activities including preparation of community relation plans and public meetings.

Ms. Jank has planned and overseen site remediation and re-development projects since 2000 for Chicago Public Schools and the Public Building Commission of Chicago. Ms. Jank has overseen the asbestos and lead based paint inspection, design and oversight services performed by Amec Foster Wheeler for Chicago Public Schools since 2005 and has been overseeing these same services for the Public Building Commission since 2010. She has also overseen pre-demolition asbestos inspections and lead based paint inspection and risk assessment for the Public/Private Joint Venture which is redeveloping military housing at Great Lakes, Fort Sheridan, Glenview Naval Air Stations and Crane Naval Base in Indiana.

Amec Foster Wheeler: 1996

Industry: 1982

Continued.

PBC ES Modular, Public Building Commission of Chicago, Chicago, Illinois. 05/2015-12/2015. Project Manager. Investigation, design and oversight of excavation of a playground area and parking area adjacent to two different Chicago Elementary Schools. Objective was the installation of modular classrooms adjacent to the existing schools: Mt. Greenwood and Tonti Elementary Schools. Responsible for all document preparation, review of contractor submittal, TACO, and project management. Ensured project met tight schedule of 3 months and came in below budget.

Lake County Skokie Valley Ped Bridge, Lake County (IL) Division of Transportation, Highland Park, Illinois. 05/2015-12/2016. Senior Associate Geologist. Phase I study for a new pedestrian bridge carrying the existing Skokie Valley Bike Path south into Cook County. This bridge will be built under electrical transmission lines and requires extensive coordination with ComEd, as well as the Union Pacific Railroad, and multiple municipal stakeholders. FHWA coordination for funding, wetland delineations, environmental site assessments, preliminary bridge design, public outreach, and landscape architecture are also all part of this project's scope of work. Type Size and Location plans were submitted to IDOT's Bureau of Bridges and Structures. Responsible for management and review of Phase I Environmental Site Assessment, and management and review of Phase II Environmental Site Assessment should one be necessary, and any other hazardous material or soil management issues.

I-90 Jane Addams Memorial Tollway, Kennedy Expressway to Oakton Street, Illinois Tollway, Cook County, Illinois. 08/2012 – 12/2015. Hazardous Waste. Final design for the Reconstruction and add-lanes of 5.5 miles of I-90 (Jane Addams Memorial Tollway) as part of Illinois Tollway's Move Illinois Program. Work includes preparing a Master Plan Update to address wider inside shoulder and lane for future transit options and improved profile. Amec Foster Wheeler serves as a major subconsultant to Parsons Brinkerhoff. The project will be let as 8 separate construction contracts, 4 of which will be led by Amec Foster Wheeler. Design services include roadway design, bridge design (13 bridges); retaining wall design; hydraulic modeling and drainage design; utility coordination; barrier warrant analyses; maintenance of traffic; signing and striping; 401/404 and IDNR permit applications; Soil Disposal analysis in conformance with new Illinois CCDD regulations; specifications and estimates. Responsible for managing environmental investigation to determine soil disposition.

Environmental Consulting Services for School Facilities, Chicago Public Schools, Chicago, Illinois. 01/2010-01/2013. Project Manager. Asbestos re-inspections of all building materials in more than 200 Chicago Public School facilities throughout the City of Chicago metropolitan area. Amec Foster Wheeler performed a review of all past inspections, reports and pertinent response actions prior to commencing field activities. Amec Foster Wheeler successfully managed asbestos subcontractors for performance of re-inspections with final review by Amec Foster Wheeler's IDPH Licensed Asbestos Management Planners. Management Plans were updated to include any changes noted during the re-inspection and the client's Access Database was updated for each re-inspection conducted. Final reports were provided in electronic and hard copy form. Client contact, project coordinator, and review of documents.

Continued.

Environmental Consulting Services for School Facilities 2005-2009, Chicago Public Schools, Chicago Illinois. 08/2005-07/2009. Project Manager.

Environmental consulting, management and oversight services under four-year (2005-2009) Master Services Agreement for various elementary, middle and high school buildings and support facilities throughout City of Chicago Public School system. Services included planning and oversight of abatement of asbestos-containing materials (ACMs) and lead-based paint; industrial hygiene services; and environmental investigations as needed. Services at more than 70 school facilities throughout City of Chicago metropolitan area. Responsible for review of design documents for asbestos and lead based paint abatement and management of services.

Leech Tishman Fuscaldo & Lampl, LLC Palm Phibrotech Phase I and II, Joliet Illinois. 08/2010-12/2010. Principal. Phase I and Phase II Environmental Site Assessment (ESA) at the Phibro-Tech facility in Joliet, Illinois. At the time, the facility was recycling/recovering materials from inorganic waste streams. Historically, the facility had processed RCRA hazardous waste, but as of about 2004, the facility no longer accepted those types of materials. The facility had an active RCRA Part B Permit and was under a consent decree which required compliance with the permit. Nine Solid Waste Management Units (SWMUs) have been identified and the facility was performing ongoing monitoring of groundwater. There are land use restrictions and open action items for institutional controls at the Site. Through performance of the Phase II ESA, Amec Foster Wheeler was able to provide a baseline characterization of the site prior to acquisition, including input on other areas of concern. Technical lead, reviewed documents, scoped Phase II, handled all technical issues

Zion Asbestos Survey, EnergySolutions, Inc., Zion, Illinois. 05/2008-10/2008. Project Manager. Asbestos inspections of a nuclear power station. A comprehensive NESHAP asbestos inspection survey of the Zion Nuclear Station, including completion of an inspection of all accessible building components for suspect ACM, collection of samples, and laboratory analysis. Then labeled all materials which were asbestos containing and prepared a comprehensive database of the results, identified asbestos containing pipe insulation on facility diagrams, and provided estimates of potential costs for abatement. Unit 2 Turbine Building 2 stories plus basement, mezzanines and platforms over 3000 samples over 35,000 linear feet of piping plus tanks and fittings. Responsible for client contact for procurement oversight of personnel and quality control of data review.

Fire Station #109 Phase II Environmental Site Assessment and Geotechnical Investigation, Public Building Commission of Chicago, Chicago Illinois. 11/2008-04/2009. Quality Assurance / Quality Control. Phase II environmental site assessment and geotechnical investigation for the new Fire Engine Company #109 at 2301-2359 South Kedzie Avenue in Chicago. Responsible for review of documents and assistance with technical issues with regard to TACO (risk assessment) and Site Remediation Program (Illinois Voluntary Remediation Program)

Mt. Greenwood Elementary Asbestos and Lead Based Paint Services, Public Building Commission of Chicago, Chicago, Illinois. 07/2010-09/2011. Project Manager. Asbestos inspection and abatement oversight services to the Public Building Commission of Chicago. Amec Foster Wheeler provided inspection and testing, and design services as well as asbestos project management and air

Continued.

sampling services on the Mt. Greenwood Public School renovation project. Responsible for review of all documentation, and interface with client.

Mt. Greenwood Elementary Phase I and Phase II Environmental Site Assessment and Construction Oversight, Public Building Commission of Chicago, Chicago, Illinois. 07/2010-07/2012. Project Manager. Phase I environmental site assessment and construction oversight for soil removal in conjunction with renovation of Mt. Greenwood School. Responsible for review of all documentation, and interface with client.

East Chicago IN UST Removal, Multiserv Group Ltd., East Chicago Illinois. 04/2009-12/2009. Principal Review. UST investigation and removal at an industrial facility in East Chicago, IN. Completed soil and ground water sampling and analysis. Retained contractor for UST removal. Completed UST removal report and UST site investigation report. Industrial facility - 2 acres. 3 buildings Responsible for reviewing UST reports required by IDEM.

Brownfield Site Remediation and Closure, City of Chicago Department of Environment, Chicago, Illinois. 09/1999-12/2005. Project Manager. Brownfield Redevelopment Environmental investigation and remediation services including site investigation and report, closure activities, risk assessment review, Remedial Objectives Report and Remedial Action Plan for 17-acre brownfield site on Chicago's west side. Site had formerly been location of construction debris disposal firm and contained over 500,000 CY of construction debris. Existing 34,000-SF building on site renovated to comply with "green building" principles and features green technology components. RAP developed to comply with green principles, including specially engineered barriers, geotextile fabric remediation, and tree resin product overlay to form pavement. Closure achieved in January 2003. Project won 2002 Phoenix Award for U.S. EPA Region 5. Responsible for authoring all documentation including, site investigation, remedial action completion report and remedial objectives report.

Sacramento Boulevard Site Investigation Remediation Construction Oversight and RACR Preparation, Chicago Green Works, Chicago, Illinois. 10/2005-05/2007. Principal. Site investigation, remediation construction oversight, and document preparation for 13-acre former "back" section of 445 North Sacramento Boulevard. Site previously occupied by foundry and other industrial operations; entered into Illinois EPA's Site Remediation Program (SRP) in 1999. Site to become new "Green" industrial park with 20,000-SF LEED (gold-certified) office headquarters and warehouse on site. Previous Amec Foster Wheeler Phase II environmental site assessment included 79 soil borings and 105 soil samples, and installation of 4 groundwater monitoring wells. Prepared documents included comprehensive site investigation report, remedial objectives report, remedial action plan (RAP), and remedial action completion report (RACR). All reports compiled in accordance with IEPA SRP program. Responsible for reviewing analytical data and provided Chicago Department of Environment with strategy recommendations for closure. Responsible for providing resource control and overall quality control.

Powell Replacement School Environmental Consultant Management, Public Building Commission of Chicago, Chicago, Illinois. 03/2009-01/2011. Principal. Environmental consulting services during site design through construction for the Powell Replacement Elementary School Project. This project began with a Phase I that Amec Foster Wheeler performed for Chicago Public Schools in 2006. No

Continued.

recognized environmental conditions (RECs) were discovered as a result of this Phase I. However, in 2009, Amec Foster Wheeler was asked to provide construction oversight and design services for the Public Building Commission on this same school site. During trenching activities to investigate subsurface anomalies at the property, free-phase oil was noted in the trench pit. Amec Foster Wheeler investigated this oil and delineated the extent of impacted soils. Based on that delineation, a Comprehensive Site Investigation Report, Remediation Objectives Report and Remedial Action Plan were prepared. Amec Foster Wheeler used averaging to limit the amount of required remediation at the site. Amec Foster Wheeler then oversaw the remediation of the oil and contaminated soils which was performed as part of construction activities at the site. Construction and soil excavation were completed and Amec Foster Wheeler submitted a Remedial Action Completion Report resulting in a No Further Action Letter for the site. Responsible for all technical aspects of project, used TACO (risk assessment) to reduce the amount of remediation needed for this school site.

Avondale/Irving Park Area Elementary School Construction Oversight, Public Building Commission of Chicago, Chicago, Illinois. 03/2009-12/2011. Principal. Environmental Oversight during soil movement and backfill activities during construction at the Avondale/Irving Park Area Elementary School site. Responsible for oversight of technical details of the project including specifications, review of subcontractor submittals and consultation on environmental issues with client.

Phase I and II Environmental Assessments, Leggett & Platt / Sterling Steel Company, LLC, Sterling, Illinois. 07/2001-10/2008. Geologist. Beginning in 2001, performed Phase I and II environmental assessments and provided regulatory support at client site, a 700-acre industrial steel operation acquired by client, including Due Diligence ASTM Phase I and Phase II, past compliance profile, entry of site into Site Remediation Program (2002) Comprehensive Site Investigation Report (CSIR), Remedial Objectives Report. Responsible for reviewing Phase I and Phase II documents and providing technical input with regard to TACO and SRP.

City of Chicago Department of Environment Burnside North Industrial Site Brownfield Phase II Investigation and Remediation, Chicago, Illinois. 09/1997-06/2005. Project Manager. Performed environmental services at 11-acre site of former steel manufacturing facility. Work included Phase II Environmental Investigation and inclusion of site into IEPA Site Remediation Program as "brownfield"; offsite disposal of surface tar and soils in conjunction with PNA's clean-up objectives; and submission of remediation Completion Report to IEPA. Responsible for reviewing analytical data and provided Chicago Department of Environment with strategy recommendations for closure. Responsible for providing resource control and overall quality control.

Brownfield Redevelopment to Roseland Place - Voluntary Site Remediation Program, Neighborhood Housing Services, Chicago (South Side), Illinois. 05/2005-01/2006. Principal Review. Brownfield Redevelopment Phase I and Phase II Environmental Site Assessments and related services under voluntary Site Remediation Program for redevelopment of 4-acre brownfield area into assisted living facility on Chicago's South Side. HUD funding for project required attainment of "No Further Remediation" (NFR) letter. Services included evaluation of prior investigation reports; support for entry into Illinois' Site Remediation Program; development of Site Investigation Report, Remedial Objectives Report, and Remedial Action Plan; and

Continued.

remediation oversight for former industrial property, which included 4 USTs. Brownfield contaminants include soil contaminated with polynuclear aromatics (PNAs), volatile organic compounds (VOCs) and lead in soils to a depth of 5' below surface grade. Responsible for reviewing Phase I documents and providing technical input with regard to TACO and SRP.

Military Housing Privatization and Redevelopment (for U.S. Navy) Environmental and Infrastructure Services, Forest City Military Communities Midwest, Four Cities in IL, IN, Illinois. 04/2005-07/2010. Project Manager.

Environmental and infrastructure services including Phase II environmental assessments, asbestos sampling, lead surveys and risk assessment and geotechnical sampling (for roadway design) for demolition and redevelopment and privatization of military housing units for the U.S. Navy at four locations (three in Illinois and one in Indiana) under long-term lease by public / private venture. Work involves demolition of approximately 1,500 buildings and construction of neighborhoods containing nearly 750 new market-level homes for Navy personnel and their families on portions of the base and enhancing portions of the base for existing tenants. Design work included roadway, drainage, sanitary sewer, water main, and electrical and telecom utilities for the new home sites as well as development of neighborhood centers, active and passive parks, dogs parks, tot lots, irrigation systems, and placement and connection of prefabricated park buildings. Responsible for Environmental portion of project, including planning document production (Hazardous Materials Management, Lead Based Paint Management, Asbestos Management, Pesticide Use, Mold Prevention, Stormwater Management) and overseeing Phase I and Phase II and asbestos lead-based paint activities.

Santa Monica Retail Auto Center Phase II Environmental Site Assessment, Soil Investigation, Confidential Client, Santa Monica California. 10/2008-02/2009.

Principal. Phase II environmental site assessment and subsurface soil investigation on 2-acre site of retail store automotive center, involving underground piping associated with former underground storage tank (UST) located on site. Responsible for overseeing phase II investigation.

Plant I Demolition Decommissioning Plan and Specifications, Confidential Client, Rockford Illinois. 10/2006-07/2009. Principal Review.

Development of decommissioning plan and demolition specifications for Phase I demolition of buildings at Plant I industrial complex. Demolition of approximately 100,000 SF of space, including one four-story office building. Project team assisted with both bid and contractor selection. Responsible for reviewing asbestos inspection report.

Centrella Phase II, Ridge Property Trust, Franklin Park, Illinois. 06/2008-01/2009. Principal Review.

Phase II Environmental Site Assessment for two properties formerly used as grocery stores and considered for acquisition by client, including soil boring subsurface investigation for monitoring well installation and groundwater monitoring. Responsible for review and TACO (IL risk assessment) consultation of Phase II analytical results.

Danville Works Plant Phase II Remedial Investigation, Confidential Client, Danville Illinois. 08/2008-02/2009. Project Coordinator.

Phase II Remedial Investigation for 86-acre industrial manufacturing complex with multiple buildings (main plant and support facilities), onsite aboveground tanks, railroad spurs and capped waste ponds. Facility produced and packaged freon (CFC refrigerants) from 1955 to 1994, then switched to packaging only. Contamination of soil and

Continued.

groundwater with volatile organic compounds (VOCs) identified since 1970s. Investigative activities to determine vertical / lateral extent of carbon tetrachloride and other CFCs and VOCs detected in soil and groundwater, and to verify if contaminant groundwater plume extended offsite. Investigation also evaluated eight onsite solid waste management units (SWMUs) to determine necessary steps to meet U.S. EPA and state EPA cleanup goals. Responsible for developing cost estimates, overseeing field work and developing reports.

Great Lakes Naval Training Center Residential Units Renovation Asbestos and Lead-Based Paint Assessments, Confidential Client, North Chicago Illinois.

06/2006-06/2009. Project Manager. Asbestos and lead-based paint inspection, testing and risk assessment services in specified portions of 20 residential homes in the Main Side and Hospital Cove residential areas near the Great Lakes Naval Training Center. Services provided in accordance with NESHAP regulations and performed prior to renovation efforts. Additional services included oversight of removal of soils in the vicinity shown to be contaminated with lead from lead-based paint, and assessment of one residential unit for presence of mold. Responsible for reviewing reports and letter reports for asbestos removal and lead-based paint testing.

Unity Junior High School Site Brownfield Redevelopment, Cook County Regional Office of Education, Mattson Associates, Inc., Cicero, Illinois. 08/2000-12/2002. Project Manager.

Environmental investigations, site assessments, soil remediation and building demolition services on accelerated basis at site of former industrial facility in operation for over a century. Site was contaminated with PNAs, PAHs, PCBs, metals and chlorinated solvents. More than 65,000 CY of contaminated soil removed. Site was divided into seven zones based on construction schedule so that remediation and closure of each zone could be performed separately to meet construction needs. Amec Foster Wheeler performed as subcontractor to prime consultant. Site was 2003 Phoenix Award - Community Impact Winner. Responsible for preparing all SRP program documentation and risk assessment.

Industrial Property Due Diligence Services, Keating Resources / Port of Will County, LLC (IL), Joliet, Illinois. 11/2006-12/2007. Principal.

Due diligence services for possible purchase of approximately 300 acres of industrial and commercial property near Illinois River for possible development of new intermodal shipping hub. Services included conducting research, attending and advising during meetings, and providing other information / technical support with regard to historic and environmental remediation activities, ongoing water permitting activities, and issues of mining operations. Responsible for reviewing Phase I and II reports and radiation reports written by another consulting firm; attended meetings with client, purchaser and purchaser's consultant to discuss report findings.

Mine and Processing Facility Planning and NPDES Permitting, Port of Will County, LLC / Keating Resources, Joliet, Illinois. 08/2003-12/2008. Principal.

Planning and NPDES permit application as part of redevelopment of former chemical facility into new underground mine and processing facility on 117-acre site. Responsible for conducting peer review and managing project tasks.

Manufacturing Facility Groundwater Remediation and Monitoring, Avaya, Inc., Montgomery, Illinois. 11/2003-04/2016. Project Manager.

Environmental services for comprehensive site investigation, risk assessment, and remedial design and

Continued.

implementation efforts associated with decommissioning a 45-acre, former printed circuit board manufacturing facility where decrease of 37% to 99% in total chlorinated-VOC concentrations in groundwater have been documented onsite. Responsible for review of ground monitoring reports, corrective action plans; consulting on hydrogeology and design of dye study.

Village of Wheeling Friendship Park Design-Build Contractor, Construction Management, UST Removal, Wheeling, Illinois. 01/2002-12/2002. Environmental Manager. Served as Prime Contractor for design-build of a municipal park with waterfall feature, lighting, pedestrian walkways and benches and green space, serving as a centerpiece for municipal beautification. Responsible for design, general contractor duties, full-time construction management and environmental services that included removal of 6 previously unidentified Underground Storage Tanks (USTs) and backfilling the site. Responsible for completing closure documents for UST.

Joliet Road Bridge Replacement, Illinois Department of Transportation, Chicago, Illinois. 01/2002-03/2005. Geologist. Transportation engineering and design of plans, specifications and estimates (PS&E) for roadway improvements and 6-span-wide flange steel-beam bridge replacement over the B&O and IHB railroad tracks; involved bridge deck and approach slabs (250' on each side of bridge), profile adjustment, drainage design and lighting design. Responsible for reviewing analytical data.

Lake Michigan Offshore Drilling Geotechnical and Geophysical Services, Raimonde Drilling Corporation, Oak Creek (nearest city), Wisconsin. 04/2004-06/2004. Project Manager. Performed geophysical, geological and hydrographic onshore / offshore subsurface investigation along proposed two-mile water intake tunnel alignment for power generating plant. Offshore investigation involved drilling from barge platform two miles offshore on Lake Michigan. Drilling included 13 boreholes, each up to 250 feet in depth, and geophysical log for each borehole. Performed soil and rock core logging, marine geophysical surveying and downhole geophysical logging. Prepared and submitted to client major report deliverable of all field activities and logging observations. Responsible for overall quality assurance and data acquisition and review, ensuring technical competence and expertise for geologic staff implementing requested services, and overall day-to-day project oversight and management.

Remediation Services Retail Distribution Facility, Confidential Client, Corpus Christi, Texas. 06/2003-12/2007. Principal Geologist. Environmental investigation of two-acre site at retail warehouse / office location impacted by petroleum from leaking underground storage tanks (LUSTs). Ongoing investigation includes soil / groundwater monitoring and plume delineation, and close interaction with TCEQ. Responsible for Principal review of documents and for providing guidance on scope of work for the investigations.

CA Remediation Retail Distribution Facility, Confidential Client, Santa Monica California. 01/2010-11/2010. Principal. Removal of 9 hydraulic lift systems and remediation of impacted soils associated with lift systems and former USTs on one-acre site with one 10,000 square foot building. Responsible for assisting with technical issues regarding remediation and types of analysis required and technical review of documents .

Continued.

CA Lift Removal Retail Distribution Facility, Confidential Client, Visalia, California. 06/2010-09/2010. Principal. Removal and remediation of one underground hydraulic lift system on one acre site for a 10,000 building. Responsible for technical review of documents and assistance with technical issues with regard to analytical issues and site closure.

District of Columbia Site Soil and Groundwater Investigation, Remediation Services, Confidential Client, Washington, District of Columbia. 2004-2011. Principal. Site investigations and corrective actions to address two releases of petroleum on vacant lot formerly occupied by retailer vehicle service center. Conducted comprehensive site assessment (including soil borings and well installations), removal of two 1,000-gallon storage tanks, geophysical surveys and excavation of test pits to conduct subsurface investigation. Approximately 2,000 tons of contaminated soil removed from one site, 5,000 tons from the other. Responsible for reviewing corrective action plan, cost estimates and sampling results.

Environmental Services, Nationwide Service Facilities, Sears Holdings Management Corporation, Nationwide, US. 1995-2012. Project Manager. Environmental services at Sears and Kmart retail stores and facilities throughout the U.S. Master Services Agreement (MSA). Services provided for stores and facilities in California, Florida, Hawaii, Illinois, Missouri, North Carolina and Texas, and included environmental assessments, risk assessments (Tier I), remedial action planning, underground storage tank (UST) assessment and removal, groundwater monitoring, site closure, regulatory compliance (including submittal for CSX rail access at one warehouse location), and removal of automobile lift systems at three auto center locations. Responsible for overseeing implementation of agreement's scope of services and interfacing with client.

Orlando Distribution Center Environmental Services, Confidential Client, Orlando, Florida. 10/2001-11/2012. Principal Geologist. Long-term environmental investigation and delineation at major retailer's former distribution center, including fleet vehicle maintenance and repair shop, in urban location. Services consisted of groundwater monitoring, soil sampling and remedial action, which included excavation source removal, dewatering, and phased chemical oxidation groundwater treatments utilizing various application techniques. Responsible for Principal review of documents and providing guidance on investigation scope of work.

Howard Park Soil Remediation Services, Confidential Client, Wilmette, Illinois. 10/2001-04/2005. Principal. Under IEPA Leaking Underground Storage Tank (LUST) program at site impacted by gasoline UST owned by local municipality, removed USTs, prepared all IEPA LUST submittals, performed Site Classification and delineation, and prepared IEPA-approved LUST Corrective Action Plan. Designed, installed and operated air sparge / soil vapor extraction (AS/SVE) remediation system. Treatment area encompassed sections of police parking lot and active park downgradient from source area. After anticipated remediation period was completed, collected confirmatory soil samples to show site was remediated. Prepared Corrective Action Completion Report requesting pathway exclusion under IEPA Tiered Approach to Corrective Action Objectives (TACO) and No Further Remediation (NFR) determination from IEPA. Responsible for reviewing all technical reports and provided risk assessment (IEPA TACO).

RCRA Closure of former Oil Storage Area, Confidential Client, Indiana. Project Manager. Additional investigation of former oil storage area found to be

Continued.

contaminated with chlorinated solvents. Remedial Action Plan has been accepted by IDEM and the design of soil vapor extraction system has been completed. Construction of the remedial system was completed.

Site Remediation Program Closure of Two Sites, Chicago Public Schools, Chicago, Illinois. Technical Lead. Reviewed previous consultant documents, and entered the sites into the SRP program. At New Sullivan School, the site was entered into the SRP in June 2000. A previous Phase I and Phase II had been completed at the property which was an entire city block in extent. No additional sampling was determined to be necessary after consultation with the IEPA in the context of developing the Remedial Objectives Report/ Remedial Action Plan for the property. Removal of soil, (the soil removal was necessary for construction), and backfill with clean soil were the planned remedial activities. These activities were completed and documented the site was given a "No Further Remediation" letter in November 2000. At the Moos School site, entry into the SRP was only accomplished in January 2001 as the Chicago Public Schools did not acquire the property until December 2000. A previous Phase I and Phase II had been completed at the property. Additional sampling was completed in 2000 and in February 2001. The site was remediated and a No Further Remediation letter obtained in October 2001. Amec Foster Wheeler completed closure under the SRP program for three other Chicago Public School sites.

Remediation of former Gas Station, Confidential Client, Confidential Location. Task Manager. Responsible for coordination of field activities and confirmation sampling for large gas station remediation project. Over 8,000 cubic yards of soil were removed for clean closure. Also responsible for investigation and closure of offsite contamination and groundwater issues. Prepared closure documentation and LUST reimbursement package.

Environmental Site Assessments, Confidential Client, Confidential City Location Illinois. 08/1997-12/2000. Principal Review. Preliminary environmental site assessment (PESA) and subsequent Phase II environmental site assessment on property adjacent to confidential manufacturing client interested in purchasing the property to expand operations. After finding subsurface impacts in groundwater on client's property, delineated the extent of onsite impacts by completing 96 sample points in 4 days, using soil probe and onsite mobile laboratory. Responsible for reviewing reports for issues and regulations.

Chicago District, Environmental Services at FUDS, U.S. Army Corps of Engineers, Chicago, Illinois. Task Manager. Responsible for task order management of multiple environmental investigations and sampling activity at Chicago area sites. Prepared work plans for field investigation, performed data interpretation and prepared project reports. The eleven projects-to-date have included: Brownfields, UST classification, geophysical investigation, groundwater sampling, well installation, sump investigation and sampling, soil sampling and sediment sampling. Two of the projects involved multiple sampling rounds. The most recent project involved the decommissioning of a former FDA laboratory contaminated with asbestos, mercury, dioxin and perchlorate. The project was completed within a very tight timeframe despite additions to the scope.

Warehouse Parcel, Confidential Client, Chicago, Illinois. Project Manager. Completed a SRP Site Characterization and Remedial Objectives report for this Brownfields site which is to be re-developed. IEPA SRP accepted the Site

Continued.

Characterization and the Remedial Objectives report. Free product at the site has been removed and confirmation sampling was completed. Final NFR letter received in August 2001. Client has requested assistance with an adjacent parcel which was entered into the SRP in June 2001. Remediation of this site has been performed and confirmation sampling completed. A completion report was submitted to the IEPA and a NFR letter was received.

TACO Evaluation, North and Cicero Site, Chicago Transit Authority (CTA), Chicago, Illinois. Task Manager. Primary author of TACO Tier 2 and Tier 3 evaluation prepared as a supplement to previous site risk assessment. IEPA has reviewed and accepted the evaluation and provided closure documentation for this former Brownfields site.

Summary Report and TACO Evaluation, 74th and Wood, Chicago Transit Authority (CTA), Chicago, Illinois. Task Manager. Primary author of summary report and TACO evaluation for this site which was remediated to allow construction to proceed in 1992 and 1993. Current evaluation was for a potential sale and lease-back

RCRA Facility Investigation Pharmaceutical Manufacturer Plant, Confidential Pharmaceutical Manufacturer, Illinois. Task Manager. Task manager and primary author for Phase II RFI report for this large, integrated manufacturing plant with six SWMUs remaining in the Corrective Action process. Performed TACO evaluation resulting in proposed closure of all six SWMUs with little or no Corrective Action. Closure documentation was approved by the IEPA.

RCRA Facility Investigation Solvent Distribution Facility, Confidential Solvent Distributor, Illinois. Project Geologist. Conducted RFI investigation at chlorinated solvent distribution facility. RFI activities consist of the installation of 12 soil borings, soil and groundwater sampling. The purpose of the investigation was to complete the horizontal and vertical delineation of soils impacted with chlorinated solvents resulting from operations at the facility's three SWMUs.

PHASE II ENVIRONMENTAL SITE ASSESSMENT

4301 W. Chicago Avenue

Chicago, Illinois

Subject: Phase II Environmental Site Assessment
4301 West Chicago Avenue
Chicago, Illinois
Project No. 3205171606

Dear Ms. Mazza:

Amec Foster Wheeler Environment & Infrastructure, Inc., is pleased to present this Phase II Environmental Site Assessment report for the above-referenced site in Chicago, Illinois. We appreciate the opportunity to serve you on this project. If you have any questions or desire further information, please feel free to contact us at 773-693-6030.

Sincerely,

Amec Foster Wheeler Environment & Infrastructure, Inc.

EXECUTIVE SUMMARY

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler), was retained by the City of Chicago Department of Fleet and Facility Management (2FM) to complete a Phase II Environmental Site Assessment (ESA) for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois (the site). The site is a 30.4-acre parcel that is currently vacant. Development of the site as a Joint Public Safety Training Academy (JPSTA) is planned. The JPSTA campus will provide the Chicago Police Department (CPD) and the Chicago Fire Department (CFD) with a central location, replacing training facilities located throughout the City.

Site History

The site was developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

Property Description

The site consists of 30.4 acres located on the southeast corner of the intersection of Kilbourn and West Chicago Avenue. The Parcel ID (Tax ID) number for the site is 16-10-200-061-0000. The site is located in a mixed land use area. At the time of the site reconnaissance, the site was vacant. The site is partially fenced and no buildings or other improvements are present on the site.

The site is situated at an elevation of approximately 610 feet above mean sea level (msl). Based on our review of the local topography, it appears that groundwater would generally flow toward the east to Lake Michigan.

Adjacent to the east is N. Kostner Avenue, beyond which is Falcon Transportation to the north and Chicago Transit Authority (CTA) to the south, to the north is W Chicago Avenue with commercial buildings lining the street and residences behind them, to the west is N. Kilbourn Avenue, beyond which is a City of Chicago Transfer Station, and to the south is a remaining railroad spur and some industrial and warehouse properties.

Recognized Environmental Conditions

Amec Foster Wheeler performed a Phase I ESA as outlined in ASTM E 1527-13 in June 2017. Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition of the property is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase were updated in November 2017 and a final Phase I report was issued on December 11, 2017. The following recognized environmental conditions (REC) were determined to be associated with the property:

- On the property, a potential underground storage tank (UST) installed in 1959 with no record of it having been removed, its use as a former rail yard and the fill materials present on the site, various debris piles and rail ties present on the site and contaminants identified during previous investigations at the property.

- CTA at 4401 West Chicago Avenue, due to USTs installed in 1992, and because it is a former rail yard and may have fill similar to the site.
- Rail IT Property, 733 North Kilbourn Avenue, due to an UST that was not closed. It is unclear if this is the site or adjacent, as Rail IT at one time owned the site and the street number identified in the EDR report could potentially put it near the southeast corner of Chicago and Kilbourn Avenues, which would be the site.
- Department of Streets and Sanitation, 750 North Kilbourn Avenue, adjacent across North Kilbourn Avenue, due to USTs removed but not closed and since it is a transfer station and incinerator which may have resulted in airborne particulates reaching the site.
- City of Chicago, 715 North Kilbourn Avenue, due to an UST that was not closed. The initial incident report for #940242 lists 715 N. Kilbourn Avenue and then subsequent documentation on the Illinois EPA website for this incident changed to 750 N. Kilbourn Avenue. Amec Foster Wheeler believes the address was mis-identified in the original report and subsequently corrected. Although an incident was reported, a subsequent Illinois EPA letter indicates the site is a non-LUST site, which could indicate there was no confirmed release, or that the incident was from a non-regulated tank.

Investigation and Results

A previous investigation by Warzyn in 1991 consisted of the installation of ten (10) soil borings and three (3) temporary wells in three (3) of the borings. Twenty (20) soil samples were collected and analyzed for volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PNAs), Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) and total cyanides. Comparison of Warzyn results to Tiered Approach to Corrective Action Objectives (TACO, 35 IAC 742) Tier 1 current objectives showed that only one sample, SB10-4, taken at 8.5 to 10.5 feet below ground surface, had a concentration which exceeded the soil remediation objectives (SROs) to which it was compared. Arsenic was detected at 13.8 mg/kg, and its soil ingestion objective (which is the same as its background concentration) is 13 mg/kg.

A 2007 Phase II by Carlson included nineteen (19) soil borings. Twenty-four soil samples were analyzed. Analyses included VOCs, semivolatile organic compounds (SVOCs), priority pollutant metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc), pH, pesticides, polychlorinated biphenyls (PBCs) and chlorinated herbicides. Comparison of Carlson results to TACO Tier 1 current objectives showed that eight (8) samples, taken at seven (7) locations had concentrations which exceeded the SROs to which the samples were compared. Five (5) samples had PNA concentrations above their objectives, and three samples had inorganic concentrations (arsenic, antimony and chromium) above SROs.

This Phase II ESA consisted of the installation of twenty-four (24) soil borings, collection of twenty-six (26) soil samples for analytical testing, the installation and sampling of two (2) temporary monitoring wells, sampling of two (2) existing monitoring wells, level survey of some existing and the newly installed wells, and a limited ground penetrating radar survey. Soil samples were generally analyzed for PNAs and Priority Pollutant metals, with select samples analyzed for the Target Compound List (TCL) from the Site Remediation Program (35 IAC 740 Appendix A) and herbicides.

Groundwater samples were analyzed variously for the TCL, PNAs, metals and VOCs. three soil samples had concentrations of PNAs which exceeded objectives and four soil samples had arsenic concentrations above its soil ingestion objective.

Remediation Objectives

Based on comparison of the results of all of these investigations to TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater, soils at the site have been identified as impacted by benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at concentrations above their soil ingestion objectives. Three chemicals at three locations exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium.

TACO allows for the averaging of results with the approval of the planned or completed sampling by Illinois EPA. Based on the Illinois EPA's approach to other sites in the Site Remediation Program (SRP), concentrations of PNAs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene) and arsenic in shallow (above 3 feet in depth) soil were averaged to represent current exposure which would be only to shallow soils. All concentrations of the listed PNAs and arsenic in soils were averaged to represent future exposures, which could be to any of the soils at the site from any depth or location. PNA and arsenic concentration were averaged in accordance with Section 742.225 of TACO to demonstrate that they would be in compliance with objectives.

Results were averaged using ProUCL Version 5.1.02. Within the PNAs' current (shallow soils) data set, one sample (GP3A at 0 to 2 feet) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier, consistent with Illinois EPA SRP requirements, to prevent access. With this concentration removed, the averages for current users for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic are below their objectives.

Within the PNAs' future (all soils) data set, two samples (GP3A at 0 to 2 feet and GP-7D at 6 to 8 feet) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier, consistent with Illinois EPA SRP requirements, to prevent access. With these concentrations removed, the averages for future site use for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic are below their objectives.

The soil component of groundwater ingestion pathway can be addressed by exclusion of the groundwater pathway in accordance with 35 IAC 742.320. The City of Chicago has an ordinance which prohibits the installation of or use of potable water wells. The TACO calculations indicate that at the concentrations detected, groundwater at 10 to 1000 feet beyond any of the concentrations exceeding TACO Tier 1 Class II groundwater ingestion objectives would have no concentrations exceeding the applicable TACO Tier 1 objectives for sites with Class II groundwater. Site conditions and concentrations of chemicals of concern which exceeded the soil component of groundwater ingestion pathway were determined to be appropriate for pathway exclusion. The evaluation showed that the pathway could be excluded.

No chemicals were of concern (above objectives) for the construction worker ingestion and inhalation routes, except possibly mercury. The site was a rail yard previously, and elemental mercury is not known to be associated with rail yards. However, given the widespread detection of mercury and

the significant concentration of mercury in one 2007 Carlson investigation sample (GP-17A, 0 to 2 feet below ground surface) of 7.5 mg/kg, Amec Foster Wheeler recommends a construction worker warning for mercury be placed on the site.

Construction Considerations

During design and construction of the JPTSA, it is recommended that the following be taken into consideration:

- Future site buildings should be constructed with a full concrete slab-on-grade foundation or with a full concrete basement floor and walls. Future site buildings should not be constructed with earthen crawl spaces, earthen floors, stone foundations, partial concrete floors, or sumps.
- Unless additional testing is performed to determine compliance with Illinois EPA's Clean Construction and Demolition Debris (CCDD) regulations, all soil being removed from the site must be disposed of in accordance with applicable regulations to a Subtitle D landfill.
- Areas depicted on Figure 9 must be covered with an Illinois EPA TACO-compliant engineered barrier such as asphalt, concrete, 3 ft of clean fill, or other Illinois EPA-approved barrier.
- Imported fill material must be certified virgin stone or other soil or earthen material, which has been tested for Target Compound List parameters (35 IAC 740 Appendix A) and found to meet the most stringent objectives for residential land use included in Appendix B of TACO.
- Construction workers who will encounter site soils should be informed of the mercury detections at the site so that they may take appropriate precautions as determined by their evaluation of the data.
- Although a GPR survey for underground tanks, utilities and foundations was performed in a limited area of the site, this does not guarantee that such underground tanks, utilities and foundations are not present in these areas, or other areas where such survey was not completed.
- A Soil Management Plan should be prepared and implemented during construction to document, at a minimum: the site specific soil excavation, disposal, storage and reuse procedures, imported material testing requirements, and environmental oversight requirements.

Conclusions

A Phase II Environmental Site Assessment has been completed for the property at 4301 W Chicago Avenue in Chicago, Illinois. This investigation and previous sampling indicated that soils at the site have been impacted by benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at concentrations above their soil ingestion objectives. Three chemicals at three locations exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium. Mercury was detected above construction worker inhalation objectives at the site. The construction worker inhalation objective is only valid if elemental mercury is a contaminant of concern. A high (7.5 mg/kg) concentration of mercury in one sample (GP-17A, 0 to 2 feet) and widespread detections of mercury above the construction worker objective, combined with limited site history has resulted in the determination that a construction worker caution should be required for the site.

4301 West Chicago Ave, Chicago, Illinois
Phase II Environmental Site Assessment

Averaging of soils above soil ingestion objectives, as allowed in TACO, has resulted in a determination that two locations should be remediated or barriered to prevent exposure. The use of the City of Chicago groundwater ordinance has allowed for exclusion of the groundwater pathway. A construction worker caution for exposure to mercury by the inhalation pathway is recommended for the site.

PHASE II ENVIRONMENTAL SITE ASSESSMENT

4301 West Chicago Avenue
Chicago, Illinois

1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure, Inc. (Amec Foster Wheeler), was retained by the City of Chicago Department of Fleet and Facility Management (2FM) to conduct a Phase II Environmental Site Assessment (ESA) for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois (the site). Development of the site as a Joint Public Safety Training Academy (JPSTA) is planned. The JPSTA campus will provide the Chicago Police Department (CPD) and the Chicago Fire Department (CFD) with a central location, replacing training facilities located throughout the City.

Although the site has not been enrolled in the Illinois EPA's Site Remediation Program, this Phase II ESA was conducted in accordance with all applicable subsections of Illinois Environmental Protection Agency, Title 35: Environmental Protection, Subtitle G: Waste Disposal, Chapter I: Pollution Control Board, Parts 740 (Site Remediation Program) and 742 (Tiered Approach to Corrective Action Objectives). This Phase II also identifies remedial actions that would be necessary to obtain an industrial/commercial comprehensive No Further Remediation Letter for the site.

1.1 PROPERTY LOCATION

The current site address is 4301 West Chicago Avenue, Chicago, Illinois. The site is located in Chicago, Cook County, Illinois. The site location is shown on Figure 1. The site is located in Township 39N, Range 13E, Section 10 at latitude 41° 53' 38" North and longitude -87° 44' 10" West. The property is currently vacant and is located in a mixed-use area.

1.2 PROPERTY DESCRIPTION

The site consists of 30.4 acres located on the southeast corner of the intersection of Kilbourn and West Chicago Avenue. The Property Index Number (PIN) for the site is 16-10-200-061-0000. The site is located in a mixed land use area. At the time of the site reconnaissance, the site was vacant. The site is partially fenced and no buildings or other improvements are present on the site.

The site is situated at an elevation of approximately 610 feet above mean sea level (msl). Based on our review of the local topography, it appears that groundwater would generally flow toward the east to Lake Michigan.

Adjacent to the east is N. Kostner Avenue, beyond which is Falcon Transportation to the north and Chicago Transit Authority (CTA) to the south, to the north is W Chicago Avenue with commercial buildings lining the street and residences behind them, to the west is N. Kilbourn Avenue, beyond which is a City of Chicago Transfer Station, and to the south is a remaining railroad spur and some industrial and warehouse properties.

1.3 RECOGNIZED ENVIRONMENTAL CONDITIONS

Amec Foster Wheeler performed a Phase I ESA as outlined in ASTM E 1527-13 in June 2017. Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition of the property is expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase were updated in November 2017 and a final Phase I report was issued on December 11, 2017. The following recognized environmental conditions (REC) (see Figure 2 for locations) were determined to be associated with the property:

- On the property, a potential underground storage tank (UST) installed in 1959 with no record of it having been removed, its use as a former rail yard and the fill materials present on the site, various debris piles and rail ties present on the site and contaminants identified during previous investigations at the property.
- CTA at 4401 West Chicago Avenue, due to USTs installed in 1992, and because it is a former rail yard and may have fill similar to the site.
- Rail IT Property, 733 North Kilbourn Avenue, due to an UST that was not closed. It is unclear if this is the site or adjacent, as Rail IT at one time owned the site and the street number identified in the EDR report could potentially put it near the southeast corner of Chicago and Kilbourn Avenues, which would be the site.
- Department of Streets and Sanitation, 750 North Kilbourn Avenue, adjacent across North Kilbourn Avenue, due to USTs removed but not closed and since it is a transfer station and incinerator which may have resulted in airborne particulates reaching the site.
- City of Chicago, 715 North Kilbourn Avenue, due to an UST that was not closed. The initial incident report for #940242 lists 715 N. Kilbourn Avenue and then subsequent documentation on the Illinois EPA website for this incident changed to 750 N. Kilbourn Avenue. Amec Foster Wheeler believes the address was mis-identified in the original report and subsequently corrected. Although an incident was reported, a subsequent Illinois EPA letter indicates the

site is a non-LUST site, which could indicate there was no confirmed release, or that the incident was from a non-regulated tank.

1.4 DOCUMENTS REVIEWED

The following reports were provided for Amec Foster Wheeler review:

- Phase II ESA, prepared by Warzyn Inc., dated August 1991 – this was a separate report, but was also in Appendix A of the Carlson Phase I ESA
- Preliminary Report of Soils Exploration, prepared by Testing Service Corporation, April 29, 1998 - this was in Appendix A to the Carlson Phase I
- Phase I ESA, prepared by Carlson Environmental, dated May 11, 1998
- Limited Phase II, prepared by Carlson Environmental, dated October 17, 2007
- Property Screen Summary Report, prepared by 2FM, dated April 10, 2017

1.5 WORK COMPLETED

This Phase II ESA consisted of the installation of twenty-four (24) soil borings, collection of twenty-six (26) soil samples for analytical testing, the installation and sampling of two (2) temporary monitoring wells, sampling of two (2) existing monitoring wells, level survey of some existing and the newly installed wells, and a limited ground penetrating radar survey. See Figure 3 for boring and well locations.

1.6 LIMITATIONS AND EXCEPTIONS

This report was prepared by Amec Foster Wheeler exclusively for the City of Chicago Department of Fleet and Facility Management. The quality of information, conclusions, and opinions contained herein is consistent with the level of effort involved in Amec Foster Wheeler services and based on: (1) information available at the time of preparation, (2) data supplied by outside sources, and (3) the assumptions, conditions, and qualifications set forth in this report.

This Phase II Environmental Site Assessment is intended to be used by the City of Chicago Department of Fleet and Facility Management for the 4301 West Chicago Avenue, Chicago, Illinois site only, subject to the terms and conditions of its contract with Amec Foster Wheeler. Any other use of, or reliance on, this report by any third party is at that party's sole risk.

Environmental impairment of a property may result from many activities, such as illegal or unreported dumping, or the spilling of hazardous wastes or materials. The presence of contaminants at a

particular property may not always be apparent, and the completion of a Phase II ESA cannot provide a guarantee that hazardous wastes or materials not discovered during this investigation do not exist. The scope of services executed for this project does not include an audit for regulatory compliance, ecological resources, endangered species, cultural and historic resources, indoor air quality, industrial hygiene, health and safety, or high-voltage power lines. It also does not include a detailed condition survey for asbestos, lead, radon, lead in drinking water, or other potential hazards or for wetlands, naturally occurring materials, or other items not outlined in Amec Foster Wheeler's scope of services.

The findings contained herein are relevant to the dates of Amec Foster Wheeler's investigation and should not be relied upon to represent conditions at later dates. If additional information becomes available, it should be provided to Amec Foster Wheeler so the original conclusions and recommendations can be modified as necessary.

1.7 REPORT ORGANIZATION

This document is the Phase II Environmental Site Assessment for 4301 West Chicago Avenue, Chicago, Illinois. A description of the contents of the document is presented below:

- Section 1.0, Introduction: provides background information regarding the purpose of this report; identifies the objectives of the investigation and the technical approach used to meet the objectives; and outlines the contents of this report.
- Section 2.0, Site Characterization: provides relevant background information regarding the site such as the site history, and the geology and physiographic setting of the site.
- Section 3.0, Site Investigation: details site-specific sampling strategies; procedures; chain-of-custody procedures and other information which assured that accurate information was gathered regarding chemical contamination at the site.
- Section 4.0, Analytical Results: presents and discusses the results obtained from the investigation.
- Section 5.0, Endangerment Assessment: details the nature and extent of contamination; presents details on potential contaminant migration pathways and contaminant fate and transport mechanisms; and evaluates exposure routes for completeness.
- Section 6.0, Remediation Objectives: compares the contaminant concentrations with Tier 1 residential criteria, construction worker objectives and soil component of groundwater

ingestion pathway objectives presented in the Tiered Approach to Corrective Action Objectives (TACO) and provides the proposed remediation objectives for the site.

- Section 7.0, Summary and Conclusions: summarizes the information presented in this document and presents conclusions.

2.0 SITE CHARACTERIZATION

The following is a description of the general setting, and previous usage of the site. Information on previous site assessment and investigation is included in this section.

2.1 PHYSICAL SETTING

2.1.1 Site Topography

The 7.5-minute Chicago Loop, Illinois, United States Geological Survey (USGS) quadrangle, published in 2012, was examined. Review of the topographic map indicates that the site is located between 600 and 610 feet above mean sea level (msl). The topography of the area is generally flat with a slight slope to the east. Based on our review of the local topography, it appears that groundwater would generally flow toward the east to Lake Michigan.

The site itself is generally bermed on the north and the southeast and southwest and fairly flat and lower in the central portion.

2.1.2 Geology/Hydrogeology

Site soils consist primarily of the Urbanland soil type, and are comprised of fine sand, sandy loam or clay loam.

The region is located in the central portion of the Central Lowlands Physiographic Province, a broad, relatively low area that roughly outlines the glaciated area and extends from the Appalachian Plateaus on the east to the Great Plains on the west, and from the Superior Upland on the north to the Interior Low Plateaus and the Ozark Plateaus on the south. The local relief in the Central Lowlands seldom exceeds a few hundred feet. The Central Lowland Province is divided into two sections, the Till Plains Section and the Great Lakes Section. The Great Lakes Section, which includes the site, contains surficial features of the youngest part of the Wisconsin Stage glacial drift, and is characterized by its many lakes, and rough surfaced moraines.

Near surface geology in the southeastern Chicago area consists primarily of glacially derived fluvial, lacustrine, and ice-contact sediments. The property is underlain by these glacial deposits which overlie Silurian Dolomite bedrock. The underlying glacial deposits in the area are predominantly the Pleistocene-aged Wadsworth Till Member of the Wedron Formation. Overlying the till in parts of the area is the Carmi Member of the Equality Formation, which is composed primarily of quiet-water, well-bedded silts. In northeastern Illinois, the Wadsworth Till ranges from clay to clayey silt to sandy, clayey silt. All tills of the Wadsworth are characterized by their high clay content and abundance of

black shale fragments. The high clay content produces medium to high plasticity and low hydraulic conductivity in the till unit.

The geologic rock stratigraphic unit underlying the site is a Paleozoic Middle Silurian (Niagoaran) dolomite.

Four regional aquifers are present within the Chicago area. The first two are shallow aquifer systems that provide groundwater for domestic and municipal use. The first of these is the sand and gravel located within glacial deposits. These deposits of sand and gravel may occur as shallow, unconfined surficial aquifers or as confined aquifers buried beneath clay till. Groundwater flow within the clay till is expected to be downward toward underlying aquifers.

The upper 50 feet of bedrock forms the second shallow aquifer system in northeastern Illinois. Prior to glaciation, the bedrock was at or near the ground surface and was subject to chemical and physical weathering processes. As a result, the shallow weathered bedrock is generally more permeable and water-bearing than deeper sections of bedrock. The Silurian Dolomite, which is the upper bedrock in much of northeastern Illinois, has historically been used as a water source for municipalities. However, most municipalities in northeastern Illinois, including Chicago, now obtain water from Lake Michigan.

The Silurian Dolomite is underlain by the Maquoketa Shale which is approximately 170 feet thick and is a regional aquitard. An aquitard may be defined as any saturated geologic formation not capable of yielding useable quantities of groundwater to a well. Sandstone and dolomite formations beneath the Maquoketa Shale form two deep regional aquifer systems capable of yielding large groundwater supplies.

In general, soils throughout the site encountered during this investigation consisted of fill material to varying depths, from 5.5 feet to as deep as 17.5 feet below ground surface (bgs), under which was a stiff gray to brown clay. With greater depth, the clay and silty clay becomes very stiff and then overlies hard, and in some cases very hard grey silty clay to clayey silt.

Groundwater was encountered at 5 feet to 30 feet bgs and the occurrence of groundwater coincided with more permeable sand or gravel in the fill materials or the zone just above the stiff, native glacial clay.

Groundwater levels in newly installed wells and previously installed wells that had been found by Amec Foster Wheeler were measured in August 2017. A level survey, with a benchmark of 100 feet for the previous well identified by Amec Foster Wheeler as Well E, was performed to aid in the

determination of the groundwater flow direction. See Table 1 for depth to groundwater and water level elevations. Two groundwater contour maps were developed: Figure 4 is a map of the shallow groundwater elevations (wells set at about 15 to 20 feet in depth) and Figure 5 is a map of deeper groundwater elevations (wells set at about 38 to 51 feet below surface). Note that Well E was excluded from the deep map as its water level was anomalous; it was about 11 feet higher than the next closest deep well. The shallow groundwater contours indicate groundwater flow is to the southeast toward the CTA facility. The deeper groundwater contours indicate that the site is a groundwater high with offsite flow in all directions from the site.

2.1.3 Groundwater Classification

Results of soil borings at the site were evaluated to determine the proper classification of the shallow groundwater at the site. Per 35 IAC Section 620.201, all groundwaters of the State are designated as either:

- Class I: Potable Resource Groundwater;
- Class II: General Resource Groundwater;
- Class III: Special Resource Groundwater; or
- Class IV: Other Groundwater.

As defined in 35 IAC Section 620.230, Class III Special Resource Groundwater is groundwater that is demonstrably unique or vital for a particularly sensitive ecological system. Since the shallow groundwater at the site is not unique or vital to a sensitive ecological system, this classification is not appropriate for the site.

According to 35 IAC Section 620.240, Class IV Other Groundwater refers to groundwater that is within the zone of attenuation of non-hazardous waste landfills, within the point of compliance of a RCRA permitted unit, groundwater designated as exempt pursuant to the UIC regulations (35 IAC 704), groundwater that naturally contains total dissolved solid concentrations in excess of 10,000 mg/L, groundwater with contaminants present no farther than 25 feet from a non-regulated source, and groundwater within a previously mined area or which underlies a coal mine refuse disposal area. Since the groundwater at the site does not satisfy any of these requirements, this groundwater classification is also not appropriate.

Therefore, the groundwater at the site would be classified as either Class I Potable Resource or Class II General Resource Groundwater. Among other requirements, 35 IAC Section 620.210 specifies that Class I groundwater is:

- a) Groundwater located 10 feet or more below the land surface and within:

- 1) The minimum setback zone of a well which serves as a potable water supply and to the bottom of such well.
- 2) Unconsolidated sand, gravel or sand and gravel which is five feet or more in thickness and that contains 12% or less of fines.
- 3) Sandstone which is 10 feet or more in thickness, or fractured carbonate which is 15 feet or more in thickness.
- 4) Any geologic material which is capable of a:
 - A) Sustained groundwater yield, from up to a 12-inch diameter borehole, of 150 gallons per day or more from a thickness of 15 feet or less; or
 - B) Hydraulic conductivity of 1×10^{-4} cm/sec or greater using one of the following test methods or its equivalent:
 - i) Permeameter;
 - ii) Slug test; or
 - iii) Pump test.

Groundwater at the site was encountered at eight (8) feet and deeper below surface, based on Amec Foster Wheeler measurements (see Table 1) and a geotechnical report prepared by Midland Standard Engineering and Testing, Inc. (MSET) (see Appendix G). Near surface soil at the site consists of sandy fill to up to about 17.5 feet below the ground surface. Grain size analysis of this fill material performed by MSET indicates that, below 6 feet in depth (B-7, 6-8 feet) the sand contains 13% fines (exceeding 12% or less). The sample (B-11) at 4 to 6 feet had only 8% fines, but the remaining clay samples (B-9, 21-22.5 feet, 61% fines; and B-15, 14 to 15.5 feet, 89% fines) had greater concentrations of fines. Below the fill is glacial till consisting of silty clay to clayey silt, which becomes stiff and hard with depth.

Soil permeability testing was conducted by MSET on the existing sandy fill and underlying silty clay. The fill was tested for hydraulic conductivity in place at boring location ESB-4. At ESB-4, a falling head permeability test was conducted to determine the soil permeability. At this location, 15.5 feet of well pipe was installed to a depth of 13 feet below the ground surface with 2.5 feet of stick up. The screened interval was at roughly a depth of 2.75 feet to 12.75 feet. Clay at this location started at a depth of 9 feet. The permeability test consisted of filling the well pipe and timing the drop of the water level for several time intervals (falling head test). A total of 4 trials were conducted.

The permeability of the silty clay at boring B-10 from a depth of 11 to 13 feet was determined by performing a laboratory hydraulic conductivity test. A Shelby tube sample was collected and

laboratory permeability testing was conducted per ASTM 5084-90. Geotechnical hydraulic conductivity testing at the site found that the sandy granular fill had a hydraulic conductivity of 8.8×10^{-4} cm/sec (just above the 1×10^{-4} cm/sec required for the Class II groundwater designation by hydraulic conductivity) and the underlying clay till had a hydraulic conductivity of 4.2×10^{-7} cm/sec. Based on the concentration of fines in the fill materials below 6 feet and the hydraulic conductivity of the underlying clay till, the groundwater classification at the site is Class II groundwater.

2.1.4 Surface Water Bodies

Surface water at the site discharges into storm sewers, and thence into the Metropolitan Water Reclamation District of Greater Chicago (MWRDGC) combined sewer system, by overland flow to other properties, or through infiltration, into the site soils. The closest apparent surface water bodies are small ponds in Garfield Park about 1 mile southeast of the site. Lake Michigan is about 6 miles to the east and the DesPlaines River is about 5 miles west of the site.

2.1.5 Wetlands

A detailed wetland evaluation is beyond the scope of this investigation. Areas that may be wetlands or nearby surface water bodies were not observed on the site. The closest wetlands appear to be small areas near the ponds in Garfield Park, about 1 mile southeast of the site.

2.1.6 Flood Maps

The property and surrounding properties are not within 100-year and 500-year flood zones as defined by the Federal Emergency Management Agency (FEMA). The information includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

2.2 SITE HISTORY

Before its first development in about 1896, the property was vacant and undeveloped. The site was first developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

2.2.1 Previous Assessments and Investigations

A previous investigation by Warzyn in 1991 consisted of the installation of ten (10) soil borings and three (3) temporary wells in three (3) of the borings. Twenty (20) soil samples were collected and analyzed for volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PNAs),

Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) and total cyanides. Total xylene was detected in two (2) samples from one (1) boring and trichlorofluoromethane was detected in samples from two (2) other borings. PNAs were widespread, but generally below 1 mg/kg concentration, although some locations were higher. Metals were detected but at concentrations considered to be background or naturally occurring. Cyanides were not detected. Groundwater flow in the shallow soils was thought to be to the north, but could not be determined based on the temporary wells. No VOCs were detected and low concentrations of PNAs, metals and cyanide (one sample) were detected in the water samples. See Table 2 for a summary of the Warzyn investigation soil sample results and comparison of these results to the Tiered Approach to Corrective Action Objectives (TACO, 35 IAC 742) Tier 1 objectives for industrial/commercial sites with Class II groundwater.

A 2007 Phase II by Carlson included nineteen (19) soil borings. Twenty-four soil samples were analyzed. Analyses included VOCs, semivolatile organic compounds (SVOCs), priority pollutant metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc), pH, pesticides, polychlorinated biphenyls (PBCs) and chlorinated herbicides. No VOCs were detected at concentrations exceeding the TACO objectives; although VOCs were detected at some locations. PNAs and carbazole were detected at concentrations that exceeded the TACO Tier 1 screening objectives. Antimony, arsenic, chromium, lead and mercury were detected at concentrations above their TACO Tier 1 objectives. PCBs, pesticides and herbicides were not detected in the two (2) samples analyzed for these parameters. The report concluded that concentrations of five (5) PNAs, one (1) SVOC and five (5) metals were present at concentrations exceeding the most stringent TACO Tier 1 residential screening levels. See Table 3 for a summary of the Carlson investigation soil sample results and comparison of these results to the TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater.

3.0 SITE INVESTIGATION

3.1 SITE-SPECIFIC SAMPLING PLAN

Prior to completing this Phase II ESA, Amec Foster Wheeler prepared a site-specific sampling plan consisting of a figure showing planned sampling locations (Figures 2 through 8) and a table (Table 4) showing planned samples and analytical testing to be performed. After revisions and discussion with the 2FM representative, the plan was implemented substantially per the revised planning documents.

3.1.1 Soil Borings

Twenty-four (24) soil borings were installed at the property. Six (6) borings (ESB-1 to ESB-6) were environmental borings drilled to about 16 feet bgs. Eighteen (18) borings (B-1 to B-18) were geotechnical borings which were drilled to depths of 16 feet to 40 feet bgs. Soil samples for environmental testing were obtained from fifteen (15) of the geotechnical borings. No environmental samples were taken from borings B-5, B-8 and B-13.

Drilling was performed by Groff Testing Corporation using a CME 75 ATV to drive 2.25 inch or 4.25-inch hollow stem augers. Soil sampling conducted through the hollow stem augers involved the use of a 1-3/8 inch, 24-inch long split-barrel sampler. The split-barrel sampler was advanced in substantial accordance with American Society for Testing Materials ("ASTM") methods, which involves driving the sampler into the soil with a 140-pound hammer, falling 30-inches. The number of blows required to drive the sampler each 6-inch interval was recorded and used as a qualitative measure of soil density. An Amec Foster Wheeler field person logged soil in general accordance with the Unified Soil Classification System. The boring logs are included in Appendix A.

After the split-barrel sampler was driven 24-inches, the sampler was extracted from the borehole, opened and screened for volatile organic vapors using a photoionization detector (PID). Headspace analysis was conducted on soil samples from each boring. Headspace analysis was completed by first placing a small portion of soil into a zip lock bag which was then sealed. The bagged samples were left undisturbed for a period of not less than ten minutes to allow any organic compounds to come to equilibrium within the bag. The tip of a Minibreak 3000 PID was then inserted into the bag. The PID utilizes a lamp with an ionization potential of 10.6 electron volts. The maximum PID response for each sample in parts per million (ppm) was recorded on the field boring logs in Appendix A.

The split-barrel sampler was decontaminated between each sample using an Alconox wash and clean water rinse. Decontamination water was discharged to the land surface away from boring and well locations. Boreholes were subsequently filled with soil cuttings and/or bentonite chips to complete boring backfilling.

3.1.2 Temporary Monitoring Wells

Two temporary wells were installed at the site in borings ESB-5 and ESB-6. The temporary wells were installed through the 4.25-inch hollow stem augers. Each well was constructed of a 2-inch ID 10-foot long PVC well screen with 0.010-inch continuous slots at an approximate depth of 6 to 16 ft. bgs. A 2-inch inner diameter (I.D.) PVC well casing was used to bring the well to land surface. The annular space surrounding the well screen was backfilled with #5 filter sand to a level approximately 2.0 foot above the well screen. The remaining annular space was backfilled with bentonite chips. Wells were level surveyed with regard to a site-specific datum. Wells were removed immediately after sampling and their boreholes backfilled with soil cuttings or bentonite chips. Temporary well installation diagrams are presented in Appendix B.

3.1.3 Soil Samples

Soil samples for all testing except volatile organic analysis were collected in laboratory-supplied, USEPA-approved eight-ounce glass sample jars. For boring locations requiring volatile organic analysis, samples were collected in laboratory-supplied USEPA-approved 40 milliliter vials with sample collection procedures conforming to SW-846 Method 5035. Prior to each sampling interval and between each boring location, the sampling equipment, were decontaminated by using an Alconox wash followed by a tap water rinse. To reduce the possibility of cross contamination between samples, a new pair of disposable latex gloves was donned by the sampler for each sample collected. Upon collection, the sample jars were labeled with the site name, sample number, date, time, and sampler initials, and were placed in a cooler containing ice. Samples were submitted to STAT Analysis Corporation of Chicago, Illinois, an Illinois EPA-accredited testing laboratory (accreditation number 100445), using proper chain of custody procedures.

3.1.4 Groundwater Samples

The wells were sampled utilizing a peristaltic pump with dedicated tubing. The well was purged prior to sampling using low flow sampling techniques until the water became visually clearer and pH, temperature and specific conductivity had stabilized. Groundwater samples were collected in laboratory-supplied, USEPA-approved, sample containers with the sampler donning a new pair of disposable nitrile gloves. Upon collection, the sample jars were labeled with the site name, sample number, date, time, and sampler initials, and were placed in a cooler containing ice. The samples

were submitted to STAT Analysis Corporation of Chicago, Illinois, an Illinois EPA-accredited testing laboratory (accreditation number 100445), using proper chain of custody procedures.

3.1.5 Ground Penetrating Radar Survey

The objective of the Ground Penetrating Radar Survey was to detect and identify potential buried metallic objects that may represent USTs, piping, buried drums or other similar objects that could be characterized as an REC and adversely affect redevelopment. Specifically, the survey was performed around an area with debris in the northwest of the site that appeared for have formerly been a structure based on the assumption that any previous tanks would have been associated with a structure. On August 7, 2017, Mr. Michael McGarry of Worksmart, Inc. (Worksmart), subcontracted by Amec Foster Wheeler, performed a GPR Survey of approximately 10,000 square feet around the structure debris pile. The area was delineated using a one meter interval grid pattern. This grid pattern should allow for objects consistent with an underground storage tank to be scanned. Multiple scans in a North – South and East – West direction were performed using a trolley-mounted USRADAR SPR unit with a 500 MHz antenna, and a 500 MHz GPR system mounted on an all-terrain rover, providing imaging to an anticipated depth of 8.5 feet.

4.0 ANALYTICAL RESULTS

This Phase II ESA consisted of the installation of twenty-four (24) soil borings, collection of twenty-six (26) soil samples for analytical testing, the installation and sampling of two (2) temporary monitoring wells, sampling of two (2) existing monitoring wells, level survey of some existing and the newly installed wells, and a limited ground penetrating radar survey. Soil samples were generally analyzed for PNAs and Priority Pollutant metals, with select samples analyzed for the Target Compound List (TCL) from the Site Remediation Program (35 IAC 740 Appendix A) and herbicides. Groundwater samples were analyzed variously for the TCL, PNAs, metals and VOCs.

Analytical testing was performed by STAT Analysis Corporation of Chicago, Illinois, an accredited Illinois EPA Environmental Laboratory Program (ELAP) laboratory (IEPA ELAP 100445). All analyses were performed in accordance with the requirements of 35 Illinois Administrative Code (IAC) Part 186 National Environmental Laboratory Accreditation Conference (NELAC) standards.

All analytical results were compared to the current Illinois EPA Tier 1 Tiered Approach to Corrective Action Objectives (TACO) Tier 1 Soil Remediation Objectives (SROs) for Industrial/Commercial sites with Class II groundwater. Soil results were compared to the Illinois TACO Soil Remediation Objectives for Industrial/Commercial land use (35 IAC 742 Appendix B Table A); for Construction Workers (35 IAC 742 Appendix B Table B); and to pH-specific objectives for sites with Class II groundwater (35 IAC 742 Appendix B Tables C and D). Background values as provided in TACO (35 IAC 742, Appendix A Tables G and H) were also used for comparison. If concentrations did not exceed background values, they were not compared to SROs. In some cases, results could not be compared to objectives (metals) but were above background, or were above pH-specific objectives. In these cases, Toxicity Characteristic Leaching Procedure (TCLP) or Synthetic Precipitation Leaching Procedure (SPLP) testing was requested from the laboratory.

Groundwater results were compared to Groundwater Remediation objectives for sites with Class II groundwater (35 IAC 742 Appendix B Table E) and to Groundwater Remediation objectives for the Indoor Inhalation Exposure Route – Diffusion and Advection (35 IAC Appendix B, Table H). Use of the objectives in 35 IAC 742 Appendix B Table H is only allowed if institutional controls are in place which ensure that any existing or potential building has a full concrete slab-on-grade or a full concrete basement floor and walls.

The current analytical results and previous results are summarized and compared to the SROs and GROs in Tables 2, 3, 5 and 6. Those results that exceed the applicable SROs and GROs are discussed in the following sections. The laboratory analytical reports are provided in Appendix C.

4.1 SOIL RESULTS

Warzyn Investigation

Comparison of Warzyn results to TACO Tier 1 current objectives showed that three samples had concentrations which exceeded the SROs to which they were compared. SB10-4, taken at 8.5 to 10.5 feet bgs, had arsenic and mercury above objectives. Arsenic was detected at 13.8 mg/kg, and its soil ingestion objective (which is the same as its background concentration) is 13 mg/kg. In addition, the same sample had mercury at a concentration above its construction worker inhalation objective. The sample concentration was 0.14 mg/kg and the construction worker inhalation objective is 0.1 mg/kg. Mercury was detected above its construction worker inhalation objective in two other samples: SB2-1 at 1 to 3 feet bgs, concentration 0.31 mg/kg (qualified by the laboratory as estimated due to a matrix issue) and SB2-1 at 1 to 3 feet bgs, concentration 0.17 mg/kg. Note that this mercury objective is only valid where elemental mercury is a contaminant of concern.

Carlson Investigation

Comparison of Carlson results to TACO Tier 1 current objectives showed that ten (10) samples, taken at nine (9) locations had concentrations which exceeded the SROs to which the samples were compared. Five (5) samples had PNA concentrations above their objectives, as summarized below.

Sample Number and Depth	Chemical	Concentration mg/kg	Soil Ingestion Objective mg/kg	Soil Component of Class II Groundwater Ingestion Objective mg/kg
GP-3A (0-2.0 ft)	Benzo(a)pyrene	6.3 E	1.3 (ingestion)	
	Benzo(b)fluoranthene	8.7E	8 (ingestion)	
	Dibenzo(a,h)anthracene	1.7	0.8 (ingestion)	
GP-6C (4-6 ft)	Benzo(a)pyrene	3.8	1.3 (ingestion)	
	Dibenzo(a,h)anthracene	0.82	0.8 (ingestion)	
GP-7D (6-8 ft)	Benzo(a)anthracene	12	8 (ingestion)	8
	Benzo(a)pyrene	13	1.3 (ingestion)	
	Benzo(b)fluoranthene	12	8 (ingestion)	
	Dibenzo(a,h)anthracene	1.0	0.8 (ingestion)	
GP-7F	Benzo(a)pyrene	2.3 E	1.3 (ingestion)	

Sample Number and Depth	Chemical	Concentration mg/kg	Soil Ingestion Objective mg/kg	Soil Component of Class II Groundwater Ingestion Objective mg/kg
(10-12 ft)				
GP-11D (1.0-3.0 ft)	Benzo(a)pyrene	3.1	1.3 (ingestion)	

mg/kg: milligrams per kilogram ft – feet below ground surface

E – laboratory qualifier – value above quantitation range

Eight (8) samples had inorganic concentrations above SROs. Arsenic and mercury in sample GP-17A at 0 to 2 feet bgs were detected at concentrations above their objectives. Arsenic was detected at a concentration of 18 mg/kg, above its soil ingestion objective of 13 mg/kg. Mercury was detected at a concentration of 7.5 mg/kg, above its construction worker inhalation objective of 0.1 mg/kg. Note that this mercury objective is only valid where elemental mercury is a contaminant of concern.

Antimony in sample GP-4E at 8 to 10 feet bgs was detected at a concentration of 23 mg/kg, which is above its pH-specific soil component of groundwater ingestion objective for Class II groundwater of 20 mg/kg. Mercury in this same sample was detected at a concentration of 0.16 mg/kg, above its construction worker inhalation objective of 0.1 mg/kg. Leaching procedure testing by the Toxicity Characteristic Leaching Procedure (TCLP) or Synthetic Precipitation Leaching Procedure (SPLP), another method accepted by the Illinois EPA to determine compliance with the soil component of groundwater ingestion objective for Class II groundwater, could not be performed as the sample was taken in 2007 and was no longer within holding times or available for testing.

For five (5) samples, mercury was the only inorganic detected above an objective. Mercury was detected above its construction worker inhalation objective (0.1 mg/kg) in the following samples: GP-6C 4 to 6 feet bgs at a concentration of 0.16 mg/kg, GP-7D 6 to 8 feet bgs at a concentration of 0.76 mg/kg, GP-7F 10 to 12 feet bgs at a concentration of 0.16 mg/kg, GP-13A 0 to 2 feet bgs at a concentration of 0.12 mg/kg and GP-15A 0 to 2 feet bgs at a concentration of 0.28 mg/kg. Note that this mercury objective is only valid where elemental mercury is a contaminant of concern.

Chromium in sample GP-19A, at 0 to 2 feet bgs, was detected at a concentration of 35 mg/kg, which is above its pH-specific soil component of groundwater ingestion objective of 28 mg/kg. The chromium pH-specific objective is for Class I groundwater as there is no chromium pH-specific objective for Class II groundwater and it is an objective for hexavalent chromium, which is not as

abundant naturally in soils as trivalent chromium. Hexavalent chromium is more toxic than trivalent chromium so it would have a lower objective. Leaching procedure testing by TCLP or SPLP could not be performed as the sample was taken in 2007 and was no longer within holding times or available for testing.

Note that had samples still been available from the Carlson sampling, it may have been possible to eliminate both chromium and antimony as chemicals of concern for the soil component of groundwater ingestion pathway by performing leaching procedure, TCLP or SPLP testing, and comparison to the appropriate objectives.

Amec Foster Wheeler Investigation

For this Phase II investigation, three (3) soil samples had concentrations of PNAs which exceeded objectives, as shown below.

Sample Number and Depth	Chemical	Concentration mg/kg	Soil Ingestion Objective mg/kg
ESB-3B (5.5-6.5 ft)	Benzo(a)pyrene	3.0	1.3 (ingestion)
	Dibenzo(a,h)anthracene	0.87	0.8 (ingestion)
ESB-4A (0.5-1.5 ft)	Benzo(a)pyrene	3.2	1.3 (ingestion)
	Dibenzo(a,h)anthracene	0.81	0.8 (ingestion)
B-6A (1-3 ft)	Benzo(a)pyrene	3.9	1.3 (ingestion)
	Dibenzo(a,h)anthracene	1.1	0.8 (ingestion)

mg/kg: milligrams per kilogram ft – feet below ground surface

Four (4) samples had arsenic concentrations above its soil ingestion objective of 13 mg/kg: ESB-6A (2-4 ft bgs) at 18 mg/kg, B-9A (1-3 ft bgs) at 14 mg/kg, B-17A (0-2 ft bgs) at 34 mg/kg and B-18A (0-2 ft bgs) at 20 mg/kg.

Two (2) soil samples had concentrations of chromium which exceeded the pH-specific soil component of groundwater ingestion objective for chromium. At sample location B-6B, 8 to 10 feet bgs, chromium was detected at 29 mg/kg and the pH-specific is 28 mg/kg. At sample location-18A, 0 to 2 feet bgs, the detected concentration was 61 mg/kg and the pH-specific chromium objective for this location is 32 mg/kg. The chromium pH-specific objective is for Class I groundwater as there is no chromium pH-specific objective for Class II groundwater and it is an objective for hexavalent

chromium, which is not as abundant naturally in soils as trivalent chromium. Hexavalent chromium is more toxic than trivalent chromium so it would have a lower objective.

Mercury was detected at nine (9) locations at concentrations which exceeded its construction worker inhalation objective. The following locations had detected concentrations of mercury that exceeded the construction worker inhalation objective (0.1 mg/kg): ESB-4A, 0.5 to 1.5 feet bgs, 0.14 mg/kg; ESB-5A, 0 to 1 feet bgs, 0.15 mg/kg; ESB-6A, 2 to 4 feet bgs, 0.15 mg/kg; B-6B, 8 to 10 feet bgs, 0.24 mg/kg; B-7A, 0 to 2 feet bgs, 0.23 mg/kg; B-9A, 1 to 3 feet bgs, 0.22 mg/kg; B-10A, 0 to 1 feet bgs, 0.20 mg/kg; B-12A, 0 to 2 feet bgs, 0.32 mg/kg and B-18A, 0 to 2 feet bgs, 0.25 mg/kg. This objective is only valid if elemental mercury is a chemical of concern for the site. The site was a former railyard and elemental mercury is not known to have been used at the site.

Some concentrations of chromium, manganese, iron and cobalt were above background, or for two (2) samples for chromium (see above), above the pH-specific objective for the soil component of groundwater ingestion pathway. Leaching procedure testing (TCLP or SPLP) was performed on these samples and the results were below the soil component of ingestion pathway objectives for Class II groundwater. The detected chromium concentration for B-6B, 8 to 10 feet bgs, was <0.0040 mg/L (non-detect) and for B-18A, 0 to 2 feet bgs, the detected chromium concentration was 0.008 mg/L. The chromium objective for the soil component of groundwater ingestion for Class II groundwater is 1.0 mg/L.

See Figure 6 for soil ingestion pathway exceedances, Figure 7 for soil component of groundwater ingestion pathway exceedances and Figure 8 for construction worker inhalation pathway exceedances. See Table 7 for a summary of all results above objectives.

4.2 GROUNDWATER RESULTS

Two temporary wells were installed and sampled. The sample from ESB-5 was analyzed for the entire Target Compound List from the Site Remediation Program (35 IAC 740 Appendix A). The sample from ESB-6 was analyzed for PNAs and metals, as they were the chemicals of concern for previous soil sampling at the site. The sample from ESB-6 was also later sampled for VOCs, using the unpreserved sample from the amber jar used for PNAs and metals. Since the sample was unpreserved, it was also past the sample's holding time.

Due to concerns about volatile compounds at the site, two of the previously installed wells at the site were sampled for volatile organic compounds (VOCs). Well I with a measured depth of 47 feet and Well C with a measured depth of 15 feet were sampled and the samples were analyzed only for VOCs. No VOCs were detected in any of the groundwater samples (1 temporary well, ESB-5 and

two previous wells, Well I and Well C). For ESB-6, methylene chloride was detected at a low level in the well; but the laboratory indicated that this detection was most probably a laboratory artifact due to the sample having been obtained from a jar that had already been opened at least twice in the laboratory.

4.3 GPR SURVEY RESULTS

During the GPR Survey, no anomalies consistent with buried debris, tanks or other metal objects were identified. There are limitations to this survey. It covered only a small area of the site, near what appeared to be a demolished building. Also, GPR, which sends an electromagnetic pulse into the subsurface, and then measures the return signal, is affected by many factors: moisture, the soil type, nearby metallic objects or electrical sources (such as power lines). Therefore, although Amec Foster Wheeler and its subcontractor, Worksmart, Inc. have performed this survey with care and as skilled professionals, no survey can completely evaluate for the presence of USTs or other underground obstructions, or eliminate the risk of encountering them during construction.

5.0 ENDANGERMENT ASSESSMENT

5.1 NATURE AND EXTENT OF CONTAMINATION

The site was vacant prior to its first developed usage. The site was developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

A previous investigation by Warzyn in 1991 consisted of the installation of ten (10) soil borings and three (3) temporary wells in three (3) of the borings. Twenty (20) soil samples were collected and analyzed for volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PNAs), Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) and total cyanides. Total xylene was detected in two (2) samples from one (1) boring and trichlorofluoromethane was detected in samples from two (2) other borings. PNAs were widespread, but generally below 1 mg/kg concentration, although some locations were higher. Metals were detected but at concentrations considered to be background or naturally occurring. Cyanides were not detected. Groundwater flow in the shallow soils was thought to be to the north, but could not be determined based on the temporary wells. No VOCs were detected and low concentrations of PNAs, metals and cyanide (one sample) were detected in the water samples.

A 2007 Phase II by Carlson included nineteen (19) soil borings. Twenty-four soil samples were analyzed. Analyses included VOCs, semivolatile organic compounds (SVOCs), priority pollutant metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc), pH, pesticides, polychlorinated biphenyls (PBCs) and chlorinated herbicides. No VOCs were detected at concentrations exceeding the TACO objectives; although VOCs were detected at some locations. PNAs and carbazole were detected at concentrations that exceeded the TACO Tier 1 screening objectives. Antimony, arsenic, chromium, lead and mercury were detected at concentrations above their TACO Tier 1 objectives. PCBs, pesticides and herbicides were not detected in the two (2) samples analyzed for these parameters. The report concluded that concentrations of five (5) PNAs, one (1) SVOC and five (5) metals were present at concentrations exceeding the most stringent TACO Tier 1 residential screening levels.

The current investigation included the installation of twenty-four (24) soil borings and two (2) temporary wells. Twenty-six (26) soil samples were obtained and four (4) groundwater samples (2 groundwater samples were from wells already present on the site). Samples were compared to current TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater.

Concentrations of PNAs, arsenic, antimony and chromium were detected in soils at concentrations above those objectives. No detected concentrations in groundwater exceeded the objectives.

Based on comparison of the results of all of these investigations to TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater, soils at the site have been identified as impacted by benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at concentrations above their soil ingestion objectives.

Groundwater at the site was tested and only low levels of inorganic and organic chemicals were detected. Soils at the site were tested and compared to soil component of groundwater ingestion objectives (soil migration to groundwater). One organic contaminant, benzo(a)anthracene, was detected at one location at a concentration which exceeded its soil component of groundwater ingestion pathway objective for sites with Class II groundwater. One contaminant, antimony, was detected at one location at a concentration above its TACO Tier 1 pH-specific soil component of groundwater ingestion objective for sites with Class II groundwater. For another contaminant, chromium, there is no pH-specific objective for sites with Class II groundwater. There are pH-specific objectives for Class I groundwater and site chromium concentrations were compared to these objectives and were below the objectives, or were analyzed again by a leaching procedure and were below the objective. However, at one location, the chromium concentration was above the Class I objective to which it was compared and the sample was from the Carlson investigation so re-analysis by a leaching procedure was not possible. Three chemicals at three locations therefore exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium.

No contaminant concentrations exceeded construction worker objectives. The mercury inhalation construction worker objective was exceeded at many locations; but, this objective is only valid if elemental mercury is a contaminant of concern at the site. No previous site use would have resulted in the use of elemental mercury at the site.

Arsenic and PNA detections above objectives were scattered throughout the site, with localized hot spots at various locations indicative of concentrations in non-native fill materials.

Investigations to-date have identified, characterized and quantified the extent of impacted soils at the site sufficiently to determine appropriate remediation objectives for soil pathways, to allow determination of the need for remediation, and to evaluate remedial options.

5.2 CONTAMINANT FATE AND TRANSPORT

The term “Fate and Transport” refers to the process that a contaminant encounters in the environment as a result of its potential to be transported, transformed (physically, chemically, or biologically), or accumulated in soil, groundwater or surface water. The following sections briefly summarize the fate and transport properties of the constituents detected above TACO Tier 1 industrial/commercial objectives for sites with Class II groundwater.

5.2.1 Inorganic Compounds (Arsenic, Antimony and Chromium)

Generally, metals (arsenic, antimony and chromium) tend to be immobile in soils, and the extent of transport and migration is dependent on environmental conditions at the site. While the pure metallic forms of these compounds are insoluble in water, many of their salts are soluble in varying degrees. The primary fate process for all of the metals in relation to groundwater and surface water transport is adsorption. These constituents may be released into solution depending on pH, the particular chemical state present, and the presence of aerobic or anaerobic conditions at the site.

Arsenic, because of its complex chemistry, exists in the environment in many different inorganic and organic forms, which have different toxicological and physicochemical properties. Inorganic arsenic exists as either the trivalent (3+) form or the pentavalent (5+) form. The inorganic trivalent arsenic forms are more toxic than the pentavalent forms. Elemental arsenic (the metalloid -0+) is essentially nontoxic even at high intakes. The dominant form of arsenic in soil and its transport are largely dependent on the physical characteristics of the soil matrix. Insoluble arsenic compounds, such as arsenic trioxide, bind tightly to organic matter in soil or sediment in surface water, soluble inorganic arsenate (As5+) predominates under normal conditions and is more stable than arsenite (EPA 1980a). Movement and partitioning of arsenic in water depends on the chemical form of arsenic and on interactions with other materials present (Callahan et al. 1979). Soluble forms of arsenic remain dissolved in the water column or adsorb onto sediments or soils, especially those containing clays, iron oxides, aluminum hydroxides, manganese compounds, and organic matter (Callahan et al. 1979; Welch et al. 1988). Sediment bound arsenic is released back into the water by chemical or biological interconversions. This interconversion is influenced by the Eh (the oxidation-reduction potential), pH, temperature, other metals, salinity, and biota (Callahan et al. 1979) (U.S. EPA Office of Solid Waste, U.S. EPA Region 6 Multimedia Planning and Permitting Division Center for Combustion Science and Engineering, Protocol for Screening Level Ecological Risk Assessment, Appendix H, August 1999).

Antimony is found naturally in the environment and the general population is exposed to low levels of it every day, primarily in food, drinking water, and air. It may be found in air near industries that process or release it, such as smelters, coal-fired plants, and refuse incinerators. In polluted areas

containing high levels of antimony, it may be found in the air, water, and soil. In the air, antimony is attached to very small particles that may stay in the air for many days. Oxidation states, speciation and redox transformation generally determine the geochemical characteristics of antimony. Oxidative dissolution of sulfide minerals and aqueous dissolution are the most prevalent geochemical mechanisms for the release of antimony to the environment. Transformation of mobile forms of antimony is predominantly controlled by naturally occurring precipitation and adsorption processes. Most antimony ends up in soil, where it attaches strongly to particles that contain iron, manganese, or aluminum. Antimony is also immobilized in the natural environment via precipitation with alkali and heavy metals resulting in extremely stable mineral phases.

Human exposure to chromium occurs from both natural and anthropogenic sources. Chromium is present naturally in soil. The mobility of chromium in soil is dependent upon the speciation of chromium, which is a function of redox potential and the pH of the soil. In most soils, chromium will be present predominantly in the chromium(III) oxidation state. This form has very low solubility and low reactivity, resulting in low mobility in the environment (Barnhart 1997; Jardine et al. 1999; Robson 2003). Under oxidizing conditions, chromium(VI) may be present in soil as CrO_4^{2-} and HCrO_4^- (James et al. 1997). In this form, chromium is relatively soluble and mobile. A leachability study comparing the mobility of several metals, including chromium, in soil demonstrated that chromium had the least mobility of all of the metals studied (Sahuquillo et al. 2003). These results support previous data finding that chromium is not very mobile in soil, especially in the trivalent oxidation state (Balasoiu et al. 2001; Jardine et al. 1999; Lin et al. 1996; Robson 2003). These results are further supported by a leachability investigation in which chromium mobility was studied for a period of 4 years in a sandy loam (Sheppard and Thibault 1991). The vertical migration pattern of chromium in this soil indicated that after an initial period of mobility, chromium forms insoluble complexes and little leaching is observed. Chromium present as insoluble oxide, $\text{Cr}_2\text{O}_3 \cdot n\text{H}_2\text{O}$, exhibited limited mobility in soil (Rifkin et al. 2004). Organic matter in soil is expected to convert soluble chromate, chromium(VI), to insoluble chromium(III) oxide, Cr_2O_3 (Calder 1988). Surface runoff from soil can transport both soluble and bulk precipitate of chromium to surface water. Soluble and unadsorbed chromium(VI) and chromium(III) complexes in soil may leach into groundwater. The leachability of chromium(VI) in the soil increases as the pH of the soil increases. On the other hand, lower pH present in acid rain may facilitate leaching of acid-soluble chromium(III) complexes and chromium(VI) compounds in soil (from ATSDR, Toxicological Profile, Chromium).

5.2.2 Polynuclear Aromatic Hydrocarbons

Most PNAs such as those found at the site (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene and dibenzo(a,h)anthracene), because of their low volatility, are classified as semivolatile organic compounds. In general, PNAs do not easily dissolve in water and are more likely to partition into sediments and soils rather than into groundwater because of their low solubilities and

high soil organic carbon-water partitioning coefficients (Koc's). As a result, transport of PNAs tends to be associated primarily with erosion of contaminated soils and sediments. PNAs sorbed to sediments may potentially affect aquatic communities downstream of contaminated sites (Irwin and others, 1998). The potential for colloid-facilitated transport of PNAs in groundwater also has been documented. PNAs possess a wide range of physicochemical properties, but generally PNAs have low vapor pressures and water solubilities, and high Koc. PNAs if released to soil will be expected to adsorb very strongly and will not be expected to leach to the groundwater. Adsorption onto suspended solids and particulate matter and complexation with natural organic substances are probably the most important environmental transport processes for these compounds. They also migrate to ground or surface waters by leaching from soil, but this is generally a slow process. Volatilization of these compounds from the aqueous phase is generally not expected to be a major fate process. PNAs may be bioaccumulated; however, some are also quickly metabolized and eliminated by most organisms. Biodegradation and biotransformation are probably an important fate process for this group of constituents, although because of their high molecular weights, degradation of these compounds is expected to be slow.

5.3 EXPOSURE ROUTE EVALUATION

5.3.1 Receptors

There are no current potential receptors. Future receptors will be personnel accessing the training facility (trainees, instructors and visitors). The City of Chicago has a groundwater ordinance which prohibits use of groundwater as a potable water source so no groundwater receptors should be present.

5.3.2 Exposure Pathways

In accordance with TACO guidance, four exposure pathways (i.e., soil ingestion, outdoor soil inhalation, protection from groundwater/surface water ingestion, and indoor inhalation) must be addressed during site closure.

5.3.2.1 Soil Ingestion Pathway

For the current and future personnel at the site, compounds above the industrial/commercial soil ingestion objectives could be accessed and ingested at concentrations above objectives at any Site areas where impacted soils are present in a contiguous area and where no natural and man-made barriers (i.e. clean soil at shallower depths, buildings, concrete pavement) are present or will be in-place in the future to prevent such ingestion.

Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic are present at the site at concentrations which exceed the TACO Tier 1 industrial/commercial soil

ingestion objective. Eight (8) of the samples had measured concentrations of PNAs which exceed the soil ingestion objective. Five (5) of the samples had measured concentrations of arsenic which exceed the soil ingestion objective

5.3.2.2 Outdoor Inhalation Exposure Pathway

Constituents bound to soils may be transported as suspended particulates (dust) or may be volatilized. Transport on dust poses less risk for the compounds detected than does soil ingestion or inhalation of volatiles.

No site soil samples had concentrations which exceeded outdoor inhalation pathway objectives, except mercury which may exceed construction worker inhalation pathway objectives if elemental mercury is a contaminant of concern for the site (see discussion in Section 6.0).

5.3.2.3 Soil and Groundwater Components of the Groundwater Ingestion Pathway

Constituents present in soil may leach to groundwater. There are no known current receptors. The City of Chicago has a groundwater ordinance which prohibits use of groundwater as a potable water source so no groundwater receptors should be present. Groundwater discharging to surface water could result in other receptors, but the concentrations, and distance to surface water should result in no effect on surface water.

No contaminants are present at the site at concentrations which exceed their TACO Tier 1 Class II groundwater ingestion objectives.

One (1) organic contaminant, benzo(a)anthracene, was detected at one location at a concentration which exceeded its soil component of groundwater ingestion pathway objective for sites with Class II groundwater. Antimony, an inorganic contaminant, was detected at one (1) location at a concentration above its TACO Tier 1 pH-specific soil component of groundwater ingestion objective for sites with Class II groundwater. The sample was from the Carlson investigation so re-analysis by a leaching procedure was not possible. For another inorganic contaminant, chromium, there is no pH-specific objective for sites with Class II groundwater. There are pH-specific objectives for Class I groundwater and site chromium concentrations from the recent investigation were compared to these objectives and were below the objectives, or were analyzed again by a leaching procedure and were below the objective. However, at one (1) location, the chromium concentration was above the Class I objective to which it was compared and the sample was from the Carlson investigation so re-analysis by a leaching procedure was not possible. Three (3) chemicals at three (3) locations therefore exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium.

5.3.2.4 Indoor Inhalation Exposure Pathway

The indoor inhalation exposure pathway refers to the migration of volatile chemicals from subsurface contaminated soils and groundwater into the indoor air spaces of overlying buildings through openings in the building foundation (for example, cracks and utility openings). Any volatile chemical may migrate in this manner. The Illinois EPA in the TACO guidance (35 IAC 742 Appendix A, Table J) provides a list of TACO volatile chemicals for the indoor inhalation route.

Acetone, benzene, carbon disulfide, carbon tetrachloride, chloroform, tetrachloroethene, toluene, trichlorofluoromethane, xylenes, 2-methyl naphthalene and naphthalene were detected at the site and are listed as volatile chemicals on 35 IAC 742 Table J in TACO. Other detected chemicals and metals are not volatile, except mercury, which was also detected and is considered a volatile chemical. Generally, these compounds and metal are present at low levels at scattered locations. Since the compounds and metal are not present in groundwater, which was sampled at three locations for VOCs and two locations for mercury, they are not a concern for the indoor inhalation pathway.

6.0 REMEDIATION OBJECTIVES

A comparison of the results with Tier 1 industrial/commercial objectives (for ingestion, for indoor and outdoor inhalation and for the soil component of groundwater ingestion for Class II groundwater) was conducted to determine the chemicals of concern for the site. Soils with PNAs, and arsenic results above the soil ingestion pathway objectives were considered for averaging (95% Upper Confidence Limit) and two (2) locations will need to be remediated or have an engineered barrier to prevent access.

Benzo(a)anthracene is present at one (1) location at a concentration which exceeds its TACO Tier 1 Class II groundwater ingestion objective. Antimony was detected at one (1) location at a concentration above its TACO Tier 1 pH-specific objective for sites with Class II groundwater and chromium, detected above its pH-specific Class I objective at one (1) location, has no pH-specific objective for sites with Class II groundwater. Groundwater pathway exclusion was evaluated for these sample results.

6.1 TIER 1 INDUSTRIAL/COMMERCIAL COMPARISON

Site investigation soil sample results have been compared to TACO Tier 1 industrial/commercial objectives for sites with Class II groundwater (35 IAC 742 Appendix B, Table B, and Table D). Soil Remediation Objectives (SROs) were determined from TACO Tier 1 industrial/commercial soil remediation objectives in 35 IAC 742 Appendix B Table B and Appendix B Table D; and background concentrations found in 35 IAC 742 Appendix A, Table H. Groundwater sample analytical results were compared to the Illinois EPA TACO Tier 1 groundwater remediation objectives (GROs) for Class II groundwater (35 IAC 742 Appendix B Table E) and to the Tier 1 Groundwater Remediation objectives (GROs) for the Indoor Inhalation Route – Diffusion and Advection (35 IAC 742, Appendix B, Table H). This comparison has resulted in the identification of samples with concentrations which exceed the Tier 1 objectives or background concentrations. Results which exceed these objectives are summarized in Table 7.

The chemicals of concern for the soil ingestion pathway are: benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic. There are no chemicals of concern for the outdoor or indoor soil inhalation pathways.

Benzo(a)anthracene is present at one (1) location at a concentration which exceeds its TACO Tier 1 Class II soil component of groundwater ingestion objective. Antimony was detected at one (1) location at a concentration above its TACO Tier 1 pH-specific soil component of groundwater objective for sites with Class II groundwater. Chromium has no pH-specific soil component of

groundwater objective for sites with Class II groundwater. At one (1) location, the chromium concentration was above the Class I objectives to which it was compared.

The pathways of concern for industrial/commercial use of the site are therefore the soil ingestion pathway and the soil component of groundwater ingestion pathway.

6.2 CONSTRUCTION WORKER COMPARISON

Soil chemical concentrations were compared to the construction worker objectives provided in TACO (35 IAC 742 Appendix B, Table B). No chemicals were of concern (above objectives) for the construction worker ingestion and inhalation routes, except possibly mercury. The site was a rail yard previously, and elemental mercury is not known to be associated with rail yards. However, given the widespread detection of mercury (see Figure 8) and the significant concentration of mercury in one 2007 Carlson investigation sample (GP-17A, 0 to 2 feet bgs) of 7.5 mg/kg, Amec Foster Wheeler recommends a construction worker warning for mercury be placed on the site.

6.3 AVERAGING OF SHALLOW PNA AND ARSENIC IMPACTED SOIL CONCENTRATIONS

TACO allows for the averaging of results with the approval of the planned or completed sampling by Illinois EPA. Based on the Illinois EPA's approach to other sites in the SRP, concentrations of PNAs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene) and arsenic in shallow (above 3 feet in depth) soil were averaged to represent current exposure which would be only to shallow soils. All concentrations of the listed PNAs and arsenic in soils were averaged to represent future exposures, which could be to any of the soils at the site from any depth or location.. PNA and arsenic concentration were averaged in accordance with Section 742.225 of TACO to demonstrate that they would be in compliance with objectives.

Results were averaged using ProUCL Version 5.1.02 Statistical Software for Environmental Applications for Data Sets with and without Nondetect Observations (ProUCL software was developed by Lockheed Martin under a contract with the EPA and is made available through the EPA Technical Support Center in Atlanta, Georgia, EPA/600/R-07/041 October 2015). The software is used to calculate a 95% upper confidence limit (UCL95) of the arithmetic mean of the concentrations of compounds detected at a site. Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic, at above 3 feet in depth, were included in the current soil calculations. Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at all depths were included in the future site use calculations. Input data and calculation results are provided in Appendix E.

Within the PNAs current (shallow soils) data set, one sample (GP3A at 0 to 2 feet bgs) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier to prevent access. With this concentration removed, the average for current users for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic is below their objectives.

Within the PNAs future (all soils) data set, two samples (GP3A at 0 to 2 feet bgs and GP-7D at 6 to 8 feet bgs) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier to prevent exposure to the soils. With these concentrations removed, the average for future site use for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic is below their objectives.

Areas around GP3A at 0 to 2 feet bgs and GP-7D at 6 to 8 feet bgs which would require soil removal or engineered barriers based on the above averaging are shown on Figure 9. The extent of these areas was based on detected concentrations and depths of PNAs in the borings around GP3A at 0 to 2 feet bgs and GP-7D at 6 to 8 feet bgs.

Engineered barriers should be consistent with the Illinois EPA's TACO requirements (35 IAC 742). Barriers cited in TACO and approved by the Illinois EPA include concrete, asphalt, or three feet of clean soil or fill. The Illinois EPA also approves alternative barriers of less than three feet of clean fill, such as 18" of clean fill with geotextile fabric. Clean fill can be certified virgin stone or other soil or earthen material, which has been tested for Target Compound List parameters (35 IAC 740 Appendix A) and found to meet the most stringent objectives for residential land use included in Appendix B of TACO.

6.4 EXCLUSION OF THE GROUNDWATER INGESTION PATHWAY

The chemicals of concern for the soil component of groundwater ingestion pathway at the site are benzo(a)anthracene, antimony and chromium. None of these chemicals were detected in the groundwater in two samples tested for metals and PNAs. The TACO regulations under 35 IAC 742.320 allow for the exclusion of the groundwater ingestion pathway from consideration if certain conditions are met. The site is evaluated for compliance with these conditions in the following paragraphs.

- A.) Requirements under Sections 742.300 and 742.305 of the regulation must be met.
35 IAC 742.300 addresses the following procedures for exclusion of an exposure route, requires that the site be fully characterized, and refers to the requirements for Tier 3 evaluation as an alternative for pathway exclusion.

35 IAC 742.305 requires that:

- (1) The sum of the concentrations of all of the organic contaminants of concern cannot exceed the attenuation capacity of the soil as determined under Section 742.215. Section 742.215 states that at each discrete sampling point, the sum of all of the organic compounds detected cannot exceed the natural organic carbon fraction of the soil. A default value of 6000 mg/kg can be used for soils within one meter of the surface and 2000 mg/kg can be used for soils below one meter.

$V \times \sum C_i \leq f_{OC} \times \text{Soil Capacity}$

- (2) The concentrations of any organic contaminant remaining in the soil shall not exceed the soil saturation limit as determined under Section 742.220. Section 742.220 states that the soil saturation limit shall be: the default value listed in Appendix A, Table A of TACO, a value derived from Equation S29 in Appendix C, Table A, or a value derived from another method approved by the Agency.

$C_i \leq \text{Soil Saturation Limit}$

- (3) Soils which contain contaminants of concern shall not exhibit the characteristics of reactivity for hazardous waste as determined under 35 IAC 721.123.

$pH \geq 2 \text{ and } pH \leq 12.5$

- (4) Soils which contain contaminants of concern shall not exhibit a pH of less than or equal to 2 or greater than or equal to 12.5.

$pH \geq 2 \text{ and } pH \leq 12.5$

- (5) Soil which contains the following inorganic contaminants of concern shall not exhibit characteristics of toxicity as determined by 35 IAC 721.124: arsenic, barium, cadmium, chromium, lead, mercury, selenium, and silver.

$C_i \leq \text{Toxicity Limits}$

(6) If contaminants of concern include polychlorinated biphenyls (PCBs), the concentration of any PCBs in the soil shall not exceed 50 parts per million.

PCB concentration in soil shall not exceed 50 ppm.

(7) The concentration of any contaminant of concern in soil gas shall not exceed 10% of its Lower Explosive Limit (LEL) as measured by a hand held combustible gas indicator that has been calibrated to manufacturer specifications

Soil gas concentrations shall not exceed 10% LEL.

B.) Corrective action measures must be completed to remove any free product to the maximum extent practicable.

Remediation to maximum extent practicable.

C.) The source of the release may not be located within the minimum or designated maximum setback zone or within the regulated recharge area of a potable water supply well.

Source of release not within setback zones or recharge areas.

D.) An ordinance adopted by a unit of local government must be in place which prohibits the installation and use of potable water supply wells for an area within 2500 feet from the source of the release. This ordinance must be approved in accordance with Section 742.1015.

Local ordinance prohibiting wells within 2500 feet of release source.

E.) The concentration of any contaminant of concern in groundwater within the minimum or designated setback zone of an existing potable water supply well will meet the applicable Tier 1 groundwater remediation objective, as demonstrated using Equation R-26 in Appendix C, Table C.

Groundwater concentrations meet Tier 1 remediation objectives.

7.0 SUMMARY AND CONCLUSIONS

Amec Foster Wheeler was retained by the City of Chicago Department of Fleet and Facility Management to complete a Phase II Environmental Site Assessment for the site located at 4301 West Chicago Avenue in Chicago, Cook County, Illinois (the site). The site is a 30.4-acre parcel that is currently vacant. Development of the site as a Joint Public Safety Training Academy is planned. The JPSTA campus will provide the Chicago Police Department (CPD) and the Chicago Fire Department (CFD) with a central location, replacing training facilities located throughout the City.

7.1 SITE HISTORY

The site was developed as a rail yard by 1900 according to historic topographic maps. Previous environmental reports for the site indicate that the rail yard was constructed in 1896 by the Chicago and Northwestern Transportation Company on previously undeveloped land. By 1978-1980, most of the rail yard tracks were gone, and by at most 2002, the parcel was totally vacant.

7.2 PROPERTY DESCRIPTION

The site consists of 30.4 acres located on the southeast corner of the intersection of Kilbourn and West Chicago Avenue. The Parcel ID (Tax ID) number for the site is 16-10-200-061-0000. The site is located in a mixed land use area. At the time of the site reconnaissance, the site was vacant. The site is partially fenced and no buildings or other improvements are present on the site.

The site is situated at an elevation of approximately 610 feet above mean sea level (msl). Based on our review of the local topography, it appears that groundwater would generally flow toward the east to Lake Michigan.

Adjacent to the east is N. Kostner Avenue, beyond which is Falcon Transportation to the north and Chicago Transit Authority (CTA) to the south, to the north is W Chicago Avenue with commercial buildings lining the street and residences behind them, to the west is N. Kilbourn Avenue, beyond which is a City of Chicago Transfer Station, and to the south is a remaining railroad spur and some industrial and warehouse properties.

7.3 RECOGNIZED ENVIRONMENTAL CONDITIONS

Amec Foster Wheeler performed a Phase I ESA as outlined in ASTM E 1527-13 in June 2017. Amec Foster Wheeler issued the Draft Phase I ESA on June 26, 2017. Acquisition of the property is

expected to occur in January 2018. Components of the Phase I ESA which are required to be completed within 180 days of the expected date of purchase were updated in November 2017 and a final Phase I report was issued on December 11, 2017. The following recognized environmental conditions (REC) were determined to be associated with the property:

- On the property, a potential underground storage tank (UST) installed in 1959 with no record of it having been removed, its use as a former rail yard and the fill materials present on the site, various debris piles and rail ties present on the site and contaminants identified during previous investigations at the property.
- CTA at 4401 West Chicago Avenue, due to USTs installed in 1992, and because it is a former rail yard and may have fill similar to the site.
- Rail IT Property, 733 North Kilbourn Avenue, due to an UST that was not closed. It is unclear if this is the site or adjacent, as Rail IT at one time owned the site and the street number identified in the EDR report could potentially put it near the southeast corner of Chicago and Kilbourn Avenues, which would be the site.
- Department of Streets and Sanitation, 750 North Kilbourn Avenue, adjacent across North Kilbourn Avenue, due to USTs removed but not closed and since it is a transfer station and incinerator which may have resulted in airborne particulates reaching the site.
- City of Chicago, 715 North Kilbourn Avenue, due to an UST that was not closed. The initial incident report for #940242 lists 715 N. Kilbourn Avenue and then subsequent documentation on the Illinois EPA website for this incident changed to 750 N. Kilbourn Avenue. Amec Foster Wheeler believes the address was mis-identified in the original report and subsequently corrected. Although an incident was reported, a subsequent Illinois EPA letter indicates the site is a non-LUST site, which could indicate there was no confirmed release, or that the incident was from a non-regulated tank.

7.4 INVESTIGATION AND RESULTS

A previous investigation by Warzyn in 1991 consisted of the installation of ten (10) soil borings and three (3) temporary wells in three (3) of the borings. Twenty (20) soil samples were collected and analyzed for volatile organic compounds (VOCs), polynuclear aromatic hydrocarbons (PNAs), Resource Conservation and Recovery Act (RCRA) metals (arsenic, barium, cadmium, chromium, lead, mercury, selenium and silver) and total cyanides. Comparison of Warzyn results to TACO Tier 1 current objectives showed that only one sample, SB10-4, taken at 8.5 to 10.5 feet below ground

surface, had a concentration which exceeded the soil remediation objectives (SROs) to which it was compared. Arsenic was detected at 13.8 mg/kg, and its soil ingestion objective (which is the same as its background concentration) is 13 mg/kg.

A 2007 Phase II by Carlson included nineteen (19) soil borings. Twenty-four (24) soil samples were analyzed. Analyses included VOCs, semivolatile organic compounds (SVOCs), priority pollutant metals (antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc), pH, pesticides, polychlorinated biphenyls (PBCs) and chlorinated herbicides. Comparison of Carlson results to TACO Tier 1 current objectives showed that eight (8) samples, taken at seven (7) locations had concentrations which exceeded the SROs to which the samples were compared. Five (5) samples had PNA concentrations above their objectives, and three samples had inorganic concentrations (arsenic, antimony and chromium) above SROs.

This Phase II ESA consisted of the installation of twenty-four (24) soil borings, collection of twenty-six (26) soil samples for analytical testing, the installation and sampling of two (2) temporary monitoring wells, sampling of two (2) existing monitoring wells, level survey of some existing and the newly installed wells, and a limited ground penetrating radar survey. Soil samples were generally analyzed for PNAs and Priority Pollutant metals, with select samples analyzed for the Target Compound List (TCL) from the Site Remediation Program (35 IAC 740 Appendix A) and herbicides. Groundwater samples were analyzed variously for the TCL, PNAs, metals and VOCs. Three (3) soil samples had concentrations of PNAs which exceeded objectives and four (4) soil samples had arsenic concentrations above its soil ingestion objective.

7.5 REMEDIATION OBJECTIVES

Based on comparison of the results of all of these investigations to TACO Tier 1 objectives for industrial/commercial sites with Class II groundwater, soils at the site have been identified as impacted by benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at concentrations above their soil ingestion objectives. Three (3) chemicals at three (3) locations exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium.

Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic in shallow (above 3 feet in depth) soil, to represent current exposure, and all of the listed PNAs and arsenic in soils to represent future exposures, which exceeded soil ingestion pathway objectives were averaged in accordance with Section 742.225 of TACO to demonstrate that they would be in compliance with objectives if the use of averaging and the already completed sampling was approved by the Illinois EPA.

Results were averaged using ProUCL Version 5.1.02. Within the PNAs current (shallow soils) data set, one sample (GP3A at 0 to 2 feet bgs) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier to prevent access. With this concentration removed, the average for current users for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic is below their objectives.

Within the PNAs future (all soils) data set, two samples (GP3A at 0 to 2 feet bgs and GP-7D at 6 to 8 feet bgs) had elevated concentrations of PNAs and will need to be remediated or have an engineered barrier to prevent access. With these concentrations removed, the averages for future site use for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic are below their objectives.

The soil component of groundwater ingestion pathway was addressed by exclusion of the groundwater pathway in accordance with 35 IAC 742.320. Site conditions and concentrations of chemicals of concern which exceeded the soil component of groundwater ingestion pathway were determined to be appropriate for pathway exclusion. The evaluation showed that the pathway could be excluded.

No chemicals were of concern (above objectives) for the construction worker ingestion and inhalation routes, except possibly mercury. The site was a rail yard previously, and elemental mercury is not known to be associated with rail yards. However, given the widespread detection of mercury and the significant concentration of mercury in one 2007 Carlson investigation sample (GP-17A, 0 to 2 feet bgs) of 7.5 mg/kg, Amec Foster Wheeler recommends a construction worker warning for mercury be placed on the site.

7.6 CONSTRUCTION CONSIDERATIONS

During design and construction of the JPTSA, it is recommended that the following be taken into consideration:

- Future site buildings should be constructed with a full concrete slab-on-grade foundation or with a full concrete basement floor and walls. Future site buildings should not be constructed with earthen crawl spaces, earthen floors, stone foundations, partial concrete floors, or sumps.
- Unless additional testing is performed to determine compliance with Illinois EPA's Clean Construction and Demolition Debris (CCDD) regulations, all soil being removed from the site must be disposed of in accordance with applicable regulations to a Subtitle D landfill.
- Areas depicted on Figure 9 must be covered with an Illinois EPA TACO-compliant engineered barrier such as asphalt, concrete, 3 ft of clean fill, or other Illinois EPA-approved barrier.

- Imported fill material must be certified virgin stone or or other soil or earthen material, which has been tested for Target Compound List parameters (35 IAC 740 Appendix A) and found to meet the most stringent objectives for residential land use included in Appendix B of TACO.
- Construction workers who will encounter site soils should be informed of the mercury detections at the site so that they may take appropriate precautions as determined by their evaluation of the data.
- Although a GPR survey for underground tanks, utilities and foundations was performed in a limited area of the site, this does not guarantee that such underground tanks, utilities and foundations are not present in these areas, or other areas where such survey was not completed.
- A Soil Management Plan should be prepared and implemented during construction to document, at a minimum: the site specific soil excavation, disposal, storage and reuse procedures, imported material testing requirements, and environmental oversight requirements.

7.7 CONCLUSIONS

A Phase II Environmental Site Assessment has been completed for the property at 4301 W Chicago Avenue in Chicago, Illinois. This investigation and previous sampling indicated that soils at the site have been impacted by benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene and arsenic at concentrations above their soil ingestion objectives. Three (3) chemicals at three locations exceeded their soil component of groundwater ingestion objectives: benzo(a)anthracene, antimony and chromium.

Averaging of soils above soil ingestion objectives, as allowed in TACO, has resulted in a determination that two (2) locations should be remediated or barriered to prevent exposure. The use of the City of Chicago groundwater ordinance has allowed for exclusion of the groundwater pathway.

A construction worker caution for exposure to mercury by the inhalation pathway is recommended for the site.

TABLE 2
SUMMARY OF WARZYN SOIL ANALYTICAL RESULTS

4301 W Chicago Ave
Chicago, Illinois

Notes:

- (1): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for industrial-commercial exposure (35 IAC 742 Appendix B, Table B).
- (2): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for construction worker exposure (35 IAC 742 Appendix B, Table B).
- (3): The soil remediation objective (SRO) for the soil component of the groundwater ingestion route for Class II groundwater 35 IAC 742 Appendix B, Table B. For metals and cyanide, objectives are based on leached concentrations or pH-specific objectives may be used
- (4): Concentrations of Inorganic Chemicals in Background Soils within Counties Inside Metropolitan Statistical Areas (35 IAC 742 Appendix A, Table G).
Concentrations of Polynuclear Aromatic Hydrocarbon Chemicals in Background Soils within the City of Chicago (35 IAC 742 Appendix A, Table H).
- (5): Results should be considered estimated due to non-homogenous sample matrix
- (6): Soil remediation objective for inhalation route only applies at sites where elemental mercury (CAS#7439-97-6) is a contaminant of concern (35 IAC 742 Appendix B, Tables A and B).

mg/kg Milligram per kilogram

NE Not established by the Illinois Environmental Protection Agency

NA Not analyzed

BOLD Laboratory Analytical Detection

BOLD + HIGHLIGHT Laboratory Analytical Detection that exceeds TACO Tier 1 Industrial-Commercial Objective for sites with Class I Groundwater

TABLE 3
SUMMARY OF CARLSON SOIL ANALYTICAL RESULTS

4301 W Chicago Ave
Chicago, Illinois

Notes:

- (1): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for industrial-commercial exposure (35 IAC 742 Appendix B, Table B).
- (2): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for construction worker exposure (35 IAC 742 Appendix B, Table B).
- (3): The soil remediation objective (SRO) for the soil component of the groundwater ingestion route for Class II groundwater 35 IAC 742 Appendix B, Table B. For metals and cyanide, objectives are based on leached concentrations or pH-specific objectives may be used. Objectives are provide for pH range of 7.25 to 8.74
- (4): Concentrations of Inorganic Chemicals in Background Soils within Counties Inside Metropolitan Statistical Areas (35 IAC 742 Appendix A, Table G).
Concentrations of Polynuclear Aromatic Hydrocarbon Chemicals in Background Soils within the City of Chicago (35 IAC 742 Appendix A, Table H).
- (5): Soil remediation objective for inhalation route only applies at sites where elemental mercury (CAS#7439-97-6) is a contaminant of concern (35 IAC 742 Appendix B, Tables A and B).
- (6): There are no Class II objectives for chromium, Class I objectives are provided, Class I objectives are for hexavalent chromium which is more toxic than trivalent chromium which is naturally more prevalent

mg/kg Milligram per kilogram

NE Not established by the Illinois Environmental Protection Agency

NA Not analyzed

ND Not detected

E Laboratory qualifier - value above quantitation range

BOLD Laboratory Analytical Detection

BOLD + HIGHLIGHT Laboratory Analytical Detection that exceeds TACO Tier 1 Industrial-Commercial Objective for sites with Class I Groundwater

		B-18C	TBD	TBD	HOLD for Vertical Delineation
PROPOSED ENVIRONMENTAL BORINGS					
ESB-1	16.0	ESB-1A	0.0 - 3.0	PNAs, PP Metals, pH	Additional Shallow Sample near soil mound
		ESB-1B	12.0' - 16.0'	PNAs	Vertical Delineation for GP-7 with elevated PNAs at 6'-12'.
ESB-2	16.0	ESB-2A	0.0 - 3.0	Target Compound List, herbicides	Additional Shallow Sample, offsite west
		ESB-2B	TBD	PNAs, PP Metals, pH	Near GP-6 with elevated PNAs at 4'-6'.
ESB-3	16.0	ESB-3A	0.0 - 3.0	Target Compound List	Additional Shallow Sample, offsite west
		ESB-3B	TBD	PNAs	Vertical Delineation for GP-6 with elevated PNAs at 4'-6'.
ESB-4	16.0	ESB-4A	0.0 - 3.0	Target Compound List	Additional Shallow Sample, former rail spur
		ESB-4B	TBD	TBD	HOLD for Vertical Delineation
ESB-5	16.0	ESB-5A	0.0 - 3.0	Target Compound List	Additional Shallow Sample, rail spur, south offsite
		ESB-5B	TBD	TBD	Additional Deep Sample.
ESB-6	16.0	ESB-6A	0.0 - 3.0	Target Compound List, herbicides	Additional Shallow Sample. Near Concrete Pile
		ESB-6B	TBD	TBD	HOLD for Vertical Delineation

TABLE 5
SUMMARY OF SOIL ANALYTICAL RESULTS

4301 W Chicago Ave
Chicago, Illinois

Notes:

- (1): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for industrial-commercial exposure (35 IAC 742 Appendix B, Table B).
- (2): Soil remediation objective (SRO) for the soil ingestion or inhalation routes for construction worker exposure (35 IAC 742 Appendix B, Table B).
- (3): The soil remediation objective (SRO) for the soil component of the groundwater ingestion route for Class II groundwater 35 IAC 742 Appendix B, Table B. For metals and cyanide, objectives are based on leached concentrations or pH-specific objectives may be used. Objectives are provided for pH range of 6.9 to 9.0 (highest pH for which pH-specific objectives are provided)
- (4): Concentrations of Inorganic Chemicals in Background Soils within Counties Inside Metropolitan Statistical Areas (35 IAC 742 Appendix A, Table G).
Concentrations of Polynuclear Aromatic Hydrocarbon Chemicals in Background Soils within the City of Chicago (35 IAC 742 Appendix A, Table H).
- (5): Soil remediation objective for inhalation route only applies at sites where elemental mercury (CAS#7439-97-6) is a contaminant of concern (35 IAC 742 Appendix B, Tables A and B)
- (6): There are no Class II objectives for chromium, Class I objectives are provided, Class I objectives are for hexavalent chromium which is more toxic than trivalent chromium which is naturally more prevalent
- (7): There are no Class II objectives for silver or vanadium, Class I objectives are provided

Notes:

Sample ESB-5 was analyzed for the entire Target Compound List from 35 IAC 740 Appendix A, including Semivolatile Organic Compounds (SVOCs), Pesticides and PCBs. No SVOCs (other than PNAs), pesticides or PCBs were detected.

- (1): The groundwater remediation objective (GRO) for the groundwater ingestion route for Class II groundwater 35 IAC 742 Appendix B, Table E.
- (2): The groundwater remediation objective for the indoor inhalation route (diffusion and advection) for industrial/commercial sites from 35 IAC 742 Appendix B, Table H.
- (3): The laboratory has indicated that the methylene chloride detected is a laboratory artifact, the result of analyzing the sample from an unpreserved amber jar from which previous aliquots for other analyses had been taken

mg/L Milligrams per liter

NE Not established by the Illinois Environmental Protection Agency

NA Not analyzed

H Sample was analyzed from unpreserved sample, past holding time for an unpreserved sample

BOLD Detected concentration

(1) Illinois EPA TACO objectives for Industrial/Commercial sites (35 IAC 742 Appendix B, Table B) most restrictive of inhalation or ingestion pathway objectives, or background concentrations, includes construction worker ingestion or inhalation concentrations

(2) Illinois EPA TACO objectives (soil) for Sites with Class II Groundwater (35 IAC 742 Appendix B, Table B)

(3) Soil remediation objective for inhalation route only applies at sites where elemental mercury (CAS#7439-97-6) is a contaminant of concern (35 IAC 742 Appendix B, Tables A and B).

E = Laboratory qualifier – value above quantitation limit

* Laboratory qualified as estimated due to non-homogenous sample matrix

CW = Construction Worker

mg/kg = milligrams per kilogram

mg/L = milligrams per liter

Analytical Report for STAT Work Order: 17080088 Revision 3

RE: City of Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 10 samples for the referenced project on 8/2/2017 6:00:00 PM. The analytical results are presented in the following report.

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Martin Kucan

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

Subject: Additional Testing -

Please perform additional leaching procedure testing (TCLP or SPLP) for the following metals on the identified samples:

B-18A – chromium and manganese your sample # 17080321-011

B-6B – chromium your sample #17080265-014

ESB-2A – cobalt, iron – your sample #17080088-001

ESB-4A – iron your sample #17080223-001

ESB-5A – iron your sample #17080126-001

ESB-6A – iron, manganese your sample #17080177-001

Analytical Report for STAT Work Order: 17080126 Revision 2

RE: 3205-17-1606, City of Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 3 samples for the referenced project on 8/3/2017 4:05:00 PM. The analytical results are presented in the following report.

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Martin Kucan

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

Analytical Report for STAT Work Order: 17080177 Revision 2

RE: 3205171606, City of Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 6 samples for the referenced project on 8/4/2017 4:45:00 PM. The analytical results are presented in the following report.

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Martin Kucan

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

CASE NARRATIVE

The VOC soil Laboratory Control Sample (LCS) analyzed 08/11/2017 had recovery of Chloromethane outside of control limits (64.0% recovery, QC limits 70-130%). Recovery in the Laboratory Control Sample Duplicate (LCSD) and Relative Percent Difference (RPD) between the LCS and LCSD were within control limits.

Analytical Report for STAT Work Order: 17080223 Revision 2

RE: 3205171606, City Of Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 9 samples for the referenced project on 8/7/2017 3:45:00 PM. The analytical results are presented in the following report.

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Martin Kucan

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

Analytical Report for STAT Work Order: 17080265 Revision 2

RE: 3205-17-1606, City of Chicago-JPSTA, 4301 W Chicago, Chicago, IL

Dear Mary Jank:

STAT Analysis received 15 samples for the referenced project on 8/8/2017 4:00:00 PM. The analytical results are presented in the following report.

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Martin Kucan

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

CASE NARRATIVE

Work Order: 17080265 Revision 2

Due to sample matrix, the PNA extract for sample B-9A (17080265-007) was concentrated to a final volume of 10mL, resulting in a 10 fold increase in reporting limits.

Analytical Report for STAT Work Order: 17080321 Revision 3

RE: 3205-17-1606, City of Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 13 samples for the referenced project on 8/9/2017 3:50:00 PM. The analytical results are presented in the following report.

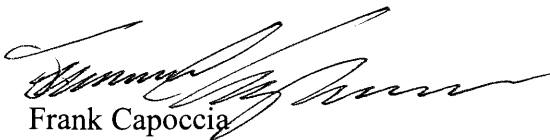

This report is revised to reflect additional analysis requested after the last report revision.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAP standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Frank Capoccia

Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

CLIENT: AMEC Foster Wheeler Environment & Infr
Project: 3205-17-1606, City of Chicago JPSTA, Chicago, IL
Work Order: 17080321 Revision 3

CASE NARRATIVE

At the customers request, sample ESB-6 (17080321-002) was prepared for VOC analysis from the unpreserved 1 L Amber Glass jar. The hold time was exceeded based on 7 day hold time for unpreserved sample. The request for analysis was made after the hold time expired. Methylene chloride present in the sample ESB-6 (17080321-002) is lab artifact.

Analytical Report for STAT Work Order: 17081066 Revision 0

RE: 3205-17-1606, Chicago JPSTA, Chicago, IL

Dear Mary Jank:

STAT Analysis received 2 samples for the referenced project on 8/29/2017 7:25:00 PM. The analytical results are presented in the following report.

All analyses were performed in accordance with the requirements of 35 IAC Part 186 / NELAC standards. Analyses were performed in accordance with methods as referenced on the analytical report. Those analytical results expressed on a dry weight basis are also noted on the analytical report.

All analyses were performed within established holding time criteria, and all Quality Control criteria met EPA or laboratory specifications except when noted in the Case Narrative or Analytical Report. If required, an estimate of uncertainty for the analyses can be provided. A listing of accredited methods/parameters can also be provided.

Thank you for the opportunity to serve you and I look forward to working with you in the future. If you have any questions regarding the enclosed materials, please contact me at (312) 733-0551.

Sincerely,

Justice Kwateng
Project Manager

The information contained in this report and any attachments is confidential information intended only for the use of the individual or entities named above. The results of this report relate only to the samples tested. If you have received this report in error, please notify us immediately by phone. This report shall not be reproduced, except in its entirety, unless written approval has been obtained from the laboratory. This analytical report shall become property of the Customer upon payment in full. Otherwise, STAT will be under no obligation to support, defend or discuss the analytical report.

APPENDIX D

Field Logs

7th / 28 / 17

①

900 AEH onsite. Have performed perimeter recon in vehicle. Walk-in entrance to site located along Kilbourn on south end Chicago Avenue on north. Tire tracks/ruts indicate a vehicle access point off Kostner just before CTA bus fenced entrance. Street parking appears legal on Chicago Ave north of site but not on Kilbourn or Kostner adjacent to the site.

MSET being locate folks expected to arrive ~9:00 am.

915 MSET onsite.

930 MSET truck up on to berm onsite via vehicle path off Kostner. Berm slope down to site is steep, will probably try with truck but not until drill rig onsite to help if needed.

950 B-7 (first marked) complete
10' accuracy

(2)

7/28/17 cont

1200 Layout of all borings complete.

Painted stakes & ribbon around.

1220 MSET (Bill W. & helper) depart site

1300 AEH departs

Andre & Harding 7/28/17

8/2/17

(3)

800 AEH exits, meet Geoff Tutty (Driller) on Kilbourn near SW entrance to site (barricaded).

810 AEH & Geoff drive around site to access path entrance near NE corner.

830 Review access point at NE, Ron Groff able to get down and up in Jeep.

840 Ron moves to evaluate parking situation and get drill rig to NE part of site.

845 Bill W. of MSET says Greg to arrive shortly to log borings for Geotech and to bringing well materials. Plan to start with env borings on south end because haven't had their locations revised. However Ron brought 2 1/4" auger today which he can't run with work with wells and wells are planned (to 20') for two Env borings on south.

945 Barrier open, prep work started at ESB-2 & ESB-3. South-center env borings. Barrier pulled in ward to site. Must replace at end of work at site.

(4)

8/2/17 (cont.)

1000 AEH stuck on conc pile (reel),
drill rig must pull free.

1020 Setting up at ESB-2, 1st
borings.

1035 Start ESB-2, 0-2' split screen.

1120 Done at ESB-2, moving to set up at
ESB-3.

1245 Done at ESB-2 on south berm.
Soon decide which borings next, possibly
Geotech.

1310 Setting up at Geotech B-7.
(SW corner of planned building 1)

1355 Continuation B-7, now geotech after
16' (not 8' cont), Ev 2.5' to 2.5',
then vary 5' 2.5-4.0'.
AEH still logging/observing.

1400 Bill Wyzgala (MSET) has been
on site repositioning round borings.
Leaves site, task complete.

Note - Site stinks awful today. Plants?
Weird because no well noted on Friday.
last week.

Note - Groff brought 2' (4" ID) augers today, mean
no 2" well possible unless hole stays open on own
and no Shelby tube possible.

8/2/17 (cont.)

(5)

1445 Done drilling at 40' B-7 hole. Must
pull augers, etc.

1500 Augers pulled, cuttings going down hole.

1525 Set to drill at B-4 (interim building, boring, 30')

1620 Drilling complete at B-4 and for
day. Clearing up cuttings.

1645 Drilling driving around debris
pile to knock down vegetation
for future GPR visit.

1700 AEH & MSET depart site. AEH at
camp on Kilbourn. Groff Loading ATV
on trailer. Barriers to remain open
during work.

1715 AEH & Groff depart site.

Chris V 8/2/17

8/3/17

- 900 AEH and MSET onsite for day 2 of drilling.
- 935 Grotf arrives onsite, well unload off trailer.
- 1000 Grotf unloaded and carefully moving to ESB-5 (target for temp well env). New catoper at south end of site.
- 1020 Setting up at ESB-5.
- 1025 AEH tells dollars that they can leave rig at the site overnight but it is at their risk and city client advises against.
- 1050 Set to drill, hold dds, safety talk, review and signoff on plans, new Grotf help. Review site hazards, contamination, and PPE.
- 1130 Byin buildings will at ESB-5.
- 1300 Well complete, moving to Building 1 geotech boring (out of sand & chips, so can't do more wells).
- 1310 Setting up on B-8. (No sample location)
- 1415 Done drilling at B-8, pulling assessor.
- 1435 Begins to rain.
- 1440 Thunder heard.

8/3/17 (cont.)

27

- 945 Waiting in vehicles on rain/thunder.
- 1500 End day. Thunder & rain continue.
- 1515 All depart site, AEH remains finishing Cox. Heavy rain and thunder. Sam start planned tomorrow.
- 1535 AEH departs site

8/9/17

- 1205-1300 Break B-6 to 30'
- 1400-1500 Break B-3 to 39.5'
- 1515 E. LAUKOMAN catch up in progress
 DISCUSS w/ MSET ON HYDRAULIC CONDUCTIVITY
 ALREADY SAMPLED. GREG INDICATED SAMPLE
 WAS COLLECTED FROM CLAY NATIVE.
 HIGH CENTRIFUGED NATIVE FILL (PERCHED ZONE)
 PREFERRED.
- 1530 E. TW OFFSITE
 GREG & MSET FINISHING FOR DAY
- 1600 DROP OFF SAMPLES @ STAT ANALYSIS.
 COC# 906943
- 1710 DROP OFF TRUCK / FIELD NOTES AT
 NIGGAS OFFICE
- 700 ESW onsite
- 715 AEH onsite
- 720 Driller getting set for drilling at B-2,
 north side of site up on berm.
- 730 AEH meet w/ driller after
 equipment xfer w/ Eric. Eric
 doing low flow sampling at
 ESB-5 (1st for TCh) and
 ESB-6 (2nd for PParticls & PNA).
- 740 Drilling at B-2 proceeds.
 ASEP review in field before
 start.
- 900 Drop at B-2, positioning at
 ESB-1 further up slope and
 into trees a bit from B-2.
- 915 Dr. to tra cam shifting ESB-1
 ~15' south. Still on berm, just not
 in tra line.
- 925 Start drilling ESB-1
- 1015 Done at ESB-1 AEH runs and chambers
 EDC. Almost done with well samples at
 ESB-6.
- 1035 Set to start at ~~ESB~~^{AEH}-B-1.

8/9/17 (cont.)

1100 ESW water sampling complete.
Departs site after refueling
bottles & equipment. Drills at
B-1 entrance.

1240 Drilling & sampling complete. Driller
cleaning up at B-18, last hole.
Still must conduct initial tests, pull
temp wells (2), fill all holes,
and pull barrier back in way
at SW entrance.

1315 Both temp wells (ESB-5 & ESB-6)
successfully pulled. Greg of MSET to
take all materials with Ben to site down
hole. MSET (Greg) conducting infiltration
test, Driller to load rig (or close to it)
and will fill existing holes across site.

1320 AEH has located all but 2 of 11
existing wells shown on survey of site.

1400 Spent ~30 minutes solely trying to find SE
most well, south of nearby well park, with
no success. Giving up.

1402 Measuring well pair:

Well	DTW (ft TOC)	DTB (ft TOC)
Well B (NW pair)	29.15	51.28
Well C (SE pair)	10.03	15.09

Well	DTW (ft)	DTB (ft)
Well D (NE pair)	25.96	44.27
Well A (SW pair)	26.26	44.04

1425 All ready to depart site, must
close barricade preventing vehicle
access.

1430 MSET offsite. AEH on Kilbourn
near entrance. Graft crew trying
to get barrier closed with jeep.

1450 Barricade looks good. Graft driller
in jeep will finish hole filling,
est 30-60 min more. Graft
drill rig on trailer offsite.

1500 AEH departs site for Lds.

Andrews 8/9/17

8/11/17

800 AEH onsite. Plan today is
to load survey wells onsite and
1 mee. DEW/OTB in wells and get
not measured (about half).

826 Jake Nordell: arrive for survey

830 Rain H&S in tailgate.

840 Begin survey.

Survey shots recorded on separate notes.

1230 Lunch and cool down break.

1330 Survey onsite resumes.

1600 Survey complete. Two circular transits
completed, all but 2 points included
in transits that tie back in.

AEH + JN depart site for day.

Suggested UCL to Use			
95% Approximate Gamma UCL	8.82		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Suggested UCL to Use			
95% Approximate Gamma UCL	8.82		
When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test			
When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL			
Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.			
Recommendations are based upon data size, data distribution, and skewness.			
These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).			
However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

Re: Soil Exploration and Analysis for Preliminary Site Development
Police & Fire Training Campus
Chicago, Illinois
MSET File No. 17439

Dear Ms. Jank:

Midland Standard Engineering & Testing, Inc. has completed a geotechnical exploration for the above referenced project.

Scope

The purpose of this exploration and analysis was to determine the various soil profile components, to determine the engineering characteristics of the subsurface materials and to provide criteria for use by the design engineers in preparing preliminary building foundation and site development plans. This report does not address environmental issues at the site. Environmental testing information is provided in a separate report by others.

The scope of this exploration included a geological reconnaissance of the site, subsurface exploration, soil testing and an engineering analysis and evaluation of the materials encountered.

General

The exploration and analysis of the foundation and subgrade conditions reported herein are considered sufficient in detail and scope to form a reasonable basis for preliminary design and project costing. This report has been prepared for the exclusive use and specific application to the proposed project.

The recommendations submitted are based on the available soil information and after discussion with the project engineer. Any revision in the plans for the proposed site development from those enumerated in this report should be brought to the attention of the Soils Engineer so that he may determine if changes in the recommendations are required. If deviations from the noted subsurface conditions are encountered during construction, they should also be brought to the attention of the Soils Engineer.

The Soils Engineer warrants that the findings, recommendations, specifications or professional advice contained herein have been promulgated after being prepared in accordance with generally accepted professional engineering practice in the fields of foundation engineering, soil mechanics and engineering geology. No other warranties are implied or expressed.

After the plans and specifications are more complete, it is recommended that the Soils Engineer be provided the opportunity to review the final design and specifications, in order that the earthwork and foundation recommendations may be properly interpreted and implemented. At that time, it may be necessary to submit supplementary recommendations.

Field Explorations

Our exploration program for the two proposed buildings consisted of drilling seventeen (17) structure borings, labeled B-1 through B-17, to depths of twenty-five (25) to forty (40) feet below the existing ground surface. Additionally, seven (7) borings, labeled ESB-1 through ESB-6 and B-18 were located to assess site conditions and for environmental testing by others.

The borings locations were staked at the site by MSET; reference the attached Boring Location Map. The ground surface elevation at each boring location was determined relative to the rim of a manhole in the eastbound lane of Kilbourn Avenue, with an assumed elevation of 100.0.

Drilling and Sampling Procedures

The soil borings were drilled using a track mounted drill rig equipped with a rotary head using hollow stem augers to advance the hole. Representative samples were obtained by the use of split-spoon sampling procedures in accordance with A.S.T.M. Procedure D-1586. Continuous sampling, back to back split spoons to a depth of sixteen feet, was conducted at all but two boring locations.

Field Tests and Measurements

Standard Penetration Tests - During the split-spoon sampling procedures, a standard penetration test was performed in accordance with current A.S.T.M. D-1586 Procedures. At sampling intervals, the sampler was lowered into the hole and seated in undisturbed soil by pushing or tapping, taking suitable precautions that the rods were reasonably tight. The sampling spoon was then advanced by driving using an automatic drop hammer. During the sampling procedure, the standard penetration value (N) of the soil was determined. The standard penetration value (N) is defined as the number of blows of a one hundred-forty pound (140 lb.) hammer required to advance the spoon sampler one foot (12") into the soil.

The results of the standard penetration tests indicate the relative density and comparative consistency of the soils, and thereby provide a basis for estimating the relative strength and compressibility of the soil profile components. The results of standard penetration tests can be found on the boring logs included in the attached documents.

Strength Tests - During the field boring operations, samples of the predominantly cohesive soil from the split-spoon sampling device were tested using a calibrated soil penetrometer to aid in determining the strength of the soil. Consideration must be given to the manner in which the values of the unconfined compressive strengths were obtained. Split-spoon sampling techniques provide a representative, but somewhat disturbed, soil sample.

Water Level Measurements - Water level observations were made during and after the boring operations and are noted on the boring logs presented herewith. In relatively pervious soils, such as sandy soils, the indicated elevations are considered reliable ground water levels. In relatively impervious soils, the accurate determination of the ground water elevation may not be possible, even after several days of observation. Seasonal variations, temperature and recent rainfall conditions may influence the levels of the ground water table, and volumes of water that may influence construction conditions will depend on the permeability of the soils.

Well Installation and Field Permeability Test

Temporary ground water monitoring well pipes were installed in borings ESB-4 and ESB-6. At ESB-4, a falling head permeability test was conducted to determine the soil permeability. At this location, 15.5 feet of well pipe was installed to a depth of 13 feet below the ground surface with 2.5 feet of stick up. The screened interval is the lower 10 feet minus the end cap, set at roughly a depth of 2.75 feet to 12.75 feet. Clay at this location starts at a depth of 9 feet. The permeability test consists of filling the well pipe and timing the drop of the water level for several time intervals. A total of 4 trials were conducted.

Laboratory Testing

A laboratory testing program was conducted to ascertain engineering characteristics of the foundation materials necessary in preparing recommendations for the proposed construction. The soil laboratory work was performed in accordance with applicable ASTM standards.

The laboratory testing program included visual classification and moisture content, on all split-spoon samples. Cohesive soil samples obtained from the split-spoon were also tested for unconfined compressive strength (Q_u). A laboratory permeability test was conducted per ASTM 5084-90 on a clay sample from boring B-10. The results of this laboratory testing are presented on the attached boring logs.

Subsurface Conditions

Subsurface Soil Profile

The subsurface soil profile present at the site consists of 5.5 to 17.5 feet of FILL overlying natural buried Topsoil and stiff Silty CLAY grading to very stiff Silty CLAY glacial till and hard Clayey SILT to Silty CLAY glacial till.

The thicker sections of FILL are present in the berm areas along the north and south property lines/street borders. The FILL is mostly granular and classifies as SAND to SAND and GRAVEL, with varying amounts of clay and silt. Silty SAND, SM and Clayey SAND, SC are also present. The FILL is slightly to medium dense with most Standard Penetration test values of 6 to 20 blows per foot. The FILL contained Slag that is mixed in with the granular soil sporadically in all locations, and more prevalent at the base of the fill. Occasional concrete and brick fragments were noted as well as wood pieces in the FILL.

The natural soil profile underlying the FILL described above consists of stiff to very stiff CLAY buried Topsoil, typically 12 to 18 inches thick, overlying stiff to very stiff light grey Silt CLAY. With greater depth, very stiff brown and grey Silty CLAY overlies hard, and in some cases very hard grey Silty CLAY to Clayey SILT.

Moisture contents (Mc) in the buried Topsoil layer range from 25 to 42 percent with most Mc readings from 30 to 39 percent. Site borings ESB-3 and ESB-5 had high moisture readings in the buried Topsoil at Mc = 82 and 46 percent, respectively. The underlying light grey Silty CLAY had moisture contents, Mc of 23 to 29 percent and unconfined compressive strengths of (Qu) of 0.93 to 3.26 tons per square foot. Except at B-2, where the light grey Silty CLAY was very moist and soft, Mc = 43 to 44 percent and Qu=0.19 tsf, and at ESB-5 where Mc = 24 and Qu = 0.31 tsf.

The brown and grey Silty CLAY had Mc=18 to 25 percent and Qu=2.25 to 5.08 tsf, in all boring locations except B-13 and B-14, where Mc of 30 to 34 percent and Qu of 1.13 and 1.40, respectively, were recorded.

The hard to very hard Clayey SILT to Silty Clay glacial till had moisture contents Mc of 9 to 19 percent with typical Qu of 4.5 to 10.86 tsf and a few sample intervals of Qu = 2 to 3 tsf. At boring B-6, a SAND layer was present from a depth of 27.5 feet to 30 feet plus.

Details of the soil types encountered in the soil borings are presented on the attached Boring Logs.

Ground Water Observations

Ground water measurements were performed during and immediately after the drilling operations. Table 1 below summarizes the ground water level readings at the borehole locations. Details of the ground water measurements are presented on the attached boring logs.

Table 1 – Ground Water Measurements

Site Description and Location

The site is a triangular piece of property that lies south of W. Chicago Avenue, between Kilbourn Avenue and Tripp Avenue, in the Garfield Park/Humbolt Park neighborhood in Chicago. The site dimensions are roughly 2300 feet east to west and 740 feet north to south in the middle. The property is currently overgrown with fill berms located along a good portion of the north line and to about the west half of the south line. Previously, the site had railroad spur tracks that led into the site at W. Chicago Street and Kilbourn Avenue, and then dead ended on the east side of the site. The tracks have been removed with occasional wood ties and ballast exposed at the ground surface. The west end of the site is elevated above street level and contained by retaining wall structures.

Project Discussion

The project site is planned for a training campus for Chicago Police and Fire workers. The current site plans include a three-story building, 120,000 to 150,000 square feet in plan dimension, with a possible basement along W. Chicago Avenue, designated Building 1. A second building, labeled Building 2, is planned one story, 100,000 SF, high bay metal structure located in the northeast portion of the site. Either of these buildings may have a pool for rescue training.

Planned site improvements include parking lots to the west of Building 1 and surrounding Building 2 on three sides. Along the north property line, fire training aids will be constructed. These may consist of 3 story towers to practice fire rescues. In the south central portion of the site, a paved area is planned for truck driver training and other vehicle training.

Recommendations

Site Mass Grading and Subgrade Preparation

The site has been filled to raise the grade for the former rail yard, and fill was used to form berms along the north and a portion of the south property lines. This fill is mostly granular, sands to sand and gravel with varying amounts of silt and clay and cinders or slag. The site sits high, compared to surrounding streets and final grade has not yet been determined.

In non-green areas, all surface vegetation, railroad debris, or unsuitable support materials should be removed at the start of fill operations. Depending on site design grades, the large fill berms along portions of the north and south property lines will be removed or used as site fill. The site is a former rail yard and the existing Fill is expected to have some debris throughout, including slag and cinders. Larger items such as clay and concrete pipe, and/or concrete slabs should not be incorporated in the fill unless crushed to 3 inches or less. Wood railroad ties

should be removed from the site. Other debris, exposed in the site grading, may occur that should not be allowed in the structural fill.

After stripping the existing vegetation, tree removal, and removal of unsuitable underlying soils, subgrade preparation can begin. The grade should be cleaned of debris or other unsuitable accumulation. In areas to receive Structural FILL or at design grade, the exposed subgrade soils should be compacted, with a minimum of five passes of a heavy vibratory roller, then proof-rolled and examined for soft, loose or unstable areas. Proof-rolling should be done with a loaded semi-dump truck, rubber tired end loader or similar equipment with a wheel load sufficient to locate any soft or unstable areas. Any localized areas of unstable or otherwise unsuitable materials should be removed to the depth encountered or treated with a stabilizing layer on which base course layers can be constructed.

Structural Fill

Material used as Structural FILL for the yard area should be a cohesive (clay type) material, classified as 'CL' 'CL-ML' or a clean (low fines content) granular material such as 'SP', 'SW', 'GP' or 'GW', in accordance with ASTM D-2487, Classification of Soils for Engineering Purposes. The structural FILL should be placed in 9-inch maximum lifts loose measure, dried to within 2 percent of its optimum moisture content, and compacted to 95 percent of the maximum dry density as defined by ASTM D-1557.

Utility Trench Backfill

The trenches for utilities should be backfilled in accordance with the requirements of the project specifications. Pipes should be bedded in the specified bedding material. All trenches within any building, pavement areas, or supporting adjacent pavement or sidewalks should be backfilled and compacted to a minimum 95 % of the maximum dry density as defined by ASTM D-1557. Outside the limits of the building and pavement areas, compaction to 90% of ASTM D-1557 will be satisfactory.

For backfill supporting pavements or other utilities, granular trench backfill such as well-graded sand, crushed stone, or sand and gravel mixtures should be used. Controlled backfilling should be accomplished by placing the backfill materials in lifts not exceeding 9" loose measure and compacting the material with the appropriate equipment. Where imported granular soils are used for backfill, these should be adjusted to the correct moisture content for compaction, then placed in a controlled manner. Jetting, inundation, or flooding is not considered an appropriate or effective method of compaction for granular trench backfill on this site. The specifications should prohibit the use of these methods.

Foundation Recommendations - Building 1 – 4-Story Campus Building

The former rail yard was filled considerably to provide rail access using an overpass of Chicago Avenue. The fill is medium dense with some slightly dense granular material that is typically looser with depth. This existing granular fill will be suitable for support of pavements and floor slabs, but not suitable for building foundations. As such, it is recommended that foundations be located in underlying natural deposits. The existing FILL at the site was not constructed to support foundation loads for a building structure and a conventional shallow depth wall and column footings cannot be used without reconstructing or treating the existing fill at considerable cost to the project.

Design floor grades and whether a basement will be incorporated in the design will dictate the most economical foundation type. Design elevations for the structure have not been established as of this report. Table 2 below shows the foundation bearing elevations and recommended bearing pressures for conventional wall and column footings and for drilled piers for use in preliminary design and project costing. Depending on the first-floor elevation, a structure with a deeper basement may result in minor footing undercuts in areas to reach bearing soil, and therefore, footings to support the building may be more feasible. A structure without a basement will likely result in a drilled pier foundation being more feasible.

Table 2 – Building 1 Foundation Bearing Depths/Elevations

Boring No.	Ground Surface Elev.	Depth to 5000 psf for Footings	Elevation 5000 psf Footings	Depth to 14 ksf for Drilled Piers	Elevation 14 ksf for Drilled Piers
B-1	108.9	18.0	90.9	27.5	81.4
B-2	108.0	21.5	86.5	23.0	85.0
B-3	101.4	14.0	87.4	20.5	80.9
B-4	104.3	12.5	91.8	21.5	82.8
B-5	103.2	15.5	87.7	21.0	82.2
B-6	110.3	20.5	89.8	32.0	78.2
B-7	106.3	17.5	88.8	22.0	84.3
B-8	103.5	13.0	90.5	23.0	80.5
B-9	102.4	14.0	88.4	23.0	79.4

Foundation Recommendations - Building 2 – Single Story, High Bay, Metal Building

We expect this building to have a floor slab elevation near the existing grade at project elevation 98 to 100. Suitable bearing soil is 8 to 12 feet below this level, so recommended foundation types, are stepped down footings or short, drilled piers with grade beams.

Table 3 – Building 2 Foundation Bearing Depths/Elevations

Boring No.	Ground Surface Elev.	Depth to 3000 psf for Footings	Elevation 3000 psf Footings	Depth to 4000 psf for Footings	Elevation 4000 psf Footings
B-10	98.5	8.5	90.0	10.5	88.0
B-11	100.0	9.0	91.0	12.0	88.0
B-12	98.3	6.5	91.8	8.5	89.8
B-13	98.5	8.0	90.5	12.0	86.5
B-14	97.9	6.5	91.4	10.0	91.4
B-15	101.8	13.0	88.8	14.5	88.8
B-16	99.9	11.0	88.9	11.0	88.9
B-17	99.2	10.0	89.2	10.0	89.2

This structure can also be constructed with frost depth footings if Geopiers are used to create bearing strength in the upper existing FILL. Geopiers consists of properly spaced compacted aggregate columns, compacted with specialized equipment to densify the column and surrounding soil. A load transfer pad, typically aggregate reinforced with a geogrid, is used across the column matrix, to convey building loads.

Seismic Design Parameters

For the site seismic design calculations, the Spectral Response Accelerations from the 2003 NEHRP Seismic Design Provisions have been computed using the USGS website. The International Building Code (IBC) site classification definition is Class D. Please reference "2012/2015 International Building Code" Spectral Response Acceleration calculation sheet that is attached to this report for the computed design parameters. The resulting seismic design parameters are $S1=0.062\text{ g}$ (0.0 sec), $SM1=0.149\text{ g}$ (0.2 sec), and $SD1=0.099\text{ g}$ (1.0 sec).

Foundation Undercuts

Foundation undercut, where necessary and replaced with granular Structural Fill, should be extended horizontally one foot wider than the footing, on each side, plus one foot for each foot of undercut below the design footing elevation. Material used as granular Structural FILL under building foundations (undercuts) should be a crushed, select granular material such as Illinois Department of Transportation (IDOT) CA06, or approved equal. The material should be placed and compacted per the specification for 'Structural FILL'.

Design Parameters Slab-On-Grade - Interior

A six (6) inch minimum thickness granular FILL of well-graded aggregate such as IDOT CA-06 crushed stone should be used over the subgrade and under the slab. Based on the indicated thickness of granular sub base, a design subgrade modulus of 150 pounds per cubic inch for cohesive (clayey) subgrades and 200 pounds per cubic inch for granular subgrades (existing upper FILL) may be used for the slab design.

These values are representative of the design soil type and assume that the subgrade is properly dried and compacted prior to the slab construction. This means all areas disturbed by the superstructure erection are corrected in accordance with the plans and specifications.

Basement for Building 1

It is our understanding that a basement may be used for Building 1. Depending on final grades, a basement floor subgrade may be at or near the buried topsoil layer/ original ground elevation. If this is the case soft soil layers and or organic soil, as well as ground water may be present at this level. The basement floor subgrade should be inspected for strength and consistency and repaired with soil undercut/stone backfill replacement as necessary prior to floor construction. This would require a construction dewatering system in place during the work until the design basement dewatering, sumps and drains, and site storm sewer systems are in place and functioning.

Swimming Pool

A swimming pool for training is included in the plans for the campus. At this time, the pool may be located in either of the two buildings. The pool is expected to have similar soil subgrade problems as described in the basement section above. The pool will be below the prevailing ground water level in the borings and should be checked for buoyancy forces in the empty condition during pool service, and designed accordingly. Lateral earth pressures for design are shown below.

Lateral Earth Pressures for Structure Design

An undrained at rest earth pressure can develop for below grade concrete walls for pools and basements, rigidly restrained at the top by the floor slab. The following table outlines the earth pressure loading for design of these walls, based on these conditions. The effects of surcharge loads and live loads on the surface behind the wall must then also be added to these earth pressures.

Soil Description	Moist Unit Weight	Submerged Unit Weight	Angle of Internal Friction	At Rest Earth Pres. Coefficient	Equiv. Fluid Pressure
Granular FILL	125 pcf	63 pcf	30°	0.50	94 psf/ft*
Cohesive (Clayey)	130 pcf	68 pcf	28°	0.53	98 psf/ft*

Note * - Includes water pressure.

For sliding restraint, a soil to concrete friction coefficient of 0.30 for clays and 0.45 for the granular soil can be used.

Soil Permeability and Infiltration

Soil permeability testing was conducted on the existing granular FILL and underlying natural Silty CLAY. The granular FILL was tested for soil permeability in place at boring location ESB-4. The permeability of the Silty CLAY present at boring B-10 from a depth of 11 to 13 feet was determined by performing a laboratory hydraulic conductivity tests. The resulting soil permeability are:

Existing Granular FILL – Sand, little to some Gravel, trace Clay, SP-GP $k = 8.8 \times 10^{-4}$ cm/sec
Natural Silty CLAY–Brown & Grey Silty CLAY, trace Sand & Gravel, CL $k = 4.2 \times 10^{-7}$ cm/sec

Site surficial water infiltration will readily permeate or infiltrate through the upper granular fill and then essentially stop at the underlying natural clay soil profile.

Pavement Design Parameters

The pavement design should consider the strength of the subgrade soil, the number or frequency of vehicles and their axle load, the increase of traffic over the design life of the pavement, and the strengths and thickness of various pavement section materials. Both the AASHTO Design Method and the Mechanistic Design Method are commonly used to determine pavement section thicknesses. The results of these designs are subject to minimum standards provided by the local plan review agency. The materials used for the pavement section should be in accordance with the current Illinois Department of Transportation "Standard Specification for Road and Bridge Construction" and the "Supplemental Specifications and Recurring Special Provisions". A design bearing ratio of IBR=5 is appropriate for pavement section analysis for the subgrade soils prepared as recommended in this report.

Pavement Thickness

Recommended pavement sections have been selected using the AASHTO design method, and are adjusted for Illinois regional and material factors as recommended by the Illinois Department of Transportation "Pavement Design Manual". The design method takes into consideration traffic loading for a 20-year pavement design life, the subgrade support value and structural layer coefficients for each component of the pavement system.

It is our understanding that the facility will be used to train fire truck drivers. Considering an assumed truck traffic loading, the recommended pavement section thickness for these areas are listed below:

Flexible Pavement		Rigid Pavement	
Material	Layer Thickness	Material	Layer Thickness
Bituminous Surface	1.5"	PC Concrete	7.0"
Bituminous Binder	3.0"	Granular Base Course	4.0"
Granular Base Course	10.0"		

Notes

^{1,2} Illinois Department of Transportation Standard Specifications for Road and Bridge Construction, Section 406, Hot Mix Asphalt Binder and Surface Course and Section 1030, Hot Mix Asphalt, High ESAL, N50 Design.

³ Illinois Department of Transportation Standard Specifications for Road and Bridge Construction, Section 351, Aggregate Base Course and Section 1004, Coarse Aggregate, IDOT CA06 gradation.

⁴ Illinois Department of Transportation Standard Specifications for Road and Bridge Construction, Section 420, Concrete Pavement and Section 1020, Portland Cement Concrete, Type PV and SI.

General Construction Recommendations

Excavations

Excavations into the granular soil profile, especially below the prevailing ground water levels will not stand vertical throughout the construction phase and will require sloping back or bracing of the sidewalls. Please note that OSHA and local codes require the use of shoring and bracing in the excavations during foundation installation and other excavation work, therefore the contractor should be well versed in these requirements.

Excavations below project elevation 93 to 95 will likely encounter ground water inflow and the contractor should be prepared to pump this water to maintain stable work conditions to avoid softening or loosening of soil.

Structural FILL and Earthwork Controls

Moisture-density relationships should be developed from materials obtained from the site excavations and from off-site borrow sources. These relationships should be used to monitor FILL and backfill placement and compaction.

Construction Materials Engineering

Foundation installation procedures should be reviewed prior to construction. Bearing materials should be sampled and tested for adequate strengths. Excavated soils and borrow materials should be evaluated for use in the project earthwork. A representative of the Geotechnical Engineer should be present during earthwork operations and foundation installation to ensure compliance with the Plans and Specifications.

Summary

The recommendations presented herein are based on the information available at the time of this writing. After the plans and specifications are more complete, we welcome the opportunity to review them with respect to prevailing soil and ground water conditions.

At that time, it may be necessary to conduct further analysis and submit supplementary recommendations. If the plans are changed with respect to the locations of structures or loading conditions, the soils information must be reviewed to determine whether it is pertinent to the new plans.

Closure

Thank you for the opportunity to provide our services. Please contact us with any questions you have regarding foundation design, earthwork, and construction for the project.

Sincerely,
MIDLAND STANDARD ENGINEERING & TESTING, INC.

William J. Wyzgala, P.E.
Principal Engineer

USGS Design Maps Summary Report

User-Specified Input

Report Title Chicago Police & Fire Training Campus
 Fri August 25, 2017 14:09:23 UTC

Building Code Reference Document 2012/2015 International Building Code
 (which utilizes USGS hazard data available in 2008)

Site Coordinates 41.89368°N, 87.73813°W

Site Soil Classification Site Class D - "Stiff Soil"

Risk Category I/II/III

USGS-Provided Output

$S_S = 0.137 \text{ g}$	$S_{MS} = 0.219 \text{ g}$	$S_{DS} = 0.146 \text{ g}$
$S_1 = 0.062 \text{ g}$	$S_{M1} = 0.149 \text{ g}$	$S_{D1} = 0.099 \text{ g}$

For information on how the SS and S1 values above have been calculated from probabilistic (risk-targeted) and deterministic ground motions in the direction of maximum horizontal response, please return to the application and select the "2009 NEHRP" building code reference document.

GENERAL NOTES

PARTICLE SIZE DESCRIPTION & TERMINOLOGY

Coarse Grained or Granular Soils have more than 50% of their dry weight retained on a #200 sieve; they are described as: boulders, cobbles, gravel or sand. Fine Grained soils have less than 50% of their dry weight retained on a #200 sieve; they are described as: clays or clayey silts if they are cohesive and silts if they are non-cohesive. In addition to gradation, granular soils are defined on the basis of their relative in-place density and the fine grained soils on the basis of their strength or consistency and their plasticity.

Major Component of Sample	Size Range	Descriptive Term of Components Also Present in Sample	Approximate Quantity (Percent)
Boulders	Over 8 in. (200 mm)	Trace	1 - 9
Cobbles	8 inches to 3 inches (200 mm to 75mm)		
Gravel	3 inches to #4 sieve (75mm to 4.75mm)	Little	10 - 19
Sand	#4 to #200 sieve (4.75mm to 0.075mm)	Some	20 - 34
Silt	Passing #200 sieve (0.075mm to 0.002mm)	And	35 - 50
Clay	Smaller than 0.002mm		

RELATIVE DENSITY AND CONSISTENCY CLASSIFICATION

GRANULAR SOILS

DENSITY CLASSIFICATION	APPROXIMATE RANGE OF N *
Very Loose	0 - 3
Slightly Dense	4 - 9
Medium Dense	10 - 29
Dense	30 - 49
Very Dense	50 - 80
Extremely Dense	80 +

COHESIVE SOILS

CONSISTENCY	UNCONFINED COMPRESSIVE STRENGTH, Qu - TSF	APPROXIMATE RANGE OF N *
Very Soft	0.25	0 - 2
Soft	0.25 - 0.49	3 - 4
Firm	0.50 - 0.99	5 - 8
Stiff	1.00 - 1.99	9 - 15
Very Stiff	2.00 - 3.99	16 - 30
Hard	4.00 - 8.00	31 - 50
Very Hard	8.00 +	Over 50

* STANDARD PENETRATION TEST (ASTM D1586) - A 2.0" outside-diameter, split barrel sampler is driven into undisturbed soil by means of a 140 pound weight falling freely through a vertical distance of 30 inches. The sampler is normally driven 3 successive 6 inch increments. The total number of blows required for the final 12 inches of penetration is the Standard Penetration Resistance (N).

Joint Public Safety Training Campus (JPSTC) Traffic Impact Study

City of Chicago
121 N LaSalle St
Chicago, IL 60602

For Chicago Department of Transportation Review

June 11, 2020

Executive Summary

The City of Chicago has contracted the Public Safety and Community Builders Joint Venture to design and build the new Joint Public Safety Training Campus (JPSTC) for the City's first responders. The 30-acre project site is located at 4301 W. Chicago Avenue and will provide Chicago Fire and Police departments (CPD and CFD) with a modern facility where scenario-based training can occur. The main training facility will have 380 off-street parking spaces. Access to this surface lot will be off of Kilbourne Avenue. In addition to this facility, the proposed campus will contain two restaurants. One of these is a 9,000 square foot sit-down breakfast restaurant with no drive-through service (Peaches) and the other is a 7,000 square foot fast casual restaurant (Culver's) with drive-through service. As part of this development, the Chicago Transit Authority (CTA) access route currently at Kostner Avenue will be realigned to Kolin Avenue. This campus will be constructed in multiple phases with estimated groundbreaking in December 2020 and completion in December 2022.

This study evaluates traffic operations on the nearby road network in existing year (2020) and future year (2022) scenarios for the AM and PM peak hour. Future (2022) traffic volumes within the study area include the background traffic growth due to regional population or employment changes, and site generated traffic volumes from the proposed site development. This report has not considered other potential developments which may be occurring with the study area.

The Chicago Metropolitan Agency for Planning (CMAP) provided projections for the surrounding roadway network. Their travel demand model indicated a 1% total growth rate from existing (2020) to future (2022) background traffic volumes. This growth rate was applied to existing (2020) traffic volumes at all study intersections to project future (2022) background traffic volumes.

The JPSTC site generated traffic includes traffic that would be added to the system as a result of the JPSTC, Peaches and Culvers end users. The CPD and CFD users will arrive at the site significantly earlier than the AM peak hour of the surrounding roadway network while the Peaches and Culvers traffic will coincide with the AM peak hour of the surrounding street network. Therefore, only the Peaches and Culvers traffic is captured in the AM peak analysis. All traffic contributing to the JPSTC training facility will depart in concurrence with the surrounding networks PM peak hour. Site generated traffic due to the JPSTC campus will add 103 vehicles¹ during the AM peak and 638 vehicles during the PM peak.

Synchro traffic analysis software was used to determine the intersection level of service (LOS) and 95th percentile queue lengths in the existing (2020) and future (2022) conditions. Key findings of the analysis are listed below:

W Chicago Avenue and N Kilbourn Avenue (West)

This intersection is operating at a LOS D in existing condition (2020) during the AM peak hour and a LOS C in the PM peak hour with the lowest LOS experienced by the eastbound through (EBT) movement at LOS E during the AM peak hour. The 95th percentile queues along W Chicago Avenue are greatest in the EB direction during the AM peak (approximately 800 feet) and in the WB direction during the PM peak (approximately 700 feet). The long queues are created by reducing the four-lane cross section to a two-lane cross section at this intersection due to the viaduct constraint.

In the 2022 Build condition, this intersection is expected to operate at a LOS C and LOS D in the AM and PM, respectively, with signal timing adjustment. All individual movements operate at a

¹ Representing only restaurant trips during AM peak hour of surrounding street. For more details refer Section 4 of this report.

LOS D or better indicating no significant impact from proposed development. However, restriping the westbound approach at N Kilbourne and Chicago Avenue to provide a left turn lane to improve safety for this movement is recommended as part of this study.

W Chicago Avenue and N Kolin Avenue

Due to the realignment of the CTA Access Road, the northbound approach at this intersection is expected to operate a LOS F during the 2022 Build condition. The northbound left turn will experience an average delay of 95 seconds in the AM peak and 105 seconds in the PM peak compared to an existing 25 seconds of delay. Although northbound approach experiences such a high delay, the 95th percentile queues will not be longer than 4 vehicles at this approach. A signal warrant analysis was performed for this intersection to determine if the intersection warrants a traffic signal in 2022. Based on the analysis, the W Chicago Avenue and N Kolin Avenue intersection does not warrant a traffic signal in 2022. That said the implementation of a signal would improve the LOS for this intersection and likely improve on the queue length for the CTA. A decision to place a signal at this intersection should be discussed between CDOT and the CTA.

N Kilbourne Avenue and Ohio Street

All-Way Stop Controlled (AWSC) Intersection on N Kilbourne Avenue at Ohio St and Lake St is operating with LOS C or better in the existing and 2022 no-build conditions, and LOS F for southbound movement during PM peak hour during 2022 build condition with approx. 250 feet queue lengths. Once, development is in place, it is expected to add northbound/southbound traffic on N Kilbourne Avenue and hence, conversion of 'Two-Way Stop Controlled (TWSC)' with stop sign at Ohio St will improve this intersection to LOS C or better for 2022 build condition.

All other intersections within the study area are operating with LOS D or better in the existing and 2022 conditions with reasonable queue lengths.

1. Introduction

1.1 Project Background

The City of Chicago has contracted the Public Safety and Community Builders Joint Venture to design and build the new Joint Public Safety Training Campus for the City's first responders. The 30-acre project site is located at 4301 W. Chicago Avenue and will provide Chicago Fire and Police departments (CFD and CPD) with a modern facility where scenario-based training can occur. The campus is located east of N Kilbourn Ave and south of W Chicago Ave. The campus will consist of a 185,000 square foot primary training and office building, approximately 380 off-street parking spaces, and an outdoor training facility which will include a mock streetscape, a six-story burn tower, and a drive training pad. An outdoor plaza space, approximately 16,000 square foot, has been dedicated for community use and programming. The plaza will have a prime location on Chicago Avenue and will be located in between the primary training building and the development lots.

The proposed Chicago Avenue development will also contain two restaurants on positioned on lots which front Chicago Avenue. One restaurant is 9,000 square foot with no drive-through service (/Peaches). The other restaurant is a 7,000 square foot fast casual restaurant (Culver's) with drive-through service.

1.2 Purpose and Objectives

The purpose of this report is to summarize and evaluate the following:

- **Existing Conditions (2020)** - Section 2 provides a description of the existing road network, transit service, and traffic volumes of vehicles, bikes and pedestrians at study intersections.
- **Proposed Development.** Section 3 presents the proposed development plan including vehicle trip generation and distribution.
- **Future Conditions (2022).** Section 4 presents estimated total traffic volumes in the full build out year (2022). This traffic is the sum of background traffic growth and the site generated trips.
- **Traffic Analysis.** Section 5 reports the results from existing (2020) and future (2022) traffic analysis, including delays, LOS and 95th-percentile queue length from Synchro evaluations.
- **Conclusion** Section 6 summarizes the key assumptions and findings of this traffic study.

The objective of this study is to evaluate and mitigate the impacts of the proposed development on the nearby street network.

2. Existing (2020) Conditions

This section provides a description of the existing road network in the vicinity of the proposed JPSTC site, existing transit service that serves the site, and collected traffic volumes of vehicles, bikes and pedestrians at study intersections.

2.1 Site Location and Study Area

The proposed JPSTC is located at 4301 W Chicago Ave in Chicago, Illinois, east of N Kilbourn Ave and south of W Chicago Ave. The 30-acre site is currently undeveloped and is surrounded by residential, commercial and manufacturing land uses. There are no nearby planned developments at this time.

Figure 1: Site location with Respect to the Surrounding Street System

2.2 Transportation System

2.2.1 Roadway Characteristics

The study area is comprised of the following streets:

W Chicago Avenue is a 30-mph minor arterial four lane cross section with two 11' lanes in the eastbound direction and two 11' lanes in the westbound direction. Left turn lanes are provided at major cross streets such as N Kostner Avenue. At the West N Kilbourn Avenue intersection, Chicago Ave narrows from a four-lane section to a two-lane section to accommodate the narrow Belt Ry. Co. of Chicago (BRC)² railway viaduct.

IDOT function class: Minor Arterial

CDOT classification: Thoroughfare

Jurisdiction: CDOT

N Kilbourn Avenue is a 30-mph north-south street separated by Chicago Avenue into two segments. N Kilbourn Avenue to the south of Chicago Avenue is a two-lane two-way street connecting Chicago Avenue and Lake Street. N Kilbourn Avenue to the north of Chicago Avenue is a one-way northbound street. Within the study area N Kilbourne Avenue passes predominantly through industrial developments.

IDOT function class: Local Road

CDOT classification: Neighborhood Street

Jurisdiction: CDOT

N Kostner Avenue is a 30-mph two-lane cross section with one lane in the northbound direction and one lane in the southbound direction. The segment south of Chicago Avenue (also called CTA Access Road) provides access to CTA's Chicago Avenue Garage. The CTA utilizes this garage daily. N Kostner Avenue is surrounded by mostly residential developments and provides access to the local street network.

IDOT function class: Local Road

CDOT classification: Neighborhood Street

Jurisdiction: CDOT

N Kolin Avenue is a 30-mph residential one-way southbound roadway. It provides parking on both sides of the corridor. N Kolin Avenue provides access to the driveways of the residential developments.

IDOT function class: Local Road

CDOT classification: Neighborhood Street

Jurisdiction: CDOT

² http://www.idot.illinois.gov/Assets/uploads/files/Transportation-System/Maps-&-Charts/RailRoad-Maps/2015_RR_MAP_CHICAGO_STLOUIS_AREA.pdf

W Ohio Street is a 30-mph east-west roadway serving an industrial development, which is generally comprised of two lanes, one in each direction, and parking on both sides of the corridor.

IDOT function class: Local Road or Street

CDOT classification: Neighborhood Street

Jurisdiction: CDOT

W Lake Street is a 30-mph major east-west arterial that runs in parallel with CTA's Green Line service. The roadway is comprised of four lanes, two lanes each direction with bike lanes and parking on both sides of the corridor. The piers of the elevated track separate the travel lanes of the same direction.

IDOT function class: Major Arterial

CDOT classification: Thoroughfare

Jurisdiction: CDOT

2.2.2 Public Transportation

- CTA Bus Route 66 runs along Chicago Avenue serving the study area and future development site. Route 66 operates between Navy Pier and Austin Boulevard with connections to the CTA Blue, Brown, Red, and Purple lines. Service is provided seven days a week.
- CTA Bus Route 54 also operates through nearby areas of the proposed site (Cicero & Chicago (North), Stop ID: 10301/15299, approx. 0.3 mile from proposed JPSTC) and serves areas between Cicero and W Chicago Avenue along N Cicero Avenue.

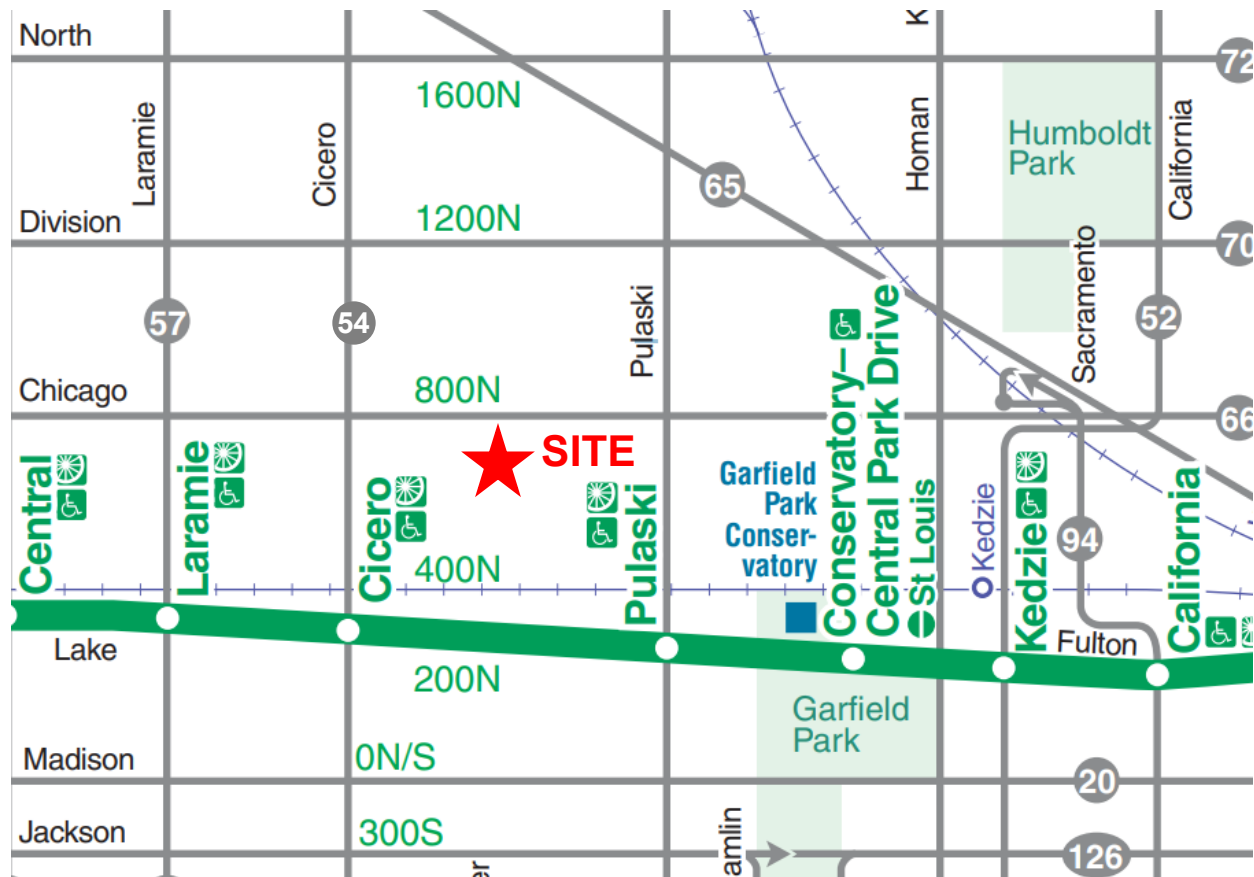

Figure 2: Public Transportation routes near JPSTC Site (Route 66 and 54)

2.2.3 Pedestrian Network

Pedestrian sidewalks (approximately 7 feet wide) are generally provided on both sides of all major streets within the study area.

2.2.4 Bicycle Network

A buffered bike lane is provided along Lake Street. Lake Street is considered a spoke route of Chicago’s bicycle network. There are no other dedicated or shared bike lanes provided on any streets within the study area.

2.2.5 Parking Facilities

On-street parallel parking is available on both sides of the W Chicago Avenue east of N Kilbourne Ave (East) intersection. This on-street parking is 8 feet wide. Parallel parking is also permitted on both sides of N Kilbourne Avenue.

2.3 Traffic Characteristics

2.3.1 Peak Hour Turning Movement Counts

Traffic data was collected on Tuesday, March 3, 2020 at six intersections as shown in **Figure 3**. It is important to note that the traffic data captured occurred before any shelter-in-place directions were put in place. As such, we are of the considered opinion that the data captured represents typical traffic data.

1. W Chicago Avenue and N Kilbourn Avenue (West) – Signalized and W Chicago Avenue and N Kilbourn Avenue (East) – Unsignalized³
2. W Chicago Avenue and N Kostner Avenue - Signalized
3. W Chicago Avenue and N Kolin Avenue – Unsignalized (TWSC)
4. N Kilbourn Avenue and W Ohio Street – Unsignalized (AWSC)
5. N Kilbourn Avenue and W Lake Street – Signalized

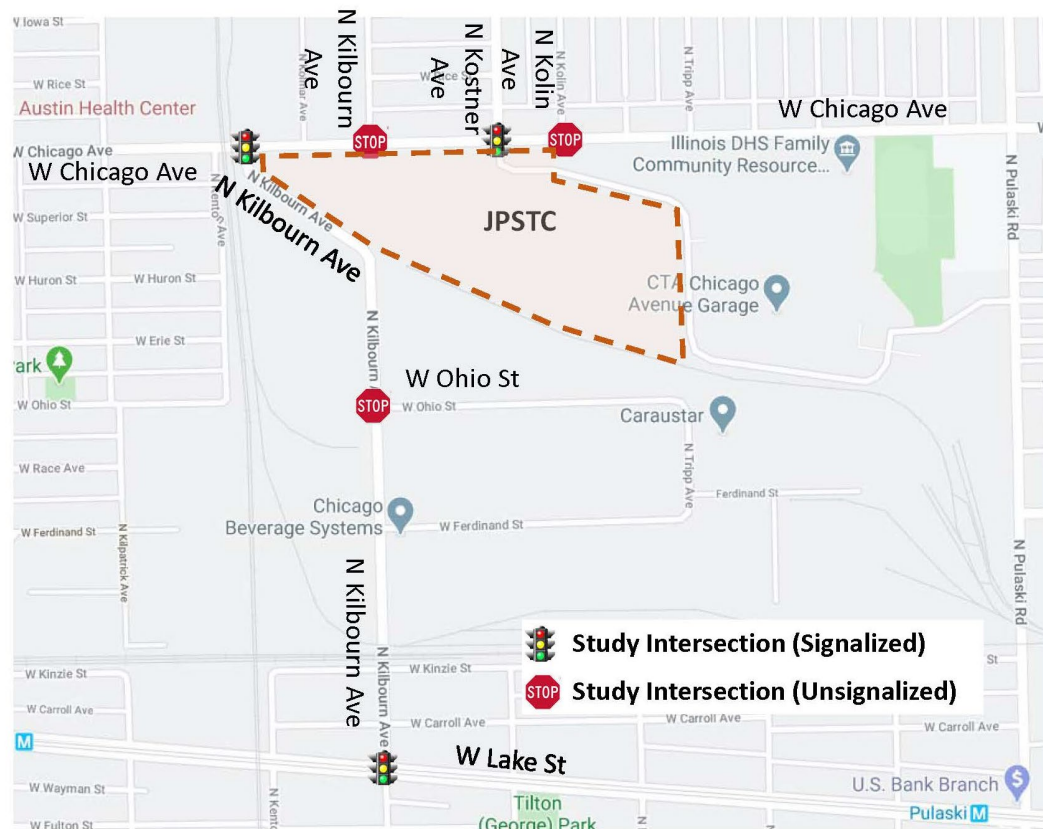

Figure 3: Study Intersections

Turning movement counts were collected for passenger cars, heavy vehicles, pedestrians and bicyclists during the AM peak hours (7am – 9am) and PM peak hours (3pm – 6pm). Additional

³ Third leg at this intersection is one-way so, no conflicting movement from third leg approaching this intersection and no stop sign. Eastbound left operates permissive.

data was collected from 6 am-7 am at the intersection of Kolin Avenue and Chicago Avenue to facilitate signal warrant analysis. **Based on the traffic counts, the AM peak hour for the study area is between 7:15 am and 8:15 am. The PM peak hour is between 3:45 pm and 4:45 pm.**

Figure 5 shows the existing peak hour vehicle traffic volumes. **Figure 6** shows the existing peak hour pedestrian and bicycle traffic volumes. Traffic count details are shown in **Appendix B**.

2.3.2 Average Annual Daily Traffic

Annual average daily traffic (AADT) data for all streets within the study area was obtained from the Illinois Department of Transportation's online traffic count database system.

Table 1 shows the existing AADT of major corridor segments within the study area.

Table 1. Existing AADT of Major Study Corridors

Corridor	AADT (vpd)
W Chicago Avenue	17,800
N Kilbourn Avenue (South)	6,350
N Kilbourn Avenue (North)	N/A
N Kostner Avenue	7,250
N Kolin Avenue	N/A
W Ohio Street	N/A
W Lake Avenue	13,100

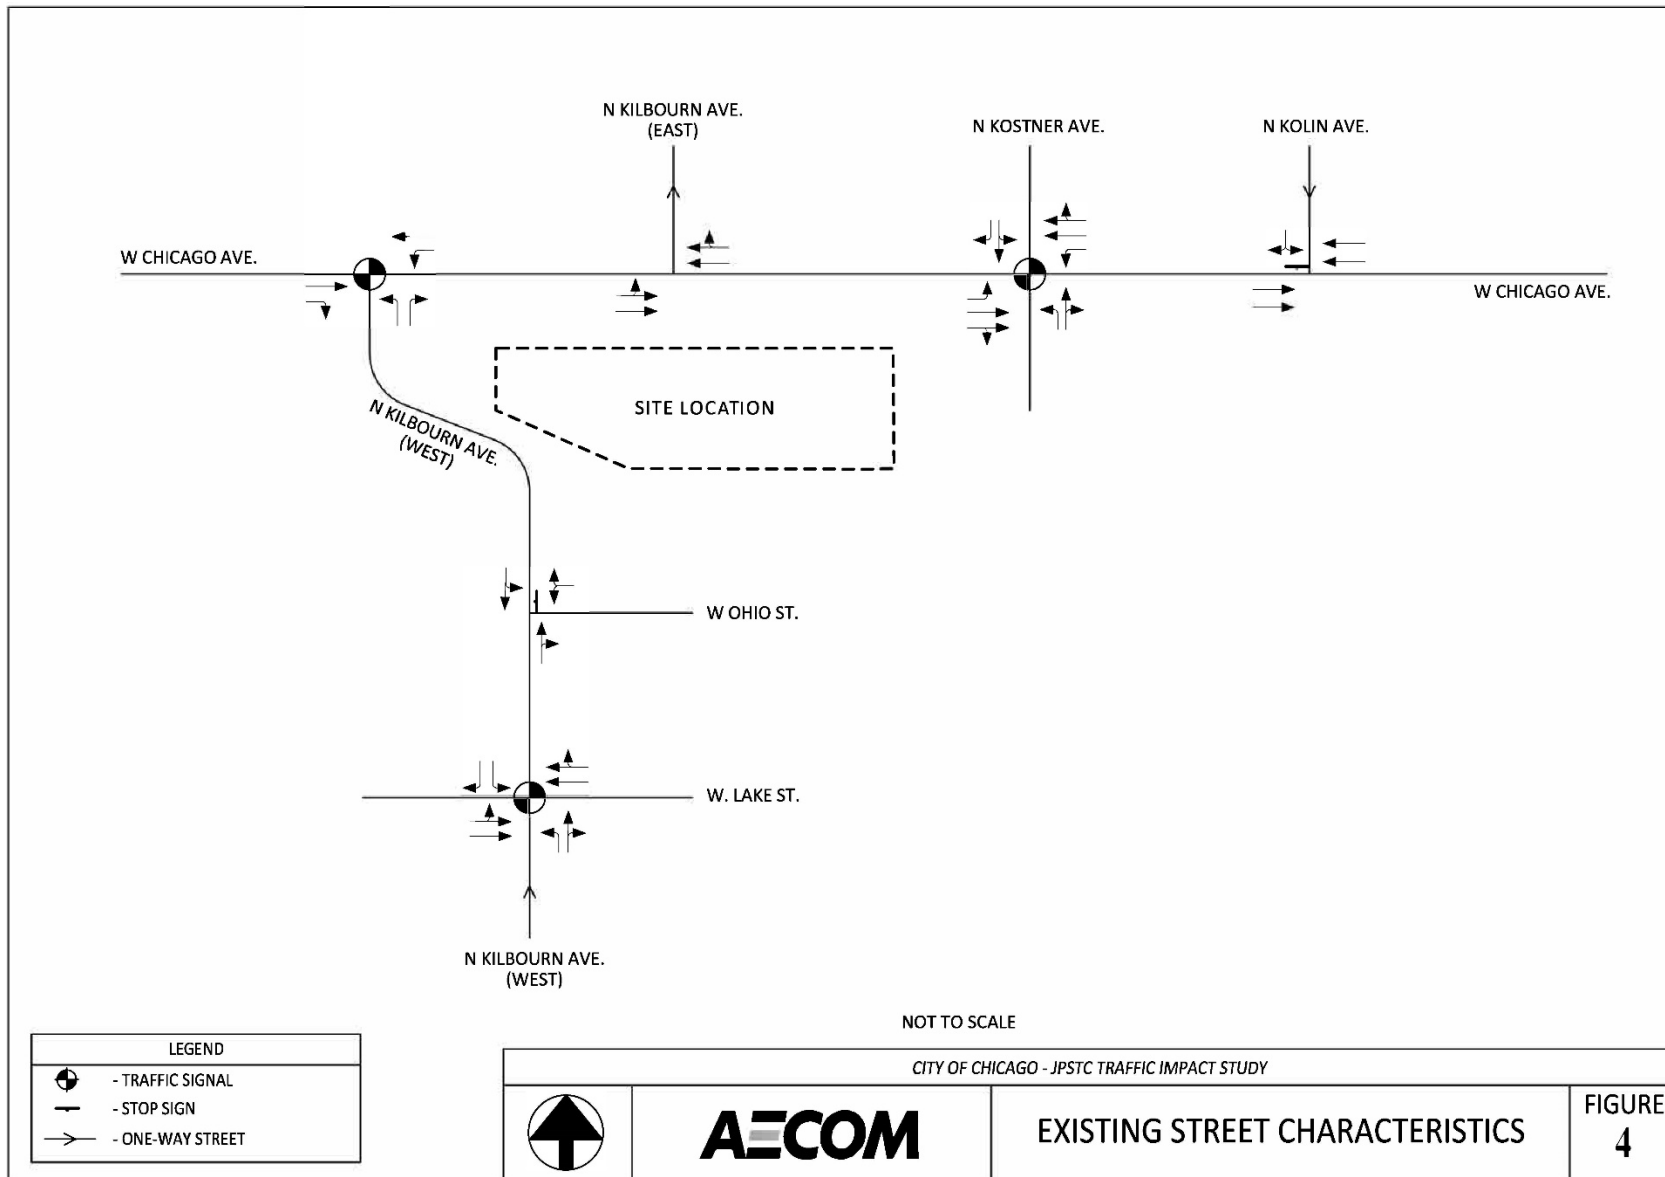

Figure 4: Lane Configurations at Study Intersections

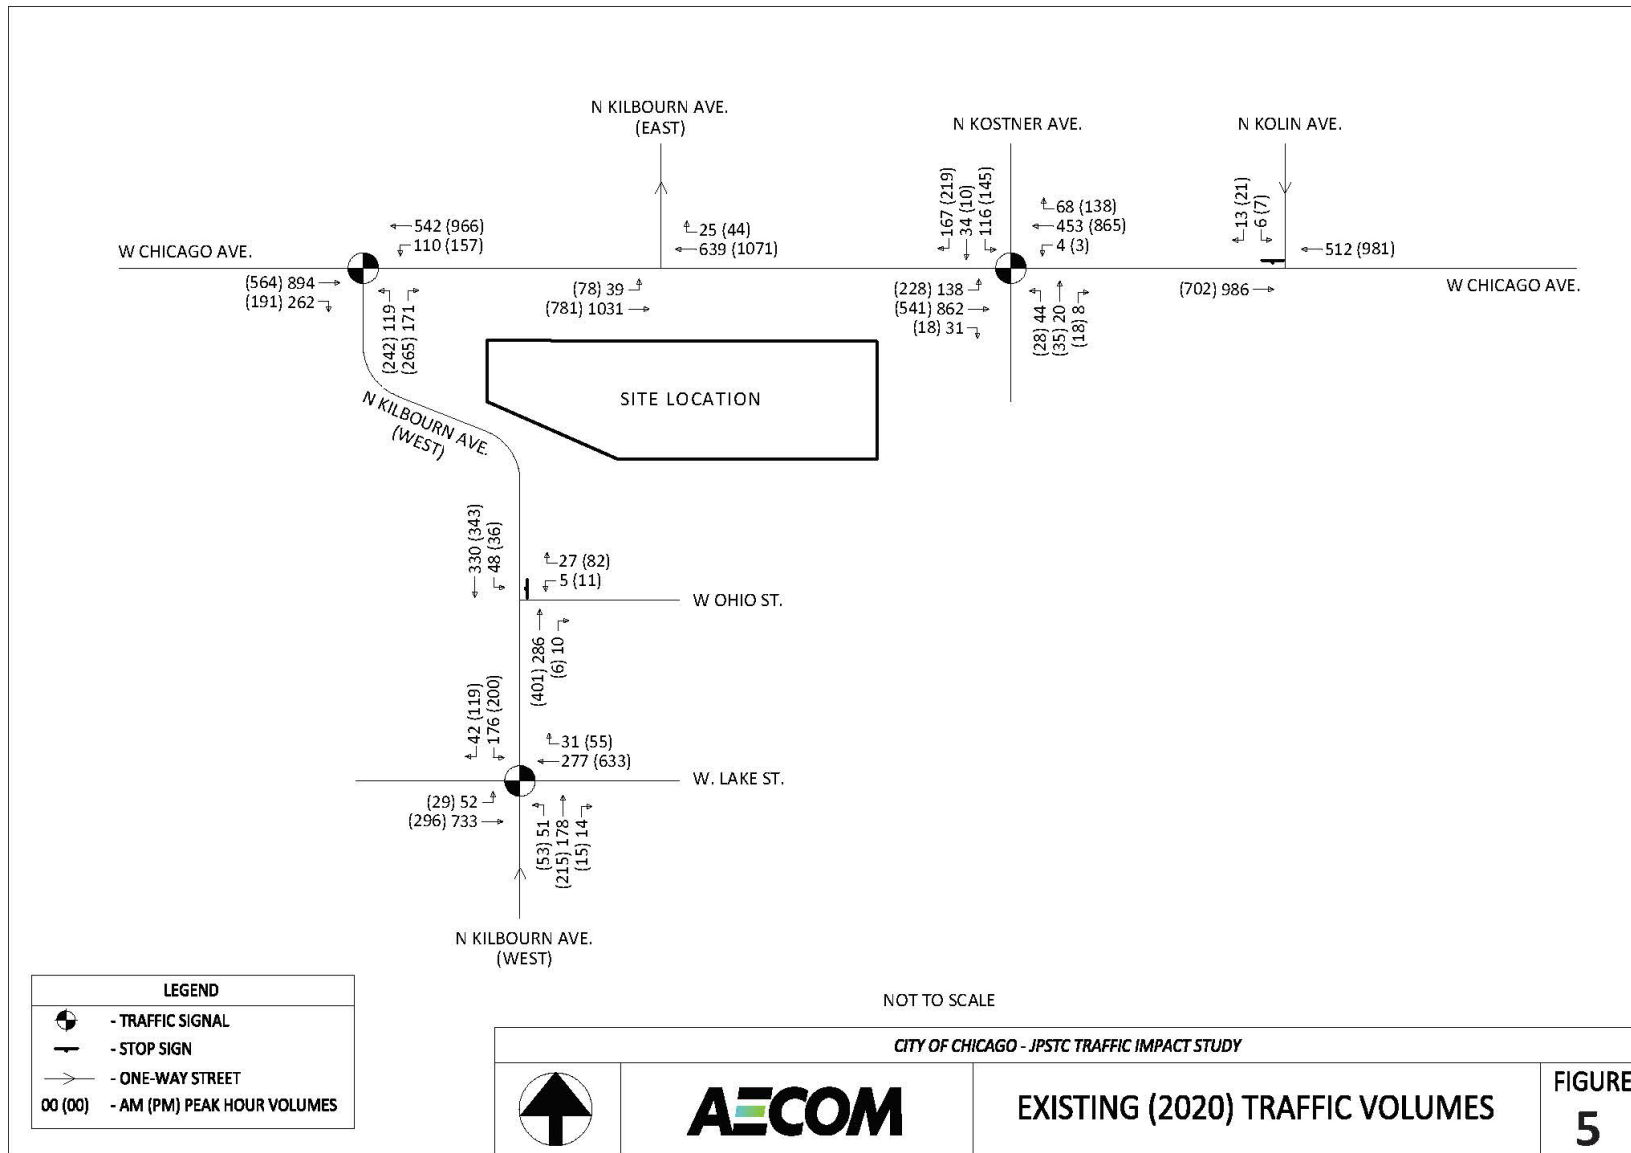

Figure 5: Existing (2020) Peak Hour Vehicle Traffic Volumes

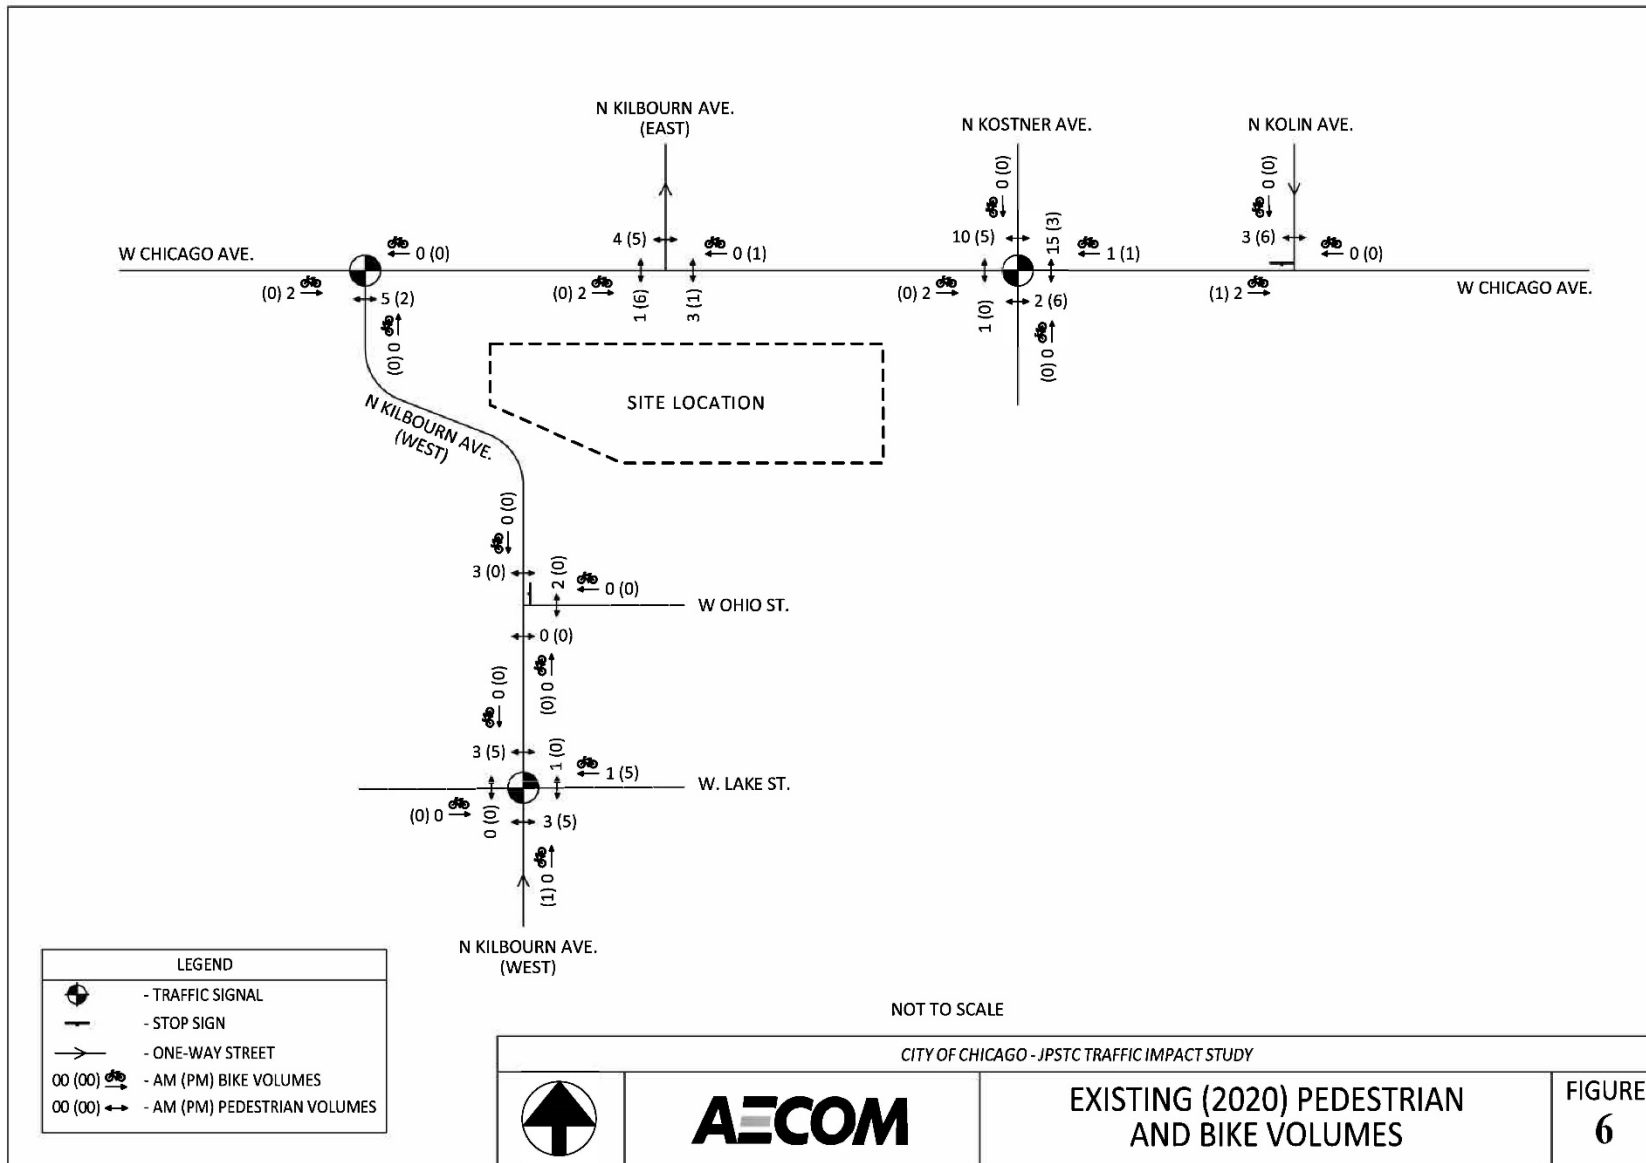

Figure 6: Existing (2020) Peak Hour Pedestrian and Bicycle Traffic Volumes

3. Proposed Development

3.1 Site Plan

Appendix A shows the proposed site plan for the campus.

3.2 Proposed Land Use(s) and Intensity

The campus will consist of a 185,000 square foot primary training and office building, approximately 380 off-street parking spaces and an outdoor training facility which will include a mock streetscape, a six-story burn tower, and a drive training pad.

An outdoor plaza space, approximately 16,000 square foot, has been dedicated for community use and programming. The plaza will have a prime location on Chicago Avenue and will be located in between the primary training building and the development lots.

The campus will also have two restaurants on site. One restaurant is 9,000 square feet with no drive-through service (Peaches). The other is a 7,000 square foot fast casual restaurant (Culver's) with drive-through service.

3.3 Proposed Site Access Locations

The City of Chicago has contracted the Public Safety and Community Builders Joint Venture (PSCB) to design and build the new Joint Public Safety Training Campus for the City's first responders. The 32-acre project site is located at 4301 W. Chicago Avenue and will provide Chicago Fire and Police departments with a modern facility where scenario-based training can occur.

The current site plan offers 380 off-street parking spaces for the training facility. Vehicles access to the surface parking lot for the main training building is from N Kilbourn Avenue and access to the small 32 spaces visitor parking is through a driveway on W Chicago Avenue expected to be used during off-peak hours by relatively small number of the visitors. Vehicles access to both of the restaurants is through the intersection at N Kostner Avenue and W Chicago Avenue.

Bike racks are proposed on the west side of the training building close to the entrance. Pedestrians could access the campus via the existing sidewalks along W Chicago Avenue and N Kilbourn Avenue. The loading dock is proposed to be located on the south side of the training building. Trucks will access the loading dock via N Kilbourn Avenue.

The CTA Access Road that aligns with Kostner Avenue in existing conditions will be shifted east and realigned with Kolin Avenue due to the campus development.

3.4 Project Phasing and Estimated Time Schedule

The construction of the campus will have one phase with estimated groundbreaking in November 2020 and completion in December 2022.

3.5 On-site Parking Facility

The current site plan offers 380 off-street parking spaces for the training facility.

However, the City has advised that there are potential options for additional off-street parking to assist in accommodating the end users for this facility.

1. The City has developed a phased master plan for the neighbor which considers additional scope being added to the current planned JPSTC Development. In Phase III of their four phases plan the City is considering the purchase of property directly to the south of the JPSTC site located on the east side of N. Kilbourn Avenue. The intent is that this property will be used for additional parking. This addition would help to address any shortfall in onsite parking.
2. The City has evaluated the possibility of converting the paved portion of the City owned transfer station, southwest of the project site (also on N. Kilbourn Ave), into overflow JPSTC dedicated parking. In the initial concept this potential lot could accommodate an additional +290 parking space.

4. Future (2022) Traffic

Future (2022) traffic volumes within the study area include the background traffic growth due to regional population or employment changes, and generated traffic volumes from proposed site development. This study has not considered other potential development sites and/or projects within the study area.

4.1 Background Traffic Growth

Chicago Metropolitan Agency for Planning (CMAP) provided 2050 ADT projections for the study area. CMAP developed traffic projections for 2050 using existing traffic volumes and the results from the October 2019 CMAP Travel Demand Analysis. The regional travel model uses CMAP 2050 socioeconomic projections and assumes the implementation of the ON TO 2050 Comprehensive Regional Plan for the Northeastern Illinois area. **Appendix G** shows the detailed growth rate information provided by CMAP.

Based on the information from CMAP a total growth rate of 1% was derived and applied to existing (2020) traffic volumes at all study intersections to estimate future (2022) background traffic volumes due to regional developments.

4.2 Trip Generation and Modal Split

For the JPSTC training building, the city estimated a maximum of 910 attendees would arriving or departing the campus within following timetable:

1. CPD
 - a. AM: 0600-0700 hrs
 - b. PM: 1530-1630 hrs
 - c. Assume 65% of 910 total attendees
2. CFD
 - a. AM: 0600-0700 hrs
 - b. PM: 1500-1600 hrs
 - c. Assume 35% of 910 total attendees

Since this incoming traffic is outside of the observed AM peak hour of the surrounding street network (7:15 am and 8:15 am), these morning trips are not considered as part of this traffic analysis.

Since part of this departing traffic falls within the PM peak hour (3:45 pm to 4:45 pm) of surrounding street networks, these trips are included as part of the PM peak analysis as per following:

- Due to the location of this facility within the neighborhood, it is assumed that 80% of the attendees arrive/leave by driving alone and the remaining 20% use other modes such as public transport, walking, biking or carpooling. This converts to 728 car trips.
- CPD: conservatively, all 65% assumed travelling during the observed PM peak hour '3:45 to 4:45PM'
- CFD: only a quarter of the 35% assumed traveling during the observed PM peak '3:45 - 4:45PM'
- JPSTC - total 65% + 9% = 74% added on '3:45 - 4:45PM'
- 74% of 728 cars = 539 cars are added on the street network for '3:45 - 4:45PM'

The generated vehicle trips from the two restaurants are estimated based on trip generation rates contained in the Trip Generation Manual, 10th Edition, published by the Institute of Transportation Engineers (ITE). **Table 2** summarizes the estimated entering and exiting trips during the AM and PM peak hour.

Table 2. Estimated Site-Generated Traffic Volumes

ITE Code	ITE Category	Quantity	Total	AM		Total	PM	
				In	Out		In	Out
Restaurants								
930	Fast Casual Restaurant (Culver's)	7,000 square foot	14	9	5	99	54	45
932	High-Turnover (Sit-Down) Restaurant (Peaches)	9,000 square foot	89	49	40	Restaurant is expected to close at 3PM.		
Subtotal			103	58	45	99	54	45
JPSTC Training Facility			0	0	0	539	0	539 ^a
Total			103	58	45	638	54	584

Note:

a. 74% of 80% of 911 attendees who will leave by cars during PM peak hour ($911 * 80% * 74% = 539$).

4.3 Trip Distribution

The restaurant generated trips are assigned to the traffic network based on the existing traffic patterns at adjacent intersections. However, the training facility trips have a different distribution from the restaurants as the training building serves as a major attraction for the work-based trips in the region. It is assumed that 50% of the trips will use I-290 to access the site via Kilbourn Avenue, and 50% of trips use Chicago Avenue. At a high level, the trips from I-290 capture trips which typically originate from the south and west while Chicago Avenue captures trips originating from the north and east; **Figure 7** and **Figure 8** shows the directional distribution of trips generated from the restaurants and the JPSTC training building, respectively. **Figure 9** shows the assignment of site-generated trips.

4.4 Total Future (2022) Traffic Volumes

Total future (2022) traffic volumes within the study area include the background traffic growth due to regional population or employment changes and generated traffic volumes from proposed site development. **Figure 10** shows total future (2022) projected traffic volumes.

Please note the decision to model the AM peak period from 7:15-8:15 AM (considered as 7 AM – 8 AM from IDOT TCDS) versus 6:00-7:00 AM which would coincide with the CPD/CFD break was based on historical count data from Illinois' Traffic Count Database System 2018 counts. The existing traffic volumes along Chicago Avenue from 6:00-7:00 AM are significantly lower than 7:00-8:00 AM. So much so that the existing 6:00-7:00 AM count volumes and CPD/CFD traffic combined is less than the 7:00-8:00 volumes. Please see **Table 3** for comparison of two peak hours during the morning peak period.

Table 3 Morning peak hour selection

Hour	Direction (Chicago Avenue)	Existing Traffic (IDOT TCDS)	JPSTC Training Facility	Restaurants	Total
6:00-7:00⁴	EB	575	182 ⁵	0 ⁶	757
	WB	355	182	0	537
7:00-8:00⁷	EB	1,109	0	35 ⁸	1137
	WB	594	0	20 ⁹	607

This table illustrates that the greatest burden on the street network is realized at a later time period than the CPD/CFD AM peak.

⁴ Volumes from <https://idot.ms2soft.com/tcds/tsearch.asp?loc=idot&mod=>

⁵ 728 cars (80% of 911 attendees) X 25% on each of eastbound and westbound Chicago Avenue

⁶ Restaurants are not expected to attract additional significant (other than pass by/destine) traffic during 6AM to 7AM.

⁷ Volumes from <https://idot.ms2soft.com/tcds/tsearch.asp?loc=idot&mod=>

⁸ Eastbound on Chicago Avenue between N Kilbourne West and N Kostner Ave

⁹ Westbound on Chicago Avenue between N Kilbourne East and N Kostner Ave

5. Traffic Analysis

5.1 Methodology and Level of Service Description

In order to quantify intersection traffic operations at the study area intersections, LOS values were determined using the industry-standard methodology presented in the *Highway Capacity Manual* (6th Edition)¹⁰, published by the Transportation Research Board (TRB). Synchro traffic analysis software (version 11), based on the *Highway Capacity Manual* (6th Edition) methodologies, was used to perform the analysis.

The term “level of service” (LOS) denotes how well (or poorly) a traffic movement operates under given traffic demands, lane configurations, and traffic controls. Each level is determined by the average amount of control delay per vehicle. Control delay is the total delay associated with stopping for a traffic signal or stop sign, and includes four components: deceleration delay, queue move up time, stopped delay, and final acceleration delay.

Table 3 shows the LOS criteria for signalized and unsignalized intersections per HCM 6th Edition. LOS A indicates small average control delays (less than 10 seconds per vehicle), whereas LOS F indicates intersection failure, resulting in extensive vehicular queues and long delays (over 80 seconds per vehicle at a signalized intersection). For the signalized intersections, the intersection delay represents the average delay of all the vehicles accessing the intersection within one hour. For the two-way stop-controlled intersections, the movement with the highest delay was used to represent the intersection delay.

Table 4. LOS Criteria at Intersections

Level of Service	Signalized Intersections (sec)	Unsignalized Intersections (sec)
A	<10	<10
B	10 – 20	10 – 15
C	20 – 35	15 – 25
D	35 – 55	25 – 35
E	55 – 80	35 – 50
F	>80	>50

Source: HCM 6th Edition

Existing signal timing at signalized intersections were provided by CDOT and used in Synchro models for this traffic analysis. **Appendix C** shows the existing signal timing plans from CDOT.

5.2 Existing and Future Capacity Analyses

Table 4 shows the intersection delay and LOS during the AM and PM peak hours for existing (2020) and future (2022) conditions. A summary of the intersection delay and LOS results by individual movements for each of the study intersections in the existing and future conditions are presented in **Table 5** to **Table 9**. Detailed Synchro outputs are documented in **Appendix D**.

¹⁰ Wherever HCS 6th edition results are not possible (such as Non-NEMA Phasing), Synchro results have been provided.

		Delay (s/veh)	10.8	-	-	18.7	-	-	61.6	-	-

¹² For unsignalized intersection, movement with highest delay is shown to represent the intersection delay for two-way stop-controlled intersection.

¹³ This intersection is recommended to be converted to Two-Way Stop Controlled 'TWSC' and delay for TWSC on westbound (Ohio St) is LOS B with 12 Seconds delay and LOS C with 15 Seconds delay for AM peak hour and PM peak hour respectively for Build 2022 condition. The delay on Northbound and Southbound (N Kilbourne Ave) for TWSC is 0 second.

Table 9. Intersection Delay and LOS Results by Movement #6 - N Kilbourne Ave & W Lake St

	Future PM	68	68	-	-	143	143	31	109	109	269	-	76

Note:

^aChicago Ave, Ohio Street and Lake Street are eastbound/westbound. All other roadways are northbound/southbound.

¹⁴ This intersection is recommended to be converted to Two-Way Stop Controlled 'TWSC' and 95th percentile queue length for TWSC on westbound (Ohio St) is LOS B with 5 feet and LOS C with 20 feet 95th percentile queue length for AM peak hour and PM peak hour respectively for Build 2022 condition. The delay on Northbound and Southbound (N Kilbourne Ave) for TWSC is 0 second.

5.4 Discussion and Recommendations

W Chicago Avenue and N Kilbourn Avenue (West)

This intersection is operating at a LOS D in existing condition (2020) during the AM peak hour and a LOS C in the PM peak hour with the lowest LOS experienced by the eastbound through (EBT) movement at LOS E during the AM peak hour. The 95th percentile queues along W Chicago Avenue are greatest in the EB direction during the AM peak (approximately 800 feet) and in the WB direction during the PM peak (approximately 700 feet). The long queues are created by reducing the four-lane cross section to a two-lane cross section at this intersection due to the viaduct constraint.

In the 2022 Build condition, this intersection is expected to operate at a LOS C and LOS D in the AM and PM, respectively, with signal timing adjustment. All individual movements operate at a LOS D or better indicating no significant impact from proposed development. However, restriping the westbound approach at N Kilbourne and Chicago Avenue to provide a left turn lane to improve safety for this movement is recommended as part of this study.

This intersection does not have any pedestrian facility and all three legs/corners have pedestrian barricades/railing restricting pedestrian to cross any roadways at this location.

W Chicago Avenue and N Kilbourn Avenue (East) intersection has three legs, but third leg is one-way and hence, no signal or stop sign at this intersection. This intersection has continental crosswalks on all three legs without pedestrian signal heads or crosswalk regulatory signage.

W Chicago Avenue and N Kostner Avenue

This intersection is operating at a LOS B in existing (2020), no-build (2022) and build (2022) conditions during the AM peak hour and a LOS B in the PM peak hour with the lowest LOS experienced by the eastbound left turn (EBL) movement during the AM Peak hour at LOS D. The 95th percentile queues along W Chicago Avenue are moderate in the EB direction during the AM peak (approximately 250 feet) and in the WB direction during the PM peak (approximately 300 feet).

This intersection has continental crosswalks on all four legs with pedestrian signal heads / flashing hand and countdown timer.

W Chicago Avenue and N Kolin Avenue

Due to the realignment of the CTA Access Road, the northbound approach at this intersection is expected to operate a LOS F during the 2022 Build condition. The northbound left turn will experience an average delay of 95 seconds in the AM peak and 105 seconds in the PM peak compared to an existing 25 seconds of delay. Although northbound approach experiences such a high delay, the 95th percentile queues will not be longer than 4 vehicles at this approach. A signal warrant analysis was performed for this intersection to determine if the intersection warrants a traffic signal in 2022. Based on the analysis, the W Chicago Avenue and N Kolin Avenue intersection does not warrant a traffic signal in 2022. That said the implementation of a signal would improve the LOS for this intersection and likely improve on the queue length for the CTA. A decision to place a signal at this intersection should be discussed between CDOT and the CTA.

Appendix E shows the results of signal warrant analysis working sheet.

N Kilbourne Avenue and Ohio Street

All-Way Stop Controlled (AWSC) Intersection on N Kilbourne Avenue at Ohio St and Lake St is operating with LOS C or better in the existing and 2022 no-build conditions, and LOS F for southbound movement during PM peak hour during 2022 build condition with approx. 250 feet queue lengths. Once, development is in place, it is expected to add northbound/southbound traffic on N Kilbourne Avenue and hence, conversion of 'Two-Way Stop Controlled (TWSC)' will improve this intersection to LOS C or better for 2022 build condition. N Kilbourne and Ferdinand St intersection is approx. 650 feet from this studied intersection with AWSC and hence, the same recommendation is extended to Ferdinand St intersection as well.

N Kilbourne and Lake St

The N Kilbourne Avenue at Lake St intersection is operating at LOS D or better for the existing, 2022 no-build and 2022 build conditions with reasonable queue lengths. It has continental marked crosswalks on all four legs with pedestrian signal heads / flashing hand.

It is expected that loading area and service areas located near to the N Kilbourne Avenue entrance will be used during off-peak hours for loading and unloading activities and will not have any negative impact on existing street network. **Appendix F** shows turning movement diagrams with WB-40 (intermediate semi-trailer – 45 feet long) near the entrance and the service area.

The development of JPSTC has marginal traffic impacts on the existing network.

6. Conclusion

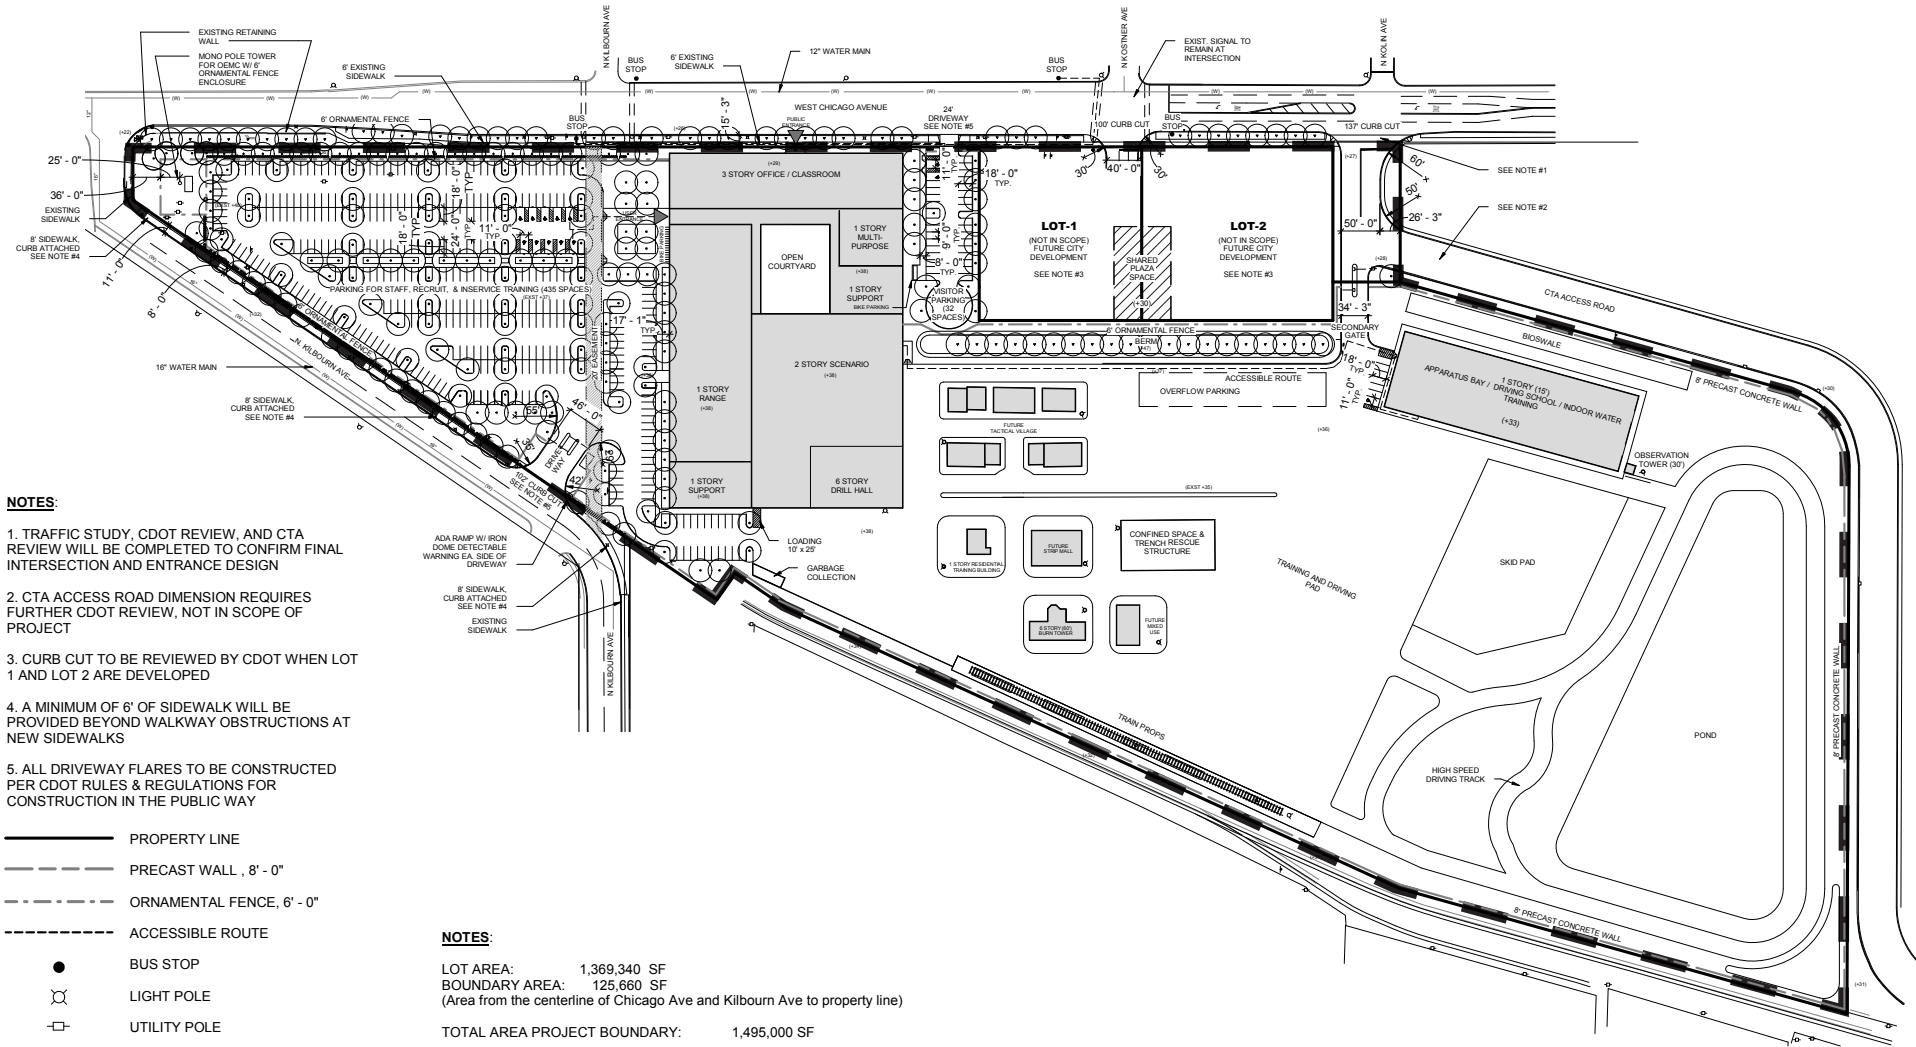

The City of Chicago intends to construct a Joint Public Safety Training Campus (JPSTC) at 4301 W Chicago Ave in Chicago, Illinois. The proposed campus contains a main training building and two restaurants. One restaurant is 9,000 square foot with no drive-through service (Peaches). The other restaurant is a 7,000 square foot fast casual restaurant (Culver's) with drive-through service. The construction of the campus will have one phase with estimated groundbreaking in November 2020 and completion in December 2022.

Based on the analyses, the study recommends the following:

- Approval of this traffic study for JPSTC campus development as traffic generated by the proposed development can be accommodated on the surrounding road network with majority of the movements within acceptable level of service.
- Restripe the westbound approach at N Kilbourne and Chicago Avenue to provide a left turn lane to improve the safety of this movement.
- Realigning the Northbound movement of the CTA Access drive to the stop-controlled N Kolin Ave intersection will result in increases in delay. Whereas the signal analysis does not warrant the addition the implementation of a signal would improve the LOS for this intersection and likely improve on the queue length for the CTA. A decision to place a signal at this intersection should be discussed between CDOT and the CTA.
- N Kilbourne and Ohio St intersection (including Ferdinand St) to Two-Way Stop Control (TWSC).
- Provide pedestrian crossing regulatory signage (W11-2) at the pedestrian crossing at W Chicago Avenue and N Kilbourn Avenue (East) to improve pedestrian safety.

Appendix A

Proposed Site Plan

NOTES:

1. TRAFFIC STUDY, CDOT REVIEW, AND CTA REVIEW WILL BE COMPLETED TO CONFIRM FINAL INTERSECTION AND ENTRANCE DESIGN
2. CTA ACCESS ROAD DIMENSION REQUIRES FURTHER CDOT REVIEW, NOT IN SCOPE OF PROJECT
3. CURB CUT TO BE REVIEWED BY CDOT WHEN LOT 1 AND LOT 2 ARE DEVELOPED
4. A MINIMUM OF 6' OF SIDEWALK WILL BE PROVIDED BEYOND WALKWAY OBSTRUCTIONS AT NEW SIDEWALKS
5. ALL DRIVEWAY FLARES TO BE CONSTRUCTED PER CDOT RULES & REGULATIONS FOR CONSTRUCTION IN THE PUBLIC WAY

- PROPERTY LINE
- - - - PRECAST WALL, 8' - 0"
- - - - ORNAMENTAL FENCE, 6' - 0"
- - - - ACCESSIBLE ROUTE
- BUS STOP
- LIGHT POLE
- UTILITY POLE
- ⊥ SIGN
- ⊕ FIRE HYDRANT

NOTES:

LOT AREA: 1,369,340 SF
 BOUNDARY AREA: 125,660 SF
 (Area from the centerline of Chicago Ave and Kilbourn Ave to property line)
 TOTAL AREA PROJECT BOUNDARY: 1,495,000 SF

Intersection Summary

~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

WARRANT 2 ANALYSIS, MUTCD, Section 4C.2, 2009

2022

Data Source: 2020 Projected Volumes

Chicago Ave & Kolin Ave

User Input:

Major Road VPH: 1556 1450 1922 1748
 Minor road VPH: 79 38 77 60

Number of lanes, major approach: Chicago Ave 2 lane(s)

Number of lanes, minor approach: Kolin Ave 2 lane(s)

Plotted Values

Major Road VPH: 1556 1450 1922 1748
 Minor road VPH: 79 38 77 60

These values are plotted below and shown as the "Result" plotted points
 If plotted point is above the controlling lane configuration line, 2 lane(s) major street/2 lane(s) minor street,
 for four or more hours during the day, then Traffic Signal Warrant is satisfied.
 Engineering Judgement is still a key part in this decision, see MUTCD Section 4C.03, 2009.

Warrant Satisfied?

N (Y or N)

N/A

***Subject: Joint Public Safety Training Campus - Chicago Avenue
CDOT***

Dear Ms. Brose:

In response to a request made on your behalf and dated March 4, 2020, we have developed year 2050 average daily traffic (ADT) projections for the subject location. These are in a table on the following page.

Traffic projections are developed using existing ADT data provided in the request letter and the results from the October 2019 CMAP Travel Demand Analysis. The regional travel model uses CMAP 2050 socioeconomic projections and assumes the implementation of the ON TO 2050 Comprehensive Regional Plan for the Northeastern Illinois area.

If you have any questions, please call me at (312) 386-8806.

Sincerely,

A handwritten signature in black ink, appearing to read "Jose Rodriguez".

Jose Rodriguez, PTP, AICP

SECTION 01 10 00 - SUMMARY**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. Project information.
2. Work covered by Contract Documents.
3. Phased construction.
4. Work by Client.
5. Work under separate contracts.
6. Future work.
7. Purchase contracts.
8. Client-furnished products.
9. Contractor-furnished, Client-installed products.
10. Access to site.
11. Coordination with occupants.
12. Work restrictions.
13. Specification and Drawing conventions.
14. Miscellaneous provisions.

- B. Related Requirements:

1. Section 01 50 00 - TEMPORARY FACILITIES AND CONTROLS for limitations and procedures governing temporary use of Client's facilities.

1.3 PROJECT INFORMATION

- A. Project Identification: EMS ADDITION

1. Project Location:
701 NORTH KILBOURN AVENUE
CHICAGO IL 60651

- B. Client: PUBLIC BUILDING COMMISSION OF CHICAGO
1. Client's Representative: CURTIS JONES JR.
50 W WASHINGTON STREET, SUITE 200
CHICAGO, IL 60602
312-744-3090
- C. Architect: AECOM SERVICES OF ILLINOIS, INC., could also refer to the respective engineers of record.
1. Project Manager: JENNA JOO
303 E WACKER DR. SUITE 1400
CHICAGO, IL 60601
312-373-6725
- D. Architect's Consultants: Architect has retained the following design professionals who have prepared designated portions of the Contract Documents:
1. Professional Land Surveying
ERIK TONNESEN
PROFESSIONALS ASSOCIATED
7100 N TRIPP AVENUE
LINCOLNWOOD, IL 60712

- E. Contractor: <CONTRACTOR> has been engaged as Contractor for this Project
- F. Sub-contractor: Is the sub-contractor to the referenced contractor.
- G. Web-Based Project Software: Project software administered by Contractor will be used for purposes of managing communication and documents during the construction stage. Software will be BIM360.
 1. See Section 01 31 00 PROJECT MANAGEMENT AND COORDINATION for requirements for using the web-based Project software.

1.4 WORK COVERED BY CONTRACT DOCUMENTS

- A. The Work of Project is defined by the Contract Documents and consists of the following:
 1. Approximately 53,000 SF, 3-story building addition at the south end of the Joint Public Safety Training Campus Phase I building.
 2. Visual Screen between Phase IA and Phase II sites.
 3. Rolling Gate at Chicago Ave. entrance.
- B. Type of Contract:
 1. Project will be constructed under a single prime contract.
 - a. EMS Addition

1.5 PHASED CONSTRUCTION

- A. The site will be occupied during construction. The Work shall be conducted per the phasing plan in the contract documents to be substantially complete as indicated:
 1. A portion of the Phase I building 2nd floor corridor, Classroom 254 and 294 shall be protected and maintained for the duration of construction in order to allow for user access. Construction will consist of demolition and restoration of existing exterior wall, roof, and roof accessories.

2. Before commencing Work of each phase, submit an updated copy of Contractor's construction schedule showing the sequence, commencement, and completion dates, and move-out and -in dates of Client's personnel for all phases of the Work.

1.6 WORK BY CLIENT

- A. General: Cooperate fully with Client so work may be carried out smoothly, without interfering with or delaying work under this Contract or work by Client. Coordinate the Work of this Contract with work performed by Client.
- B. Concurrent Work: Client will perform the following construction operations at Project site. Those operations will be conducted simultaneously with Work under this Contract.
 1. Wireless network active devices
 2. Communications network active devices
 3. Security system active devices
- C. Subsequent Work: Client will perform the following additional work at site after Substantial Completion. Completion of that work will depend on successful completion of preparatory Work under this Contract.
 1. Installation of electric vehicle charging stations

1.7 WORK UNDER SEPARATE CONTRACTS

- A. General: Cooperate fully with separate contractors so work on those contracts may be carried out smoothly, without interfering with or delaying Work under this Contract or other contracts. Coordinate the Work of this Contract with work performed under separate contracts.

1.8 ACCESS TO SITE

- A. General: Contractor shall have limited use of Project site for construction operations as indicated on Drawings by the Contract limits and as indicated by requirements of this Section.
- B. Use of Site: Limit use of Project site to areas within the Contract limits indicated. Do not disturb portions of Project site beyond areas in which the Work is indicated.
 1. Limits: Confine construction operations to those within the EMS Addition and selected site areas for screen and rolling gate installation. Avoid work within Phase IA, IB, and II.
 2. Limits: Limit site disturbance, including earthwork and clearing of vegetation, to 40 feet (12.2 m) beyond building perimeter; 10 feet (3 m) beyond surface walkways, patios, surface parking, and utilities less than 12 inches (300 mm) in diameter; 15 feet (4.5 m) beyond primary roadway curbs and main utility branch trenches; and

25 feet (7.6 m) beyond constructed areas with permeable surfaces (such as pervious paving areas, stormwater detention facilities, and playing fields) that require additional staging areas in order to limit compaction in the constructed area.

3. Driveways, Walkways and Entrances: Keep driveways and entrances serving premises clear and available to Client, Client's employees, emergency vehicles and other Contractors at all times. Do not use these areas for parking or for storage of materials. See contract drawings for staging area location. Refer to phasing as described in this section.
 - a. Schedule deliveries during non-peak neighborhood traffic times and to minimize use of driveways and entrances by construction operations.
 - b. Schedule deliveries during non-peak neighborhood traffic times and to minimize space and time requirements for storage of materials and equipment on-site.
- C. Condition of Existing Grounds: Maintain portions of existing grounds, landscaping, and hardscaping affected by construction operations throughout construction period. Repair damage caused by construction operations.

1.9 COORDINATION WITH OCCUPANTS

- A. Partial Client Occupancy: Client will occupy the premises during the entire construction period, with the exception of areas under construction. Cooperate with Client during construction operations to minimize conflicts and facilitate Client usage. Perform the Work so as not to interfere with Client's operations. Maintain existing exits unless otherwise indicated. Coordinate access with Phasing as described in this section.
 1. Maintain access to existing walkways, corridors, and other adjacent occupied or used facilities. Do not close or obstruct walkways, corridors, or other occupied or used facilities without written permission from Client and authorities having jurisdiction.
 2. Provide not less than 72 hours' notice to Client of activities that will affect Client's operations.
- B. Client Limited Occupancy of Completed Areas of Construction: Client reserves the right to occupy and to place and install equipment in completed portions of the Work, prior to Substantial Completion of the Work, provided such occupancy does not interfere with completion of the Work. Such placement of equipment and limited occupancy shall not constitute acceptance of the total Work.
 1. Architect will prepare a Certificate of Substantial Completion for each specific portion of the Work to be occupied prior to Client acceptance of the completed Work.
 2. Obtain a Certificate of Occupancy from authorities having jurisdiction before limited Client occupancy.
 3. Before limited Client occupancy, mechanical and electrical systems shall be fully operational, and required tests and inspections shall be successfully completed. On occupancy, Client will operate and maintain mechanical and electrical systems serving occupied portions of Work.

C. Campus Coordination

JPSTC CAMPUS HOURS OF OPERATION	24 hours a day, 7 days a week
Calendar Year Operating Hours	
Staff regular hours	6:00am-4:00pm, Monday-Friday
Student regular hours	24 hours a day, 7 days a week
Building Engineer regular hours	6AM-2:30PM, Monday-Friday
Custodian regular hours	24 hours a day, Monday-Friday
Weekend activities	Training Sessions
Last day of training for students	N/A
Breaks	N/A
Construction Black Out Dates	
Student Testing Dates:	As Needed
Other Black Out Dates	City Designated Holidays
Other Important Dates	
Night Training Dates	24 hours a day, 7 days a week
Misc Events Dates	TBD

D. SPECIAL REQUIREMENTS:

CRITICAL COORDINATION ITEMS	
Long Lead Items	
ComEd Coordination	
People's Gas Coordination	
CDOT Coordination	
OEMC Coordination	
AV/IT Coordination	AV/IT to be copied on all relevant submittals. AV/IT is critical to getting internet and communications set up at the facility once complete. Adequate time must be given in order to set up server necessary or completion of GC scope items.
Safety and Security Coordination	Camera and Intrusion Detection System scope included in project. Note that coordination with 2FM Safety and Security will need to take place for camera programming upon completion of install.
New Keying System	Include details if scope requires or N/A if not applicable
Moving	If moves are required to perform the work, Staff will be required to label and pack the material to be moved. <USER AGENCY> Operations will provide boxes and provide moving services to make moves out of and back into designated spaces. ITS will be responsible for moving computers. Client is responsible for coordinating with ITS for reconnecting any computers that are required to be disconnected and relocated due to construction.

Cleaning	2FM approved post-construction clean of new building and any impacted areas of existing building is required prior to SC and turnover of responsibilities to <USER AGENCY>. Contractor responsible for Final Clean in all areas impacted by construction, including corridors used for access. Cleaning includes stripping and waxing of VCT flooring.
OTHER COORDINATION INFORMATION	
Assigned <USER AGENCY> cleaning vendor and contact information:	
Does end users have anyone with ADA needs?	
Any ongoing or other upcoming projects at the site:	
Any leases impacting Work:	
Does project scope require any material to be salvaged?	Relocated gate arm and AI phone/card access at Kilbourn Ave.
Staging area(s)	Refer to the Phasing Plan in the project documents for reference.

1.10 WORK RESTRICTIONS

- A. Work Restrictions, General: Comply with restrictions on construction operations.
 - 1. Comply with limitations on use of public streets and with other requirements of authorities having jurisdiction.
- B. On-Site Work Hours
 - 1. The Joint Public Safety Training Campus normal business hours are 6:00AM - 4:00PM Mon - Fri and Closed Sat – Sun (Administrative Personnel).
 - a. Weekend Hours: N/A
 - b. Early Morning Hours: N/A
 - c. Hours for Utility Shutdowns: Client to be notified 7 to 10 days prior to shut down, Client will provide shutdown hours upon notice of which utilities are to be affected and length of time to be shut down.
 - d. Hours for Core Drilling, noisy activity or vibrations: Client requires 7 to 10 days prior notice of type and length of time for loud work.
- C. Existing Utility Interruptions: Do not interrupt utilities serving facilities occupied by Client or others unless permitted under the following conditions and then only after providing temporary utility services according to requirements indicated:
 - 1. Notify Client not less than 1 week in advance of proposed utility interruptions.
 - 2. Obtain Client’s written permission before proceeding with utility interruptions.

- D. Noise, Vibration, and Odors: Coordinate operations that may result in high levels of noise and vibration, odors, or other disruption to Client occupancy with Client.
 - 1. Notify Client not less than two days in advance of proposed disruptive operations.
 - 2. Obtain Client's written permission before proceeding with disruptive operations.
- E. Restricted Substances: Use of tobacco products and other controlled substances Project site is not permitted.
- F. Employee Identification: Client will provide identification tags for Contractor personnel working **within existing building**. **General Contractor will provide identification tags for Contractor personnel working on Project Site but not within the existing building**. Require personnel to use identification tags at all times.
- G. Employee Screening: Comply with Client requirements for drug and background screening of Contractor personnel working on Project site.
 - 1. Maintain list of approved screened personnel with Client's representative.

1.11 SPECIFICATION AND DRAWING CONVENTIONS

- A. Specification Content: The Specifications use certain conventions for the style of language and the intended meaning of certain terms, words, and phrases when used in particular situations. These conventions are as follows:
 - 1. Imperative mood and streamlined language are generally used in the Specifications. The words "shall," "shall be," or "shall comply with," depending on the context, are implied where a colon (:) is used within a sentence or phrase.
 - 2. Specification requirements are to be performed by Contractor unless specifically stated otherwise.
- B. Division 01 General Requirements: Requirements of Sections in Division 01 apply to the Work of all Sections in the Specifications.
- C. Drawing Coordination: Requirements for materials and products identified on Drawings are described in detail in the Specifications. One or more of the following are used on Drawings to identify materials and products:
 - 1. Terminology: Materials and products are identified by the typical generic terms used in the individual Specifications Sections.
 - 2. Abbreviations: Materials and products are identified by abbreviations published as part of the U.S. National CAD Standard, defined within the specifications or as scheduled on Drawings.
 - 3. Keynoting: Materials and products are identified by reference keynotes referencing Specification Section numbers found in this Project Manual.

1.12 GENERAL REQUIREMENTS

- A. General Contractor shall review and be familiar with the site conditions.
- B. General Contractor shall provide all temporary and permanent driveway apron and alley permits for the duration of the construction if required. The General Contractor is to pay all fees required for processing permits and is to contact and comply with all authorities and jurisdiction required for permitting.
- C. General Contractor shall provide snow removal and generally maintain ingress and egress ensuring the site is clear and free of debris further maintaining accessibility that conforms with OSHA, Chicago Building Code, and emergency egress standards.
- D. General Contractor shall provide all required permits for street access for truck delivery from the local and state jurisdiction.
- E. General Contractor shall, at all times, provide access to the work for the Architect/Engineer of Record, Client's Representative, and Client, their employees or representatives and the representative of any other authority having jurisdiction. The General Contractor shall provide safe and proper facilities for access and inspection, including standby personnel as required.
- F. General Contractor shall be required to coordinate and complete the work within the contractual completion date(s) for the work as described within Section 00 73 00 - Supplemental Conditions and this section. The General Contractor shall be also held responsible for meeting all related provisions as described within this section.
- G. General Contractor shall coordinate access to the building at a mutually agreed upon location. Contractor may be required to remove <USER AGENCY> core from construction entry door and replace it with a construction core provided by the General Contractor for the duration of the project. At project conclusion, General Contractor shall reinstall original <USER AGENCY> core removed for construction.
- H. General Contractor shall survey the site and photograph the area of construction operations. Upon completion of the work the Contractor is to restore the area to the documented condition prior to the start of work or as otherwise indicated in the Contract Documents. The GC shall provide evidence of compliance.
- I. General Contractor is to replace all removed trees, bushes, ground covers and grass on the Chicago City Colleges' property disrupted, or otherwise damaged as a result of construction activities. Hard surfaces including but not limited to concrete pavement walks and asphalt surfaces shall be restored to condition prior to construction. Restoration of hard surfaces may require cleaning, repair or replacement.
- J. General Contractor shall coordinate and maintain all exit egress during construction as required by the City of Chicago code, other entities with jurisdiction, and as directed by the Commission's Representatives. The General Contractor shall provide and maintain all materials and labor including barricades, construction fence, doors, partitions, and fire rated walls as required for safe egress. All costs for this work shall be included in the Contract Base Bid regardless of whether it is indicated in the Contract Documents or not.

- K. No deliveries will be permitted to either the existing facility or the new addition between the hours of 3:00PM to 7:00AM Sun-Sat, weekends or City designated holidays.
- L. During the calendar year, no work may be performed as declared by City Ordinance.
- M. The Contractor is to set up and stage the entire project within the boundaries of the construction fence. The General Contractor is responsible for maintaining and modifying the fence as necessary and as approved in the Site Utilization Plan for the life of the project. Removal and disposal of the fence and project signage at the conclusion of the project is the responsibility of the General Contractor.
- ~~N. Building Engineer or other <USER AGENCY> staff (including contract employees) will not be paid overtime by the Commission, in order to be present at times when work is in progress in the existing Building. The General Contractor shall be responsible for all overtime costs for the <USER AGENCY> staff member for work outside of normal working hours, if need is due to construction work. Overtime arrangements for <USER AGENCY> staff includes weekends, holidays, and generally hours beyond that listed in Site Restrictions above. Recognized Holidays are as follows with Saturday holidays observed on Friday, and Sunday holidays observed on Monday (contract employees may follow a different schedule):~~
 - ~~1. New Year's Day~~
 - ~~2. Dr. Martin Luther King Jr.'s Birthday~~
 - ~~3. Lincoln's Birthday~~
 - ~~4. Washington's Birthday~~
 - ~~5. Pulaski Day~~
 - ~~6. Memorial Day~~
 - ~~7. Juneteenth Day~~
 - ~~8. Independence Day~~
 - ~~9. Labor Day~~
 - ~~10. Columbus Day~~
 - ~~11. Veterans Day~~
 - ~~12. Thanksgiving Day~~
 - ~~13. Christmas Day~~

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

3.1 SITE UTILIZATION PLAN

- A. Prior to Notice to Proceed, the Contractor shall prepare and submit to the Commission's Representative, the Building Engineer, and the Architect/Engineer of Record for approval a Site Utilization Plan based on the Construction Operations Parameters outlined in this section. Mobilization on-site is not to occur until approval of the Site Utilization Plan is obtained. A preliminary meeting to review site elements and Construction Operations with the Commission's Representative, Architect/Engineer of Record, and School staff prior to submission of the Site Utilization Plan shall be held.

- B. The Site Utilization Plan shall be provided in a full-size graphic drawing electronic format (same size as the Construction Document drawings), printable in 11x17 inch format. Provide a separate plan for the site and for each floor of the existing building where work is being performed. Modifications to the format and sheet size shall be permitted if pre-approved by the Commission's Representative and if proposed modifications shall facilitate preparation, presentation and review of the Site Utilization Plan. Electronic copies of the Contract Document drawings as appropriate shall be provided for this purpose upon request. The Site Utilization Plan shall at a minimum include the following elements:
1. Title block information including Facility Name, Contract Number, General Contractor, Building floor/level information, and current plan date.
 2. Building footprint of both new (if applicable) and existing buildings, trees, landscaping, paving, drainage structures, existing and ornamental fencing and other important site features.
 3. Areas of staging for students and staff, student drop-off points, existing school entrances and exits, staff parking areas, and traffic patterns for both construction and non-construction vehicles.
 4. Limits of construction and required construction fencing including any existing fencing to remain.
 5. Required covered construction barricade walkways.
 6. Areas allowed for staging purposes: construction personnel parking, material storage, and construction trailer(s). Such activities are to only take place in areas designated.
 7. Any specific site conditions required to be observed such as keeping alleys clear next to adjacent properties, and any other issues listed on the Construction Operations Site Plan.
 8. Areas allowed for site access gates.
 9. Areas of work within the existing building for the period of time covered by the Site Utilization Plan, coordinated with the Project Schedule. Each area should indicate planned beginning and end dates for work in that area. Areas where all work is completed are to be noted.
 10. Construction worker ingress/egress, material staging areas in the existing building.
 11. Proposed locations of temporary protection, barricades, and temporary walls within the existing building.
 12. Location of all temporary exits and path of travel.
 13. Indication of specific areas and their required contractual completion dates. If overtime work is required to meet the project dates it shall be at no additional cost to the Chicago Public Schools.
 14. Locations of construction signage.
 15. Indicate truck routes to nearest highway. Deliveries shall not deviate from this route.
 16. Limits of phasing with associated sequencing and dates (if applicable).

3.2 SITE UTILIZATION PLAN UPDATES

- A. The General Contractor is required to submit for approval updated Site Utilization Plans whenever conditions in the current approved plan have changed. Approval is required

prior to proceeding on any changed conditions not previously approved. Requirements for updating include the following:

1. In coordination with the project schedule provide detailed information regarding work in the existing building including phasing, vacation of existing in-use areas, and any other information requested by the Commission's Representative.
2. Revision to the site plan to reflect changing conditions regarding construction fencing, ingress and egress, student and staff staging, construction deliveries, areas of stored materials, parking, and any other construction facility revisions.

END OF SECTION 01 10 00

SECTION 01 22 00 – UNIT PRICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes administrative and procedural requirements for unit prices.
- B. Related Requirements:
 - 1. Section 012600 "Contract Modification Procedures" for procedures for submitting and handling Change Orders.
 - 2. Section 014000 "Quality Requirements" for field testing by an independent testing agency.

1.3 DEFINITIONS

- A. Unit price is an amount incorporated into the Agreement, applicable during the duration of the Work as a price per unit of measurement for materials, equipment, or services, or a portion of the Work, added to or deducted from the Contract Sum by appropriate modification, if the scope of Work or estimated quantities of Work required by the Contract Documents are increased or decreased.

1.4 PROCEDURES

- A. Unit prices include all necessary material, plus cost for delivery, installation, insurance, applicable taxes, overhead, and profit.
- B. Measurement and Payment: See individual Specification Sections for work that requires establishment of unit prices. Methods of measurement and payment for unit prices are specified in those Sections.
- C. Owner reserves the right to reject Contractor's measurement of work-in-place that involves use of established unit prices and to have this work measured, at Owner's expense, by an independent surveyor acceptable to Contractor.
- D. List of Unit Prices: A schedule of unit prices is included in Part 3. Specification Sections referenced in the Part 3 "Schedule of Unit Prices" Article contain requirements for materials described under each unit price.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 SCHEDULE OF UNIT PRICES

A. Unit Price No. 1: Drilled shaft length adjustment.

1. Description: Drilled shaft length adjustment including labor, drilling, soil removal, concrete, and reinforcing steel as specified in Section 316329 "Drilled Concrete Shafts"
2. Unit of Measurement: linear foot of drilled shaft length.
3. Quantity Allowance: As shown on Drawings. Contract value will be adjusted up or down based upon unit prices and actual length of shaft installed.

END OF SECTION 01 22 00

SECTION 01 23 00 - ALTERNATES**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section includes administrative and procedural requirements for alternates.

1.2 DEFINITIONS

- A. Alternate: An amount proposed by bidders and stated on the Bid Form for certain work defined in the bidding requirements that may be added to or deducted from the base bid amount if Owner decides to accept a corresponding change either in the amount of construction to be completed or in the products, materials, equipment, systems, or installation methods described in the Contract Documents.
 - 1. Alternates described in this Section are part of the Work only if enumerated in the Contract.
 - 2. The cost or credit for each alternate is the net addition to or deduction from the Contract Sum to incorporate alternate into the Work. No other adjustments are made to the Contract Sum.
 - 3. Include as part of each alternate, miscellaneous devices, accessory objects, and similar items incidental to or required for a complete installation whether or not indicated as part of alternate.

1.3 PROCEDURES

- A. Alternates quoted on Bid Forms will be reviewed and accepted or rejected at Client's option. Accepted Alternates will be identified in the Owner-Contractor Agreement.
- B. Coordination: Revise or adjust affected adjacent work as necessary to completely integrate work of the alternate into Project.
 - 1. Include as part of each alternate, miscellaneous devices, accessory objects, and similar items incidental to or required for a complete installation whether or not indicated as part of alternate.
- C. Execute accepted alternates under the same conditions as other work of the Contract.

1.4 SCHEDULE OF ALTERNATES

- A. Schedule: A schedule of alternates is included at the end of this Section. Specification Sections referenced in schedule contain requirements for materials necessary to achieve the work described under each alternate.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 SCHEDULE OF ALTERNATES

- A. Alternate No. 1: Chicago Ave. Gate. See G107 for additional information.
1. Base Bid: Add loop detector at south side of existing sliding gate, double-height mounted AI phone/card reader, and photo beams to existing rolling gate. Connect proposed AI phone to (2) front desks at Phase I building and guard shack at EMS Addition.
 2. Alternate: Add 24' wide automated, ornamental Chicago Building Code compliant rolling gate with screen to match adjacent ornamental fence at Chicago Ave. entrance to Phase II. Provide required grading, retaining walls, utilities, operator, and accessories as required for installation of new gate. Modify existing fence at east of drive to accommodate pedestrian gate. Provide photo beams, double-height mounted card reader, security camera connected to both front desks and loop detectors. Connect proposed AI phone to (2) front desks at Phase I building. Provide two (2) single panel, LED traffic light. Provide buried power, control, and fiber conduits to existing building. Route the conduits in the grass area. Conduit entry into the building shall be concealed. Connect to the existing power panel, next available circuit.
- B. Alternate No. 2: Visual Screen
1. Base Bid: No changes to existing conditions.
 2. Alternate: Add approximately 350' linear feet of 6' height aluminum, powder-coated in manufacturer's black color. Provide .125" minimum thickness of perforated metal infill panels to be installed on existing ornamental fence. Metal screen to be perforated with maximum 3/16" round holes with minimum 50% openings.
- C. Alternate No. 3: Exterior Cladding - Metal Panel Material
1. Base Bid: Aluminum panels, coping, and associated accessories.
 2. Alternate: In place of aluminum panels, provide galvanized steel metal panels, coping, and associated accessories. Provide stainless steel fasteners.

END OF SECTION 01 23 00

SECTION 01 25 00 - SUBSTITUTION PROCEDURES**PART 1 - GENERAL**

1.01 SECTION INCLUDES

- A. Procedural requirements for proposed substitutions.

1.02 DEFINITIONS

- A. Substitutions: Changes from Contract Document requirements proposed by Contractor to materials, products, assemblies, and equipment.
 - 1. Substitutions for Cause: Proposed due to changed Project circumstances beyond Contractor's control.
 - a. Unavailability: The specified product or method of construction is no longer available.
 - b. Regulatory changes.
 - c. There is no condition under which the specified product or method of construction can be installed as shown on the Contract Documents.
 - d. There is no condition under which the specified product or method of construction can be provided within the time limits of the Contract.
 - 2. Substitutions for Convenience: Proposed due to possibility of offering substantial advantage to the Project and to the Client.
 - a. Substitution requests offering advantages solely to the Contractor will not be considered.

PART 2 - PRODUCTS - NOT USED**PART 3 - EXECUTION**

3.01 GENERAL REQUIREMENTS

- A. All Substitution Requests are to utilize the form 01 25 00.01 – Substitution Request Form.
- B. Refer to 01 60 00 - Product Requirements for additional requirements for product selection and substitution limitations.
- C. A Substitution Request for products, assemblies, materials, and equipment constitutes a representation that the submitter:
 - 1. Has investigated proposed product and determined that it meets or exceeds the quality level of the specified product, equipment, assembly, or system.
 - 2. Agrees to provide the same warranty for the substitution as for the specified product.
 - 3. Agrees to coordinate installation and make changes to other work that may be required for the work to be complete, with no additional cost to Client.
 - 4. Waives claims for additional costs or time extension that may subsequently become apparent.

- D. Document each request with complete data substantiating compliance of proposed substitution with Contract Documents. Burden of proof is on proposer.
 - 1. Note explicitly any non-compliant characteristics.
- E. Content: Include information necessary for tracking the status of each Substitution Request, and information necessary to provide an actionable response.
 - 1. Forms included in Section 00 25 00.01 – Substitution Request Form are adequate for this purpose, and must be used.
 - 2. Attach applicable supporting documentation. Provide point-by-point side-by-side comparison addressing essential attributes specified, as appropriate and relevant for the item.
- F. Limit each request to a single proposed substitution item.
 - 1. Submit an electronic document, combining the request form with supporting data into single document.
- G. There shall be no time extensions granted due to time required for completion of the Substitution process either successfully or unsuccessfully.

3.02 SUBSTITUTION PROCEDURES

- A. Submittal Form: Submit substitution requests by completing the form in Section 01 25 00.01 – Substitution Request Form. Use only this form; other forms of submission are unacceptable.
- B. Submit request for Substitution for Cause within 14 days of discovery of need for substitution, but not later than 14 days prior to time required for review and approval by Architect/Engineer of Record, in order to stay on approved project schedule.
- C. Submit request for Substitution for Convenience immediately upon discovery of its potential advantage to the project, but not later than 14 days prior to time required for review and approval by Architect/Engineer of Record, in order to comply with approved project schedule.
 - 1. In addition to meeting general documentation requirements, document how the requested substitution benefits the Client through cost savings, time savings, greater energy conservation, or in other specific ways.
 - 2. Document means of coordinating of substitution item with other portions of the work, including work by affected subcontractors.
- D. The Architect/Engineer of Record shall consider requests for substitutions which are received within thirty (30) days after the Notice to Proceed. Any such requests which are received by the Architect/Engineer of Record more than thirty (30) days after the date of the Notice to Proceed may be considered or rejected in the sole and absolute discretion of the Architect/Engineer of Record.

3.03 RESOLUTION

- A. Architect/Engineer of Record may request additional information and documentation prior to rendering a decision. Contractor shall provide this data in an expeditious manner. Architect/Engineer of Record will request additional information or documentation for evaluation within one week of receipt of a request for substitution.

- B. Architect/Engineer of Record will notify Contractor in writing of decision to accept or reject request within 14 days of receipt of the request, or 7 days of receipt of additional information or documentation, whichever is later.
1. Architect/Engineer of Record's decision following review of proposed substitution will be noted on the submitted form.
 2. Contractor shall use the product specified if the Architect/Engineer of Record cannot make a decision on the use of a proposed substitute within the time allocated.

Manufacturer Address		
Contact Name		
Phone Number		

Reason For Substitution (select one of the following):

- The specified product or method of construction is no longer available.
- There is no condition under which the specified product or method of construction can be installed as shown on the Contract Documents.
- There is no condition under which the specified product or method of construction can be provided within the time limits of the Contract.
- Additional benefits (in cost, time, or performance) are available to the Board with the requested substitute product.

Additional Explanation: _____

Attach applicable supporting documentation including, but not limited to, the following (select all that are included with this request):

- Itemized Comparison of the requested substitution with product specified. **REQUIRED**
- Performance and Test Data, including performance against specified reference standards. **REQUIRED**
- Manufacturer's Qualifications: Evidence of manufacturer qualifications and reputation for prompt delivery and efficiency in servicing products. **REQUIRED**
- Previous Installations: Attach list of not less than 5 similar projects on which proposed substitution was used. List projects in the Chicago area. List name and

address of project, date of installation, and name, address, and phone number of Architect. REQUIRED

- Color Chart, illustrating Manufacturer's full range. IF APPLICABLE**
- Installation Instructions. IF APPLICABLE**
- Maintenance Instructions. IF APPLICABLE**
- Changes in Work: Attach data relating to changes required in other work to permit use of proposed substitution and changes required in construction schedule. IF APPLICABLE**
- Cost Data: Attach accurate cost data on proposed substitution in comparison with product specified. IF APPLICABLE**

In making this request for substitution, the Submitting Contractor and General Contractor represents that:

- a. Contractor has examined the Contract Documents and investigated the proposed product/system and has determined that the proposed substitution is appropriate for the use intended for this Project, and shall meet or exceed the quality level of the specified product/system.
- b. Contractor shall provide the same warranties for the substituted product/system as required for the product/system specified.
- c. Contractor shall coordinate installation of accepted substitution into Work, and make changes to other Work that may be required for the Work to be complete with no additional cost to the Board.
- d. Contractor waives all claims for additional costs related to accepted substitutions that may subsequently become apparent.
- e. Cost data is complete and includes any and all related costs for this Project.

Submitting Company Name:

Authorized Signature:

Printed Name: _____

Date: _____

REVIEWED BY INSTALLER: (company name): _____

Signature: _____

Date: _____

REVIEWED BY MANUFACTURER: (company name): _____

Signature: _____

Date: _____

REVIEWED BY GENERAL CONTRACTOR: (company name): _____

Signature: _____

Date: _____

Requests that are not complete will be returned by the Architect for additional information.

Requests that do not meet Client requirements for acceptable substitutions will be rejected.

AOR/EOR REVIEW: The submitted information has been reviewed by the Architect and found to be complete and meets the Client requirements for acceptable substitution

Agreement By (Name):

Architect Firm Name: _____ **Date:** _____

Client REVIEW:

Substitution Accepted by Client: _____ **Date:** _____ **Submit**
substituted product for review.

Substitution Rejected by Client: _____ **Date:** _____ **Submit**
specified product for review.

SECTION 01 26 00 - CONTRACT MODIFICATION PROCEDURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes administrative and procedural requirements for handling and processing Contract modifications.
- B. Related Requirements:
 - 1. Section 01 25 00 - SUBSTITUTION PROCEDURES for administrative procedures for handling requests for substitutions made after the Contract award.

1.3 MINOR CHANGES IN THE WORK

- A. Architect will issue through Contractor supplemental instructions authorizing minor changes in the Work, not involving adjustment to the Contract Sum or the Contract Time, on AIA Document G710 form.

1.4 PROPOSAL REQUESTS

- A. Contractor Initiated Proposal Requests: Contractor will issue a detailed description of proposed changes in the Work that may require adjustment to the Contract Sum or the Contract Time. If necessary, the description will include supplemental or revised Drawings and Specifications.
 - 1. Work Change Proposal Requests issued by Contractor are not instructions either to stop work in progress or to execute the proposed change.
 - 2. Within 5 working days, when not otherwise specified, after receipt of Proposal Request, submit a quotation estimating cost adjustments to the Contract Sum and the Contract Time necessary to execute the change.
 - a. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.
 - b. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
 - c. Include costs of labor and supervision directly attributable to the change.

- d. Include an updated Contractor's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationships. Use available total float before requesting an extension of the Contract Time.
 - e. Quotation Form: Use form type as provided by the Contractor.
- B. Contractor Initiated Proposals: If latent or changed conditions require modifications to the Contract, Contractor may initiate a claim by submitting a request for a change to the Client.
- 1. Include a statement outlining reasons for the change and the effect of the change on the Work. Provide a complete description of the proposed change. Indicate the effect of the proposed change on the Contract Sum and the Contract Time.
 - 2. Include a list of quantities of products required or eliminated and unit costs, with total amount of purchases and credits to be made. If requested, furnish survey data to substantiate quantities.
 - 3. Indicate applicable taxes, delivery charges, equipment rental, and amounts of trade discounts.
 - 4. Include costs of labor and supervision directly attributable to the change.
 - 5. Include an updated Contractor's construction schedule that indicates the effect of the change, including, but not limited to, changes in activity duration, start and finish times, and activity relationship. Use available total float before requesting an extension of the Contract Time.
 - 6. Comply with requirements in Section 01 25 00 - SUBSTITUTION PROCEDURES if the proposed change requires substitution of one product or system for product or system specified.
 - 7. Proposal Request Form: Use form type as provided by the Contractor.

1.5 CHANGE ORDER PROCEDURES

- A. On Client's approval of a Work Change Proposal Request, Contractor will issue a Change Order for signatures of Client and Contractor on a format provided by the Contractor.

1.6 CONSTRUCTION CHANGE DIRECTIVE

- A. Construction Change Directive: Contractor may issue a Construction Change Directive on a format provided by the Contractor. Construction Change Directive instructs Contractor to proceed with a change in the Work, for subsequent inclusion in a Change Order.
 - 1. Construction Change Directive contains a complete description of change in the Work. It also designates method to be followed to determine change in the Contract Sum or the Contract Time.
- B. Documentation: Maintain detailed records on a time and material basis of work required by the Construction Change Directive.

1. After completion of change, submit an itemized account and supporting data necessary to substantiate cost and time adjustments to the Contract.

1.7 WORK CHANGE DIRECTIVE

- A. Work Change Directive: Contractor may issue a Work Change Directive on a format provided by the Contractor. Work Change Directive instructs Contractor to proceed with a change in the Work, for subsequent inclusion in a Change Order.
 1. Work Change Directive contains a complete description of change in the Work. It also designates method to be followed to determine change in the Contract Sum or the Contract Time.
- B. Documentation: Maintain detailed records on a time and material basis of work required by the Work Change Directive.
 1. After completion of change, submit an itemized account and supporting data necessary to substantiate cost and time adjustments to the Contract.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION 01 26 00

SECTION 01 26 13 – REQUESTS FOR INTERPRETATION (RFI)**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section specifies administrative and procedural requirements for handling and processing Requests for Interpretation.
- B. Related Sections include the following:
 - 1. Section 01 26 00 - CONTRACT MODIFICATION PROCEDURES for procedural requirements governing handling and processing of Contract modifications.
 - 2. Section 01 31 00 - PROJECT MANAGEMENT AND COORDINATION.
 - 3. Section 01 33 00 - SUBMITTAL PROCEDURES for submittal requirements for RFI drawings.
 - 4. Section 01 60 00 - PRODUCT REQUIREMENTS for product and substitution requirements.

1.3 DEFINITIONS

- A. Request for Interpretation (RFI): Request from Contractor seeking interpretation or clarification of some requirement of Contract Documents and not involving change in Contract Sum or Contract Time.
 - 1. Improper RFI: An RFI meeting any of the following conditions:
 - a. RFI not prepared in accordance with requirements of this Section
 - b. RFI missing graphic solution proposal from contractor where appropriate
 - c. RFI with subject listed as improper subject matter in “GENERAL” Article of this section.
 - d. RFI requiring a response in 48 hours or less.
 - 2. Frivolous RFI: RFI that requests information that is clearly indicated on or reasonably inferable from Contract Documents.

1.4 GENERAL

- A. Immediately on discovery of the need for additional information or interpretation of the Contract Documents, Contractor shall prepare and submit an RFI in the form specified, or a form provided by the Contractor.

1. ALL RFIs must be submitted to the Architect. RFIs submitted directly to the Owner may be deemed improper and may delay the Architect's response.
- B. Submit RFI from subcontractor or material supplier through Contractor who shall review and sign each RFI prior to submittal to the Contractor.
1. Contractor will return RFIs submitted to Architect by other entities controlled by Contractor with no response.
 2. Coordinate and submit RFIs in a prompt manner so as to avoid delays in Contractors work or work of other contractors.
- C. Improper subjects for RFIs: Do not submit RFI for following:
1. Requests for approval of submittals. Comply with Section 01 33 00 - SUBMITTAL PROCEDURES.
 2. Requests for approval of substitutions. Comply with Section 01 60 00 - PRODUCT REQUIREMENTS.
 3. Requests for approval of Contractor's means and methods.
 4. Requests for coordination information already indicated in the Contract Documents.
 5. Requests for coordination of various materials and systems indicated on Contract Documents with field conditions and with each other. Comply with Section 01 31 00 - PROJECT MANAGEMENT AND COORDINATION.
 6. To provide as-built information required by Record Documents specified in Section 01 78 39 - PROJECT RECORD DOCUMENTS.
 7. To request changes which are known to entail additional cost or credit, or alter Contract Time. Comply with Section 01 26 00 - CONTRACT MODIFICATION PROCEDURES.
 8. Requests for interpretation of Architect's actions on submittals.
 9. Incomplete RFIs or inaccurately prepared RFIs.

1.5 REQUEST FOR INTERPRETATION (RFI)

- A. General:
1. RFI is a request for interpretation only. If Contractor believes response to RFI results in change in Contract Sum, Contract Time, or both, and complies with Division 01 Section "Contract Modification Procedures."
 2. Submit RFI on form attached or as provided by the Contractor, subject to Contractors prior review and approval. Form shall be completely in full and if prepared by hand, shall be fully legible after scanning, photocopying or transmission by facsimile (FAX), e-mail, or other approved electronic means of transmission.
 3. RFI may be submitted by e-mail or via web-based system. Address for e-mail or web address and login information will be distributed by the office of the Architect. Electronic form of attached Request for Interpretation will be provided upon request.
- B. Number RFIs sequentially using only next sequential number. Do not include subcontractors RFI number on form; include date submitted.

1. Each page of attachments to RFI shall bear RFI number and shall be consecutively numbered.
- C. Content of RFIs:
1. Specifically identify time response interpretation is required to avoid impact on Construction Schedule and Cost.
 - a. RFIs requesting responses within 96 hours or less shall be deemed Improper, unless approved verbally by the Architect's designated authorized representative.
 2. Include a detailed, legible description of item needing information or interpretation and the following:
 - a. Project name.
 - b. Project number.
 - c. Date.
 - d. Date shall reflect the Date submitted to the Architect.
 - e. Name of Contractor.
 - f. Name of Architect.
 - g. RFI number, numbered sequentially.
 - h. RFI subject.
 - i. Specification Section number and title and related paragraphs, as appropriate.
 - j. Drawing number and detail references, as appropriate.
 - k. Field dimensions and conditions, as appropriate.
 - l. Contractor's suggested resolution.
 - m. If Contractor's solution(s) impacts the Contract Time or the Contract Sum, Contractor shall state impact in the RFI.
 - n. Contractor's signature.
 - o. Attachments: Include sketches, descriptions, measurements, photos, Product Data, Shop Drawings, coordination drawings, and other information necessary to fully describe items needing interpretation.
 - 1) Include dimensions, thicknesses, structural grid references, and details of affected materials, assemblies, and attachments on attached sketches.
- D. RFI shall include written and graphic solutions proposed by Contractor. Contractor will determine if proposal is in accord with Contract Documents and design intent of Project.
1. Contractor's failure to make reasonable effort to propose realistic solution may result in Request for Interpretation returned with no action.
 2. Submit separate RFI for each item or, subject to Contractor's approval, group of closely related items requiring interpretation or clarification. RFIs containing more than a single item or group of closely related items not approved by Contractor will be returned unanswered or will be reviewed with the time specified for review allotted to each individual item, at Contractor's discretion.
- E. Improper or Frivolous RFI:
1. Will be returned unanswered and shall be labeled as frivolous in the official RFI log.

2. At Contractor's request, after notification by Contractor that RFI is improper or frivolous, RFI will be processed with processing costs charged to Contractor as follows:
 - a. Contractor shall reimburse Contractor for Architect's account for time spent in processing improper or frivolous RFI at rate of 2.5 times rate of Direct Personnel Expense (DPE). Direct Personnel Expense is defined as direct salaries of Architect's personnel engaged on Project and portion of costs of mandatory, and customary contributions and benefits related thereto, including employment taxes and other statutory employee benefits, insurance, sick leave, holidays, vacations, pensions, and similar contributions and benefits.
- F. For RFIs submitted in form of drawings, follow submittal procedures specified for Shop Drawings in Division 01 Section "Submittal Requirements."

1.6 REVIEW AND SUBMITTAL

- A. Submit Electronic copy of completed RFI form to Architect, including required attachments.
 1. RFIs received on Friday afternoon will not be processed until following Monday, which will be recorded receipt of RFI date.
- B. Allow minimum of seven (7) working days review and response time for each RFI.
 1. Requested response time indicated on RFI shall be consistent with minimum review period specified.
 - a. Circumstances which might require a shorter response time **MUST BE** preceded by a telephone call to the Contractor's designated Project Director. The Project Director must pre-approve any review time of seven (7) working days or less.
 2. Requested response time will be extended where required by concurrent review of excessive number of RFIs, including improper and frivolous RFIs.
- C. Contractor's Action: Contractor will review each RFI, determine action required, and respond.
 1. The following RFIs will be returned without action:
 - a. RFIs that meet improper or frivolous definitions as listed in this section.
 2. Contractor's action may include a request for additional information, in which case Architect's time for response will date from time of receipt of additional information.
 - a. If an RFI is submitted, that either relates to a previously submitted RFI, or continues a dialogue related to the RFI's previous submission date, as a result of the Contractor failing to adequately state the question or to provide required Content in accordance with Paragraph 1.4.C, the RFI (including the previously related RFI), or the latest dialogue, shall be considered the date on which the RFI is received.
 3. Contractor's action on RFIs that may result in a change to the Contract Time or the Contract Sum may be eligible for Contractor to submit Change Proposal according to Division 01 Section "Contract Modification Procedures."

- a. If Contractor believes the RFI response warrants change in the Contract Time or the Contract Sum, notify Architect in writing within 10 days of receipt of the RFI response.
- D. On receipt of Contractor's action, update the RFI log and immediately distribute the RFI response to affected parties. Review response and notify Contractor within seven days if Contractor disagrees with response.
- E. RFI Log: Prepare, maintain, and submit a tabular log of RFIs organized by the RFI number. Submit log bi-weekly and as requested by Architect. Use software log that is part of Project Web site to include not less than the following:
 - 1. Project name.
 - 2. Name and address of Contractor.
 - 3. Name and address of Architect.
 - 4. RFI number including RFIs that were dropped and not submitted.
 - 5. RFI description.
 - 6. Date the RFI was submitted.
 - 7. Date Architect's response was received.
 - 8. Identification of related Minor Change in the Work, Construction Change Directive, and Proposal Request, as appropriate.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION 01 29 00

SECTION 01 29 00 - PAYMENT PROCEDURES**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section includes administrative and procedural requirements necessary to prepare and process Applications for Payment.

1.2 SCHEDULE OF VALUES

- A. Coordination: Coordinate preparation of the schedule of values with preparation of Contractor's construction schedule.
 - 1. Coordinate line items in the schedule of values with items required to be indicated as separate activities in Contractor's construction schedule.
 - 2. Submit the schedule of values to Contractor at earliest possible date, but no later than 10 working days before the date scheduled for submittal of initial Applications for Payment.
- B. Format and Content: Provide at least one line item for each Specification Section, a draft of proposed line items shall be submitted to the Architect for approval.
 - 1. Arrange schedule of values consistent with format of AIA Document G703.
 - 2. Provide a breakdown of the Contract Sum in enough detail to facilitate continued evaluation of Applications for Payment and progress reports. Provide multiple line items for principal subcontract amounts in excess of five percent of the Contract Sum.
 - 3. Provide a separate line item in the schedule of values for each part of the Work where Applications for Payment may include materials or equipment purchased or fabricated and stored, but not yet installed.
 - a. Differentiate between items stored on-site and items stored off-site.
 - 4. Allowances: Provide a separate line item in the schedule of values for each allowance. Show line-item value of unit-cost allowances, as a product of the unit cost, multiplied by measured quantity. Use information indicated in the Contract Documents to determine quantities.
 - 5. Overhead Costs: Show cost of temporary facilities and other major cost items that are not direct cost of actual work-in-place as separate line items.
 - 6. Closeout Costs. Include separate line items under Contractor and principal subcontracts for Project closeout requirements in an amount totaling five percent of the Contract Sum and subcontract amount.
 - 7. Schedule of Values Revisions: Revise the schedule of values when Change Orders or Construction Change Directives result in a change in the Contract Sum. Include at least one separate line item for each Change Order and Construction Change Directive.

1.3 APPLICATIONS FOR PAYMENT

- A. Each Application for Payment following the initial Application for Payment shall be consistent with previous applications and payments.
- B. Payment Application Times: The date for each progress payment is indicated in the Agreement between Client and Contractor, occurring monthly. The period of construction work covered by each Application for Payment is the period indicated in the Agreement.
 - 1. Submit draft copy of Application for Payment seven days prior to due date for review by Architect.
- C. Application for Payment Forms: Use AIA Document G702 and AIA Document G703 as form for Applications for Payment.
- D. Application Preparation: Complete every entry on form. Notarize and execute by a person authorized to sign legal documents on behalf of Architect. Architect will return incomplete applications without action.
 - 1. Entries shall match data on the schedule of values and Contractor's construction schedule. Use updated schedules if revisions were made.
 - 2. Include amounts for work completed following previous Application for Payment, whether or not payment has been received. Include only amounts for work completed at time of Application for Payment.
 - 3. Include amounts of Change Orders and Construction Change Directives issued before last day of construction period covered by application.
- E. Transmittal: Submit three signed and notarized original copies of each Application for Payment to Architect by a method ensuring receipt within 24 hours. One copy shall include waivers of lien and similar attachments if required.
 - 1. Transmit each copy with a transmittal form listing attachments and recording appropriate information about application.
- F. Waivers of Mechanic's Lien: With each Application for Payment, submit waivers of mechanic's lien from subcontractors, sub-subcontractors, and suppliers for construction period covered by the previous application.
 - 1. Submit partial waivers on each item for amount requested in previous application, after deduction for retainage, on each item.
 - 2. When an application shows completion of an item, submit conditional final or full waivers.
 - 3. Owner reserves the right to designate which entities involved in the Work must submit waivers.
 - 4. Submit final Application for Payment with or preceded by conditional final waivers from every entity involved with performance of the Work covered by the application who is lawfully entitled to a lien.
 - 5. Waiver Forms: Submit executed waivers of lien on forms acceptable to Architect.

- G. Initial Application for Payment: Administrative actions and submittals that must precede or coincide with submittal of first Application for Payment include the following:
1. List of subcontractors.
 2. Schedule of values.
 3. Contractor's construction schedule (preliminary if not final).
 4. Products list (preliminary if not final).
 5. Sustainable design action plans, including preliminary project materials cost data.
 6. Schedule of unit prices.
 7. Submittal schedule (preliminary if not final).
 8. List of Contractor's staff assignments.
 9. List of Architect's principal consultants.
 10. Copies of building permits.
 11. Copies of authorizations and licenses from authorities having jurisdiction for performance of the Work.
 12. Initial progress report.
 13. Report of preconstruction conference.
 14. Certificates of insurance and insurance policies, if still pending.
 15. Performance and payment bonds, if applicable.
 16. Data needed to acquire Owner's insurance, if applicable.
- H. Application for Payment at Substantial Completion: After Architect issues the Certificate of Substantial Completion, submit an Application for Payment showing 100 percent completion for portion of the Work claimed as substantially complete.
1. Include documentation supporting claim that the Work is substantially complete and a statement showing an accounting of changes to the Contract Sum.
 2. This application shall reflect Certificate(s) of Substantial Completion issued previously for Owner occupancy of designated portions of the Work.
- I. Final Payment Application: After completing Project closeout requirements, submit final Application for Payment with releases and supporting documentation not previously submitted and accepted, including, but not limited to, the following:
1. Evidence of completion of Project closeout requirements.
 2. Insurance certificates for products and completed operations where required and proof that taxes, fees, and similar obligations were paid.
 3. Updated final statement, accounting for final changes to the Contract Sum.
 4. Consent of Surety for Final Payment, if applicable.
 5. Evidence that claims have been settled.
 6. Final meter readings for utilities, a measured record of stored fuel, and similar data as of date of Substantial Completion or when Owner took possession of and assumed responsibility for corresponding elements of the Work.
 7. Final liquidated damages settlement statement.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION (NOT USED)

END OF SECTION 01 29 00

SECTION 01 31 00 - PROJECT MANAGEMENT AND COORDINATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes administrative provisions for coordinating construction operations on Project including, but not limited to, the following:

1. General coordination procedures.
2. Coordination drawings.
3. RFIs.
4. Digital project management procedures.
5. Project meetings.

- B. Related Requirements:

1. Section 01 26 13 - REQUEST FOR INTERPRETATION (RFI) for procedural requirements for the submission
2. Section 01 73 00 - EXECUTION for procedures for coordinating general installation and field-engineering services, including establishment of benchmarks and control points.

1.3 DEFINITIONS

- A. BIM: Building Information Modeling.
- B. RFI: Request for Interpretation. Request from Owner, Architect, or Contractor seeking information required by or clarifications of the Contract Documents.

1.4 INFORMATIONAL SUBMITTALS

- A. Subcontract List: Prepare a written summary identifying individuals or firms proposed for each portion of the Work, including those who are to furnish products or equipment fabricated to a special design. Include the following information in tabular form:
 1. Name, address, telephone number, and email address of entity performing subcontract or supplying products.
 2. Number and title of related Specification Section(s) covered by subcontract.
 3. Drawing number and detail references, as appropriate, covered by subcontract.

1.5 GENERAL COORDINATION PROCEDURES

- A. Coordination: Coordinate construction operations included in different Sections of the Specifications to ensure efficient and orderly installation of each part of the Work. Coordinate construction operations included in different Sections that depend on each other for proper installation, connection, and operation.
1. Schedule construction operations in sequence required to obtain the best results where installation of one part of the Work depends on installation of other components, before or after its own installation.
 2. Coordinate installation of different components to ensure maximum performance and accessibility for required maintenance, service, and repair.
 3. Make adequate provisions to accommodate items scheduled for later installation.
- B. Administrative Procedures: Coordinate scheduling and timing of required administrative procedures with other construction activities to avoid conflicts and to ensure orderly progress of the Work. Such administrative activities include, but are not limited to, the following:
1. Preparation of Contractor's construction schedule.
 2. Preparation of the schedule of values.
 3. Installation and removal of temporary facilities and controls.
 4. Delivery and processing of submittals.
 5. Progress meetings.
 6. Preinstallation conferences.
 7. Project closeout activities.
 8. Startup and adjustment of systems.

1.6 COORDINATION DRAWINGS

- A. Coordination Drawings, General: Prepare coordination drawings according to requirements in individual Sections, and additionally where installation is not completely indicated on Shop Drawings, where limited space availability necessitates coordination, or if coordination is required to facilitate integration of products and materials fabricated or installed by more than one entity.
1. Content: Project-specific information, drawn accurately to a scale large enough to indicate and resolve conflicts. Do not base coordination drawings on standard printed data. Include the following information, as applicable:
 - a. Indicate functional and spatial relationships of components of architectural, structural, civil, mechanical, and electrical systems.
 - b. Indicate dimensions shown on Drawings. Specifically note dimensions that appear to be in conflict with submitted equipment and minimum clearance requirements. Provide alternative sketches to Architect indicating proposed resolution of such conflicts. Minor dimension changes and difficult installations will not be considered changes to the Contract.
- B. Coordination Drawing Organization: Organize coordination drawings as follows:

1. Floor Plans and Reflected Ceiling Plans: Show architectural and structural elements, and mechanical, plumbing, fire-protection, fire-alarm, and electrical Work. Show locations of visible ceiling-mounted devices relative to acoustical ceiling grid. Supplement plan drawings with section drawings where required to adequately represent the Work.
2. Plenum Space: Indicate sub-framing for support of ceiling and wall systems, mechanical and electrical equipment, and related Work. Locate components within plenums to accommodate layout of light fixtures and other components indicated on Drawings. Indicate areas of conflict between light fixtures and other components.
3. Mechanical Rooms: Provide coordination drawings for mechanical rooms showing plans and elevations of mechanical, plumbing, fire-protection, fire-alarm, and electrical equipment and ancillary items such as, but not limited to, piping, conduits, and valves.
4. Structural Penetrations: Indicate penetrations and openings required for all disciplines.
