4. Insulation Adhesive.
5. Insulation Sealant.
6. Insulation Mastic.
7. Insulation Jacketing.

QUALITY ASSURANCE

All testing and ratings shall meet the standards set in ASTM E-84, NFPA 255, and UL 723.

Indoor insulation shall have a flame-spread rating not exceeding 25 and a smoke developed rating not exceeding 50. Outdoor insulation shall have a flame-spread rating not exceeding 75 and a smoke developed rating not exceeding 150.

Insulation accessories shall have the same or better ratings as the insulation product they serve.

Insulation values shall be in accordance with the State Energy Codes.

Maximum insulation temperature limits must exceed maximum fluid working temperatures.

DELIVERY, STORAGE, AND HANDLING

Packaging: Insulation material containers shall be marked by manufacturer with flame and smoke ratings, and maximum use temperature.

Protection: Leave insulation boxed and stored until time for use. Elevate and cover material to avoid moisture, dust, and physical abuse.

COORDINATION

Coordinate size and location of supports, hangers, and insulation shields with ductwork and piping installer.

Coordinate clearance requirements with piping installer for piping insulation application and ductwork installer for duct insulation application, and equipment installer for equipment insulation application. Before preparing piping and ductwork Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

Coordinate installation and testing of heat tracing.

SCHEDULING

Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

PART 2 - PRODUCTS**MANUFACTURERS**

Fiberglass Insulation: Owens-Corning, Knauf, CertainTeed, Johns Manville, and Manson.

Closed-cell Insulation: Aeroflex, Armacell, and K-flex.

Adhesive: Foster, Johns Manville, and 3M.

Sealant: Foster, Boss Products, and Dow Chemical.

Mastic: Foster.

Aluminum Jacketing: Ideal Products, Pabco, and RPR Inc.

PVC Jacketing: Proto, and Johns Manville.

GENERAL

Products shall not contain asbestos, lead, mercury, or mercury compounds and be HCFC free.

Use of water-soluble treatments is prohibited.

TYPES OF INSULATION

- Type 1: Fiberglass heavy-density insulation with all service jacket and pressure sealing lap adhesive on longitudinal and butt strips. Jacket vapor membrane shall have an installed vapor permeance of not more than 0.09 perms. Staple and seal with pressure-sealing lap adhesive on longitudinal and butt strips. Thermal conductivity (k-value) not greater than 0.23 at mean temperature of 75 deg F.
- Type 2: Flexible closed cell elastomeric thermal pipe insulation. Thermal conductivity (k-value) not greater than 0.27 at 75 deg F. Indoor insulation shall have a flame-spread rating not exceeding 25 and a smoke developed rating not exceeding 50.
- Type 3: Flexible fiberglass duct wrap laminated to foil-reinforced kraft vapor membrane facing with 2 inch stapling flange. 1.0 pcf density with thermal conductivity (k-value) not greater than 0.27 at 75 deg F. Vapor membrane shall be less than 0.09 perms.
- Type 4: Semirigid fiberglass industrial board with foil scrim kraft vapor membrane facing. 3.0 pcf density with thermal conductivity (k-value) not greater than 0.23 at 75 deg F. Vapor membrane shall be less than 0.09 perms.
- Type 5: Rigid fiberglass industrial board with foil scrim kraft vapor membrane facing. 6.0 pcf density with thermal conductivity (k-value) not greater than 0.22 at 75 deg F. Vapor membrane shall be less than 0.09 perms.
- Type 6: Flexible closed cell elastomeric thermal sheet insulation. Thermal conductivity (k-value) not greater than 0.27 at 75 deg F. Indoor insulation shall have a flame-spread rating not exceeding 25 and a smoke developed rating not exceeding 50.

TYPES OF JACKETING

- Type 1: PVC jacket. 0.030-inch-thick ultraviolet-resistant PVC jacket. Jacket is to be self-extinguishing and have zero fuel contribution.
- Type 2: Aluminum jacket. 0.016-inch-thick aluminum jacket with "Pittsburgh Seam." Seal between metal jacket and sleeve.
- Type 3: Rubberized bitumen membrane. 0.060 inch thick. Designed with a cross laminated high strength polyethylene laminated to raw aluminum. This film is then laminated to rubberized bitumen compound with a release liner. Self-healing if punctured, UV stable, and will expand and contract with the mechanical system. "Alumaguard" / "Alumaguard Lite" as manufactured by Polyguard. Install a layer of "Alumaguard" on the top & sides of duct and "Alumaguard Lite" on the bottom. For cold weather installations the "Alumaguard LT" as manufactured by Polyguard, can be used. Install per manufacturer's instructions.

FITTINGS AND VALVES

- Premolded PVC covers over molded insulation. Insulation same thickness as on adjoining pipe. Insulation shall have a flame-spread rating not exceeding 25 and a smoke-developed rating not exceeding 50.

SCHEDULE OF INSULATION

System Type	Fluid Temperature Range (F)	Insulation Type	Insulation Thickness					
			1" and smaller	1" to 1-1/4"	1-1/2" to 3"	4" to 6"	8" and larger	Duct or Equip.
Hydronic Piping								
Heating Water	100 – 200	1	1.5	1.5	2.0	2.0	2.0	N/A
Chilled Water	40 – 60	1 or 2	0.5	0.5	1.0	1.0	1.0	N/A
Cooling Coil Condensate	40 – 60	1 or 2	0.5	0.5	1.0	1.0	1.0	N/A
Make-up Water	40 – 60	1 or 2	0.5	0.5	1.0	1.0	1.0	N/A
Refrigerant	Below 40	1 or 2	0.5	1.0	1.0	1.5	1.5	N/A
Duct								
Supply	45 – 120	3 (*C)	N/A	N/A	N/A	N/A	N/A	1.5
(*A) Return	70 – 95	3 (*C)	N/A	N/A	N/A	N/A	N/A	1.0
Outside Air	-20 – 120	3 (*C)	N/A	N/A	N/A	N/A	N/A	2.0
(*B) Relief Air	70 – 95	3 (*C)	N/A	N/A	N/A	N/A	N/A	1.0
(*B) Exhaust	70 – 95	3 (*C)	N/A	N/A	N/A	N/A	N/A	1.0
Equipment								
Heating Water Tanks	100 – 200	4 or 5	N/A	N/A	N/A	N/A	N/A	1.5
Heating Water Heat Exchangers	100 – 200	4 or 5	N/A	N/A	N/A	N/A	N/A	1.5
Heating Water Air Separators	100 – 200	4 or 5	N/A	N/A	N/A	N/A	N/A	1.5
Chilled Water Pumps	40 – 60	4, 5, or 6	N/A	N/A	N/A	N/A	N/A	1.0
Chilled Water Tanks	40 – 60	4, 5, or 6	N/A	N/A	N/A	N/A	N/A	1.0
Chilled Water Heat Exchangers	40 – 60	4, 5, or 6	N/A	N/A	N/A	N/A	N/A	1.0
Chilled Water Air Separators	40 – 60	4, 5, or 6	N/A	N/A	N/A	N/A	N/A	1.0
Note: For piping and ductwork exposed to outdoor temperatures, increase thickness by 0.5 inches.								
*A: Only ductwork/Piping in non-air-conditioned areas (Including: Shafts, Ceiling space with roof above, and Attics) or ductwork/Piping exposed to outdoor temperatures.								
*B: Only ductwork/Piping exposed to outdoor temperatures or ductwork from plenum at louver (or other outside opening) back to motorized or backdraft damper.								
*C: For visible rectangular ductwork (non-mechanical rooms) or ductwork installed outside use Type 4 or Type 5 insulation. For mechanical rooms use Type 4 or Type 5 insulation for rectangular ductwork with bottom of duct elevation below 10 feet A.F.F.								

EXPOSED INDOOR PIPING LESS THAN 10 FEET ABOVE NEAREST WALKING SURFACE

Cover piping insulation with Type 1 or Type 2 Jacketing.

OUTDOOR PIPING

Cover piping insulation with Type 2 Jacketing.

OUTDOOR DUCTWORK

Cover ductwork insulation with Type 3 Jacketing. For the top of rectangular ductwork, under the jacketing provide tapered insulation centered on the duct to slope to the sides for drainage. Tapered insulation shall run the entire length of duct.

PART 3 - EXECUTION

EXAMINATION

Examine substrates and conditions for compliance with requirements for installation and other conditions affecting performance of insulation application.

Verify that systems and equipment to be insulated have been tested and are free of defects.

Verify that surfaces to be insulated are clean and dry.

Proceed with installation only after unsatisfactory conditions have been corrected.

PREPARATION

Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

GENERAL INSTALLATION REQUIREMENTS

Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment, ducts and fittings, and piping including fittings, valves, and specialties.

Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment, duct system, and pipe system as specified in schedule of insulation.

Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

Install insulation with longitudinal seams at top and bottom of horizontal runs.

Install multiple layers of insulation with longitudinal and end seams staggered.

Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

Keep insulation materials dry during application and finishing.

Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

Install insulation with least number of joints practical.

Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.

1. Install insulation continuously through hangers and around anchor attachments.
2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

Apply insulation with duct and pipe surfaces at room temperature.

Make insulation continuous except through fire-rated walls/floors. Do not leave gaps in insulation at sleeves, hangers, anchors, supports, etc.

Insulate all fittings, valve bodies, flanges, and other pipe accessories.

Install insulation with factory-applied jackets as follows:

5. Draw jacket tight and smooth.
6. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
7. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 3 inches o.c.
 - a. For below ambient services, apply vapor-barrier mastic over staples.
8. Cover joints and seams with tape as recommended by insulation material manufacturer to maintain vapor seal.

9. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to duct and pipe flanges and fittings.

Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

For insulation at hangers and bracing, see Division 23 Section "Hangers and Supports for HVAC Piping and Equipment."

EQUIPMENT INSULATION INSTALLATION

Pipe and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.

10. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of tank and vessel surfaces.
11. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
12. Protect exposed corners with secured corner angles.
13. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
 - a. Do not weld anchor pins to ASME-labeled pressure vessels.
 - b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
 - c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
 - d. Do not overcompress insulation during installation.
 - e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
 - f. Impale insulation over anchor pins and attach speed washers.
 - g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
14. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
15. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from

each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.

16. Stagger joints between insulation layers at least 3 inches.
17. Install insulation in removable segments on equipment access doors, manholes, handholes, and other elements that require frequent removal for service and inspection.
18. Bevel and seal insulation ends around manholes, handholes, ASME stamps, and nameplates.
19. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

Flexible Elastomeric Thermal Insulation Installation for Tanks and Vessels: Install insulation over entire surface of tanks and vessels.

20. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
21. Seal longitudinal seams and end joints.

Insulation Installation on Pumps

22. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch-diameter fasteners with wing nuts. Alternatively, secure the box sections together using a latching mechanism.
23. Fabricate boxes from galvanized steel, at least 0.050 inch thick.
24. For below ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.

DUCT INSULATION INSTALLATION

Flexible fiberglass duct wrap installations: Secure insulation with adhesive and anchor pins and speed washers.

25. Apply adhesives according to manufacturer's recommended coverage rates per square foot, for 100 percent coverage of duct and plenum surfaces.
26. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
27. Install anchor pins and speed washers on sides and bottom of horizontal ducts and sides of vertical ducts as follows:
 - a. On duct sides with dimensions 18 inches and smaller, along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.

- b. On duct sides with dimensions larger than 18 inches. Space 16 inches o.c. each way, and 3 inches maximum from insulation joints. Apply additional pins and clips to hold insulation tightly against surface at cross bracing.
 - c. Anchor pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
- 28. Impale insulation over anchors and attach speed washers.
 - 29. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
 - 30. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation segment with 1/2-inch staples, 1 inch o.c., and cover with pressure-sensitive tape having same facing as insulation.
 - 31. Overlap unfaced blankets a minimum of 2 inches on longitudinal seams and end joints. Secure with steel band at end joints and spaced a maximum of 18 inches o.c.
 - 32. Apply insulation on rectangular duct elbows and transitions with a full insulation segment for each surface. Apply insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
 - 33. Insulate duct stiffeners, hangers, and flanges that protrude beyond the insulation surface with 6-inch-wide strips of the same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with anchor pins spaced 6 inches o.c.
 - 34. Apply vapor-retarder mastic to open joints, breaks, and punctures for insulation indicated to receive vapor retarder.

Semi-rigid and rigid fiberglass board installations: Secure board insulation with adhesive and anchor pins and speed washers.

- 35. Apply adhesives according to manufacturer's recommended coverage rates per square foot, for 100 percent coverage of duct and plenum surfaces.
- 36. Apply adhesive to entire circumference of ducts and to all surfaces of fittings and transitions.
- 37. Space anchor pins as follows:
 - a. On duct sides with dimensions 18 inches and smaller, along longitudinal centerline of duct. Space 3 inches maximum from insulation end joints, and 16 inches o.c.
 - b. On duct sides with dimensions larger than 18 inches. Space 16 inches o.c. each way, and 3 inches maximum from insulation joints. Apply additional pins and clips to hold insulation tightly against surface at cross bracing.
 - c. Anchor pins may be omitted from top surface of horizontal, rectangular ducts and plenums.
 - d. Do not overcompress insulation during installation.
- 38. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.

39. Create a facing lap for longitudinal seams and end joints with insulation by removing 2 inches from one edge and one end of insulation segment. Secure laps to adjacent insulation segment with 1/2-inch staples, 1 inch o.c., and cover with pressure-sensitive tape having same facing as insulation.
40. Apply insulation on rectangular duct elbows and transitions with a full insulation segment for each surface. Groove and score insulation to fit as closely as possible to outside and inside radius of elbows. Apply insulation on round and flat-oval duct elbows with individually mitered gores cut to fit the elbow.
41. Insulate duct stiffeners, hangers, and flanges that protrude beyond the insulation surface with 6-inch-wide strips of the same material used to insulate duct. Secure on alternating sides of stiffener, hanger, and flange with anchor pins spaced 6 inches o.c.
42. Apply vapor-retarder mastic to open joints, breaks, and punctures for insulation indicated to receive vapor retarder.

PIPE INSULATION INSTALLATION

Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:

43. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity, unless otherwise indicated.
44. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
45. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
46. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
47. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below ambient services, provide a design that maintains vapor barrier.

48. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.
49. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below ambient services and a breather mastic for above ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.
50. For services not specified to receive a field-applied jacket except for flexible elastomeric and polyolefin, install fitted PVC cover over elbows, tees, strainers, valves, flanges, and unions. Terminate ends with PVC end caps. Tape PVC covers to adjoining insulation facing using PVC tape.
51. Stencil or label the outside insulation jacket of each union with the word "UNION." Match size and color of pipe labels.

Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes, vessels, and equipment. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

Install removable insulation covers at locations indicated. Installation shall conform to the following:

52. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
53. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
54. Construct removable valve insulation covers in same manner as for flanges except divide the two-part section on the vertical center line of valve body.
55. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
56. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

PIPING CELLULAR-GLASS INSULATION INSTALLATION

Insulation Installation on Straight Pipes and Tubes

57. Secure each layer of insulation to pipe with wire or bands and tighten bands without deforming insulation materials.

58. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
59. For insulation with factory-applied jackets on above ambient services, secure laps with outward clinched staples at 6 inches o.c.
60. For insulation with factory-applied jackets on below ambient services, do not staple longitudinal tabs but secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.

Insulation Installation on Pipe Flanges

61. Install preformed pipe insulation to outer diameter of pipe flange.
62. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
63. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of cellular-glass block insulation of same thickness as pipe insulation.
64. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

Insulation Installation on Pipe Fittings and Elbows

65. Install preformed sections of same material as straight segments of pipe insulation when available. Secure according to manufacturer's written instructions.
66. When preformed sections of insulation are not available, install mitered sections of cellular-glass insulation. Secure insulation materials with wire or bands.

Insulation Installation on Valves and Pipe Specialties

67. Install preformed sections of cellular-glass insulation to valve body.
68. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
69. Install insulation to flanges as specified for flange insulation application.

PIPING FLEXIBLE ELASTOMERIC INSULATION INSTALLATION

Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

Insulation Installation on Pipe Flanges

70. Install pipe insulation to outer diameter of pipe flange.
71. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
72. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with cut sections of sheet insulation of same thickness as pipe insulation.

73. Secure insulation to flanges and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

Insulation Installation on Pipe Fittings and Elbows

74. Install mitered sections of pipe insulation.
75. Secure insulation materials and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

Insulation Installation on Valves and Pipe Specialties

76. Install preformed valve covers manufactured of same material as pipe insulation when available.
77. When preformed valve covers are not available, install cut sections of pipe and sheet insulation to valve body. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
78. Install insulation to flanges as specified for flange insulation application.
79. Secure insulation to valves and specialties and seal seams with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

END OF SECTION 23 07 00

SECTION 23 08 00 - COMMISSIONING OF HVAC&R

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes commissioning process requirements for Heating Ventilating Air Conditioning and Refrigeration (HVAC&R) systems, assemblies, and equipment.
- B. Provide documentation and testing of these systems, as well as training of the Owner's operation and maintenance personnel. Work with the Commissioning Authority and in cooperation with other members of the commissioning team to ensure compliance.
- C. Refer to Section 01 91 13 GENERAL COMMISSIONING REQUIREMENTS for commissioning requirements.
- D. Related Sections:
 - 1. Division 01 Section "General Commissioning Requirements" for commissioning process requirements.
 - 2. Division 23 Sections related to Testing, Adjusting and Balancing (TAB).
 - 3. Division 23 Sections related to Building Direct Digital Control (DDC) System.

1.3 COMMISSIONING

- A. This section governs the commissioning of HVAC&R systems.
- B. The following systems and equipment shall be commissioned, where applicable.
 - 1. Building Automation System
 - 2. Central Heating and Cooling Plant Equipment
 - 3. Air Handling Units
 - 4. Terminal Air Units
 - 5. Finned Tube Radiant Heaters
 - 6. Exhaust Fans
 - 7. Convection Radiant Heaters
 - 8. Radiant Ceiling Panels
 - 9. Cabinet Unit Heaters
 - 10. Hydronic, Refrigerant, and Condensate Piping
 - 11. Pumps

12. Mechanical Identification
13. Ductwork Construction, Insulation and Testing
14. Split System and Type Cooling System

- C. Refer to Division 01. Section 01 91 13, "General Commissioning Requirements" for the Work related to commissioning of these systems.

PART 2 - PRODUCTS: NOT USED

PART 3 - EXECUTION: NOT USED

END OF SECTION 23 08 00

SECTION 23 09 00 – CONTROLS AND INSTRUMENTATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. All work of this Division shall be coordinated and provided by the single Building Management System (BMS) Contractor.
- B. The work of this Division shall be scheduled, coordinated, and interfaced with the associated work of other trades. Reference the Division 23 Sections for details.
- C. The work of this Division shall be as required by the Specifications, Point Schedules and Drawings.
- D. If the BMS Contractor believes there are conflicts or missing information in the project documents, the Contractor shall promptly request clarification and instruction from the design team.
- E. The BMS Contractor shall be responsible for obtaining existing main building temperature controls system submittals and field verification as required to facilitate the addition of new controls network componentry and devices.

1.2 DEFINITIONS

- A. Analog: A continuously variable system or value not having discrete levels. Typically exists within a defined range of limiting values.
- B. Binary: A two-state system where an “ON” condition is represented by one discrete signal level and an “OFF” condition is represented by a second discrete signal level.
- C. Building Management System (BMS): The total integrated system of fully operational and functional elements, including equipment, software, programming, and associated materials, to be provided by this Division BMS Contractor and to be interfaced to the associated work of other related trades.
- D. BMS Contractor: The single Contractor to provide the work of this Division. This Contractor shall be the primary manufacturer, installer, commissioner and ongoing service provider for the BMS work.
- E. Control Sequence: A BMS pre-programmed arrangement of software algorithms, logical computation, target values and limits as required to attain the defined operational control objectives.
- F. Direct Digital Control: The digital algorithms and pre-defined arrangements included in the BMS software to provide direct closed-loop control for the designated equipment and controlled variables. Inclusive of Proportional, Derivative and Integral control

algorithms together with target values, limits, logical functions, arithmetic functions, constant values, timing considerations and the like.

- G. BMS Network: The total digital on-line real-time interconnected configuration of BMS digital processing units, workstations, panels, sub-panels, controllers, devices and associated elements individually known as network nodes. May exist as one or more fully interfaced and integrated sub-networks, LAN, WAN or the like.
- H. Node: A digitally programmable entity existing on the BMS network.
- I. BMS Integration: The complete functional and operational interconnection and interfacing of all BMS work elements and nodes in compliance with all applicable codes, standards and ordinances so as to provide a single coherent BMS as required by this Division.
- J. Provide: The term “Provide” and its derivatives when used in this Division shall mean to furnish, install in place, connect, calibrate, test, commission, warrant, document and supply the associated required services ready for operation.
- K. PC: Personal Computer from a recognized major manufacturer
- L. Furnish: The term “Furnish” and its derivatives when used in this Division shall mean supply at the BMS Contractor’s cost to the designated third party trade contractor for installation. BMS Contractor shall connect furnished items to the BMS, calibrate, test, commission, warrant and document.
- M. Wiring: The term “Wiring” and its derivatives when used in this Division shall mean provide the BMS wiring and terminations.
- N. Install: The term “Install” and its derivatives when used in this Division shall mean receive at the jobsite and mount.
- O. Protocol: The term “protocol” and its derivatives when used in this Division shall mean a defined set of rules and standards governing the on-line exchange of data between BMS network nodes.
- P. Software: The term “software” and its derivatives when used in this Division shall mean all of programmed digital processor software, preprogrammed firmware and project specific digital process programming and database entries and definitions as generally understood in the BMS industry for real-time, on-line, integrated BMS configurations.
- Q. The use of words in the singular in these Division documents shall not be considered as limiting when other indications in these documents denote that more than one such item is being referenced.
- R. Headings, paragraph numbers, titles, shading, bolding, underscores, clouds and other symbolic interpretation aids included in the Division documents are for general information only and are to assist in the reading and interpretation of these Documents.
- S. The following abbreviations and acronyms may be used in describing the work of this:
 - ADC - Analog to Digital Converter

AHJ	-	Authority Having Jurisdiction
AI	-	Analog Input
AN	-	Application Node
ANSI	-	American National Standards Institute
AO	-	Analog Output
ASCII	-	American Standard Code for Information Interchange
ASHRAE	-	American Society of Heating, Refrigeration & Air Conditioning Engineers
AWG	-	American Wire Gauge
BTL	-	BACnet Testing Laboratories
CPU	-	Central Processing Unit
CRT	-	Cathode Ray Tube
DAC	-	Digital to Analog Converter
DDC	-	Direct Digital Control
DI	-	Digital Input
DO	-	Digital Output
EEPROM	-	Electrically Erasable Programmable Read Only Memory
EMI	-	Electromagnetic Interference
FAS	-	Fire Alarm Detection and Annunciation System
GUI	-	Graphical User Interface
HOA	-	Hand-Off-Auto
ID	-	Identification
IEEE	-	Institute of Electrical and Electronics Engineers
I/O	-	Input/Output
IT	-	Information Technology
LAN	-	Local Area Network
LCD	-	Liquid Crystal Display
LED	-	Light Emitting Diode
MCC	-	Motor Control Center
NC	-	Normally Closed
NIC	-	Not In Contract
NO	-	Normally Open
OWS	-	Operator Workstation
OAT	-	Outdoor Air Temperature
PC	-	Personal Computer
RAM	-	Random Access Memory
RF	-	Radio Frequency
RFI	-	Radio Frequency Interference
RH	-	Relative Humidity
ROM	-	Read Only Memory
RTD	-	Resistance Temperature Device
SPDT	-	Single Pole Double Throw
SPST	-	Single Pole Single Throw
XVGA	-	Extended Video Graphics Adapter
TBA	-	To Be Advised
TCP/IP	-	Transmission Control Protocol/Internet Protocol
TTD	-	Thermistor Temperature Device
UPS	-	Uninterruptible Power Supply
VAC	-	Volts, Alternating Current
VAV	-	Variable Air Volume
VDC	-	Volts, Direct Current

WAN - Wide Area Network

1.3 BMS DESCRIPTION:

- A. The Building Any and all components of the BMS that are connected via field bus or IP network, including the network controllers, field controllers, application specific controllers, server and user interface software, system and controller programming tools and software applications shall be designed, engineered, and tested to work together as a complete building management system, and shall be manufactured by the same BMS manufacturer. Systems that use or require network controllers, field controllers, application specific controllers, server and user interface software, programming tools and software from more than one BMS manufacturer shall not be accepted.
- B. Any and all components of the BMS that are connected via field bus or IP network, including the network controllers, field controllers, application specific controllers, server and user interface software, system and controller programming tools and software applications shall be designed, engineered, and tested to work together as a complete building management system, and shall be manufactured by the same BMS manufacturer. Systems that use or require network controllers, field controllers, application specific controllers, server and user interface software, programming tools and software from more than one BMS manufacturer shall not be accepted.
- C. All points of user interface shall be on standard PCs that do not require the purchase of any special software from the BMS manufacturer for use as a building operations terminal. The primary point of interface on these PCs will be a standard Web Browser.
- D. Where necessary and as dictated elsewhere in these Specifications, Servers shall be used for the purpose of providing a location for extensive archiving of system configuration data, and historical data such as trend data and operator transactions. All data stored will be through the use of a standard data base platform: Microsoft SQL Server Express or Microsoft SQL Server as dictated elsewhere in this specification.
- E. The work of the single BMS Contractor shall be as defined individually and collectively in all Sections of this Division specification together with the associated Point Sheets and Drawings and the associated interfacing work as referenced in the related documents.
- F. The BMS work shall consist of the provision of all labor, materials, tools, equipment, software, software licenses, software configurations and database entries, interfaces, wiring, tubing, installation, labeling, engineering, calibration, documentation, samples, submittals, testing, commissioning, training services, permits and licenses, transportation, shipping, handling, administration, supervision, management, insurance, temporary protection, cleaning, cutting and patching, warranties, services, and items, even though these may not be specifically mentioned in these Division documents which are required for the complete, fully functional and commissioned BMS.

- G. Provide a complete, neat and workmanlike installation. Use only manufacturer employees who are skilled, experienced, trained, and familiar with the specific equipment, software, standards and configurations to be provided for this Project.
- H. Manage and coordinate the BMS work in a timely manner in consideration of the Project schedules. Coordinate with the associated work of other trades so as to not impede or delay the work of associated trades.
- I. The BMS as provided shall incorporate, at minimum, the following integrated features, functions and services:
 - 1. Operator information, alarm management and control functions.
 - 2. Enterprise-level information and control access.
 - 3. Information management including monitoring, transmission, archiving, retrieval, and reporting functions.
 - 4. Diagnostic monitoring and reporting of BMS functions.
 - 5. Offsite monitoring and management access.
 - 6. Energy management
 - 7. Standard applications for terminal HVAC systems.
 - 8. Integration or monitoring connections to all other systems provided by others as identified in the sequence of operations.

1.4 QUALITY ASSURANCE

- A. General:
 - 1. The Building Management System Contractor shall be the primary manufacturer-owned branch office that is regularly engaged in the engineering, programming, installation and service of total integrated Building Management Systems.
 - 2. The BMS Contractor shall be a recognized national manufacturer, installer and service provider of BMS.
 - 3. The Building Management System (BMS) installer shall be a BMS manufacturer-owned branch office, or an independent controls contractor who is factory trained and authorized by the BMS manufacturer to sell, service and support the Building Management System specified herein.
 - 4. Independent controls contractors who are authorized by the BMS manufacturer must provide a letter written and signed by a company officer of the specific BMS manufacturer. This document must be dated within the 30 days prior to bid submittal and must state that they are currently a "direct authorized representative" in good standing for the BMS manufacturer for the building management system products described and listed in this specification, that they have "direct purchasing access" to all of the BMS manufacturer's controllers, servers, software and components and technical support, and that they will continue to be an Authorized representative with this access for the duration of the installation and warranty phases of project.
 - 5. If an independent controls contractor is to be considered via addendum, the contractor must provide a letter written by a company officer of the specific BMS manufacturer with the following verbiage; "should this contractor fail to provide a complete and operational system (as judged by the Design-Builder), the Manufacturer will complete the project to the Design-Builder's satisfaction at no

additional cost to the Owner". This letter must be dated within 30 days prior to bid submittal and provided to the engineer along with the other supporting documentation at the time of request for equivalence.

6. The BMS Contractor shall have a branch facility within a 100-mile radius of the job site supplying complete maintenance and support services on a 24 hour, 7-day-a-week basis. The BMS Contractor shall have at this facility at least eight (8) factory trained, directly employed and full time technical staff, spare parts inventory, and all necessary test and diagnostic equipment.
7. As evidence and assurance of the contractor's ability to support the Owner's system with service and parts, the contractor must have been in the BMS business for at least the last ten (10) years and have successfully completed total projects of at least 10 times the value of this contract in each of the preceding five years.
8. The Building Management System architecture shall consist of the products of a manufacturer regularly engaged in the production of Building Management Systems, and shall be the manufacturer's latest standard of design at the time of bid.

B. Workplace Safety and Hazardous Materials

1. Provide a safety program in compliance with the Contract Documents.
2. The BMS Contractor shall have a corporately certified comprehensive Safety Certification Manual and a designated Safety Supervisor for the Project.
3. The Contractor and its employees and subtrades shall comply with federal, state and local safety regulations.
4. The Contractor shall ensure that all subcontractors and employees have written safety programs in place that covers their scope of work, and that their employees receive the training required by the OSHA rules that have jurisdiction for at least each topic listed in the Safety Certification Manual.
5. Hazards created by the Contractor or its subcontractors shall be eliminated before any further work proceeds.
6. Hazards observed but not created by the Contractor or its subcontractors shall be reported to either the General Contractor or the Design-Builder within the same day. The Contractor shall be required to avoid the hazard area until the hazard has been eliminated.
7. The Contractor shall sign and date a safety certification form prior to any work being performed, stating that the Contractors' company is in full compliance with the Project safety requirements.
8. The Contractor's safety program shall include written policy and arrangements for the handling, storage and management of all hazardous materials to be used in the work in compliance with the requirements of the AHJ at the Project site.
9. The Contractor's employees and subcontractor's staff shall have received training as applicable in the use of hazardous materials and shall govern their actions accordingly.

C. Quality Management Program

1. Designate a competent and experienced employee to provide BMS Project Management. The designated Project Manager shall be empowered to make technical, scheduling and related decisions on behalf of the BMS Contractor. At minimum, the Project Manager shall:

- a. Manage the scheduling of the work to ensure that adequate materials, labor and other resources are available as needed.
- b. Manage the financial aspects of the BMS Contract.
- c. Coordinate as necessary with other trades.
- d. Be responsible for the work and actions of the BMS workforce on site

1.5 REFERENCES

A. All work shall conform to the following Codes and Standards, as applicable:

- 1. National Fire Protection Association (NFPA) Standards.
- 2. National Electric Code (NEC) and applicable local Electric Code.
- 3. Underwriters Laboratories (UL) listing and labels.
- 4. UL 864 UUKL Smoke Control
- 5. UL 268 Smoke Detectors.
- 6. UL 916 Energy Management
- 7. NFPA 70 - National Electrical Code.
- 8. NFPA 90A - Standard For The Installation Of Air Conditioning And Ventilating Systems.
- 9. NFPA 92A and 92B Smoke Purge/Control Equipment.

Footnotes:

- *1: BMS controls contractor must hire the electrical contractor for the project to route and install all conduit.
- *2: VAV box controller factory install would normally be by Division 23 Mechanical who furnishes the VAV boxes; could be by BMS for field installation where applicable
- *3: BMS controls contractor is only responsible for the low voltage wiring and conduit associated with connecting the system into BMS system. All other low voltage wiring and conduit is the responsibility of the contractor furnishing and installing the system.
- *4: Cabinet/Unit Heater Controls – for line voltage stand-alone controls: furnished by Division 23 Mechanical Contractor who furnishes the Cabinet/Unit Heaters; line voltage stand-alone controls installed and connected by Division 26 Electrical Contractor. Alternately, controls may be furnished and installed by BMS Contractors for projects requiring Cabinet/Unit Heater controls to be integrated into BMS.

1.7 SUBMITTALS.

A. Shop Drawings, Product Data, and Samples.

1. The BMS contractor shall submit a list of all shop drawings with submittals dates within 30 days of contract award.
2. Submittals shall be in defined packages. Each package shall be complete and shall only reference itself and previously submitted packages. The packages shall be as approved by the Architect and Engineer for Contract compliance.
3. Allow 15 working days for the review of each package by the Architect and Engineer in the scheduling of the total BMS work.
4. Equipment and systems requiring approval of local authorities must comply with such regulations and be approved. Filing shall be at the expense of the BMS Contractor where filing is necessary. Provide a copy of all related correspondence and permits to the Design-Builder.
5. Prepare an index of all submittals and shop drawings for the installation. Index shall include a shop drawing identification number, Contract Documents reference and item description.
6. The BMS Contractor shall correct any errors or omissions noted in the first review.
7. At a minimum, submit the following:

- a. BMS network architecture diagrams including all nodes and interconnections.
- b. Systems schematics, sequences, and flow diagrams.
- c. Points schedule for each point in the BMS, including: Point Type, Object Name, Expanded ID, Display Units, Controller type, and Address.
- d. Samples of Graphic Display screen types and associated menus.
- e. Detailed Bill of Material list for each system or application, identifying quantities, part numbers, descriptions, and optional features.
- f. Control Damper Schedule including a separate line for each damper provided under this section and a column for each of the damper attributes, including: Code Number, Fail Position, Damper Type, Damper Operator, Duct Size, Damper Size, Mounting, and Actuator Type.
- g. Room Schedule including a separate line for each VAV box and/or terminal unit indicating location and address
- h. Control Valve Schedules including a separate line for each valve provided under this section and a column for each of the valve attributes: Code Number, Configuration, Fail Position, Pipe Size, Valve Size, Body Configuration, Close off Pressure, Capacity, Valve CV, Design Pressure, and Actuator Type.
- i. Details of all BMS interfaces and connections to the work of other trades.
- j. Product data sheets or marked catalog pages including part number, photo and description for all products including software.

1.8 RECORD DOCUMENTATION

A. Operation and Maintenance Manuals

1. Three (3) copies of the Operation and Maintenance Manuals shall be provided to the Design-Builder upon completion of the project. The entire Operation and Maintenance Manual shall be furnished on Compact Disc media, and include the following for the BMS provided:
 - a. Table of contents.
 - b. As-built system record drawings. Computer Aided Drawings (CAD) record drawings shall represent the as-built condition of the system and incorporate all information supplied with the approved submittal.
 - c. Manufacturer's product data sheets or catalog pages for all products including software.
 - d. System Operator's manuals.
 - e. Archive copy of all site-specific databases and sequences.
 - f. BMS network diagrams.
 - g. Interfaces to all third-party products and work by other trades.
2. The Operation and Maintenance Manual CD shall be self-contained, and include all necessary software required to access the product data sheets. A logically organized table of contents shall provide dynamic links to view and print all product data sheets. Viewer software shall provide the ability to display, zoom, and search all documents.

- B. On-Line documentation: After completion of all tests and adjustments the contractor shall provide a copy of all as-built information and product data to be installed on a customer designated computer workstation or server.

1.9 Warranty

A. Standard Material and Labor Warranty:

1. Provide a three-year labor and material warranty on the BMS.
2. If within twelve months from the date of acceptance of product, upon written notice from the Design-Builder, it is found to be defective in operation, workmanship or materials, it shall be replaced, repaired or adjusted at the option of the BMS Contractor at the cost of the BMS Contractor
3. Maintain an adequate supply of materials within 100 miles of the Project site such that replacement of key parts and labor support, including programming. Warranty work shall be done during BMS Contractor's normal business hours

PART 2 - PRODUCTS

2.1 GENERAL DESCRIPTION

- A. The Building Management System (BMS) shall use an open architecture and fully support a multi-vendor environment. To accomplish this effectively, the BMS shall support open communication protocol standards and integrate a wide variety of third-party devices and applications. The system shall be designed for use on the Internet, or intranets using off the shelf, industry standard technology compatible with other owner provided networks.
- B. The Building Management System shall consist of the following:
 1. Standalone Network Automation Engine(s)
 2. Field Equipment Controller(s)
 3. Input/Output Module(s)
 4. Local Display Device(s)
 5. Portable Operator's Terminal(s)
 6. Distributed User Interface(s)
 7. Network processing, data storage and communications equipment
 8. Other components required for a complete and working BMS
- C. The system shall be modular in nature and shall permit expansion of both capacity and functionality through the addition of sensors, actuators, controllers and operator devices, while re-using existing controls equipment.
- D. System architectural design shall eliminate dependence upon any single device for alarm reporting and control execution.
 1. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.

2. The System shall maintain all settings and overrides through a system reboot.
3. Acceptable Manufacturers
 - a. Basis of Design: Johnson Controls, Inc., Facility Explorer by Local Branch Office
 - b. Siemens Building Systems, APOGEE

2.2 BMS ARCHITECTURE

- A. The existing Joint Public Safety Training Campus (JPSTC) is served by a JCI Facility Explorer system hardware with Tridium Niagara framework.
- B. Automation Network
 1. The automation network shall be based on a PC industry standard of Ethernet TCP/IP. Where used, LAN controller cards shall be standard “off the shelf” products available through normal PC vendor channels.
 2. The BMS shall network multiple user interface clients, automation engines, system controllers and application-specific controllers. Provide application and data server(s) as required for systems operation.
 3. All BMS devices on the automation network shall be capable of operating at a communication speed of 100 Mbps, with full peer-to-peer network communication.
 4. Network Automation Engines (NAE) shall reside on the automation network.
 5. The automation network will be compatible with other enterprise-wide networks. Where indicated, the automation network shall be connected to the enterprise network and share resources with it by way of standard networking devices and practices.
- C. Control Network
 1. Network Automation Engines (NAE) shall provide supervisory control over the control network and shall support the following communication protocols:
 - a. BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9
 - 1) The NAE shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - 2) The NAE shall be tested and certified as a BACnet Building Controller (B-BC).
 2. Control networks shall provide either “Peer-to-Peer,” Master-Slave, or Supervised Token Passing communications, and shall operate at a minimum communication speed of 9600 baud.
 3. DDC Controllers shall reside on the control network.
 4. Control network communication protocol shall be BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135.
 5. A BACnet Protocol Implementation Conformance Statement (PICS) shall be provided for each controller device (master or slave) that will communicate on the BACnet MS/TP Bus.

D. Integration**1. Hardwired**

- a. Analog and digital signal values shall be passed from one system to another via hardwired connections.
- b. There will be one separate physical point on each system for each point to be integrated between the systems.

2. Direct Protocol (Integrator Panel)

- a. The BMS system shall include appropriate hardware equipment and software to allow bi-directional data communications between the BMS system and 3rd party manufacturers' control panels. The BMS shall receive, react to, and return information from multiple building systems, including but not limited to the chillers, boilers, variable frequency drives, power monitoring system, and medical gas.
- b. All data required by the application shall be mapped into the Automation Engine's database, and shall be transparent to the operator.
- c. Point inputs and outputs from the third-party controllers shall have real-time interoperability with BMS software features such as: Control Software, Energy Management, Custom Process Programming, Alarm Management, Historical Data and Trend Analysis, Totalization, and Local Area Network Communications.

3. BACnet Protocol Integration - BACnet

- a. The neutral protocol used between systems will be BACnet over Ethernet and comply with the ASHRAE BACnet standard 135-2008.
- b. A complete Protocol Implementation Conformance Statement (PICS) shall be provided for all BACnet system devices.
- c. The ability to command, share point object data, change of state (COS) data and schedules between the host and BACnet systems shall be provided.

2.3 USER INTERFACE**A. Dedicated Web Based User Interface**

1. Where indicated on plans (Engineering & CUP) the BMS Contractor shall provide and install a personal computer for command entry, information management, network alarm management, and database management functions. All real-time control functions, including scheduling, history collection and alarming, shall be resident in the BMS Network Automation Engines to facilitate greater fault tolerance and reliability.
2. Dedicated User Interface Architecture – The architecture of the computer shall be implemented to conform to industry standards, so that it can accommodate applications provided by the BMS Contractor and by other third party applications suppliers, including but not limited to Microsoft Office Applications. Specifically it must be implemented to conform to the following interface standards.

- a. Microsoft Internet Explorer for user interface functions
 - b. Microsoft Office Professional for creation, modification and maintenance of reports, sequences other necessary building management functions
 - c. Microsoft Outlook or other e-mail program for supplemental alarm functionality and communication of system events, and reports
 - d. Required network operating system for exchange of data and network functions such as printing of reports, trends and specific system summaries
3. PC Hardware – The two personal computer(s) shall be configured as follows:
- a. Memory – 16 GB (8 GB Minimum)
 - b. CPU– Pentium 4 processor. 3.2 GHz Clock Speed (2.0 GHz minimum)
 - c. Hard Drive – 500 GB free hard drive space (80GB minimum)
 - d. Hard drive backup system – CD/RW, DVD/RW or network backup software provided by IT department
 - e. CD ROM Drive – 32X performance
 - f. Ports – (2) USB 3.0, Ethernet, VGA, microphone/headset.
 - g. Keyboard – 101 Keyboard and 2 Button Mouse
 - h. CRT configuration – 1-2 CRTs as follows:
 - 1) Each Display – 24” Flat Panel Monitor 1920 x 1080 resolution minimum
 - 2) 16 bit or higher color resolution
 - 3) Display card with multiple monitor support
 - 4) LAN communications – Ethernet communications board; 3Comm or equal
4. Operating System Software
- a. Windows 10 or higher (64 bit)
 - b. Where user interface is not provided via browser, provide complete operator workstation software package, including any hardware or software keys. Include the original installation disks and licenses for all included software, device drivers, and peripherals.
 - c. Provide software registration cards to the Owner for all included software.
5. Peripheral Hardware
- a. Reports printer:
 - 1) Printer Make – Hewlett Packard DeskJet
 - 2) Print Speed – 600 DPI Black, 300 DPI Color
 - 3) Buffer – 64 K Input Print Buffer
 - 4) Color Printing – Include Color Kit

B. Distributed Web Based User Interface

- 1. All features and functions of the dedicated user interface previously defined in this document shall be available on any computer connected directly or via a wide area or virtual private network (WAN/VPN) to the automation network and conforming to the following specifications.

2. The software shall run on the Microsoft Internet Explorer (11.0 or higher) browser supporting the following functions:
 - a. Configuration
 - b. Commissioning
 - c. Data Archiving
 - d. Monitoring
 - e. Commanding
 - f. System Diagnostics

3. Minimum hardware requirements:
 - a. 8GB RAM
 - b. 3.0 GHz Clock Speed Pentium 4 Microprocessor
 - c. 100 GB Hard Drive.
 - d. 1 Keyboard with 83 keys (minimum).
 - e. SVGA 1024x768 resolution display with 64K colors and 16 bit color depth
 - f. Mouse or other pointing device

C. Site Management User Interface Application Components

1. Operator Interface
 - a. An integrated browser-based client application shall be used as the user operator interface program.
 - b. The System shall employ an event-driven rather than a device polling methodology to dynamically capture and present new data to the user.
 - c. All Inputs, Outputs, Setpoints, and all other parameters as defined within Part 3, shown on the design drawings, or required as part of the system software, shall be displayed for operator viewing and modification from the operator interface software.
 - d. The user interface software shall provide help menus and instructions for each operation and/or application.
 - e. The system shall support customization of the UI configuration and a home page display for each operator.
 - f. The system shall support user preferences in the following screen presentations:
 - 1) Alarm
 - 2) Trend
 - 3) Display
 - 4) Applications
 - g. All controller software operating parameters shall be displayed for the operator to view/modify from the user interface. These include: setpoints, alarm limits, time delays, PID tuning constants, run-times, point statistics, schedules, and so forth.
 - h. The Operator Interface shall incorporate comprehensive support for functions including, but not necessarily limited to, the following:

- 1) User access for selective information retrieval and control command execution
- 2) Monitoring and reporting
- 3) Alarm, non-normal, and return to normal condition annunciation
- 4) Selective operator override and other control actions
- 5) Information archiving, manipulation, formatting, display and reporting
- 6) BMS internal performance supervision and diagnostics
- 7) On-line access to user HELP menus
- 8) On-line access to current BMS as-built records and documentation
- 9) Means for the controlled re-programming, re-configuration of BMS operation and for the manipulation of BMS database information in compliance with the prevailing codes, approvals and regulations for individual BMS applications

i. The system shall support a list of application programs configured by the users that are called up by the following means:

- 1) The Tools Menu
- 2) Hyperlinks within the graphics displays
- 3) Key sequences

j. The operation of the control system shall be independent of the user interface, which shall be used for operator communications only. Systems that rely on an operator workstation to provide supervisory control over controller execution of the sequences of operations or system communications shall not be acceptable.

2. Navigation Trees

- a. The system will have the capability to display multiple navigation trees that will aid the operator in navigating throughout all systems and points connected. At minimum provide a tree that identifies all systems on the networks.
- b. Provide the ability for the operator to add custom trees. The operator will be able to define any logical grouping of systems or points and arrange them on the tree in any order. It shall be possible to nest groups within other groups. Provide at minimum 5 levels of nesting.
- c. The navigation trees shall be “dockable” to other displays in the user interface such as graphics. This means that the trees will appear as part of the display, but can be detached and then minimized to the Windows task bar. A simple keystroke will reattach the navigation to the primary display of the user interface.

3. Alarms

- a. Alarms shall be routed directly from Network Automation Engines to PCs and servers. It shall be possible for specific alarms from specific points to be routed to specific PCs and servers. The alarm management portion of the user interface shall, at the minimum, provide the following functions:
 - 1) Log date and time of alarm occurrence.

- 2) Generate a "Pop-Up" window, with audible alarm, informing a user that an alarm has been received.
 - 3) Allow a user, with the appropriate security level, to acknowledge, temporarily silence, or discard an alarm.
 - 4) Provide an audit trail on hard drive for alarms by recording user acknowledgment, deletion, or disabling of an alarm. The audit trail shall include the name of the user, the alarm, the action taken on the alarm, and a time/date stamp.
 - 5) Provide the ability to direct alarms to an e-mail address or alphanumeric pager. This must be provided in addition to the pop up window described above. Systems that use e-mail and pagers as the exclusive means of annunciating alarms are not acceptable.
 - 6) Configuration of which NAE offline alarms are seen by each user
 - 7) Any attribute of any object in the system may be designated to report an alarm.
- b. The BMS shall annunciate diagnostic alarms indicating system failures and non-normal operating conditions.
 - c. The BMS shall allow a minimum of 4 categories of alarm sounds customizable through user defined wav.files.
 - d. The BMS shall annunciate application alarms at minimum, as required by Part 3.
4. Reports and Summaries
- a. Reports and Summaries shall be generated and directed to the user interface displays, with subsequent assignment to printers, or disk. As a minimum, the system shall provide the following reports:
 - 1) All points in the BMS
 - 2) All points in each BMS application
 - 3) All points in a specific controller
 - 4) All points in a user-defined group of points
 - 5) All points currently in alarm
 - 6) All points locked out
 - 7) All user defined and adjustable variables, schedules, interlocks and the like.
 - b. Summaries and Reports shall be accessible via standard UI functions and not dependent upon custom programming or user defined HTML pages.
 - c. Selection of a single menu item, tool bar item, or tool bar button shall print any displayed report or summary on the system printer for use as a building management and diagnostics tool.
 - d. Provide the capability to view, command and modify large quantities of similar data in tailored summaries created online without the use of a secondary application like a spreadsheet. Summary definition shall allow up to seven user defined columns describing attributes to be displayed including custom column labels. Up to 100 rows per summary shall be supported. Summary viewing shall be available over the network using a standard Web browser.

- e. Provide a focused set of reports that includes essential information required for effective management of energy resources within the facility. Energy reports shall be configurable from predefined, preconfigured templates. Required includes but shall not be limited to:
 - 1) Energy Overview
 - 2) Load Profile
 - 3) Simple Energy Cost
 - 4) Consumption
 - 5) Equipment Runtime
 - 6) Electrical Energy
 - 7) Energy Production
- f. Reports shall be selectable by date, time, area and device. Each report shall include a color visual summary of essential energy information.

5. Schedules

- a. A graphical display for time-of-day scheduling and override scheduling of building operations shall be provided. At a minimum, the following functions shall be provided:
 - 1) Weekly schedules
 - 2) Exception Schedules
 - 3) Monthly calendars
- b. Weekly schedules shall be provided for each group of equipment with a specific time use schedule.
- c. It shall be possible to define one or more exception schedules for each schedule including references to calendars
- d. Monthly calendars shall be provided that allow for simplified scheduling of holidays and special days for a minimum of five years in advance. Holidays and special days shall be user-selected with the pointing device or keyboard, and shall automatically reschedule equipment operation as previously defined on the exception schedules.
- e. Changes to schedules made from the User Interface shall directly modify the Network Automation Engine schedule database.
- f. Schedules and Calendars shall comply with ASHRAE SP135/2008 BACnet Standard.
- g. The Calendar object supports an option to add a reference to another Calendar Object that is designated to be the master for the facility. Any Supervisory and BAC calendars can be configured to reference a single master Global Calendar. Changes to the master global calendar are automatically synced with all calendars that are referenced.
- h. Selection of a single menu item or tool bar button shall print any displayed schedule on the system printer for use as a building management and diagnostics tool.
- i. Software shall be provided to configure and implement optimal start and stop programming based on existing indoor and outdoor environmental conditions as well as equipment operating history

- j. The system Solar Clock shall support the scheduling and energy management functions. The Solar Clock will calculate the sunrise, sunset, and sun angle values for a specified latitude and longitude. A time offset can also be specified. An example would be to use the Solar Clock object as a master to an interlock to turn lights on 30 minutes after sunset and off 30 minutes before sunrise.
6. Security/Passwords
- a. Multiple-level passwords access protection shall be provided via roles and permissions. The feature will allow the system to base access on a user's job title or role and allow the user/manager access interface control, display, and database manipulation capabilities based on an assigned password.
 - b. Roles may be copied and altered to meet specific roles and permissions based on the particular policies.
 - c. Each user shall have the following: a user account name (with a maximum of 30 characters), a complex password or passphrase (with a min of 8 characters and a max of 50 characters), other user account policies (such as session timeout), timesheet access based on day of the week and time of day, and specific user view.
 - d. The system shall allow each user to change his or her password at will.
 - e. When entering or editing passwords, the system shall not echo the actual characters for display on the monitor.
 - f. A maximum of 150 categories may be used to determine or assign areas of responsibilities to each user account. A maximum of 13 (of the 150) named categories which are specifics such as "No Access, View, Advanced Review, Operate, Intervene, Diagnostic, Manage Item Events, Manage Every, and Configure Items".
 - g. A minimum of 100 unique passwords shall be supported.
 - h. Operators shall be able to perform only those commands available for their respective passwords. Display of menu selections shall be limited to only those items defined for the access level of the password used to log-on.
 - i. Operators shall be further limited to only access, command, and modify those buildings, systems, and subsystems for which they have responsibility. Provide a minimum of 100 categories of systems to which individual operators may be assigned.
 - j. The system shall automatically generate a report of log-on/log-off and system activity for each user. Any action that results in a change in the operation or configuration of the control system shall be recorded, including: modification of point values, schedules or history collection parameters, and all changes to the alarm management system, including the acknowledgment and deletion of alarms.
 - k. The system shall have the ability to provide a Department of Defense (DoD) specific warning banner for applicable sites that warns the user they are accessing a restricted site.
 - l. After successful login to the Site Management Portal (SMP) the last time and date that user name was previously logged in is shown on the screen.
 - m. Each login attempt is recorded in the system Audit Log with the option to record the IP address of the PC that made the login.

7. Screen Manager
 - a. The system will allow a customized image on the login screen (i.e. organization name, logo).
 - b. User View navigations can be displayed as either a set of tabs or a drop down list.
 - c. Allows user preference for assigning of a background color for when an object is Out of Service which will enable the operator to quickly distinguish points that have been commanded to this state.
 - d. The User Interface shall be provided with screen management capabilities that allow the user to activate, close, and simultaneously manipulate a minimum of 4 active display windows plus a network or user defined navigation tree.

8. Dynamic Color Graphics
 - a. The naming/numbering/tagging convention used must be a coordinated effort between the Mechanical Contractor, Controls Contractor, Owner, Design-Builder, and A/E and must be approved by all parties prior to implementation. The naming/numbering/tagging convention must be consistent and reflected through the building automation control system, charts, diagrams, tagging and O&M manuals.
 - b. Graphic layouts are to be approved by the Design-Builder prior to implementation.
 - c. The graphics application program shall be supplied as an integral part of the User Interface. Browser or Workstation applications that rely only upon HTML pages shall not be acceptable.
 - d. The graphics applications shall include a create/edit function and a runtime function. The system architecture shall support an unlimited number of graphics documents (graphic definition files) to be generated and executed. The graphics shall be able to display and provide animation based on real-time data that is acquired, derived, or entered.
 - e. Graphics runtime functions – A maximum of 16 graphic applications shall be able to execute at any one time on a user interface or workstation with 4 visible to the user. Each graphic application shall be capable of the following functions:
 - 1) All graphics shall be fully scalable
 - 2) The graphics shall support a maintained aspect ratio.
 - 3) Multiple fonts shall be supported.
 - 4) Unique background shall be assignable on a per graphic basis.
 - 5) The color of all animations and values on displays shall indicate the status of the object attribute.
 - 6) Graphics that represent buildings or systems shall allow natural links and transitions between related detailed tabular views of data that complement the graphic.
 - f. Operation from graphics – It shall be possible to change values (setpoints) and states in system controlled equipment directly from the graphic.
 - g. Floor Plan graphics – The user interface shall provide graphic applications that summarize conditions on a floor. Floor plan graphics shall indicate

thermal comfort using dynamic colors to represent zone temperature deviations from zone setpoint(s). Floor plan graphics shall display overall metrics for each zone in the floor.

- h. Aliasing – Many graphic displays representing part of a building and various building components are exact duplicates, with the exception that the various variables are bound to different field values. Consequently, it shall be possible to bind the value of a graphic display to aliases, as opposed to the physical field tags.
- i. Graphic editing tool – A graphic editing tool shall be provided that allows for the creation and editing of graphic files. The graphic editor shall be capable of performing/defining all animations, and defining all runtime binding.
 - 1) The graphic editing tool shall provide a library of standard HVAC equipment, floor plan, lighting, security and network symbols.
 - 2) The graphic editing tool shall provide for the creation and positioning of library symbols by dragging from tool bars or drop-downs and positioning where required.
 - 3) The graphics editing tool shall permit the importing of AutoCAD drawings for use in the system.
 - 4) The graphic editing tool shall be able to add additional content to any graphic by importing images in the SVG, PNG or JPG file formats.

9. Historical trending and data collection

- a. Each Automation Engine shall store trend and point history data for all analog and digital inputs and outputs, as follows:
 - 1) Any point, physical or calculated, may be designated for trending. Two methods of collection shall be allowed:
 - a) Defined time interval
 - b) Upon a change of value
 - 2) Each Automation Engine shall have the capability to store multiple samples for each physical point and software variable based upon available memory, including an individual sample time/date stamp. Points may be assigned to multiple history trends with different collection parameters.
- b. Trend and change of value data shall be stored within the engine and uploaded to a dedicated trend database or exported in a selectable data format via a provided data export utility. Uploads to a dedicated database shall occur based upon one of the following: user-defined interval, manual command, or when the trend buffers are full. Exports shall be as requested by the user or on a time scheduled basis.
- c. The system shall provide a configurable data storage subsystem for the collection of historical data. Data can be stored in SQL database format.
- d. The system shall provide data to enable optimization capabilities including fault detection and diagnostics, advanced analytics and central plant optimization without the need of a gateway or additional hardware.

10. Trend data viewing and analysis
 - a. Provide a trend viewing utility that shall have access to all database points.
 - b. It shall be possible to retrieve any historical database point for use in displays and reports by specifying the point name and associated trend name.
 - c. The trend viewing utility shall have the capability to define trend study displays to include multiple trends
 - d. Displays shall be able to be single or stacked graphs with on-line selectable display characteristics, such as ranging, color, and plot style.
 - e. Display magnitude and units shall both be selectable by the operator at any time without reconfiguring the processing or collection of data. This is a zoom capability.
 - f. Display magnitude shall automatically be scaled to show full graphic resolution of the data being displayed.
 - g. The Display shall support the user's ability to change colors, sample sizes, and types of markers.

11. Database Management
 - a. Where a separate SQL database is utilized for information storage the System shall provide a Database Manager that separates the database monitoring and managing functions by supporting two separate windows.
 - b. Database secure access shall be accomplished using standard SQL authentication including the ability to access data for use outside of the Building Automation application.
 - c. The database managing function shall include summarized information on trend, alarm, event, and audit for the following database management actions:
 - 1) Backup
 - 2) Purge
 - 3) Restore
 - d. The Database Manager shall support four tabs:
 - 1) Statistics – shall display Database Server information and Trend, Alarm (Event), and Audit information on the Databases.
 - 2) Maintenance – shall provide an easy method of purging records from the Server trend, alarm (event), and audit databases by supporting separate screens for creating a backup prior to purging, selecting the database, and allowing for the retention of a selected number of day's data.
 - 3) Backup – Shall provide the means to create a database backup file and select a storage location.
 - 4) Restore – shall provide a restricted means of restoring a database by requiring the user to log into an Expert Mode in order to view the Restore screen.

- e. The Status Bar shall appear at the bottom of all Database Manager Tabs and shall provide information on the current database activity. The following icons shall be provided:
 - 1) Ready
 - 2) Purging Record from a database
 - 3) Action Failed
 - 4) Refreshing Statistics
 - 5) Restoring database
 - 6) Shrinking a database
 - 7) Backing up a database
 - 8) Resetting internet information Services
 - 9) Starting the Device Manager
 - 10) Shutting down the Device Manager
 - 11) Action successful
- f. The Database Manager monitoring functions shall be accessed through the Monitoring Settings window and shall continuously read database information once the user has logged in.
- g. The System shall provide user notification via taskbar icons and e-mail messages when a database value has exceeded a warning or alarm limit.
- h. The Monitoring Settings window shall have the following sections:
 - 1) General – Shall allow the user to set and review scan intervals and start times.
 - 2) Email – Shall allow the user to create and review e-mail and phone text messages to be delivered when a Warning or Alarm is generated.
 - 3) Warning – shall allow the user to define the Warning limit parameters, set the Reminder Frequency, and link the e-mail message.
 - 4) Alarm – shall allow the user to define the Alarm limit parameters, set the Reminder Frequency, and link the e-mail message.
 - 5) Database login – Shall protect the system from unauthorized database manipulation by creating a Read Access and a Write Access for each of the Trend, Alarm (Event) and Audit databases as well as an Expert Mode required to restore a database.
- i. The Monitoring Settings Taskbar shall provide the following informational icons:
 - 1) Normal – Indicates by color and size that all databases are within their limits.
 - 2) Warning - Indicates by color and size that one or more databases have exceeded their Warning limit.
 - 3) Alarm - Indicates by color and size that one or more databases have exceeded their Alarm limit.
- j. The System shall provide user notification via Taskbar icons and e-mail messages when a database value has exceeded a warning or alarm limit.

12. Portable Operator Terminal

- a. For systems that do not provide full access to systems configuration and definition via the Browser Based user interface the BMS Contractor shall provide a portable operator terminal for programming purposes. The terminal shall be configured as follows:
 - 1) Personal Laptop Computer Manufacturer – Dell, Compaq or HP
 - 2) 16 GB RAM (8 GB minimum) – Windows 10
 - 3) 2.0 GHz Clock Speed Pentium 4 Microprocessor or higher
 - 4) 80 GB Hard Drive (40 GB minimum)
 - 5) (1) CD-ROM Drive, 32x speed
 - 6) (1) Serial (1) Parallel (2) USB ports
 - 7) 1 Keyboard with 83 keys (minimum).
 - 8) Integral 2 button Track Point or Track Ball.
 - 9) 10" SVGA 1024x768 resolution color display
 - 10) Two PCMCIA Type II or one Type III card slot
 - 11) Complete operator workstation software package, including any hardware or software.
 - 12) Original printed manuals for all software and peripherals.
 - 13) Original installation disks or CD for all software, device drivers, and peripherals
 - 14) Software registration cards for all included software shall be provided to the Owner.
 - 15) Carrying case
 - 16) Spare battery.
 - 17) External power supply/battery charger

13. Proprietary Portable Terminal

- a. Manufacturers providing proprietary portable terminals shall submit technical data sheets for the terminal and all associated software and hardware.
- b. The proprietary terminal shall meet the same operator interface software requirements as specified above.

14. Software

- a. Portable operator terminals shall support all controllers within the system on a direct-connect communications basis.
- b. When used to access First or Second Tier controllers, the portable operator terminal shall utilize the standard operator workstation software, as previously defined.
- c. When used to access Application Specific Controllers, the portable operator terminal shall utilize either the standard operator workstation software, as previously defined, or controller-specific utility software.

2.4 NETWORK AUTOMATION ENGINES (NAE)**A. Network Automation Engine**

1. The Network Automation Engine (NAE) shall be a fully user-programmable, supervisory controller. The NAE shall monitor the network of distributed application-specific controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Automation Engines.
2. Automation network – The NAE shall reside on the automation network and shall support a subnet of system controllers.
3. User Interface – Each NAE shall have the ability to deliver a web based User Interface (UI) as previously described. All computers connected physically or virtually to the automation network shall have access to the web based UI.
 - a. The web based UI software shall be imbedded in the NAE. Systems that require a local copy of the system database on the user's personal computer are not acceptable.
 - b. The NAE shall support up a minimum of four (4) concurrent users.
 - c. The web based user shall have the capability to access all system data through one NAE.
 - d. Remote users connected to the network through an Internet Service Provider (ISP) or telephone dial up shall also have total system access through one NAE.
 - e. Systems that require the user to address more than one NAE to access all system information are not acceptable.
 - f. The NAE shall have the capability of generating web based UI graphics. The graphics capability shall be imbedded in the NAE.
 - g. Systems that support UI Graphics from a central database or require the graphics to reside on the user's personal computer are not acceptable.
 - h. The web based UI shall support the following functions using a standard version of Microsoft Internet Explorer:
 - 1) Configuration
 - 2) Commissioning
 - 3) Data Archiving
 - 4) Monitoring
 - 5) Commanding
 - 6) System Diagnostics
 - i. Systems that require workstation software or modified web browsers are not acceptable.
 - j. The NAE shall allow temporary use of portable devices without interrupting the normal operation of permanently connected modems.
 - k. Processor – The NAE shall be microprocessor-based with a minimum word size of 32 bits. The NAE shall be a multi-tasking, multi-user, and real-time digital control processor. Standard operating systems shall be employed. NAE size and capability shall be sufficient to fully meet the requirements of this Specification.
 - l. Memory – Each NAE shall have sufficient memory to support its own operating system, databases, and control programs, and to provide supervisory control for all control level devices.
 - m. Hardware Real Time Clock – The NAE shall include an integrated, hardware-based, real-time clock.
 - n. The NAE shall include troubleshooting LED indicators to identify the following conditions:

- 1) Power – On/Off
 - 2) Ethernet Traffic – Ethernet Traffic/No Ethernet Traffic
 - 3) Ethernet Connection Speed – 10 Mbps/100 Mbps/1000 Mbps
 - 4) FC Bus A – Normal Communications/No Field Communications
 - 5) FC Bus B – Normal Communications/No Field Communications
 - 6) Peer Communication – Data Traffic between NAE Devices
 - 7) Run – NAE Running/NAE in Startup/NAE Shutting Down/Software Not Running
 - 8) Bat Fault – Battery Defective, Data Protection Battery Not Installed
 - 9) 24 VAC – 24 VAC Present/Loss Of 24VAC
 - 10) Fault – General Fault
 - 11) Modem RX – NAE Modem Receiving Data
 - 12) Modem TX – NAE Modem Transmitting Data
- o. Communications Ports – The NAE shall provide the following ports for operation of operator Input/Output (I/O) devices, such as industry-standard computers, modems, and portable operator’s terminals.
- 1) Two (2) USB port
 - 2) Two (2) URS-232 serial data communication port
 - 3) Two (2) RS-485 port
 - 4) One (1) Ethernet port
- p. Diagnostics – The NAE shall continuously perform self-diagnostics, communication diagnosis, and diagnosis of all panel components. The Network Automation Engine shall provide both local and remote annunciation of any detected component failures, low battery conditions, or repeated failures to establish communication.
- q. Power Failure – In the event of the loss of normal power, The NAE shall continue to operate for a user adjustable period of up to 10 minutes after which there shall be an orderly shutdown of all programs to prevent the loss of database or operating system software.
- 1) During a loss of normal power, the control sequences shall go to the normal system shutdown conditions. All critical configuration data shall be saved into Flash memory.
 - 2) Upon restoration of normal power and after a minimum off-time delay, the controller shall automatically resume full operation without manual intervention through a normal soft-start sequence.
- r. Certification – The NAE shall be listed by Underwriters Laboratories (UL).
- s. Controller network – The NAE shall support the following communication protocols on the controller network:
- t. The NAE shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
- 1) The NAE shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - 2) The NAE shall be tested and certified as a BACnet Building Controller (B-BC) using BACnet Protocol Revision 12 or higher.

- 3) A BACnet Protocol Implementation Conformance Statement shall be provided for the NAE.
- 4) The Conformance Statements shall be submitted 10 days prior to bidding.
 - (i) The NAE shall support a minimum of 100 control devices.

B. DDC System Controllers**1. Advanced Application Field Equipment Controller**

- a. The Field Equipment Controller (FEC) shall be a fully user-programmable, digital controller that communicates via BACnet MS/TP protocol or optionally via N2Open.
- b. The FAC shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
 - 1) The FAC shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - 2) The FAC shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
 - 3) A BACnet Protocol Implementation Conformance Statement shall be provided for the FAC.
 - 4) The Conformance Statement shall be submitted 10 days prior to bidding.
- c. The FAC shall employ a finite state control engine to eliminate unnecessary conflicts between control functions at crossover points in their operational sequences. Suppliers using non-state based DDC shall provide separate control strategy diagrams for all controlled functions in their submittals.
- d. Controllers shall be factory programmed with a continuous adaptive tuning algorithm that senses changes in the physical environment and continually adjusts loop tuning parameters appropriately. Controllers that require manual tuning of loops or perform automatic tuning on command only shall not be acceptable. The FAC shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
- e. The FAC shall include an integral real-time clock and support time-based tasks which enables these field controllers to monitor and control:
 - 1) Schedules
 - 2) Calendars
 - 3) Alarms
 - 4) Trends
- f. The FAC can continue time-based monitoring when offline for extended periods of time from a system network.
- g. The FAC can operate as a stand-alone controller in applications that do not require a networked supervisory device or for network applications where it is preferred to have the scheduling, alarming, and/or trending performed locally in the field controllers.

- h. The FAC shall include troubleshooting LED indicators to identify the following conditions:
 - 1) Power On
 - 2) Power Off
 - 3) Download or Startup in progress, not ready for normal operation
 - 4) No Faults
 - 5) Device Fault
 - 6) Field Controller Bus - Normal Data Transmission
 - 7) Field Controller Bus - No Data Transmission
 - 8) Field Controller Bus - No Communication
 - 9) Sensor-Actuator Bus - Normal Data Transmission
 - 10) Sensor-Actuator Bus - No Data Transmission
 - 11) Sensor-Actuator Bus - No Communication
- i. The FAC shall accommodate the direct wiring of analog and binary I/O field points.
- j. The FAC shall support the following types of inputs and outputs:
 - 1) Universal Inputs - shall be configured to monitor any of the following:
 - a) Analog Input, Voltage Mode
 - b) Analog Input, Current Mode
 - c) Analog Input, Resistive Mode
 - d) Binary Input, Dry Contact Maintained Mode
 - e) Binary Input, Pulse Counter Mode
 - 2) Binary Inputs - shall be configured to monitor either of the following:
 - a) Dry Contact Maintained Mode
 - b) Pulse Counter Mode
 - 3) Analog Outputs - shall be configured to output either of the following:
 - a) Analog Output, Voltage Mode
 - b) Analog Output, Current Mode
 - 4) Binary Outputs - shall output the following:
 - a) Line-voltage relay outputs
 - b) 24 VAC Triac
 - 5) Configurable Outputs - shall be capable of the following:
 - a) Analog Output, Voltage Mode
 - b) Binary Output Mode
- k. The FAC shall have the ability to reside on a Field Controller Bus (FC Bus).
- l. The FC Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard protocol SSPC-135, Clause 9.

- m. The FC Bus shall support communications between the FACs and the NAE.
 - n. The FC Bus shall also support Input/Output Module (IOM) communications with the FAC and with the NAE.
 - o. The FC Bus shall support a minimum of 100 IOMs and FACs in any combination.
 - p. The FC Bus shall operate at a maximum distance of 15,000 Ft. between the FAC and the furthest connected device.
 - q. The FAC shall have the ability to monitor and control a network of sensors and actuators over a Sensor-Actuator Bus (SA Bus).
 - 1) The SA Bus shall be a Master-Slave/Token-Passing (MS/TP) Bus supporting BACnet Standard Protocol SSPC-135, Clause 9.
 - 2) The SA Bus shall support a minimum of 10 devices per trunk.
 - 3) The SA Bus shall operate at a maximum distance of 1,200 Ft. between the FAC and the furthest connected device.
 - r. The FAC shall have the capability to execute complex control sequences involving direct wired I/O points as well as input and output devices communicating over the FC Bus or the SA Bus.
 - s. The FAC shall support, but not be limited to, the following applications:
 - t. Chilled water/central plant optimization applications including but not limited to:
 - 1) Selection and sequencing of up to eight chillers of different sizes
 - 2) Selection and sequencing of up to eight (each) primary and secondary chilled water pumps of varying pumping capacities
 - 3) Selection and sequencing of up to four heat exchangers, of different capacities
 - 4) A proven and documented central cooling plant optimization program that incorporates custom equipment efficiency profiles, without rewriting software code, in order to meet the building load using the least amount of energy as calculated.
 - 5) The use of advanced control algorithms that apply equipment specific parameters, including operational limits and efficiency profiles, in order to determine equipment start and runtime preferences
 - 6) Identification of the most efficient equipment combination and automatic control of state and speed of all necessary equipment to balance runtime, optimize timing and sequencing and ensure the efficiency and stability of the central cooling plant
 - 7) Control definition for the chiller plant in a single FAC, FEC, or NCE, as supported by available memory and point Input/Output (I/O), or capable of being split across multiple FACs, FECs, or NCEs
 - a) Heating central plant applications
 - b) Built-up air handling units for special applications
 - c) Terminal & package units
 - d) Special programs as required for systems control
2. The FAC shall support a Local Controller Display (DIS-1710) either as an integral part of the FAC or as a remote device communicating over the SA Bus.

- a. The Display shall use a BACnet Standard SSPC-135, clause 9 Master-Slave/Token-Passing protocol.
- b. The Display shall allow the user to view monitored points without logging into the system.
- c. The Display shall allow the user to view and change setpoints, modes of operation, and parameters.
- d. The Display shall provide password protection with user adjustable password timeout.
- e. The Display shall be menu driven with separate paths for:
 - 1) Input/Output
 - 2) Parameter/Setpoint
 - 3) Overrides
- f. The Display shall use easy-to-read English text messages.
- g. The Display shall allow the user to select the points to be shown and in what order.
- h. The Display shall support a back lit Liquid Crystal Display (LCD) with adjustable contrast and brightens and automatic backlight brightening during user interaction.
- i. The display shall be a minimum of 4 lines and a minimum of 20 characters per line
- j. The Display shall have a keypad with no more than 6 keys.
- k. The Display shall be panel mountable.

2.5 FIELD DEVICES

A. Input/Output Module

- 1. The Input/Output Module (IOM) provides additional inputs and outputs for use in the FEC.
- 2. The IOM shall communicate with the FEC over the FC Bus or the SA Bus.
- 3. The IOM shall support BACnet Standard MS/TP Bus Protocol ASHRAE SSPC-135, Clause 9 on the controller network.
 - a. The IOM shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - b. The IOM shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
 - c. A BACnet Protocol Implementation Conformance Statement shall be provided for the FEC.
 - d. The Conformance Statement shall be submitted 10 days prior to bidding.
 - 1) The IOM shall be assembled in a plenum-rated plastic housing with flammability rated to UL94-5VB.
 - 2) The IOM shall have a minimum of 4 points to a maximum of 17 points.
 - 3) The IOM shall support the following types of inputs and outputs:
 - e. Universal Inputs - shall be configured to monitor any of the following:

- 1) Analog Input, Voltage Mode
 - 2) Analog Input, Current Mode
 - 3) Analog Input, Resistive Mode
 - 4) Binary Input, Dry Contact Maintained Mode
 - 5) Binary Input, Pulse Counter Mode
- f. Binary Inputs - shall be configured to monitor either of the following:
- 1) Dry Contact Maintained Mode
 - 2) Pulse Counter Mode
- g. Analog Outputs - shall be configured to output either of the following
- 1) Analog Output, Voltage Mode
 - 2) Analog Output, current Mode
- h. Binary Outputs - shall output the following:
- 1) 24 VAC Triac
- i. Configurable Outputs - shall be capable of the following:
- 1) Analog Output, Voltage Mode
 - 2) Binary Output Mode
4. The IOM shall include troubleshooting LED indicators to identify the following conditions:
- a. Power On
 - b. Power Off
 - c. Download or Startup in progress, not ready for normal operation
 - d. No Faults
 - e. Device Fault
 - f. Normal Data Transmission
 - g. No Data Transmission
 - h. No Communication
5. Network Thermostat
- a. The network thermostat shall be capable of controlling two- or four-pipe fan coils, cabinet unit heaters, a pressure dependent Variable Air Volume System, zoning type systems employing reheat including local hydronic reheat valves, or other similar equipment.
 - b. The Networked Thermostat shall communicate over the FC Bus using BACnet Standard protocol SSPC-135.
 - 1) Communications shall be selectable locally at thermostat through the display
 - c. The TEC shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.

- 1) The TEC shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
 - 2) A BACnet Protocol Implementation Conformance Statement shall be provided for the TEC.
 - 3) The Conformance Statement shall be submitted 10 days prior to bidding.
- d. The network thermostat shall include a 4.2 inch LED backlit touch screen with the following configurable icons.
- e. Home screen configurable icons include
- 1) On/Off icon
 - 2) Fan override icon
 - 3) Zone temperature icon
 - 4) Hold temperature icon
 - 5) Zone humidity (on applicable models) icon
 - 6) Occupancy status (on applicable models) icon
 - 7) Temperature setpoint icon
 - 8) Alarm icon
 - 9) Unit status icon
 - 10) Date/Time icon
 - 11) Fan override icon
- f. Home screen non-configurable icon includes
- 1) Menu icon
6. The network thermostat shall provide the flexibility to support any one of the following inputs:
- a. Integral indoor air temperature sensor
 - b. Analog input for remote air temperature sensing that supports the following sensor types
 - 1) Nickel
 - 2) Platinum
 - 3) A99B PENN
 - 4) 2.25k ohm NTC
 - 5) 10k ohm NTC
 - 6) 10k ohm NTC Type 3
 - c. Universal input that supports the following configurations
 - 1) Analog sensor
 - 2) Cooling when switch is closed
 - 3) Heating when switch is closed
 - d. Remote indoor air temperature sensor
 - e. Two configurable binary inputs with the following configurations
 - 1) Disabled

- 2) Occupancy
 - 3) Override
 - 4) Remote PIR
 - 5) Dirty filter
 - 6) Service
 - 7) Fan Lock
 - 8) Open door
 - 9) Open window
- f. The network thermostat shall provide the flexibility to support any one of the following fan outputs:
- 1) Three speed fan control
 - 2) Proportional speed fan control configurable from 0 to 10V
- g. The network thermostat shall provide the flexibility to support any one of the following valve outputs:
- 1) Two on/off
 - 2) Two floating
- h. The network thermostat shall provide 4 digit passcode security
- i. The network thermostat shall provide the flexibility to adjust the following control parameters:
- 1) Adjustable maximum setpoint offset from 0 to 20°F
 - 2) Adjustable fan on delay from 0 to 120 seconds
 - 3) Adjustable fan off delay from 0 to 120 seconds
 - 4) Adjustable minimum cooling on time from 0 to 360 seconds
 - 5) Adjustable minimum cooling off time from 0 to 360 seconds
 - 6) Adjustable minimum heating on time from 0 to 360 seconds
 - 7) Adjustable minimum heating off time from 0 to 360 seconds
 - 8) Adjustable minimum reheat on time from 0 to 360 seconds
 - 9) Adjustable minimum reheat off time from 0 to 360 seconds
 - 10) Adjustable stroke time from 5 to 300 seconds
 - 11) Adjustable supply fan minimum command from 0 to 100%
 - 12) Adjustable supply fan Medium command from 0 to 100%
 - 13) Adjustable supply fan high command from 0 to 100%
 - 14) Adjustable reheat minimum damper position from 0 to 100%
- j. Where required by application and indicated on plans or room schedules provide the network thermostat with an integral Passive Infra-Red (PIR) occupancy sensor models.
- k. Where required by application and indicated on plans or room schedules provide the network thermostat with an integral relative humidity sensor model.
- l. The network thermostat shall employ nonvolatile electrically erasable programmable read-only memory (EEPROM) for all adjustable parameters.
- m. The network thermostat shall have a temperature accuracy of $\pm 0.9\text{F}^\circ/\pm 0.5\text{C}^\circ$ at 70.0°F/21.0°C typical calibrated

- n. The network thermostat shall have a humidity accuracy of $\pm 5\%$ RH from 20 to 80% RH at 50 to 90°F (10 to 32°C)
- o. The network thermostat shall provide user equipment visibility from a mobile device through the Mobil Access Portal (MAP) release 4.0 or later.

B. VAV Modular Assembly

- 1. The VAV Modular Assembly shall provide both standalone and networked direct digital control of pressure-independent, variable air volume terminal units. It shall address both single and dual duct applications.
- 2. The VMA shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - a. The VMA shall be tested and certified as a BACnet Application Specific Controller (B-ASC).
 - b. A BACnet Protocol Implementation Conformance Statement shall be provided for the VMA.
- 3. The VAV Modular Assembly shall communicate over the Field Controller Bus (FC Bus) using BACnet Standard protocol SSPC-135, Clause 9.
- 4. The VAV Modular Assembly shall have internal electrical isolation for AC power, DC inputs, and MS/TP communications. An externally mounted isolation transformer shall not be acceptable.
- 5. The VAV Modular Assembly shall be a configurable digital controller with integral differential pressure transducer and damper actuator. All components shall be connected and mounted as a single assembly that can be removed as one piece.
- 6. Inputs:
 - a. Analog inputs with user defined ranges shall monitor the following analog signals, without the addition of equipment outside the terminal controller cabinet:
 - 1) 0-10 VDC Sensors
 - 2) 1000ohm RTDs
 - 3) NTC Thermistors
 - b. Binary inputs shall monitor dry contact closures. Input shall provide filtering to eliminate false signals resulting from input "bouncing."
 - c. For noise immunity, the inputs shall be internally isolated from power, communications, and output circuits.
 - d. Provide side loop application for humidity control.
- 7. Outputs
 - a. Analog outputs shall provide the following control outputs:
 - 1) 0-10 VDC
 - b. Binary outputs shall provide a SPST Triac output rated for 500mA at 24 VAC.
 - c. For noise immunity, the outputs shall be internally isolated from power, communications, and other output circuits.

d. Application Configuration

- 1) The VAV Modular Assembly shall be configured with a software tool that provides a simple Question/Answer format for developing applications and downloading.

e. Sensor Support

- 1) The VAV Modular Assembly shall communicate over the Sensor-Actuator Bus (SA Bus) with a Network Sensor.
- 2) The VMA shall support an LCD display room sensor.
- 3) The VMA shall also support standard room sensors as defined by analog input requirements.
- 4) The VMA shall support humidity sensors defined by the AI side loop.

C. Network Sensors

1. The Network Sensors (NS) shall have the ability to monitor the following variables as required by the systems sequence of operations:
 - a. Zone Temperature
 - b. Zone Humidity
 - c. Zone Setpoint
 - d. Discharge Air Temperature
 - e. Zone CO2
2. The NS shall transmit the information back to the controller on the Sensor-Actuator Bus (SA Bus) using BACnet Standard protocol SSPC-135, Clause 9.
3. The NS shall be BACnet Testing Labs (BTL) certified and carry the BTL Label.
 - a. The NS shall be tested and certified as a BACnet Smart Sensors (B-SS).
 - b. A BACnet Protocol Implementation Conformance Statement shall be provided for the NS.
 - c. The Conformance Statement shall be submitted 10 days prior to bidding.
4. The Network Zone Temperature Sensors shall include the following items:
 - a. A backlit Liquid Crystal Display (LCD) to indicate the Temperature, Humidity and Setpoint
 - b. An LED to indicate the status of the Override feature
 - c. A button to toggle the temperature display between Fahrenheit and Celsius
 - d. A button to program the display for temperature or humidity
 - e. A button to initiate a timed override command
 - f. Available in either surface mount, wall mount, or flush mount
 - g. Available with either screw terminals or phone jack
5. The Network Discharge Air Sensors shall include the following:
 - a. 4 inch or 8 inch duct insertion probe
 - b. 10 foot pigtail lead
 - c. Dip Switches for programmable address selection

- d. Ability to provide an averaging temperature from multiple locations
 - e. Ability to provide a selectable temperature from multiple locations
6. The Network CO2 Zone Sensors shall include the following:
- a. Available in either surface mount or wall mount
 - b. Available with screw terminals or phone jack
7. Many-To-One Wireless Room Temperature Sensor System

2.6 SYSTEM TOOLS

A. System Configuration Tool (SCT)

- 1. The Configuration Tool shall be a software package enabling a computer platform to be used as a stand-alone engineering configuration tool for a Network Automation Engine (NAE) or a Network Integration Engine (NIE).
- 2. The configuration tool shall provide an archive database for the configuration and application data.
- 3. The configuration tool shall have the same look-and-feel at the User Interface (UI) regardless of whether the configuration is being done online or offline.
- 4. The configuration tool shall include the following features:
 - a. Basic system navigation tree for connected networks
 - b. Integration of BACnet enabled devices
 - c. Customized user navigation trees
 - d. Point naming operating parameter setting
 - e. Graphic diagram configuration
 - f. Alarm and event message routing
 - g. Graphical logic connector tool for custom programming
 - h. Downloading, uploading, and archiving databases
- 5. The configuration tool shall have the capability to automatically discover field devices on connected buses and networks. Automatic discovery shall be available for the following field devices:
 - a. BACnet Devices
- 6. The configuration tool shall be capable of programming the Field Equipment Controllers.
 - a. The configuration tool shall provide the capability to configure, simulate, and commission the Field Equipment Controllers.
 - b. The configuration tool shall allow the FECs to be run in Simulation Mode to verify the applications.
 - c. The configuration tool shall contain a library of standard applications to be used for configuration.
- 7. The configuration tool shall be capable of programming the field devices.

- a. The configuration tool shall provide the capability to configure, simulate, and commission the field devices.
 - b. The configuration tool shall allow the field devices to be run in Simulation Mode to verify the applications.
 - c. The configuration tool shall contain a library of standard applications to be used for configuration
8. A wireless access point shall allow a wireless enabled portable PC to make a temporary Ethernet connection to the automation network.
- a. The wireless connection shall allow the PC to access configuration tool through the web browser using the User Interface (UI).
 - b. The wireless use of configuration tool shall be the same as a wired connection in every respect.
 - c. The wireless connection shall use the Bluetooth Wireless Technology.
- B. Handheld VAV Balancing Sensor (ATV7003)
1. The sensor shall be a light weight portable device of dimensions not more than 3.2 x 3.2 x 1.0 inches.
 2. The sensor shall be capable of displaying data and setting balancing parameters for VAV control applications.
 3. The sensor shall be powered through a connection to either the Sensor-Actuator (SA) or the Field Controller (FC) Bus.
 4. The sensor shall be a menu driven device that shall modify itself automatically depending upon what type of application resides in the controller.
 5. The sensor shall contain a dial and two buttons to navigate through the menu and to set balancing parameters.
 6. The sensor shall provide an adjustable time-out parameter that will return the controller to normal operation if the balancing operation is aborted or abandoned.
 7. The sensor shall include the following
 - a. 5 foot retractable cable
 - b. Laminated user guide
 - c. Nylon carrying case
 8. The sensor shall be Underwriters Laboratory UL 916 listed and CSA certified C22.2 N. 205, CFR47.

2.7 INPUT DEVICES

A. General Requirements

1. Installation, testing, and calibration of all sensors, transmitters, and other input devices shall be provided to meet the system requirements.

B. Temperature Sensors

1. General Requirements:

- a. Sensors and transmitters shall be provided, as outlined in the input/output summary and sequence of operations.
- b. The temperature sensor shall be of the resistance type, and shall be either two-wire 1000 ohm nickel RTD, or two-wire 1000 ohm platinum RTD.
- c. The following point types (and the accuracy of each) are required, and their associated accuracy values include errors associated with the sensor, lead wire, and A to D conversion:

Point Type	Accuracy
Chilled Water	$\pm .5^{\circ}\text{F.}$
Room Temp	$\pm .5^{\circ}\text{F.}$
Duct Temperature	$\pm .5^{\circ}\text{F.}$
All Others	$\pm .75^{\circ}\text{F.}$

C. Room Temperature Sensors

- 1. Room sensors shall be constructed for either surface or wall box mounting.
- 2. Room sensors shall have the following options when specified:
 - a. Setpoint warmer/cooler dial or reset slide switch providing a +3 degree (adjustable) range.
 - b. Individual heating/cooling setpoint slide switches.
 - c. A momentary override request push button for activation of after-hours operation.
 - d. Analog thermometer.

D. Room Temperature Sensors with Integral Display

- 1. Room sensors shall be constructed for either surface or wall box mounting.
- 2. Room sensors shall have an integral LCD display and either a setpoint adjustment dial or setpoint adjustment push buttons, and the following capabilities when specified:
 - a. Display room air temperatures.
 - b. Display and adjust room comfort setpoint.
 - c. Display and adjust fan operation status via push button.
 - d. Override request via Occupancy Override push button with LED status for activation of after-hours operation.
 - e. Override request via setpoint adjustment dial or setpoint adjustment push buttons for activation of after-hours operation.
 - f. Occupancy sensor
 - g. F/C toggle pushbutton to toggle between F and C.
 - h. RH%/Temperature toggle push button to temporarily display RH%

E. Thermo Wells

- 1. Thermowell manufacturer shall have models available in stainless steel, brass body, and copper bulb.

2. When thermo wells are required, the sensor and well shall be supplied as a complete assembly, including wellhead and sensor.
3. Thermo wells shall be pressure rated and constructed in accordance with the system working pressure.
4. Thermo wells and sensors shall be mounted in a direct mount (no adapter) offering faster installation or 1/2" NPT saddle and allow easy access to the sensor for repair or replacement.
5. Thermo wells constructed of 316 stainless steel shall comply with Canadian Registration Number (CRN) pressure vessel rating.

F. Outside Air Sensors

1. Outside air sensors shall be designed to withstand the environmental conditions to which they will be exposed. They shall also be provided with a solar shield.
2. Sensors exposed to wind velocity pressures shall be shielded by a perforated plate that surrounds the sensor element.
3. Temperature transmitters shall be of NEMA 3R (IP54) or NEMA 4 (IP65) construction and rated for ambient temperatures.
4. The outdoor sensor can be easily mounted on a roof, pole or side of a building utilizing its already assembled mounting bracket.
5. Outside Relative Humidity sensors 0-100% full range of accurate measurement. Operating temperature -4 to 140F (-20 to 60C).
6. Outside temperature sensors operating temperature range is -40 to 140F, +/- .55F (+/- .3C).

G. Duct Mount Sensors

1. Duct mount sensors shall mount in an electrical box through a hole in the duct, and be positioned so as to be easily accessible for repair or replacement.
2. Duct sensors shall be insertion type and constructed as a complete assembly, including lock nut and mounting plate.
3. For outdoor air duct applications, a weatherproof mounting box with weatherproof cover and gasket shall be used.

H. Averaging Sensors

1. For ductwork greater in any dimension that 48 inches and/or where air temperature stratification exists, an averaging sensor with multiple sensing points shall be used.
2. For plenum applications, such as mixed air temperature measurements, a continuous averaging sensor or a string of sensors mounted across the plenum shall be used to account for stratification and/or air turbulence. The averaging string shall have a minimum of 4 sensing points per 12-foot long segment.
3. Capillary supports at the sides of the duct shall be provided to support the sensing string.

I. Acceptable Manufacturers: Johnson Controls, Minco.

1. Note: Include others, as appropriate.

J. Humidity Sensors

1. The sensor shall be a solid-state type, relative humidity sensor of the Thin Film Capacitance or Bulk Polymer Design. The sensor element shall resist service contamination.
2. The humidity transmitter shall be equipped with non-interactive span and zero adjustments, a 2-wire isolated loop powered, 4-20 mA, 0-100% linear proportional output.
3. The humidity transmitter shall meet the following overall accuracy, including lead loss and Analog to Digital conversion. 3% between 20% and 80% RH @ 77 Deg F unless specified elsewhere.
4. Outside air relative humidity sensors shall be installed with a rain proof, perforated cover. The transmitter shall be installed in a NEMA 3R (IP54) or NEMA 4 (IP65) enclosure with sealtite fittings.
5. A single point humidity calibrator shall be provided, if required, for field calibration. Transmitters shall be shipped factory pre-calibrated.
6. Duct type sensing probes shall be constructed of 304 stainless steel, and shall be equipped with a neoprene grommet, bushings, and a mounting bracket.
7. Acceptable Manufacturers: Johnson Controls and Vaisala.

K. CO2 Sensors

1. Where shown on the drawings, CO2 sensors shall have the following features:
 - a. Jumper selectable: 0-20mA, 4-20mA & 0-10VDC output
 - b. Liquid Crystal Display
2. The CO2 sensors shall have the ability to monitor and output the following variables as required by the systems sequence of operations:
 - a. Zone carbon-dioxide
3. The CO2 shall transmit the information back to the controller via jumper selectable 0-20mA, 4-20mA & 0-10VDC output signals.
 - a. The CO2 sensors shall provide a maximum output current of 25mA; Maximum output voltage of 12.5V.
 - b. The CO2 sensors shall be FCC compliant to CFR47 Part 15 subpart B Class A.
4. The CO2 Sensors shall be available with
 - a. CO2 reponse time (0-63%) of 1 minute
 - b. Less than 0.083% of full scale/F° temperature dependence of CO2 output
 - c. Long term CO2 stability $\pm 5\%$ of full scale for 5 years
 - d. CO2 measurement accuracy of $\pm(40\text{ppm} + 2.0\%$ of reading)
 - e. CO2 non-linearity of less than 1.0% of full scale
5. The CO2 Sensors may include the following items :
 - a. Relay output module
 - b. Liquid Crystal Display module
 - c. Analog temperature module with linear 0-10VDC output for 32-122F

L. Differential Pressure Transmitters**1. General Air and Water Pressure Transmitter Requirements:**

- a. Pressure transmitters shall be constructed to withstand 100% pressure over-range without damage, and to hold calibrated accuracy when subject to a momentary 40% over-range input.
- b. Pressure transmitters shall transmit a 0 to 5 VDC, 0 to 10 VDC, or 4 to 20 mA output signal.
- c. Differential pressure transmitters used for flow measurement shall be sized to the flow sensing device, and shall be supplied with Tee fittings and shut-off valves in the high and low sensing pick-up lines to allow the balancing Contractor and Owner permanent, easy-to-use connection.
- d. A minimum of a NEMA 1 housing shall be provided for the transmitter. Transmitters shall be located in accessible local control panels wherever possible.

2. Low Differential Water Pressure Applications (0" - 20" w.c.)

- a. The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of flow meter differential pressure or water pressure sensing points.
- b. The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
 - c. .01-20" w.c. input differential pressure range.
 - d. 4-20 mA output.
 - e. Maintain accuracy up to 20 to 1 ratio turndown.
 - f. Reference Accuracy: +0.2% of full span.
 - g. Acceptable Manufacturers: Setra and Mamac.

3. Medium to High Differential Water Pressure Applications (Over 21" w.c.)

- a. The differential pressure transmitter shall meet the low pressure transmitter specifications with the following exceptions:
 - 1) Differential pressure range 10" w.c. to 300 PSI.
 - 2) Reference Accuracy: +1% of full span (includes non-linearity, hysteresis, and repeatability).
- b. Standalone pressure transmitters shall be mounted in a bypass valve assembly panel. The panel shall be constructed to NEMA 1 standards. The transmitter shall be installed in the panel with high and low connections piped and valved. Air bleed units, bypass valves, and compression fittings shall be provided.
- c. Acceptable Manufacturers: Setra and Mamac.

4. Building Differential Air Pressure Applications (-1" to +1" w.c.)

- a. The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of differential pressure or air pressure sensing points.
 - b. The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
 - 1) -1.00 to +1.00 w.c. input differential pressure ranges. (Select range appropriate for system application)
 - 2) 4-20 mA output.
 - 3) Maintain accuracy up to 20 to 1 ratio turndown.
 - 4) Reference Accuracy: +0.2% of full span.
 - 5) Acceptable Manufacturers: Johnson Controls
5. Low Differential Air Pressure Applications (0" to 2.5" w.c.)
- a. The differential pressure transmitter shall be of industrial quality and transmit a linear, 4 to 20 mA output in response to variation of differential pressure or air pressure sensing points.
 - b. The differential pressure transmitter shall have non-interactive zero and span adjustments that are adjustable from the outside cover and meet the following performance specifications:
 - 1) (0.00 - 1.00" to 5.00") w.c. input differential pressure ranges. (Select range appropriate for system application.)
 - 2) 4-20 mA, 0-5 VDC, 0-10 VDC, output.
 - 3) Maintain accuracy up to 20 to 1 ratio turndown.
 - 4) Reference Accuracy: +0.25%, or 0.5% of full span.
 - c. Acceptable Manufacturers: Johnson Controls and Ruskin.
6. Medium Differential Air Pressure Applications (5" to 21" w.c.)
- a. The pressure transmitter shall be similar to the Low Air Pressure Transmitter, except that the performance specifications are not as severe. Differential pressure transmitters shall be provided that meet the following performance requirements:
 - 1) Zero & span: (c/o F.S./Deg. F): .04% including linearity, hysteresis and repeatability.
 - 2) Accuracy: 1% F.S. (best straight line) Static Pressure Effect: 0.5% F.S. (to 100 PSIG.
 - 3) Thermal Effects: <+.033 F.S./Deg. F. over 40°F. to 100°F. (calibrated at 70°F.).
 - b. Standalone pressure transmitters shall be mounted in a bypass valve assembly panel. The panel shall be constructed to NEMA 1 standards. The transmitter shall be installed in the panel with high and low connections piped and valved. Air bleed units, bypass valves, and compression fittings shall be provided.
 - c. Acceptable manufacturers: Johnson Controls and Ruskin.

M. Flow Monitoring

1. Air Flow Monitoring

a. Fan Inlet Air Flow Measuring Stations

- 1) At the inlet of each fan and near the exit of the inlet sound trap, airflow sensors shall be provided that shall continuously monitor the fan air volumes or velocity pressure.
- 2) Each sensor shall be surface mount type. Unit shall be capable of monitoring and reporting the airflow and temperature at each fan inlet location through two or four sensing circuits. If a static pressure manifold is used, it shall incorporate dual offset static tips on the opposing sides of the averaging manifold so as to be insensitive to flow-angle variations of as much as + 20° in the approaching air stream.
- 3) Devices creating fan performance degradation, resulting in additional energy consumption, caused from pressure drop associated with probes or mounting apparatus in the center of the fan inlet are not allowed. The device shall not induce a significant pressure drop, nor shall the sound level within the duct be amplified by its singular or multiple presence in the air stream. Sensor circuit casings shall be constructed of U.L. 94 flame rated, high impact ABS and include a stainless steel thermistor cap that maintains the precise calibrated flow over the heated and ambient measurement points. Each sensor circuit shall consist of two ceramic base, glass encapsulated, thermistors for measuring ambient temperature and velocity. Circuit shall be designed for operation in a wide range of environments, including high humidity (non-condensing) and rapid thermal cycling.
- 4) Acceptable manufacturers are: Johnson Controls or Ebtron Models GTC116P+ or GTC108-F

2. Single Probe Air Flow Measuring Sensor

- a. The single probe airflow-measuring sensor shall be duct mounted with an adjustable sensor insertion length of up to eight inches. The transmitter shall produce a 4-20 mA or 0-10 VDC signal linear to air velocity. The sensor shall be a thermal dispersion and utilize one temperature sensor and a heated thermistor. The sensor pair shall measure the air temperature and airflow velocity.

3. Duct Air Flow Measuring Stations

- a. Furnish and install, at locations shown on plans or as in accordance with schedules, an equalized air measuring probe system piped to a high performance pressure transducer or an electronic type airflow temperature measuring station.
- b. Each device shall be designed and built to comply with, and provide results in accordance with, accepted practice as defined for system testing in the ASHRAE Handbook of fundamentals, as well as in the Industrial Ventilation Handbook.

- c. Assembly shall be AMCA tested and capable of measuring a range from 70 to 5,000 FPM (22 to 1524 MPM).
- d. Equalized air measuring assembly shall measure to $\pm 3\%$ average and consist of 6063T5 extruded aluminum step sensing blade(s) with anodized finish, plenum-rated polyethylene pressure tubing, brass barbed fittings, mounting hardware and a glass-on-silicone capacitance sensor pressure transducer capable of measuring up to five field-selectable pressure ranges up to 2.5 in. w.c.
- e. The transducer shall be accurate to $\pm 0.5\%$, or 0.25% of full scale and be contained in a National Electrical Manufacturer's Association (NEMA) 4 (IP-65) enclosure. Transducer shall be factory mounted and piped to high and low pressure ports through fittings made of brass.
- f. All sensor tubing shall terminate in solid brass barbed fittings.
- g. Total and static pressure manifolds shall terminate with external ports for connection to control tubing. An identification label shall be placed on each unit casing, listing model number, size, area, and specified airflow capacity.
- h. Air straightener shall be provided for sizes over 17 square feet (1.6 sq meter).
- i. Airflow measuring station assemblies shall be fabricated of galvanized steel or aluminum casing of appropriate thickness for slip fits or with 90 Deg. connecting flanges in configuration and size equal to that of the duct into which it is mounted. Each station shall be complete with an air directionalizer and parallel cell profile suppressor (3/4" maximum cell) across the entering air stream and mechanically fastened to the casing in such a way to withstand velocities up to 5000 feet per minute. This air directionalizer and parallel cell honeycomb suppressor shall provide 98% free area, and eliminate turbulent and rotational flow from the air stream prior to the measuring point.
- j. Equalized air measuring probe assemblies shall be, in all respects, equivalent to Johnson Controls® AD-1250 or AD-1251 airflow measuring systems.
- k. Electronic air measuring station shall be capable of monitoring and reporting the airflow and temperature at each measuring location through one or more measuring probes containing multiple sensor points and a control transmitter that outputs a 4-20 mA linear signal.
- l. Probe(s) shall be constructed of an airfoil shaped aluminum extrusion containing the sensor circuit(s).
- m. Each sensor circuit shall consist of coated thermistors, for temperature and velocity, mounted to a Printed Circuit Board (PCB).
- n. Probe multiplexer circuit(s) shall include a microprocessor that collects data from each PCB and digitally communicates the average airflow and temperature of each probe to a microprocessor based control transmitter.
- o. Multiplexer board shall be encased to prevent moisture damage.
- p. Shielded CAT5e communications cable shall be Underwriters Laboratories Inc.® (UL) plenum-rated with RJ45 terminal connectors. Dust boot covers and gold-plated contacts shall link probes to electronic controller.
- q. Control transmitter shall be capable of processing independent sensing points and shall operate on a fused 24 VAC supply.
- r. Control transmitter shall feature a 16 x 2 character alphanumeric LCD screen, digital offset/gain adjustment, continuous performing sensor/transmitter diagnostics, and a visual alarm to detect malfunctions.

- s. All electronic components of the assembly shall be Restriction of Hazardous Substances (RoHS) Directive compliant.
- t. Equal to Johnson Controls AD-1252
- u. Installation Considerations
 - 1) The maximum allowable pressure loss through the Flow and Static Pressure elements shall not exceed .04" w.c. at 1000 feet per minute, or .11" w.c. at 2000 feet per minute. Each unit shall measure the airflow rate within an accuracy of plus 3-5% as determined by AMCA.
 - 2) Where the stations are installed in insulated ducts, the airflow passage of the station shall be the same size as the inside airflow dimension of the duct. Station flanges shall be 1.5 inches to facilitate matching connecting ductwork.
 - 3) Where control dampers are shown as part of the airflow measuring station, parallel blade precision controlled volume dampers integral to the station and complete with actuator, and linkage shall be provided.
 - 4) Stations shall be installed in strict accordance with the manufacturer's published requirements, and in accordance with ASME Guidelines affecting non-standard approach conditions.
 - a) All air measuring devices shall be tested according to AMCA Standard 610
 - b) Acceptable manufacturers: Johnson Controls, Air Monitor Corp., Tek-Air, Ruskin, and Dietrich Standard.

4. Static Pressure Traverse Probe

- a. Duct static traverse probes shall be provided where required to monitor duct static pressure. The probe shall contain multiple static pressure sensors located along exterior surface of the cylindrical probe.
- b. Acceptable manufacturers: Cleveland Controls

5. Shielded Static Air Probe

- a. A shielded static pressure probe shall be provided at each end of the building. The probe shall have multiple sensing ports, an impulse suppression chamber, and airflow shielding. A suitable probe for indoor and outdoor locations shall be provided.
- b. Water Flow Monitoring
 - 1) Water flow meters shall be electromagnetic type with integral microprocessor-Based electronics. The meter shall have an accuracy of 0.25%.
 - 2) Acceptable manufacturers: Onicon

N. Power Monitoring Devices

1. Current Measurement (Amps)

- a. Current measurement shall be by a combination current transformer and a current transducer. The current transformer shall be sized to reduce the full

amperage of the monitored circuit to a maximum 5 Amp signal, which will be converted to a 4-20 mA DDC compatible signal for use by the Facility Management System.

- b. Current Transformer – A split core current transformer shall be provided to monitor motor amps.
 - 1) Operating frequency – 50 - 400 Hz.
 - 2) Insulation – 0.6 Kv class 10Kv BIL.
 - 3) UL recognized.
 - 4) Five amp secondary.
 - 5) Select current ration as appropriate for application.
 - 6) Acceptable manufacturers: Setra

- c. Current Transducer – A current to voltage or current to mA transducer shall be provided. The current transducer shall include:
 - 1) 6X input over amp rating for AC inrushes of up to 120 amps.
 - 2) Manufactured to UL 1244.
 - 3) Accuracy: +.5%, Ripple +1%.
 - 4) Minimum load resistance 30kOhm.
 - 5) Input 0-20 Amps.
 - 6) Output 4-20 mA.
 - 7) Transducer shall be powered by a 24VDC regulated power supply (24 VDC +5%).
 - 8) Acceptable manufacturers: Setra

O. Smoke Detectors

- 1. Ionization type air duct detectors shall be furnished as specified elsewhere in Division 28 for installation under Division 23. All wiring for air duct detectors shall be provided under Division 28, Fire Alarm System.

P. Status and Safety Switches

- 1. General Requirements
 - a. Switches shall be provided to monitor equipment status, safety conditions, and generate alarms at the BMS when a failure or abnormal condition occurs. Safety switches shall be provided with two sets of contacts and shall be interlock wired to shut down respective equipment.

- 2. Current Sensing Switches
 - a. The current sensing switch shall be self-powered with solid-state circuitry and a dry contact output. It shall consist of a current transformer, a solid state current sensing circuit, adjustable trip point, solid state switch, SPDT relay, and an LED indicating the on or off status. A conductor of the load shall be passed through the window of the device. It shall accept over-current up to twice its trip point range.
 - b. Current sensing switches shall be used for run status for fans, pumps, and other miscellaneous motor loads.

- c. Current sensing switches shall be calibrated to show a positive run status only when the motor is operating under load. A motor running with a broken belt or coupling shall indicate a negative run status.
 - d. Acceptable manufacturers: Johnson Controls
- 3. Air Filter Status Switches
 - a. Differential pressure switches used to monitor air filter status shall be of the automatic reset type with SPDT contacts rated for 2 amps at 120VAC.
 - b. A complete installation kit shall be provided, including: static pressure tops, tubing, fittings, and air filters.
 - c. Provide appropriate scale range and differential adjustment for intended service.
 - d. Acceptable manufacturers: Johnson Controls, Cleveland Controls
- 4. Air Flow Switches
 - a. Differential pressure flow switches shall be bellows actuated mercury switches or snap acting micro-switches with appropriate scale range and differential adjustment for intended service.
 - b. Acceptable manufacturers: Johnson Controls, Cleveland Controls
- 5. Air Pressure Safety Switches
 - a. Air pressure safety switches shall be of the manual reset type with SPDT contacts rated for 2 amps at 120VAC.
 - b. Pressure range shall be adjustable with appropriate scale range and differential adjustment for intended service.
 - c. Acceptable manufacturers: Johnson Controls, Cleveland Controls
- 6. Water Flow Switches
 - a. Water flow switches shall be equal to the Johnson Controls P74.
- Q. Low Temperature Limit Switches
 - 1. The low temperature limit switch shall be of the manual reset type with Double Pole/Single Throw snap acting contacts rated for 16 amps at 120VAC.
 - 2. The sensing element shall be a minimum of 15 feet in length and shall react to the coldest 18-inch section. Element shall be mounted horizontally across duct in accordance with manufacturers recommended installation procedures.
 - 3. For large duct areas where the sensing element does not provide full coverage of the air stream, additional switches shall be provided as required to provide full protection of the air stream.
 - 4. The low temperature limit switch shall be equal to Johnson Controls A70.
- R. Control Relays
 - 1. Control Pilot Relays

- a. Control pilot relays shall be of a modular plug-in design with retaining springs or clips.
 - b. Mounting Bases shall be snap-mount.
 - c. DPDT, 3PDT, or 4PDT relays shall be provided, as appropriate for application.
 - d. Contacts shall be rated for 10 amps at 120VAC.
 - e. Relays shall have an integral indicator light and check button.
 - f. Acceptable manufacturers: Johnson Controls, Relay In Box (RIB)
2. Lighting Control Relays
- a. Lighting control relays shall be latching with integral status contacts.
 - b. Contacts shall be rated for 20 amps at 277 VAC.
 - c. The coil shall be a split low-voltage coil that moves the line voltage contact armature to the ON or OFF latched position.
 - d. Lighting control relays shall be controlled by:
 - 1) Pulsed Tri-state Output – Preferred method.
 - 2) Pulsed Paired Binary Outputs.
 - 3) A Binary Input to the Facility Management System shall monitor integral status contacts on the lighting control relay. Relay status contacts shall be of the “dry-contact” type.
 - e. The relay shall be designed so that power outages do not result in a change-of-state, and so that multiple same state commands will simply maintain the commanded state. Example: Multiple OFF command pulses shall simply keep the contacts in the OFF position.

S. Electronic Signal Isolation Transducers

1. A signal isolation transducer shall be provided whenever an analog output signal from the BMS is to be connected to an external control system as an input (such as a chiller control panel), or is to receive as an input signal from a remote system.
2. The signal isolation transducer shall provide ground plane isolation between systems.
3. Signals shall provide optical isolation between systems.
4. Acceptable manufacturers: Advanced Control Technologies

T. Thermostats

1. Electric room thermostats of the heavy-duty type shall be provided for unit heaters, cabinet unit heaters, and ventilation fans, where required. All these items shall be provided with concealed adjustment. Finish of covers for all room-type instruments shall match and, unless otherwise indicated or specified, covers shall be manufacturer’s standard finish.

2.8 OUTPUT DEVICES

A. Actuators and Operators

1. General Requirements
 - a. Damper and valve actuators shall be electronic and/or pneumatic, as specified in the System Description section.
 - b. The manufacturer shall be ISO 9001 certified.

- B. Electronic Damper Actuators
 1. Spring Return Actuators:
 - a. Manufactured, brand labeled or distributed by Johnson Controls, Inc. or approved equivalent.
 - b. Regulatory Agency Listing: cULus ,CSA C22.2 No. 24-93, and CE marked
 - c. Direct-Coupled Design: Requires no crankarm or linkage for mounting to a shaft.
 - d. Coupling: toothed V-bolt clamp and nuts with toothed cradle.
 - e. Reversible Mounting: Provides either clockwise or counterclockwise operation.
 - f. Power Failure Operation: Mechanical spring return system drives load to the home position. Other forms of internal energy storage for power failure operation are not acceptable.
 - g. Motor Technology:
 - 1) Modulating Types: Microprocessor-controlled Brushless DC motor
 - 2) On/Off Types: DC brush motor.
 - h. Overload Protection: Electronic stall detection protects from overload at all angles of rotation without the use of end switches.
 - i. Enclosure Ratings: NEMA type 2 / IP54 mounted in any orientation.
 - j. Double-Insulated construction: Eliminate the need for electrical ground wires.
 - k. Wiring: Integral cables with colored and numbered conductors.
 - l. Sized for torque required to seal damper at load conditions
 - m. Parallel Operation: Actuators shall be available that are capable of being mechanically or electrically paralleled.
 - n. Proportional actuators shall be user configurable without the use of external computer software or programming tools. Calibration, input signal range selection, and control logic reversal shall be selectable with an external mode selection switch.
 - o. Operating Temperature Range:
 - 1) 70 lb·in. Torque and Below: -40°F to 140°F
 - 2) 71 lb·in. Torque and above: -40°F to 131°F
 - p. Power Requirements:
 - 1) Modulating Types:
 - a) 27 lb·in. Torque and Below: 5VA maximum
 - b) 70 lb·in. to 19 lb·in.Torque: 8VA maximum
 - c) 89 lb·in. to 71 lb·in.Torque: 10VA maximum

- d) 90 lb·in. to 177 lb·in.Torque: 16VA maximum
- 2) 2-Position Types:
 - a) 27 lb·in. Torque and Below: 5VA maximum
 - b) 70 lb·in. to 19 lb·in.Torque: 7VA maximum
 - c) 71 lb·in. to 177 lb·in.Torque: 25VA maximum
- 2. Non-Spring Return Actuators:
 - a. Manufactured, brand labeled or distributed by Johnson Controls, Inc. or approved equivalent.
 - b. Regulatory Agency: UL Listed ,CSA Certified, and CE marked
 - c. Direct-Coupled Design: Requires no crankarm or linkage for mounting to a shaft.
 - d. Coupling:
 - 1) Above 80 lb·in.: toothed V-bolt clamp and nuts with toothed cradled
 - 2) 80 lb·in.and below: single cup-point set screw and toothed cradle.
 - e. Overload Protection: Electronic stall detection or magnetic slip clutch protects from overload at all angles of rotation without the use of end switches.
 - f. Minimum Enclosure Ratings:
 - 1) Types with covered wiring terminals: NEMA type 2 / IP42 mounted in any orientation.
 - 2) Types without covered wiring terminals: NEMA type 1 / IP30 or IP40.
 - 3) Types with integrated cables: NEMA 2 / IP42 mounted in any orientation.
 - g. Sized for torque required to seal damper at load conditions
 - h. Parallel Operation: Actuators shall be available that are capable of being mechanically or electrically paralleled.
 - i. Proportional actuators shall be user configurable without the use of external computer software or programming tools.
 - j. Operating Temperature Range: -4°F to 122°F except for VAV and similar indoor applications in which case 32°F to 122°F is acceptable.
 - k. Power Requirements: 24 V with models available for both 24 VAC and 24 VDC operation, maximum
 - 1) Above 80 lb·in.: 7.5 VA at 24 VAC
 - 2) 80 lb·in.and below: 3.5 VA at 24VAC
 - l. The manufacturer shall provide 5-year limited warranty from the date of sale covering defects in material or workmanship.

2.9 CONTROL VALVES

- A. Pressure Independent Valves, 1/2 through 6 in.

1. Acceptable Manufacturers:
 - a. IMI Hydronics / TA (TA-Fusion P / TA-Compact P / TA Modulator)
2. The valve should be a control valve with adjustable, stepless, pre-settable balancing and built-in dp-controller. It shall be supplied and installed as shown on the drawings to ensure proper balancing and performs the control function for water flows.
3. The valve shall be pressure independent with integral spring and diaphragm arrangement for integral differential pressure control over built in control section.
4. The valve/actuator shall have retained EQM characteristic for all recommended pre-settings.
5. Test points shall be provided for measuring differential pressure and be integral with the body and incorporate means for positive leak tight shutoff when not in use.
6. True flow measurement must be possible with balancing instrument. Flow deviation max +/- 10%. Measurement of differential pressure with no valve coefficient will not suffice.
7. The valve shall have the capacity for manual, leak tight shutoff without the actuator attached for maintenance purposes and to allow measurement of available differential pressure for diagnostics.
8. It should be possible to perform a high speed flush with the valve installed in the system without causing damage to the product and without removing / replacing any parts.
9. The valve shall have a minimum valve authority rating of 0.75.
10. Material: Valve body with connection in sizes 1 1/2" to 2" shall be made of dezincification resistant alloy brass with a pressure rating of 235 psi. Sizes 2 1/2 - 6" shall consist of ductile iron housings and stainless steel valve plugs with a pressure rating of 365 psi. The minimum differential pressure shall be 5 psi.
11. Material: Valve body and insert with connection sizes 3/8" to 1 1/4" shall be of dezincification resistant alloy brass with stainless steel valve plug, spindle, and spring. EPDM membrane and o-rings with a pressure rating of 230 psi. The minimum differential pressure shall be 3 psi.
12. Threaded connections shall be NPT in accordance with ANSI/ASME B1.20.1-1983.
13. Valve actuators shall be full modulating, low voltage (24VAC) and of the same manufacturer as the control valve.

2.10 CONTROL DAMPERS

- A. The BMS Contractor shall furnish all automatic dampers. All automatic dampers shall be sized for the application by the BMS Contractor or as specifically indicated on the Drawings.
 1. All dampers used for throttling airflow shall be of the opposed blade type arranged for normally open or normally closed operation, as required. The damper is to be sized so that, when wide open, the pressure drop is a sufficient amount of its close-off pressure drop to shift the characteristic curve to near linear.

2. All dampers used for two-position, open/close control shall be parallel blade type arranged for normally open or closed operation, as required.
 3. Damper frames and blades shall be constructed of either galvanized steel or aluminum. Maximum blade length in any section shall be 60". Damper blades shall be 16-gauge minimum and shall not exceed eight (8) inches in width. Damper frames shall be 16-gauge minimum hat channel type with corner bracing. All damper bearings shall be made of reinforced nylon, stainless steel or oil-impregnated bronze. Dampers shall be tight closing, low leakage type, with synthetic elastomer seals on the blade edges and flexible stainless steel side seals. Dampers of 48"x48" size shall not leak in excess of 8.0 cfm per square foot when closed against 4" w.g. static pressure when tested in accordance with AMCA Std. 500.
 4. Airfoil blade dampers of double skin construction with linkage out of the air stream shall be used whenever the damper face velocity exceeds 1500 FPM or system pressure exceeds 2.5" w.g., but no more than 4000 FPM or 6" w.g.
 - a. Acceptable manufacturers are Johnson Controls VD-1250, VD1630, or VD-1330, Ruskin CD50 or CD60, and Vent Products 5650.
- B. One piece rolled blade dampers with exposed or concealed linkage may be used with face velocities of 1500 FPM or below.
1. Acceptable manufacturers are: Johnson Controls VD-1620, VD-1320, Ruskin CD36, and Vent Products 5800.
 2. Multiple section dampers may be jack-shafted to allow mounting of piston pneumatic actuators and direct connect electronic actuators. Each end of the jackshaft shall receive at least one actuator to reduce jackshaft twist.

2.11 MISCELLANEOUS DEVICES

A. Variable Frequency Motor Speed Control Drives

1. See specification section 23 0514 Variable Frequency Drives for requirements.
2. Local Control Panels
 - a. All control panels shall be factory constructed, incorporating the BMS manufacturer's standard designs and layouts. All control panels shall be UL inspected and listed as an assembly and carry a UL 508 label listing compliance. Control panels shall be fully enclosed, with perforated sub-panel, hinged door, and slotted flush
 - b. In general, the control panels shall consist of the DDC controller(s), display module as specified and indicated on the plans, and I/O devices—such as relays, transducers, and so forth—that are not required to be located external to the control panel due to function. Where specified the display module shall be flush mounted in the panel face unless otherwise noted.
 - c. All I/O connections on the DDC controller shall be provide via removable or fixed screw terminals.
 - d. Low and line voltage wiring shall be segregated. All provided terminal strips and wiring shall be UL listed, 300-volt service and provide adequate clearance for field wiring.

- e. All wiring shall be neatly installed in plastic trays or tie-wrapped.
- f. A 120 volt convenience outlet, fused on/off power switch, and required transformers shall be provided in each enclosure.

3. Power Supplies

- a. DC power supplies shall be sized for the connected device load. Total rated load shall not exceed 75% of the rated capacity of the power supply.
- b. Input: 120 VAC +10%, 60Hz.
- c. Output: 24 VDC.
- d. Line Regulation: +0.05% for 10% line change.
- e. Load Regulation: +0.05% for 50% load change.
- f. Ripple and Noise: 1 mV rms, 5 mV peak to peak.
- g. An appropriately sized fuse and fuse block shall be provided and located next to the power supply.
- h. A power disconnect switch shall be provided next to the power supply.

B. Gas Monitoring System

1. General:

- a. Contractor will furnish, install and place in operating condition a hazardous gas monitoring system suitable for detecting combustible gas and various toxic gases. The system shall be installed in accordance with the drawings and as specified herein complete with all accessories necessary for proper operation.
- b. The system shall be designed to minimize the risk to personnel and facilities of exposure to dangerously high concentrations of gases. Also, inherent in the system design will be internal, continuous self-diagnostics to ensure the system is operating properly.
- c. Products used in the work of this Section shall be produced by manufacturers regularly engaged in the manufacture of similar items and with a history of satisfactory production acceptable to the Engineer. The manufacturer shall have an ISO 9001:2008 Registered Quality Control System in place and approved.
- d. The controller shall be FM Approved. Combustible gas sensor modules shall also be FM approved (hazardous location and performance) and SIL-2 Certified. The combustible gas sensor shall have FM hazardous locations approval per FM Specification 3600, and FM Performance approval per FM Specification 6320.
- e. The Contractor shall be responsible to ensure that all equipment items and accessories supplied as part of the gas monitoring system are compatible and will operate as a complete working system. The controller shall be capable of accepting a signal from any combination of combustible gas, or toxic gas sensors utilizing SentryBus, Modbus RTU, 4-20 mA or digital output.
- f. The equipment shall be manufactured by Sierra Monitor Corporation, 1991 Tarob Court, Milpitas, CA 95035 USA, Phone (408) 262-6611, Fax (408) 262-9042, or approved equivalent.

2. Operation (Controller)

- a. The controller shall be capable of:
 - 1) Accepting input from devices utilizing 4-20 mA (2, 3 or 4-wire per ISA specifications), RS-485 Modbus RTU, SentryBus and binary (supervised or digital).
 - 2) Large 5.7" color, backlit touch-screen interface with appropriate bar charts, text data screens necessary for display of operation and configuration/set-up.
 - 3) Interface up to 32 module addresses
 - 4) Capable of 4-20 mA (2 or 3-wire) output, SPDT relays, digital output
 - 5) Multiple protocol communication
 - 6) Capable of remote operation via WebServer or remote terminal
 - 7) Configuration of the controller system shall be easy and meet user defined needs in terms of input, output, power and signal
 - 8) There shall be a Warning and Alarm (Low and High) level alarm for each sensor and a trouble alarm for each controller. The type of alarm shall be annunciated on the controller display panel with an alarm LED.
3. Operation (Sensors)
 - a. The sensor/transmitters shall have a minimum of 180 day calibration interval for the toxic gas sensor and 365 days for combustible gas sensor module.
 - b. The gas sensor module must be able to be calibrated without opening the enclosure (non-intrusive calibration) using a magnetic wand to activate four keys.
 - c. Utilizing an integral display and magnetic wand activated keys, the sensor module must have a menu-driven procedure for calibration, set-up, maintenance and alarm reset.
 - d. Sensor module will have user selectable ranges.
 - e. Operating temperature for toxic gas sensor modules shall be 4 degree F to plus 122 degree F.
 - f. Operating temperature for toxic gas sensors shall be -4 degree F to 140 degree F.
 - g. Operating ranges shall be up to 1200 PPM (User adjustable) for Carbon Monoxide gas sensor modules
 - h. Operating ranges shall be 0 to 100% LEL for the combustible gas sensors.
 - i. There shall be a high and a low level alarm for each sensor and a trouble alarm for each controller. The type of alarm shall be annunciated on the controller display panel with an alarm LED.
 - j. The 5 amp alarm Relays for Alarm, Warning, and ¼ amp Trouble relay will be integral to the sensor module and will activate circuitry for remote alarm indication.
 - k. HART communication for set up and diagnostics.
4. Interconnectivity
 - a. Sensor module shall include multiple interface/connectivity capabilities, including:

- 1) 4-20 mA output (selectable as Type 3 3-wire circuit or Type 4 4-wire circuit). 4-20 mA output will have:
 - a) User-selectable values for output during calibration and trouble conditions
 - b) Interface testing during set-up confirming 4mA and 20 mA matching between the module and the interface device
 - b. RS-485 digital interface utilizing Modbus RTU protocol with baud rate user-adjustable between 2400 and 38400 baud. Manufacturer will supply a complete Modbus memory map that shall include addresses for:
 - 1) Concentration
 - 2) High Alarm Value
 - 3) Low Alarm Value
 - 4) High Alarm Relay status
 - 5) Low Alarm Relay status
 - 6) Range
 - 7) Units
 - 8) Module number
 - c. SentryBus digital interface to enable interconnectivity to Sentry controllers.
 - d. Integral High and Low alarm relays (SPDT type):
 - e. A minimum of 5 Amps to enable interface to control devices.
 - f. Shall be integral to the sensor module and field-selectable through non-intrusive means, without use of an external remote control unit. Selectable features include:
 - 1) Alarm level
 - 2) Latching/Non-Latching
 - 3) Sentry control or Module control
5. Sensor Enclosure
- a. Sensor and transmitter housing for all gas sensor modules shall be FM or ATEX approved explosion proof for use in Class 1, Division I, Groups B, C and D areas.
 - b. Enclosures shall have a NEMA 4 rating and available in either epoxy-coated, die-cast copper-free aluminum or 316 Stainless Steel.
6. Sensor Calibration
- a. Calibration shall be single-person, auto-adjusting without any manual adjustments required and without exposing circuit electronics to the atmosphere. Global calibration procedure controls all calibration functions at IT Controller.
 - b. A calibration system shall be available consisting of cylinders of calibration gas plus pressure and flow regulator for delivery of the calibration gas to the sensor.
7. Approvals

- a. Combustibles and primary toxic gas sensor modules shall be SIL-2 Certified.
- b. The combustible gas sensor module and controller shall have FM Performance approval.
- c. The combustible gas sensor shall have FM hazardous locations approval per FM Specification 3600, and FM Performance approval per FM Specification 6320.
- d. Manufacturer must be ISO9001:2008 certified.

PART 3 - PERFORMANCE/EXECUTION

3.1 BMS SPECIFIC REQUIREMENTS

A. Existing BMS

1. Coordinate the provision installation of all materials, UI and IoT componentry to be compatible with existing JPSTC front end system architecture.

B. Graphic Displays

1. The naming/numbering/tagging convention used must be a coordinated effort between the Mechanical Contractor, Controls Contractor, Owner, Design-Builder, and A/E and must be approved by all parties prior to implementation. The naming/numbering/tagging convention must be consistent and reflected through the building automation control system, charts, diagrams, tagging and O&M manuals.
2. Provide a color graphic system flow diagram display for each system with all points as indicated on the point list. All terminal unit graphic displays shall be from a standard design library. Utilize existing main building graphic icons and symbology.
3. User shall access the various system schematics via a graphical penetration scheme and/or menu selection.
4. Custom Reports:
 - a. Provide custom reports as required for this project
5. Actuation / Control Type
6. Primary Equipment
 - a. Controls shall be provided by equipment manufacturer as specified herein.
 - b. All damper and valve actuation shall be electric.
7. Air Handling Equipment
 - a. All air handlers shall be controlled with a HVAC-DDC Controller
 - b. All damper and valve actuation shall be electric.
8. Terminal Equipment:

- a. Terminal Units (VAV, UV, etc.) shall have electric damper and valve actuation.
- b. All Terminal Units shall be controlled with HVAC-DDC Controller)

3.2 INSTALLATION PRACTICES

A. BMS Wiring

1. All conduit, wiring, accessories and wiring connections required for the installation of the Building Management System, as herein specified, shall be provided by the BMS Contractor unless specifically shown on the Electrical Drawings under Division 26 Electrical. All wiring shall comply with the requirements of applicable portions of Division 26 and all local and national electric codes, unless specified otherwise in this section.
2. All BMS wiring materials and installation methods shall comply with BMS manufacturer recommendations.
3. The sizing, type and provision of cable, conduit, cable trays, and raceways shall be the design responsibility of the BMS Contractor. If complications arise, however, due to the incorrect selection of cable, cable trays, raceways and/or conduit by the BMS Contractor, the Contractor shall be responsible for all costs incurred in replacing the selected components.

a. Class 2 Wiring

- 1) All Class 2 (24VAC or less) wiring shall be installed in conduit unless otherwise specified.
- 2) Conduit is not required for Class 2 wiring in concealed accessible locations. Class 2 wiring not installed in conduit shall be supported every 5' from the building structure utilizing metal hangers designed for this application. Wiring shall be installed parallel to the building structural lines. All wiring shall be installed in accordance with local code requirements.
4. Class 2 signal wiring and 24VAC power can be run in the same conduit. Power wiring 120VAC and greater cannot share the same conduit with Class 2 signal wiring.
5. Provide for complete grounding of all applicable signal and communications cables, panels and equipment so as to ensure system integrity of operation. Ground cabling and conduit at the panel terminations. Avoid grounding loops.

B. BMS Line Voltage Power Source

1. 120-volt AC circuits used for the Building Management System shall be taken from panel boards and circuit breakers provided by Division 26.
2. Circuits used for the BMS shall be dedicated to the BMS and shall not be used for any other purposes.
3. DDC terminal unit controllers may use AC power from motor power circuits.

C. BMS Raceway

1. All wiring shall be installed in conduit or raceway except as noted elsewhere in this specification. Minimum control wiring conduit size 1/2".
2. Where it is not possible to conceal raceways in finished locations, surface raceway (Wiremold) may be used as approved by the Architect.
3. All conduits and raceways shall be installed level, plumb, at right angles to the building lines and shall follow the contours of the surface to which they are attached.
4. Flexible Metal Conduit shall be used for vibration isolation and shall be limited to 3 feet in length when terminating to vibrating equipment. Flexible Metal Conduit may be used within partition walls. Flexible Metal Conduit shall be UL listed.

D. Penetrations

1. Provide fire stopping for all penetrations used by dedicated BMS conduits and raceways.
2. All openings in fire proofed or fire stopped components shall be closed by using approved fire resistive sealant.
3. All wiring passing through penetrations, including walls shall be in conduit or enclosed raceway.
4. Penetrations of floor slabs shall be by core drilling. All penetrations shall be plumb, true, and square.

E. BMS Identification Standards

1. Node Identification. All nodes shall be identified by a permanent label fastened to the enclosure. Labels shall be suitable for the node location.
2. Cable types specified in Item A shall be color coded for easy identification and troubleshooting.

F. BMS Panel Installation

1. The BMS panels and cabinets shall be located as indicated at an elevation of not less than 2 feet from the bottom edge of the panel to the finished floor. Each cabinet shall be anchored per the manufacturer's recommendations.
2. The BMS contractor shall be responsible for coordinating panel locations with other trades and electrical and mechanical contractors.

G. Input Devices

1. All Input devices shall be installed per the manufacturer recommendation
2. Locate components of the BMS in accessible local control panels wherever possible.

H. HVAC Input Devices – General

1. All Input devices shall be installed per the manufacturer recommendation
2. Locate components of the BMS in accessible local control panels wherever possible.
3. The mechanical contractor shall install all in-line devices such as temperature wells, pressure taps, airflow stations, etc.

4. Input Flow Measuring Devices shall be installed in strict compliance with ASME guidelines affecting non-standard approach conditions.
5. Outside Air Sensors
 - a. Sensors shall be mounted on the North wall to minimize solar radiant heat impact or located in a continuous intake flow adequate to monitor outside air conditions accurately.
 - b. Sensors shall be installed with a rain proof, perforated cover.
6. Water Differential Pressure Sensors
 - a. Differential pressure transmitters used for flow measurement shall be sized to the flow-sensing device.
 - b. Differential pressure transmitters shall be supplied with tee fittings and shut-off valves in the high and low sensing pick-up lines.
 - c. The transmitters shall be installed in an accessible location wherever possible.
7. Medium to High Differential Water Pressure Applications (Over 21" w.c.):
 - a. Air bleed units, bypass valves and compression fittings shall be provided.
8. Building Differential Air Pressure Applications (-1" to +1" w.c.):
 - a. Transmitters exterior sensing tip shall be installed with a shielded static air probe to reduce pressure fluctuations caused by wind.
 - b. The interior tip shall be inconspicuous and located as shown on the drawings.
9. Air Flow Measuring Stations:
 - a. Where the stations are installed in insulated ducts, the airflow passage of the station shall be the same size as the inside airflow dimension of the duct.
 - b. Station flanges shall be two inch to three inch to facilitate matching connecting ductwork.
10. Duct Temperature Sensors:
 - a. Duct mount sensors shall mount in an electrical box through a hole in the duct and be positioned so as to be easily accessible for repair or replacement.
 - b. The sensors shall be insertion type and constructed as a complete assembly including lock nut and mounting plate.
 - c. For ductwork greater in any dimension than 48 inches or where air temperature stratification exists such as a mixed air plenum, utilize an averaging sensor.
 - d. The sensor shall be mounted to suitable supports using factory approved element holders.
11. Space Sensors:

- a. Shall be mounted per ADA requirements.
 - b. Provide lockable tamper-proof covers in public areas and/or where indicated on the plans.
12. Low Temperature Limit Switches:
- a. Install on the discharge side of the first water coil in the air stream.
 - b. Mount element horizontally across duct in a serpentine pattern insuring each square foot of coil is protected by 1 foot of sensor.
 - c. For large duct areas where the sensing element does not provide full coverage of the air stream, provide additional switches as required to provide full protection of the air stream.
13. Air Differential Pressure Status Switches:
- a. Install with static pressure tips, tubing, fittings, and air filter.
14. Water Differential Pressure Status Switches:
- a. Install with shut off valves for isolation.
 - 1) HVAC Output Devices
 - 2) All output devices shall be installed per the manufacturers recommendation. The mechanical contractor shall install all in-line devices such as control valves, dampers, airflow stations, pressure wells, etc.
 - 3) Actuators: All control actuators shall be sized capable of closing against the maximum system shut-off pressure. The actuator shall modulate in a smooth fashion through the entire stroke. When any pneumatic actuator is sequenced with another device, pilot positioners shall be installed to allow for proper sequencing.
 - 4) Control Dampers: Shall be opposed blade for modulating control of airflow. Parallel blade dampers shall be installed for two position applications.
 - 5) Control Valves: Shall be sized for proper flow control with equal percentage valve plugs. The maximum pressure drop for water applications shall be 5 PSI.
 - 6) Electronic Signal Isolation Transducers: Whenever an analog output signal from the Building Management System is to be connected to an external control system as an input (such as a chiller control panel), or is to receive as an input a signal from a remote system, provide a signal isolation transducer. Signal isolation transducer shall provide ground plane isolation between systems. Signals shall provide optical isolation between systems

3.3 TRAINING

- A. The BMS contractor shall provide the following training services:

1. Provide 40 hours, broke down into 4 hour sessions, covering a minimum of 2 staff shifts, of on-site orientation by a system technician who is fully knowledgeable of the specific installation details of the project. This orientation shall, at a minimum, consist of a review of the project as-built drawings, the BMS software layout and naming conventions, and a walk through of the facility to identify panel and device locations.
2. Provide 1 week of factory training for two people.
3. Provide 20 additional hours of on-site training after one year of facility operation.

3.4 COMMISSIONING

A. Fully commission all aspects of the Building Management System work.

1. Acceptance Check Sheet
 - a. Prepare a check sheet that includes all points for all functions of the BMS as indicated on the point list included in this specification.
 - b. Submit the check sheet to the Engineer for approval
 - c. The Engineer will use the check sheet as the basis for acceptance with the BMS Contractor.
2. VAV box performance verification and documentation:
 - a. The BMS Contractor shall test each VAV box for operation and correct flow. At each step, after a settling time, box air flows and damper positions will be sampled. Following the tests, a pass/fail report indicating results shall be produced. Possible results are Pass, No change in flow between full open and full close, Reverse operation or Maximum flow not achieved. The report shall be submitted as documentation of the installation.
 - b. The BMS Contractor shall issue a report based on a sampling of the VAV calculated loop performance metrics. The report shall indicate performance criteria, include the count of conforming and non-conforming boxes, list the non-conforming boxes along with their performance data, and shall also include graphical representations of performance.
3. Promptly rectify all listed deficiencies and submit to the Engineer that this has been done.

END OF SECTION 23 09 00

SECTION 23 21 13 – HYDRONIC PIPING**PART 1 - GENERAL****SUMMARY**

This Section includes pipe and fitting materials, and joining methods, for the following systems:

1. Heating Water piping.
2. Chilled Water piping.
3. Makeup Water piping.
4. Cooling Coil Condensate Drain piping.

SUBMITTALS

Provide coordination drawings per Division 23 Section "General Mechanical Requirements".

QUALITY ASSURANCE

Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code - Steel."

Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX.

5. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
6. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

ASME Compliance: Comply with ASME B31.9, "Building Services Piping," for materials, products, and installation. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 01.

Grooved mechanical piping systems shall be installed according to grooved manufacturer's installation instructions. All grooved piping products shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as grooved components.

PART 2 - PRODUCTS**PIPING**

For piping 4 inches and smaller: Schedule 40 black steel pipe, furnace-butt welded, continuous welded (ASTM A53, Type F) or Drawn-Temper Copper Tubing (ASTM B 88, Type L).

For piping 5 inches and larger: Schedule 40 black steel pipe, electric-resistance welded (ASTM A53, Type E, Grade B).

PIPE FITTINGS

For Piping 2 Inches and Smaller

1. Steel Pipe:
 - a. Welded Wrought-Steel Fittings (ASTM A234).
 - b. Cast-Iron Threaded Fittings, Class 125 (ASME B16.4).
 - c. Malleable-Iron Threaded Fittings, Class 150 (ASME B16.3).
2. Copper: Welded or Soldered Wrought-Copper (ASME B16.22)

For Piping Larger Than 2 Inches

3. Steel Pipe:
4. Welded Wrought-Steel Fittings (ASTM A234)
5. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings, minimum Class 150 rating (ASME B16.5)
6. Copper: Soldered Wrought-Copper (ASME B16.22)

Grooved Mechanical-Joint Fittings and Couplings

7. Contractors with minimum of 5 installed grooved mechanical-joint systems may use grooved mechanical joint fittings and couplings on roll grooved standard weight Schedule 40 piping 2 inches to 60 inches.
8. Basis-of-Design Product: Subject to compliance with requirements, provide Victaulic grooved mechanical-joint fittings and couplings. If another manufacturer is used with a manufacturer's torque requirement, the contractor shall create a log of the measured torque at every mechanical joint.
9. Grooved End Fittings: Standard fittings shall be cast of ductile iron conforming to ASTM A-536, Grade 65-45-12, forged steel conforming to ASTM A-234, Grade WPB 0.375" wall, or fabricated from Std Wt Carbon Steel pipe conforming to ASTM A-53, Type F, E or S, Grade B. Fittings provided with an alkyd enamel finish or hot dip galvanized to ASTM A-153. Zinc electroplated fittings and couplings conform to ASTM B633. (Fittings 14" and larger shall be supplied with Victaulic factory AGS grooved ends).
10. Couplings 2" through 12": Manufactured in two segments of cast ductile iron, conforming to ASTM A-536, Grade 65-45-12. Gaskets shall be pressure responsive synthetic rubber, grade to suit the intended service, conforming to ASTM D-2000.

- a. Rigid Type: Coupling housings with offsetting, angle-pattern bolt pads shall be used to provide system rigidity and support and hanging in accordance with ANSI B31.1, B31.9 and NFPA 13.
 - 1) Victaulic Style 107N QuickVic®. Installation ready rigid coupling for direct stab installation, without field disassembly. Gasket shall be Grade "EHP" EPDM compound with red color code designed for operating temperatures from -30 Deg F to +250 Deg F.
 - b. Flexible Type: Use in locations where vibration attenuation and stress relief are required. Flexible couplings may be used in lieu of flexible connectors at equipment connections. Three couplings, for each connector, shall be placed in close proximity to the vibration source.
 - 1) Victaulic Style 177 QuickVic®. Installation ready flexible coupling for direct stab installation, without field disassembly. Gasket shall be Grade "EHP" EPDM compound with red color code designed for operating temperatures from -30 Deg F to +250 Deg F.
11. Couplings 14" through 60": Couplings shall consist of two ASTM A-536 ductile iron housing segments with wedge shaped AGS key profile and lead in chamfer.
- a. Rigid Type: Victaulic Style AGS W07. Coupling key designed to fill wedge shaped AGS groove. Gasket shall be Grade "E" EPDM with green color code designed for operating temperatures from -30 Deg F to +230 Deg F.
 - b. Flexible Type: Victaulic Style AGS W77. Coupling key designed to fill wedge shaped AGS groove and allow for linear and angular movement, vibration attenuation, and stress relief. Gasket shall be Grade "E" EPDM with green color code designed for operating temperatures from -30 Deg F to +230 Deg F.
12. Grooved Joints: Assemble joints with coupling and gasket, lubricant, and bolts. Cut or roll grooves in ends of pipe based on pipe and coupling manufacturer's written instructions for pipe wall thickness.
13. Victaulic prefabricated pump drop assemblies, which include check valves, butterfly valves, strainers, suction diffusers, flexible couplings (style 177 or W77), and grooved pipe, may be used in lieu of individual components. Victaulic Series 380, 381, 382.
14. Vic-Headers: Victaulic prefabricated factory-fabricated grooved end header [manifold] all-in-one assembly for fluid distribution. Header shall consist of an ASTM A53, Grade B, standard weight pipe spool with required outlet connections. Grooved ends roll grooved to Victaulic [OGS] [AGS] dimensions, with enamel coating or galvanized to project requirements.

JOINING MATERIALS

Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.

15. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
 - a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
 - b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

Gasket Material: Thickness, material, and type suitable for fluid to be handled and working temperatures and pressures.

Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

Solder Filler Metals (Pipes 2 inches and less): ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

Brazing Filler Metals (Pipes greater than 2 inches): AWS A5.8, BCuP Series, copper-phosphorus alloys for joining copper with copper; or BAg-1, silver alloy for joining copper with bronze or steel.

Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

PART 3 - EXECUTION

PIPING INSTALLATIONS

Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Install piping as indicated without major deviations. Major deviations shall be approved by the Design-Builder on Coordination Drawings prior to installation.

Coordinate the exact location of this work, with the work of other trades prior to fabrication or installation and verify all dimensions and elevations. Provide additional offsets and sections of piping as may be required to meet the applicable job conditions. Coordinate with and review all related drawings of all trades prior to start of work.

Refer to specification section 23 05 00 "General Mechanical Requirements" for HVAC expansion loop fittings.

Main piping shall be run horizontal with no slope. Branch piping shall pitch down back to main piping, uniformly a minimum of one inch in 60 feet.

Provide trapped cooling coil condensation piping from outlets of drain pans of all cooling coils. Pitch all cooling coil condensation piping down a minimum of 1 inch in 30 feet in the direction of flow. Install insect screen at outdoor terminations.

Minimum pipe size shall be 3/4 inch unless noted otherwise.

Provide eccentric fittings and/or eccentric reducing couplings in all cases where air or water pockets would otherwise occur in the main due to reduction in pipe size. Eccentric fittings shall keep the pipes flush on top for water piping and flush on the bottom for condensate or drain piping.

Do not run piping over or within 3 feet of electrical switchgear, panels, or similar equipment.

No piping shall pass through walls at an angle of other than 90 degrees.

No pipe, piping fittings, or coverings shall in any way extend partly into any plastered wall or ceiling.

Install piping concealed in walls, ceilings, webs of columns, or furring where possible, unless otherwise approved by the Design-Builder and except in equipment rooms and service areas.

Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

No piping shall be installed in a manner that will interfere with doorways, door and window operation, ventilation equipment, ductwork, lighting and outlets or other equipment, nor prevent proper vibration isolation or service of equipment or components.

Install all piping in locations and elevations such that coils, tubes, and filters can be removed and replaced without major piping removal.

Install piping to permit valve servicing.

Install piping to allow application of insulation.

Install groups of pipes parallel to each other (where applicable).

If a hole is required after the structure is cast, its location and size shall be approved by the Design-Builder and structural engineer. Core-drill the hole. Maintain the fire integrity of the structure.

All fittings shall be far enough away from plastered surfaces to allow space for installation of escutcheons. Escutcheons must not extend over any irregular parts of the walls, with all voids between piping materials and construction being properly filled in an approved manner. Provide nickel-plated steel escutcheons on all exposed pipes passing through walls, ceiling, floors, and partitions.

Provide unions or flanges of suitable temperature and pressure rating between all dissimilar metals including where copper tubing or components are connected to steel or cast iron piping or components. Unions on copper tubing shall be solder-type, copper-to-copper, up to and including 2-inch pipe size, and flanged 150-pound brass companion flanges for 2-1/2-inch pipe size and above.

Install unions in pipes 2 inch and smaller, adjacent to each valve, at final connections to each piece of equipment, and elsewhere as indicated. Unions are not required on flanged devices.

Install flange or grooved coupling in piping, 2-1/2 inch and larger, at final connections to valves, apparatus, and equipment and elsewhere as indicated.

Install flexible connectors at inlet and discharge connections to pumps (except in-line pumps) and other vibration producing equipment.

Install branch connections to mains using tee fittings in main pipe, with the branch connected to the top of the main pipe. The use of nipples welded directly into piping for branch take-offs will not be permitted.

Install expansion loops, expansion joints, anchors, and pipe alignment guides as indicated on drawings.

Install drains, consisting of a tee fitting, 3/4-inch ball valve, and short 3/4-inch threaded nipple with cap, at low points in piping system mains and elsewhere as required for system drainage.

Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting. Install automatic air vents at high points of system piping in mechanical equipment rooms only.

PIPE JOINT CONSTRUCTION

Join pipe and fittings according to the following requirements.

Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

Soldered Joints: Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook".

Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter.

Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:

1. Align threads at point of assembly.
2. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
3. Assemble joint wrench tight. Wrench on valve shall be on the valve end into which the pipe is being threaded.

4. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.

Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Align flanges surfaces parallel with gasket concentrically positioned. Assemble joints by sequencing bolt tightening to make initial contact of flanges and gaskets as flat and parallel as possible. Use suitable lubricants on bolt threads. Tighten bolts gradually and uniformly using torque wrench.

Grooved Joints: Pipe ends shall be clean and free from indentations, projections and roll marks in the area from pipe end to groove for proper gasket sealing. Install piping in accordance with latest installation instructions. Verify gasket is suitable for intended service. Factory trained representative (direct employee of grooved manufacturer) shall provide on-site training for contractor's field personnel.

SLEEVES

Provide sleeves wherever pipes pass through building construction. Anchor all sleeves to building construction. Size sleeves to permit passage of insulation where insulation is required. Maintain the fire integrity of walls, floors, ceilings, and partitions.

Where pipes pass through foundation walls or footings, provide cast iron sleeve and caulk the space between sleeve and pipe with lead wool, watertight.

Install sleeves in floors perfectly plumb and sleeves in walls level. Center the pipe in the sleeve. Pack sleeves with fire rated materials, per shop drawings, approved submittals, and caulk in tight.

Set sleeves in walls, floor, and foundations during the construction.

Fire Barrier Penetrations: Where pipes pass through fire-rated walls, partitions, ceilings and floors, maintain the fire-rated integrity.

FIELD QUALITY CONTROL

Prepare hydronic piping according to ASME B31.9 and as follows:

5. Leave joints, including welds, uninsulated and exposed for examination during test.
6. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
7. Flush hydronic piping systems with clean water; then remove and clean or replace strainer screens.

8. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
9. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

Perform the following tests on hydronic piping:

10. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
11. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
12. Isolate expansion tanks and determine that hydronic system is full of water.
13. Subject piping system to hydrostatic test pressure that is not less than 125 psi for a length of 6 hours. No pressure drop shall occur over this duration. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
14. After hydrostatic test pressure has been applied, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
15. Prepare written report of testing.

Perform the following before operating the hydronic system:

16. Open manual valves fully.
17. Inspect pumps for proper rotation.
18. Set makeup pressure-reducing valves for required system pressure.
19. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
20. Set temperature controls so all coils are calling for full flow.
21. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
22. Verify lubrication of motors and bearings.

CLEANING

At completion of project, thoroughly flush each of the various HVAC hydronic circulating systems with a cleaning solution as recommended by the chemical supplier so as to remove any oil, rust, dirt, scale, or grease that may be present.

Utilize water treatment provider's instructions to clean system. Drain and rinse systems completely with clean water, and clean all screens and strainers.

After cleaning is complete, drain system and rinse with fresh water. The chemical supplier shall test and check drain water for pH level and condition.

Submit report to the Engineer on condition and finalized method of chemical treatment recommended by the chemical supplier and utilized for this project.

If drain water indicates an acid level, neutralize the system with an alkaline-type material as recommended by the chemical supplier and reflush entire system.

END OF SECTION 23 21 13

SECTION 23 21 23 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Close-coupled, in-line centrifugal pumps.
2. Separately coupled, vertically mounted, in-line centrifugal pumps.
3. Automatic condensate pump units.

1.2 DEFINITIONS

- A. ECM: Electronically commutated motor.
- B. EPDM: Ethylene propylene diene monomer.
- C. FKM: Fluoroelastomer polymer.
- D. HI: Hydraulic Institute.
- E. NBR: Nitrile rubber or Buna-N.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of pump.
- B. Shop Drawings: For each pump.
- C. Delegated Design Submittals: For each pump.
 1. Include design calculations for selecting vibration isolators and for designing vibration isolation bases.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans, or BIM model, drawn to scale, showing the items described in this Section, and coordinated with all building trades.
- B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 CLOSE-COUPLED, IN-LINE CENTRIFUGAL PUMPS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Armstrong Fluid Technology.
 - 2. Bell & Gossett; a Xylem brand.
 - 3. Taco Comfort Solutions.
- B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, close-coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally or vertically.
- C. Pump Construction:
 - 1. Casing: Radially split, cast iron, with threaded gauge tappings at inlet and outlet and threaded companion-flangeconnections.
 - 2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For constant-speed pumps, trim impeller to match specified performance.
 - 3. Pump Shaft Sleeve: Type 304 stainless steel.
 - 4. Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless steel spring, and NBR rubber bellows and gasket. Include water slinger on shaft between motor and seal.
 - 5. Seal Flushing: Flush, cool, and lubricate pump seal by directing pump discharge water to flow over the seal.
- D. Motor: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230500 "General Mechanical Requirements."
 - 1. Enclosure : Totally enclosed, fan cooled.
 - 2. NEMA Premium Efficient motors as defined in NEMA MG 1.
 - 3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.

4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
5. Variable-speed motor.
6. Provide integral pump motor variable-speed controller.

2.3 SEPARATELY COUPLED, VERTICALLY MOUNTED, IN-LINE CENTRIFUGAL PUMPS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Armstrong Fluid Technology.
 2. Bell & Gossett; a Xylem brand.
 3. Taco Comfort Solutions.
- B. Description: Factory-assembled and -tested, centrifugal, overhung-impeller, separately coupled, in-line pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted vertically.
- C. Pump Construction:
 1. Casing: Radially split, cast iron, with threaded gauge tappings at inlet and outlet and threaded companion-flange connections.
 2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw. For pumps that are not frequency-drive controlled, trim impeller to match specified performance.
 3. Pump Shaft: Type 316 stainless steel.
 4. Seal: Mechanical seal consisting of carbon rotating ring against a ceramic seat held by a stainless steel spring, and NBR bellows and gasket.
- D. Shaft Coupling: Molded-rubber insert with interlocking spider capable of absorbing vibration.
- E. Motor: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230500 "General Mechanical Requirements."
 1. Enclosure: Totally enclosed, fan cooled.
 2. NEMA Premium Efficient motors as defined in NEMA MG 1.
 3. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
 4. Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 5. Variable-speed motor.
 6. Provide integral pump motor variable-speed controller.

2.4 AUTOMATIC CONDENSATE PUMP UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Refco Manufacturing (US) Inc.
 2. Bell & Gossett; a Xylem brand.
 3. GRUNDFOS CBS Inc.
 4. Little Giant; a brand of Franklin Electric Co., Inc.
- B. Description: Packaged units with corrosion-resistant pump, plastic tank with cover, and automatic controls. Collects and removes condensate from fan coil units, air handling units, condensing boilers, and similar components. Include factory- or field-installed check valve and 72-inch-minimum, electrical power cord with plug.

2.5 PUMP SPECIALTY FITTINGS

- A. Suction Diffuser:
1. Angle pattern.
 2. 175-psig pressure rating, ductile-iron body and end cap, pump-inlet fitting.
 3. Bronze 16-mesh wire startup and Type 304 stainless steel permanent strainers with 3/16-inch.
 4. Type 304 stainless steel straightening vanes.
 5. Drain plug.
 6. Factory-fabricated support.
- B. Triple-Duty Valve:
1. Angle or straight pattern.
 2. 175-psig pressure rating, ductile-iron body, pump-discharge fitting.
 3. Valve with multi-turn stem and memory stop to allow valve to be returned to its original position after shutoff.
 4. Brass valve disc with EPDM rubber seat.
 5. Type 304 stainless steel valve stem.
 6. Drain plug and bronze-fitted shutoff, balancing, and check valve features.
 7. Brass gauge ports with integral check valve and orifice for flow measurement.

PART 3 - EXECUTION

3.1 PUMP INSTALLATION

- A. Comply with HI 1.4.
- B. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.

- C. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.
- D. Automatic Condensate Pump Units: Install units for collecting condensate and extend to open drain.
- E. Equipment Mounting:
 - 1. Install base-mounted pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - 2. Comply with requirements for vibration isolation and seismic-control devices specified in Section 230548 "Vibration Control for HVAC Piping and Equipment."

3.2 ALIGNMENT

- A. Engage a factory-authorized service representative to perform alignment service.
- B. Comply with requirements in HI standards for alignment of pump and motor shaft. Add shims to the motor feet and bolt motor to base frame. Do not use grout between motor feet and base frame.
- C. Comply with pump and coupling manufacturers' written instructions.
- D. After alignment is correct, tighten foundation bolts evenly but not too firmly. Completely fill baseplate with nonshrink, nonmetallic grout while metal blocks and shims or wedges are in place. After grout has cured, fully tighten foundation bolts.

3.3 PIPING CONNECTIONS

- A. Comply with requirements for piping specified in Section 23 21 13 "Hydronic Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where installing piping adjacent to pump, allow space for service and maintenance.
- C. Connect piping to pumps. Install valves that are same size as piping connected to pumps.
- D. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.
- E. Install triple-duty valve on discharge side of pumps.
- F. Install suction diffuser and shutoff valve on suction side of pumps.
 - 1. Use startup strainer for initial system startup. Install permanent strainer element before turnover of system to Owner.
- G. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

- H. Install pressure gauges on pump suction and discharge or at integral pressure-gauge tapping, or install single gauge with multiple-input selector valve.
- I. Install check valve on each condensate pump unit discharge unless unit has a factory-installed check valve.

3.4 ELECTRICAL CONNECTIONS

- A. Connect wiring in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- B. Ground equipment in accordance with Section 260526 "Grounding and Bonding for Electrical Systems."
- C. Install electrical devices furnished by manufacturer, but not factory mounted, in accordance with NFPA 70 and NECA 1.
- D. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
 - 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."

3.5 CONTROL CONNECTIONS

- A. Install control and electrical power wiring to field-mounted control devices.
- B. Connect control wiring in accordance with Section 260523 "Control-Voltage Electrical Power Cables."

3.6 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks in accordance with manufacturer's written instructions.
 - 2. Check piping connections for tightness.
 - 3. Clean strainers on suction piping. Use startup strainer for initial startup.
 - 4. Perform the following startup checks for each pump before starting:
 - a. Verify bearing lubrication.
 - b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
 - c. Verify that pump is rotating in correct direction.
 - 5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
 - 6. Start motor.

7. Open discharge valve slowly.

3.7 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Hydronic pumps will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain hydronic pumps.

END OF SECTION 23 21 23

SECTION 23 23 00 – REFRIGERANT PIPING

PART 1 - GENERAL

REFERENCE

All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

DESCRIPTION

Work Included

1. Furnish all labor, materials, tools, equipment, and services for the refrigeration piping system as indicated, in accordance with provisions of the Contract Documents.
2. Completely coordinate with work of all other trades.
3. Although such work is not specifically indicated, furnish and install all supplementary or miscellaneous items, appurtenances and devices incidental to or necessary for a sound, secure and complete installation.

Refrigeration Piping System

4. Refrigeration piping.
5. Refrigeration valves.
6. Refrigeration specialties.

QUALITY ASSURANCE

Qualify brazing processes and brazing operators in accordance with ASME, "Boiler and Pressure Vessel Code," Section IX, "Welding & Brazing Qualifications."

Regulatory Requirements: Comply with provisions of the following codes:

7. ANSI B31.5: ASME Code for Pressure Piping -- Refrigerant Piping.
8. ANSI/ASHRAE Standard 15: Safety Code for Mechanical Refrigeration.
9. International Mechanical Code.

SUBMITTALS

Shop Drawings: Drawings showing layout of refrigerant piping, specialties and fittings, including, but not limited to, pipe and tube sizes, valve arrangements and locations, slopes of horizontal runs, wall and floor penetrations, and equipment connection details. Before any site work begins, selection data must be submitted to the Engineer showing the refrigerant line loss with the actual condensing unit and coil at condition

shown on the schedule sheet of the bid set for all conditions listed on the schedule sheet as well as the manufacturer's recommended DX piping diagram and specialties. Note areas where underground piping enters and leaves underslab conduit.

Product Data: Refrigerant pipe "type".

Samples: Not required for review.

Project Information: Not required for review.

Contract Close-Out Information

10. Brazers' certificates signed by Contractor certifying that Brazers comply with requirements specified under "Quality Assurance" above.
11. Test result reports.
12. Maintenance data for refrigerant valves and piping specialties, for inclusion in Operating & Maintenance Manuals.

PART 2 - PRODUCTS

MANUFACTURERS

Subject to compliance with requirements, provide products of one of the following:

1. Refrigerant Valves and Specialties
 - a. Emerson Climate Technologies.
 - b. Danfoss.
 - c. Henry Technologies.
 - d. Parker-Hannifin Corp.
 - e. Sporlan Valve Co.

PIPE AND FITTINGS

Refrigerant Piping: Copper, dehydrated, with high-temperature soldered joints and wrought copper (400 psig) fittings.

2. For Underground Use: Type K without joints.
3. For Above-Ground Use: Type L, or type ACR with wrought copper fittings and brazed joints. Mechanical fittings (crimp or flare) are not permitted.
4. If other than Type ACR tubing is used, clean and protect inside of tubing as specified in "Cleaning" section.

For field assembled units, size refrigeration lines according to manufacturer's published tables using pressure or temperature drops as follows:

5. Suction Lines: 2 deg F.
6. Liquid Lines: 1 deg F or 2 psi.
7. Hot Gas Lines: 1deg F or 3.6 psi.

8. Size discharge and hot gas risers for positive oil return to compressors.

Hangers: As specified in Division 23 Section "Hangers and Supports for HVAC Piping and Supports".

9. Install hangers over outside of insulation.
10. Use copper or cadmium-plated hangers when in direct contact with copper lines.

SPECIALTIES

Moisture Indicator: Show presence of moisture in system by change of color.

11. Install adjacent to filter.
12. In bypass line use Sporlan SA-12S.

Strainers: Design to permit removing screen without removing strainer from piping system.

13. Provide with screens of not larger than 80 mesh.
14. Provide strainers on liquid line serving each thermostatic expansion valve and in suction line serving each refrigerant compressor not equipped with integral strainer.

Oil Traps: Provide in lines as required.

VALVES

All Valves: All bronze.

15. In Lines 2 Inches and Less: Solder ends.
16. In Lines 3 Inches and Over: Four bolt union ends.

Shut Off Valves: Packed type with gas-tight cap seal and hard metal seats and shoulders which permit packing stuffing boxes wide open under pressure, or sealed diaphragm type.

17. Wheel, globe, angle or "T" handle.

Check Valves

18. In Liquid Lines 5/8 inch and Less: Lift check type.
19. In Lines 3/4 inch-2 inch: Swing check type.
20. In Lines 3 inches and Over: Wafer-type swing check with bronze disc.

Expansion Valves: Sized by manufacturer for refrigerant used.

21. Provide one in each circuit with liquid distribution connection immediately.

Vent and Test Valves: Angle cap type with seal and outlet caps.

Install pressure regulating and relief valves as required by ASHRAE Standard 15.

PART 3 - EXECUTION

CLEANING

Before installation of copper tubing other than Type ACR tubing, clean the tubing and fitting using following cleaning procedure:

1. Remove coarse particles of dirt and dust by drawing a clean, lintless cloth through the tubing by means of a wire or an electrician's tape.
2. Draw a clean, lintless cloth saturated with trichloroethylene through the tube or pipe. Continue this procedure until cloth is not discolored by dirt.
3. Draw a clean, lintless cloth saturated with compressor oil, squeezed dry, through the tube or pipe to remove remaining lint. Inspect tube or pipe visually for remaining dirt and lint.
4. Finally, draw a clean, dry lintless cloth through the tube or pipe.

PIPING INSTALLATION

General: Install refrigerant piping in accordance with ASHRAE Standard 15 -- "The Safety Code for Mechanical Refrigeration."

Install piping for minimum number of joints using as few elbows and other fitting as possible.

Arrange piping to allow normal inspection and servicing of compressor and other equipment. Install valves and specialties in accessible locations to allow for servicing and inspection.

Provide adequate clearance between pipe and adjacent walls and hanger, or between pipes for insulation installation. Use sleeves through floors, walls, or ceilings, sized to permit installation of full thickness insulation.

Insulate suction lines. Liquid lines are not required to be insulated, except where they are installed adjacent and clamped to suction lines, where both liquid and suction lines shall be insulated as a unit.

5. Do not install insulation until system testing has been completed and all leaks have been eliminated.

Install branch tie-in lines to parallel compressors equal length, and pipe identically and symmetrically.

Install seamless soft copper tubing in straight length in underground conduit as shown.

6. Install traps and double risers as required to entrain oil in vertical runs.
7. Liquid lines may be installed level.

Use fittings for all changes in direction and all branch connections.

Install exposed piping at right angles or parallel to building walls. Diagonal runs are not permitted, unless expressly indicated.

Install piping free of sags or bends and with ample space between piping to permit proper insulation applications.

Conceal all pipe installations in walls, pipe chases, utility spaces, above ceilings, below grade or floors, unless indicated to be exposed to view.

Install piping tight to slabs, beams, joists, columns, walls, and other permanent elements of the building. Provide space to permit insulation applications, with 1 inch clearance outside the insulation. Allow sufficient space above removable ceiling panels to allow for panel removal.

Locate groups of pipe parallel to each other, spaced to permit applying insulation and servicing of valves.

Exterior Wall Penetrations: Seal pipe penetrations through exterior walls using sleeves and mechanical sleeve seals. Pipe sleeves smaller than 6" shall be steel; pipe sleeves 6 inches and larger shall be sheet metal.

Fire Barrier Penetrations: Where pipes pass through fire-rated walls, partitions, ceilings, and floors, maintain the fire-rated integrity.

Make reductions in pipe sizes using eccentric reducer fittings installed with the level side down.

Install strainers immediately ahead of each expansion valve, solenoid valve, hot gas bypass valve, compressor suction valve, and as required to protect refrigerant piping system components.

Install moisture/liquid indicators in liquid lines between filter/driers and thermostatic expansion valves and in liquid line to receiver.

8. Install moisture/liquid indicators in lines larger than 2-1/8-inch OD, using a bypass line.

Install unions to allow removal of solenoid valves, pressure regulating valves, expansion valves, and at connections to compressors and evaporators.

Install flexible connectors at the inlet and discharge connection of compressors.

PIPE JOINT CONSTRUCTION

Brazed Joints: Comply with the procedures contained in the AWS "Brazing Manual."

9. **WARNING:** Some filler metals contain compounds which produce highly toxic fumes when heated. Avoid breathing fumes. Provide adequate ventilation.
10. **CAUTION:** When solenoid valves are being installed, remove the coil to prevent damage. When sight glasses are being installed, remove the glass. Remove stems, seats, and packing of valves, and accessible internal parts of refrigerant

specialties before brazing. Do not apply heat near the bulb of the expansion valve.

During brazing fill the pipe and fittings with an inert gas (i.e., nitrogen or carbon dioxide) to prevent formation of scale.

Heat joints using oxy-acetylene torch. Heat to proper and uniform brazing temperature.

EQUIPMENT CONNECTIONS

The Drawings indicate the general arrangement of piping, fittings, and specialties.

Install piping adjacent to machine to allow servicing and maintenance.

All suction piping not completely concealed underslab or in ceiling cavities shall be rigidly mounted, insulated and covered with PVC jackets.

TESTING

Inspect, test, and perform corrective action for refrigerant piping in accordance with ASME Code B31.5, Chapter VI.

Preparation for Testing: Prepare piping in accordance with ASME B31.9 and as follows:

11. Leave joints, including welds, un-insulated and exposed for examination during the test.
12. Provide temporary restraints for expansion joints which cannot sustain the reactions due to test pressure. If temporary restraints are not practical, isolate expansion joints from testing.
13. Isolate equipment that is not to be subjected to the test pressure of the piping. If a valve is used to isolate the equipment, its closure shall be capable of sealing against the test pressure without damage to the valve. Flanged joints at which blinds are inserted to isolate equipment need not be tested.
14. Install relief valve set at a pressure to protect against damage by expansion of liquid or other source of overpressure during the test.

Testing Procedure

15. Use ambient temperature water as the testing medium, except where there is a risk of damage due to freezing. Another liquid may be used, if it is safe for workmen and compatible with the piping system components.
16. Use vents installed at high points in the system to release trapped air while filling the system. Use drains installed at low points for complete removal of that liquid.
17. Examine system to see that equipment and parts that cannot withstand test pressures are properly isolated. Examine test equipment to ensure that it is tight and that low pressure filling lines are disconnected.
18. All hydrostatic pressure shall be held for a minimum of 6 hours without a loss of pressure.

- 19. All gravity test shall be held long enough to visually inspect each joint with no visible loss of water for 15 minutes.
- 20. Air test will be held for a minimum of 2 hours without loss of pressure.
- 21. Any visible leakage or appreciable pressure drop during the test will be cause for rejection of the test. Additional tests will be required after corrective measures have been taken until satisfactory results are obtained.

Testing Requirements

Pipe Leak Testing		
Type of Pipe	Pressure Requirement	Minimum Test Duration
Refrigerant - High side	275 psig dry nitrogen	24 hours
Refrigerant - Low side	150 psig dry nitrogen	24 hours
All other piping test method determined by Superintendent		
* All sewers and drains shall not have more than 100 gallons per inch of nominal diameter per mile of length of either infiltration or exfiltration or as required by USEPA construction requirements under the clean water act.		

Testing Records

- 22. A signed and dated affidavit of testing shall be provided to the Superintendent within 72 hours of completion of testing.
- 23. Each affidavit shall contain, at a minimum, the testing date, testing start and end time (duration of testing), system or subsystem tested, test medium and pressure, test results, name and signature of individual performing test, name and signature of test witness and whether the portion of pipe tested meets state and local regulations and Purdue requirements for leaking.
- 24. Copies of all affidavits shall be included in the Operation and Maintenance Manuals.

ADJUSTING AND CLEANING

Verify actual evaporator applications and operating conditions, and adjust thermostatic expansion valve to obtain proper evaporator superheat requirements.

Clean and inspect refrigerant piping systems as recommended by equipment manufacturer.

Adjust controls and safeties. Replace damaged or malfunctioning controls and equipment with new materials and products.

COMMISSIONING

Charge system using the following procedure:

- 25. Install core in filter dryer after leak test but before evacuation.

26. Evacuate refrigerant system with vacuum pumps; until temperature of 35 deg F is indicated on vacuum dehydration indicator.
27. During evacuation, apply heat to pockets, elbows, and low spots in piping.
28. Maintain vacuum on system for minimum of 5 hours after closing valve between vacuum pump and system.
29. Break vacuum with refrigerant gas, and allow pressure to build up to 2 psi.
30. Complete charging of system, using new filter dryer core in charging line. Provide full operating charge.

Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing, and preventative maintenance of refrigerant piping valves and refrigerant piping specialties.

Review data in Operating and Maintenance Manuals. Refer to Division 01 Section "Project Closeout".

Schedule training with Owner through the Design-Builder, with at least 7 days' advance notice.

END OF SECTION 23 23 00

SECTION 23 25 00 – HVAC WATER TREATMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. This Section includes the following HVAC water-treatment systems:
 - 1. HVAC water-treatment chemicals.

1.3 DEFINITIONS

- A. EEPROM: Electrically erasable, programmable read-only memory.
- B. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.

1.4 PERFORMANCE REQUIREMENTS

- A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or the environment.
- B. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.
- C. Closed hydronic systems, including chilled water cooling and heating hot water, shall have the following water qualities:
 - 1. pH: Maintain a value within 9.0 to 10.5.
 - 2. "P" Alkalinity: Maintain a value within 100 to 500 ppm.
 - 3. Boron: Maintain a value within 100 to 200 ppm.
 - 4. Chemical Oxygen Demand: Maintain a maximum value of 100 ppm.
 - 5. Soluble Copper: Maintain a maximum value of 0.20 ppm.
 - 6. TDS: Maintain a maximum value of 10 ppm.
 - 7. Ammonia: Maintain a maximum value of 20 ppm.
 - 8. Free Caustic Alkalinity: Maintain a maximum value of 20 ppm.
 - 9. Microbiological Limits:

- a. Total Aerobic Plate Count: Maintain a maximum value of 1000 organisms/ml.
- b. Total Anaerobic Plate Count: Maintain a maximum value of 100 organisms/ml.
- c. Nitrate Reducers: Maintain a maximum value of 100 organisms/ml.
- d. Sulfate Reducers: Maintain a maximum value of 0 organisms/ml.
- e. Iron Bacteria: Maintain a maximum value of 0 organisms/ml.

1.5 ACTION SUBMITTALS

- A. Product Data: Include rated capacities, operating characteristics, furnished specialties, and accessories for the following products:
 1. Chemical material safety data sheets.
- B. Shop Drawings: Pretreatment and chemical treatment plan

1.6 INFORMATIONAL SUBMITTALS

- A. Field quality-control test reports.
- B. Other Informational Submittals:
 1. Water-Treatment Program: Written sequence of operation on an annual basis for the application equipment required to achieve water quality defined in the "Performance Requirements" Article above.
 2. Water Analysis: Illustrate water quality available at Project site.

1.7 QUALITY ASSURANCE

- A. HVAC Water-Treatment Service Provider Qualifications: An experienced HVAC water-treatment service provider capable of analyzing water qualities, installing water-treatment equipment, and applying water treatment as specified in this Section.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.8 MAINTENANCE SERVICE

- A. Scope of Maintenance Service: Provide chemicals and service program to maintain water conditions required above to inhibit corrosion, scale formation, and biological growth for cooling, chilled-water piping, heating hot water piping and equipment. Services and chemicals shall be provided for a period of one year from date of Substantial Completion, and shall include the following:
 1. Initial water analysis and HVAC water-treatment recommendations.

2. Startup assistance for Contractor to flush the systems, clean with detergents, and initially fill systems with required chemical treatment prior to operation.
3. Periodic field service and consultation.
4. Customer report charts and log sheets.
5. Laboratory technical analysis.
6. Analyses and reports of all chemical items concerning safety and compliance with government regulations.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. US Water Services
 2. Barclay Chemical Co.; Water Management, Inc.
 3. GE Betz.
 4. GE Osmonics.
 5. H-O-H Chemicals, Inc.
 6. Watcon, Inc.

2.2 CHEMICALS

- A. Chemicals shall be as recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment, and that can attain water quality specified in Part 1 "Performance Requirements" Article.

PART 3 - EXECUTION

3.1 WATER ANALYSIS

- A. Perform an analysis of supply water to determine quality of water available at Project site.

3.2 FIELD QUALITY CONTROL

- A. Perform tests and inspections and prepare test reports.
 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

- B. At eight-week intervals following Substantial Completion, perform separate water analyses on hydronic systems to show that automatic chemical-feed systems are maintaining water quality within performance requirements specified in this Section. Submit written reports of water analysis advising Design-Builder of changes necessary to adhere to Part 1 "Performance Requirements" Article.
- C. Comply with ASTM D 3370 and with the following standards:
 - 1. Silica: ASTM D 859.
 - 2. Steam System: ASTM D 1066.
 - 3. Acidity and Alkalinity: ASTM D 1067.
 - 4. Iron: ASTM D 1068.
 - 5. Water Hardness: ASTM D 1126.

3.3 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain HVAC water-treatment systems and equipment. Refer to Division 01 Section "Demonstration and Training."
- B. Training: Provide a "how-to-use" self-contained breathing apparatus video that details exact operating procedures of equipment.

END OF SECTION 23 25 00

SECTION 23 30 00 – DUCTWORK AND ACCESSORIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION

A. Description of Systems

1. Ductwork, fittings, and accessories.
2. Access doors.
3. Dampers.
4. Combination fire/smoke dampers.
5. Diffusers, registers and grilles.
6. Pressure relief doors.
7. Louver blank-off panels.
8. Acoustical pipe lagging.
9. Duct elbow silencers.
10. Duct leakage testing.

B. Work Installed But Not Furnished

1. Automatic dampers and operators. See Division 23 Section "Controls and Instrumentation".
2. Duct-mounted smoke detectors. See Division 26.

C. Definitions

1. Gage
2. Steel sheet and wire: U.S. Standard gage
 - a. Aluminum sheet: Browne & Sharpe Gage
 - b. Steel wire: Washburn and Moen Gage
3. Concealed Insulated Surfaces: Piping, ductwork and equipment in walls, partitions, floors, pipe chases, pipe shafts, duct shafts, sealed alleyways, and above suspended ceilings.
4. Exposed Insulated Surfaces: Piping, ductwork and equipment located in mechanical rooms, tunnels and rooms without suspended ceilings.

D. Drawings show tentative arrangement of partitions, diffusers and lights.

1. Owner reserves right to rearrange rooms, lights, and diffusers prior to actual installation to suit his needs.

2. Final location of diffusers, registers and grilles shall be from architectural reflected ceiling plans.

1.3 QUALITY ASSURANCE

A. Design and Installation Standards

1. ASHRAE Hand Book – HVAC Systems and Equipment, current chapter on duct construction.
2. ADC Standard 1062: GRD-84, Test Code for Grilles, Registers and Diffusers.
3. ADC Test Code FD 72-R1, Flexible Air Duct Test Code.
4. AMCA Standard 210, Test Code.
5. ASHRAE Standard 70, Method of Testing for Rating Fans for rating performance of Outlets and Inlets.
6. SMACNA HVAC Duct Construction Standard - Metal and Flexible, Third Edition, 2009. [NO EXCEPTIONS]
7. NFPA 90-A, Standard for the Installation of Air Conditioning and Ventilating Systems.
8. International Mechanical Code.
9. ASTM C1071: Microbial growth resistant coatings.

B. Fire and Smoke Rating Test Standards

1. ASTM E84, NFPA 255, and UL 723.

1.4 SUBMITTALS

A. Shop Drawings

1. Ductwork layout at 1/4-inch to 1-foot scale.
2. Indicate dimensions, elevations, clearances, etc.
3. Indicate all equipment, transitions, and fittings to scale.
4. Provide equipment connection details and ductwork support details.
5. Drawings shall be fully coordinated with the work of all other Trades.
6. Any interference that cannot be resolved between the various Trades shall be clearly identified on the Drawings.
7. Contractor shall not fabricate or install ductwork or equipment without approved Shop Drawings.

B. Product Data

1. All product items specified.
2. Manufacturer's literature and performance data.

C. Samples: Not required for review.

D. Reference Submittals: Not required for review.

E. Contract Closeout Information

1. Operating and maintenance data.
2. Test, Adjust and balance reports.
3. “As-Built” drawings.
4. Warranties.

1.5 JOB CONDITIONS

- A. Coordinate the exact location of this work with the work of other trades prior to fabrication and installation. Verify all dimensions and elevations. Provide additional offsets and section of ductwork as required to meet job conditions. Coordinate with and review all related Drawings of all trades prior to start of work.
- B. See requirements of Division 23 Section “General Mechanical Requirements”.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

- A. Ductwork: McGill Airflow LLC; Semco, Sheet Metal Products Co.; Tangent Air; Monroe Metal Manufacturing Co.; Spiral-Air; Regional Sheetmetal Manufacturing, LLC and Lindab USA.
- B. Duct Sealer: Durkee-Atwood; Hardcast Inc.; McGill Airseal LLC; Foster Products Division; HB Fuller; and Ductmate.
- C. Duct Sealing Tape: Durkee-Atwood; Hardcast Inc.; and McGill Airseal LLC.
- D. Turning Vanes: Aero-Dyne; Airsan; Hart & Cooley; Titus; Vent Products Co.; and Ductmate.
- E. Duct fittings: Buckley, Flexmaster USA, Ins, McGill Air Flow LLC, ACME Mfg.
- F. Flexible Fan Connections: Base: Duro-Dyne; Elgin; Ventfabrics; and Ductmate.
- G. Flexible Duct: Acme Manufacturing Co.; Flexmaster USA, Inc.; Clevepak Corp.; Clevaflex Division; General Flex Corp.; Flexible Technologies, Automation Industries, Inc.; Flexible Systems Group.
- H. Fabric Ductwork (and Accessories): Duct Sox; Fabricair; Q-Sox; approved equivalent.
- I. Access Doors: Advanced Air, Inc.; Air Balance Inc.; Air Dynamics, Inc.; Greenheck; Prefco Products, Inc.; Ruskin; McGill Airflow LLC; Ventfabrics; Zurn Industries, Inc.; and Ductmate.
- J. Manual Dampers: Air Balance, Inc.; Greenheck; Krueger; Pottorff; Prefco Products Inc.; Ruskin Manufacturing Co.; McGill Airflow LLC and Safe-Air Inc.
- K. Backdraft Dampers: Air Balance, Inc.; Greenheck; Cesco; Pottorff; Prefco Products Inc.; Ruskin Manufacturing Co.; and Safe-Air Inc.

- L. Fire and Combination Fire/Smoke Dampers: Pottorff; Greenheck; Air Balance, Inc.; Ruskin Manufacturing Co.; Arrow United Industries, Inc.; Prefco Products; Safe-Air Inc.
- M. Diffusers, Registers, and Grilles: Anemostat; Krueger; Titus; and Price.
- N. Pressure Relief Doors: Ruskin, Green Heck, Pottorff, KEES, AJ Manufacturing, Inc.

2.2 MATERIALS—GENERAL

A. Sheet Metal

- 1. Galvanized Steel: ASTM A93, A924, A653, F.S. QQ-I-716

B. Duct Sealer

- 1. NFPA rating of "Non-Combustible."
- 2. Flame Spread Rating: 25 or lower, in dry condition.
- 3. Smoke Developed Rating: 50 or lower, in dry condition.
- 4. Resistant to water and water vapors.
- 5. Pressure Rupture Rating: 16-in. water gauge, minimum.
- 6. Durkee-Atwood, Permatite Class I; Hardcast 601; or United McGill, Uni-Grip Duct Sealer.

C. Flexible Ducts

- 1. UL 181, 191
- 2. NFPA 90A and 90B

D. Solder: ASTM B23, Grade 50B or F.S. QQ-S-571, Composition Sn50.

E. Duct Sealing Tape

- 1. NFPA rating of "Non-Combustible."
- 2. Flame Spread Rating: 25 or lower, in dry condition.
- 3. Smoke Developed Rating: 50 or lower, in dry condition.
- 4. Adhesive: Specifically compounded for adhesion to galvanize and stainless steel.
- 5. Tape to be UL listed.

F. RTV Foam: UL-listed room temperature vulcanized silicone rubber foam.

G. Acoustical Duct Liner (Transfer air only)

- 1. Knauf, Certain Teed Corp., Owens-Corning, Manville or Manson.

2.3 DUCTWORK, FITTINGS, AND ACCESSORIES

A. Ductwork - General

- 1. Constructed of galvanized steel sheet.

- a. Maintain full areas and suitable shapes at all points.
 - b. Shapes may be changed to fit unusual space conditions.
 - c. Provide all necessary transitions and offsets to complete systems.
 2. Each duct system shall be constructed for the specific external static pressures shown on the Contract Drawings.
- B. Ductwork, under 4 in wg (water gauge), Sheet Metal
 1. Ductwork includes but is not limited to:
 - a. All ductwork on outlet side of air terminal units and air pressure reducing valves.
 - b. Parts of return, exhaust and relief air ductwork as indicated.
 2. Construct in accord with SMACNA HVAC Duct Construction Standard as follows:
 - a. Rectangular duct: Table 2-5 or 2-19, positive or negative.
 - b. Round duct: 10 in wg static pressure Table 3-5, positive or Table 3-13 negative.
 - c. Round ducts shall be spiral seam.
 3. For all ducts with longest side 24 inches and over: Construct using the Ductmate, Nexus, Quicduc, SMACNA T-24 flange, or Pyramid-Lok duct connection systems.
 - a. Seal flanged ends with pressure-sensitive, high-density, closed-cell neoprene or polyurethane tape gasket, "Tremco 440", or butyl gasket.
 - b. For smaller duct sizes (longest side 23 inches or less): Above systems are optional.
 4. Seal all ducts based on external static pressures. For external static pressures below 1.5 in wg seal to meet SMACNA Seal Class B for 2 in wg as a minimum. For external static pressures below 4 in wg seal to meet SMACNA Seal Class A for 10 in wg as a minimum.
 5. Runouts to Diffusers, Register and Grilles: May use flexible ducts.
 - a. Exception: Flexible ducts may not pass through smoke or fire-rated walls, floors, or ceilings.
 - b. Maximum flexible duct length: 5 ft.
 - c. Minimum turning radius: As recommended by manufacturer.
- C. Ductwork, 4-inch wg and Over
 1. Ductwork includes:
 - a. All supply ductwork from air handling unit discharge to connection with air terminal units and air pressure reducing valves.
 - b. Rectangular supply, return, and exhaust duct operating in (positive or negative) pressure.

2. Construct in accordance with SMACNA HVAC Duct Construction Standard as follows:
 - a. Rectangular duct: Table 2-7 or 2-21, 10 in wg static pressure, positive or negative.
 - b. Round duct: Table 3-5 10 in wg positive static pressure. Table 3-13, 10 in wg negative static pressure.
 - c. Flat oval duct: Table 3-15, 10 in wg static pressure.
 - d. Round and flat oval ducts to be spiral lockseam constructed.
3. Runouts to Air Terminal Units: Rigid or flexible ductwork.
 - a. Exception: Flexible ducts may not pass through smoke or fire-rated walls, floors, or ceilings.
 - b. Maximum flexible duct length: 3 feet.
 - c. Minimum turning radius: As recommended by manufacturer.
4. Seal all ducts to seal Class A requirements.

D. Aluminum Ductwork

1. Use aluminum ductwork for systems as noted on drawings.
2. Construct in accordance with SMACNA HVAC Duct Construction Standard as follows:
 - a. Type 3003-H14, conforming to ASTM B-209.
 - b. Use Table 2-50 to convert galvanized steel gauges required in paragraphs above, to comparable aluminum thicknesses.
 - c. Use Table 2-51 and Table 2-52 and notes for how to adapt the steel duct reinforcement required in paragraphs above, to comparable aluminum reinforcement.
3. Duct joints shall be all-soldered construction.
4. Provide only fasteners, hangers, turning vanes, access doors, taps, fittings, dampers, insulation, supports, reinforcing, and accessories that are fully compatible with aluminum.

E. Duct Hangers and Supports

1. In accordance with the following:
 - a. Ductwork (Sheet Metal): SMACNA HVAC Duct Construction Standard, Chapter 5.

F. Duct Fitting and Joints under 4-Inch wg

1. Radius Elbows Without Vanes: Radius ratio (R/W) of 1.5 and greater.
 - a. Radius ratio (R/W) less than 1.5 are not allowed.

2. Where square throat elbows are indicated or required, provide with turning vanes.
3. Connections to Diffusers, Grilles and Registers: Fitted securely to necks or collars provided behind diffuser, grille, or register face area.
4. Branch Connections
 - a. Round: Factory-built bellmouth-type with locking quadrant damper.
 - b. Rectangular: 45-degree entry type or radius elbow.
5. Provide all necessary transition pieces and duct collars to make connections to ductwork from neck sizes scheduled or shown on Drawings.
6. Where building walls, floor and ceilings form portions of duct or plenum, provide gasketed angles or channels at junction points, securely bolted to building structure.

G. Duct Fittings and Joints on Systems 4 in-Inch wg and Over

1. Elbows 3- through 12-Inch Diameter: Die-stamped, for minimum air friction loss, with continuous corrosion-resistant welds.
2. Elbows over 12 Inch Diameter: Welded segment-type or standing seam, not less than 5 pieces for 90-degree elbows, and not less than 3 pieces for 45-degree elbows, using corrosion-resistant welds.
3. Tees: "Low loss, short cone-type," unless specifically detailed otherwise for space limitations.
4. "Y"s 45-degree type; 60-degree type may be used if space conditions dictate.
5. Install "Y"s where indicated.
6. Where tees are indicated, "Y"s may be substituted if space is available.
7. "Y"s: Straight-sided-type (no cone).
8. Take-Offs from Air Handling Unit Plenums: Bellmouth fittings.
9. "Y" take-offs from horizontal ceiling mounted ducts to serve boxes: May be straight-sided, shop-fabricated-type by accurately cutting and welding "Y"s into spiral ducts without use of fittings.

H. Turning Vanes

1. For square-throat elbows.
2. Velocities up to 2500 fpm: Single-vane, runner Type 2, with 3/4-inch trailing edge, 2-inch vane radius, and 1-1/2-inch vane spacing, minimum 24-ga.
 - a. For widths over 36 inches install vanes in 2 or more sections or use tie rods to limit unbraced vane length.
3. Where inlet and outlet dimensions of elbows are not equal, set 2 or more sections at 45-degree angle to give optimum turning as detailed on sheet metal drawings.

I. Partitions and Blank-Off Plates

1. Where used as part of an air handling unit, construct of 14-ga sheet metal with 1-1/2-inch standing seams.

2. Partitions 8 feet long or less: Use 1-1/2 x 1/4-inch angles spaced 2 feet on centers for additional bracing.
3. Partitions over 8 feet long: Use 2 x 1/4-inch angles.

J. Flexible Fan Connections

1. Material: Minimum 30 ounce Neoprene double-coated closely woven glass fabric flexible connections.
2. Fasten fabric to sheet metal duct work and to fan collar extension with 3/16-inch rivets spaced not more than 5 inch on center.
3. Locate in inlet and outlet of all fans, as close to fan as possible.
4. Provide at all ducts crossing building expansion joints and where indicated on drawings.
5. Connections shall not be under tension.
6. Isolate duct system from all equipment by at least 1 inch.

K. Flexible Ducts, Preinsulated

1. Under 4 inch wg Construction
 - a. Spiral wire or band, reinforced fabric liner or flexible aluminum or galvanized steel duct.
 - b. Nominal 1 inch x 3/4 lb/cf fiberglass insulation covered with vinyl, polyethylene or reinforced metallized vapor barrier.
2. 4 inch wg and Over Construction
 - a. Spiral wire or band, reinforced fabric liner or 2-ply flexible aluminum or hot-dip galvanized duct.
 - b. Nominal 1 inch x 3/4 lb/cf fiberglass insulation covered with vinyl, polyethylene or reinforced metallized vapor barrier.
3. Rated Working Pressure
 - a. Under 4 in wg duct: 5 inches positive or negative.
 - b. 4 inch wg and over duct: 10 inches positive.
4. Fire-resistant, self-extinguishing, UL Standard 181, Class 1, with flame spread of 25 or less and smoke development not to exceed 50.
5. R value – 6.0 unconditioned spaces, 4.2 conditioned spaces.
6. Under 4 inch wg Connections
 - a. Secure non-metallic duct to collar or sleeve with nylon draw band.
 - b. Secure metallic duct (under 12 inches in diameter) to collar with minimum three #8 sheet metal screws equally spaced around the duct's circumference. For ducts 12 inches in diameter and over use minimum five #8 sheet metal screws.
7. 4 inch wg and over Connections

- a. Secure duct to collar or sleeve with duct sealer and 1/2-inch aluminum or galvanized steel bands or clamps.
 - b. Secure insulation jacket with 2 wraps of duct tape.
8. Insulation and vapor barrier on factory-fabricated ducts shall be fitted over the core connection and shall also be secured with a draw band.
 9. Duct Sealer: E Moore Co., Tuff-Bond No. 12; Benjamin Foster No. 30-02, or McGill Airseal.
 10. Turn Radius: Not less than R/D equal to 1.0.
 11. Provide flexible duct supports in accord with Figure 3-10 and 3-11, SMACNA HVAC Duct Construction Standards.
 12. FLEXIBLE DUCTS SHALL NOT BE USED FOR RETURN OR EXHAUST.
- L. Access Doors
1. Provide at all fire, smoke, or duct-mounted dampers and where indicated.
 2. Doors shall close with air pressure, and shall have latches and hinges.
 3. Provide doors with 2-inch extension necks to clear insulation where applicable.
 4. Install all doors to permit easy visual inspection of fire or smoke dampers.
 5. Hardware: Ventlok, or equal, as follows:
 - a. Doors up to 12-inch maximum, in any direction: One No. 100.
 - b. Doors up to 18 inch long: Two No. 140 or No. 205.
 - c. Doors up to 24 inch long: Two No. 260.
 - d. Doors over 24 inch long: Two or more No. 310.
 - e. Door handles: Ventlok 220
 6. Provide gasket seal on all access doors.
- M. Fabric Ductwork
1. General
 - a. Description of Work
 - 1) Extent of non-metal ductwork is indicated on drawings and by requirements of this section.
 - 2) Types of non-metal ductwork required for this project include the following:
 - a) Textile Air Dispersion products.
 - b. Quality Assurance
 - 1) Building Codes and Standards
 - a) Product must be Classified by Underwriter's Laboratories in accordance with the 25/50 flame spread/smoke developed requirements of NFPA 90-A and UL 2518.
 - b) All product sections must be labeled with the logo and classification marking of Underwriter's Laboratories.

- 2) Design & Quality Control
 - a) Manufacturer must have documented design support information including duct sizing; vent, orifice, and/or nozzle location; vent, orifice, and/or nozzle sizing; length; and suspension. Parameters for design, including maximum air temperature, velocity, pressure, and textile permeability, shall be considered and documented.
 - c. Submittals
 - 1) Product Data: Submit manufacturer's specifications on materials and manufactured products used for work of this section.
 - 2) Building Code Data: Submit UL file number under which product is Classified by Underwriter's Laboratories for both NFPA 90-A and UL 2518.
 - 3) Provide detailed drawings confirming configuration of Textile Dispersion System (diameter, lengths, airflow, pressure, and textile permeability).
 - 4) Provide detailed installation instructions for components to be installed.
 - 5) Provide warranty and maintenance documentation.
 - d. Warranty
 - 1) Manufacturer must provide a 20-Year Product Warranty for products supplied for the fabric portion of this system, as well as a Design and Performance Warranty.
 - e. Delivery, Storage, and Handling
 - 1) Protect textile air dispersion system and hanger components from damage during shipping, storage, and handling.
 - 2) Where possible, store products inside and protect from weather. Where necessary to store outside, store above grade and enclose with a vented waterproof wrapping.
2. Products
- a. Textile Air Dispersion System:
 - 1) SkeleCore FTS (Fabric Tensioning System): Air diffusers shall be constructed with internal tensioning frame.
 - a) System shall cylindrically tension textile along the entire length of textile duct, including all fittings (crosses, elbows, reducers and tees).
 - b) Tensioning system shall include full 360-degree tensioning and intermediate rings with quick connection spacer tubes concealed inside the fabric system.

- c) Interior structure to include multiple mechanically adjustable tension devices. To provide proper textile tensioning, structural and textile system shall be configured in segments of no more than 45 feet.
 - d) Textile components supported solely by metal cylindrical rings.
 - e) Each cylindrical ring shall require a vertical metal to metal cable safety attachment.
 - f) Vertical supports are Galvanized steel with available lengths of 5'(standard), 10', 15', & 30'.
- b. Textile
- 1) Sedona-Xm
 - a) Textile Construction: Filament/filament twill polyester treated with a machine washable anti-microbial agent by the fabric manufacturer, fire retardant in accordance with UL 2518.
 - b) Air Permeability: 2 (+2/-1) CFM/ft² per ASTM D737, Frazier
 - c) Weight: 6.8 oz. /yd² per ASTM D3776
 - d) Warranty: 20 years with standard inlet velocity.
 - 2) Textile Color
 - a) Standard: blue, white, tan, red, green, silver, black. Color by Design-Builder.
- c. Textile System Fabrication Requirements:
- 1) Textile system to be constructed in modular lengths (zippered) with proper radial securing clips (inlets, endcaps and mid-sections) and top access zippers for vertical cable safety attachment.
 - 2) Integrated air dispersion shall be specified and approved by manufacturer.
 - a) Linear Vents
 - i. Air dispersion accomplished by linear vent and permeable fabric. Linear vents must be sized in 1 CFM per linear foot increments (based on .5" SP), starting a 1 CFM through 90 CFM per linear foot. Linear vent is to consist of an array of open orifices rather than a mesh style vent to reduce maintenance requirements of mesh style vents. Linear vents should also be designed to minimize dusting on fabric surface.
 - ii. Size of vent openings and location of linear vents to be specified and approved by manufacturer.
 - 3) Inlet connection to metal duct via fabric draw band with anchor patches as supplied by manufacturer. Anchor patches to be secured to metal duct via zip screw fastener – supplied by contractor.
 - 4) Inlet connection includes zipper for easy removal / maintenance.

- 5) Lengths to include required intermediate zippers as specified by manufacturer.
- 6) System to include Adjustable Flow Devices to balance turbulence, airflow and distribution as needed. Flow restriction device shall include ability to adjust the airflow resistance from 0.06 – 0.60 in w.g. static pressure.
- 7) End cap includes zipper for easy maintenance.
- 8) Each section of the textile shall include identification labels documenting order number, section diameter, section length, piece number, code certifications and other pertinent information.

d. Design Parameters:

- 1) Textile air diffusers shall be designed from 0.25" water gage minimum to 3.1" maximum, with 0.5" as the standard.
- 2) Textile air diffusers shall be limited to design temperatures between 0 degrees F and 180 degrees F.
- 3) System overall design; diameter, length, airflow, operating static pressure and dispersion shall be designed or approved by the manufacturer.
- 4) Do not use textile diffusers in concealed locations.
- 5) Use textile air dispersion systems only for positive pressure air distribution components of the mechanical ventilation system.

3. Installation

a. Installation of Textile Air Dispersion System

- 1) Install chosen suspension system in accordance with the requirements of the manufacturer. Instructions for installation shall be provided by the manufacturer with product.

b. Cleaning and Protection

- 1) Clean air handling unit and ductwork prior to the DuctSox system unit-by-unit as it is installed. Clean external surfaces of foreign substance which may cause corrosive deterioration of facing.
- 2) Temporary Closure: At ends of ducts that are not connected to equipment or distribution devices at time of ductwork installation, cover with polyethylene film or other covering, which will keep the system clean until installation is completed.
- 3) If DuctSox systems become soiled during installation, they should be removed and cleaned following the manufacturer's standard terms of laundry.

2.4 DAMPERS

A. Dampers - General

1. Sizes and Types: As indicated.

2. Locate where indicated.
3. Factory-built and -assembled dampers.

B. Dampers, Automatic-Control-Type

1. Furnished in Division 23 Section "Controls and Instrumentation".
2. Install as specified in this Section.

C. Dampers, Manual (Rectangular and Square)

1. Opposed-blade-type, fitted with shank bolts, marked for direction (open/closed).
2. Provide for double-socket wrenches to fit square shank and locking hex nut.
3. Construction: Heavy minimum 12-gauge galvanized steel frames, flat or angle iron, with blades of 16-ga galvanized steel, equipped with brass pin running on stainless steel pivot for vertical axis.

D. Damper, Manual (Round)

1. Butterfly-type with circular blade mounted to shaft.
2. Frame: Minimum 14-ga galvanized steel channel.
3. Blade: Minimum 16-ga galvanized steel.
4. Axle: 1/2-inch diameter.
5. Bearings: Self-lubricating nylon or stainless steel sleeve.

E. Dampers, Backdraft, under 4 inch wg

1. Counterbalanced, gravity-operated.
2. Fabricate of aluminum.
3. Blades: Provided with common linkage rod and felt seals.

2.5 COMBINATION FIRE/SMOKE DAMPERS

- A. Parallel blade type with all blades hinged together for operation in unison and bearings arranged for automatic operation.
- B. May be used in lieu of separate dampers in low pressure systems for normally closed operation.
- C. Static Pressure Loss: Not over 0.25 inch WG at 2000 fpm and 24 inches x 24 inches.
- D. Use oversized dampers where necessary.
- E. Fire Rating: UL labeled for 1-1/2 hour.
- F. UL 555S Leakage Class: I (8 cfm/ft² at 4 inch WG).
- G. Firestat: UL listed.
 1. Lock damper in closed position at 212 deg F duct temperature.
 2. Provide override function to operate damper in a smoke control operation.

3. Provide two damper position indicator switches to provide remote indicating damper position

H. Operator: Electric motor mounted on exterior of damper sleeve.

2.6 FIRE DAMPERS

A. Fire Dampers - General

1. UL-labeled, 1-1/2-hr.-rated for penetrations through barriers with fire resistance ratings less than 3 hours.
2. UL-labeled, 3-hr.-rated for penetrations through barriers with fire resistance ratings of 3 hours or more.
3. Provide where indicated and where required by NFPA and local regulations.
4. Provide with mounting angles and minimum 18 -gauge sleeves.
5. Fusible link temperature rating to be per NFPA 90A (approximately 50 deg F above operating temperature but not less than 212 deg F and not to exceed 286 deg F).
6. All dampers to be dynamic rated.

B. Fire Dampers in Ducts under 4 inch wg

1. Multi-blade for openings over 12 x 12 inches, single-blade for openings 12 x 12 inch and less.
2. Multi-blade dampers: All blades must be out of airstream.
3. In small ducts, 8 inch and less: 1 inch larger in each dimension to give total loss through damper of 0.10 inch WG or less.
4. 1-1/2-hr.-rated: Air Balance, Inc. Model D19; Ruskin Model DIBD2; Greenheck DFD150.
5. 3-hr.-rated: Air Balance, Inc. Model D39; Ruskin Model DIBD23; Greenheck DFD350.

C. Fire Dampers in Ducts 4in wg and over

1. With sleeve and adapter fittings on each side of sleeve.
2. 1-1/2-hr.-rated: Air Balance, Inc. Model MD19; Ruskin Model DFD60; Greenheck DFDAF-310.
3. 3-hr.-rated: Air Balance, Inc. Model MD39; Ruskin Model DFD60-3; Greenheck DFDAF-330.

2.7 DIFFUSERS, REGISTERS, AND GRILLES

A. Diffusers, Ceiling

1. Square-type or slot-type as indicated.
2. Size, Type, and Manufacturer: As scheduled.
3. Finish: Factory-applied, baked or electrocoated enamel; color as selected by Design-Builder or as indicated.
4. Sponge rubber gasketed for ceiling diffusers and supply registers.

5. Provide all necessary screws, duct collars, transitions and air pattern deflectors.
6. Paint interior of perforated supply and return diffusers flat black. Exterior surfaces to match ceiling color, of factory enamel finish.
7. Use nominal 24-x 24-inch panel style diffusers in areas with lay in ceilings.
8. For hard ceilings, use 12- x 12-inch face diffusers with overlap style mounting for 6-inch diameter neck sizes; and 24- x 24-inch face for neck sizes 8 inches and larger.
9. Use circular diffusers in areas where ductwork is exposed only where indicated.
10. For all Supply Air devices, provide with molded insulation blanket/insulated backpan unless noted otherwise.
11. Provide opposed-blade dampers where scheduled on the Drawings.
12. Provide easily removed inner core with a positive lock.

B. Air Grilles and Registers

1. Size, Type, and Manufacturer: As scheduled.
2. Finish: Factory-applied, baked or electrocoated enamel; color as selected by Design-Builder or as indicated.
3. Sponge rubber gasketed for ceiling and wall supply units.
4. Provide all necessary screws, duct collars, and transitions.
5. Provide opposed blade dampers with supply air grilles and registers where scheduled on the Drawings.

C. Diffusers and Grilles, Linear

1. Size, Type, and Manufacturer: As scheduled
2. Adjustable pattern, extruded aluminum or steel.
3. Fixed pattern, extruded aluminum, airline grille with 0-degree deflection, and damper.
4. Fixed pattern, extruded aluminum, airline grille with 15-degree deflection, and damper.

D. High Capacity Drum Louver

1. Furnish and install high capacity drum louver supply outlets of sizes and mounting types indicated on the plans and air distribution schedule.
2. The outlets shall have aluminum frame construction, and extruded aluminum drum and vanes.
3. The outlets shall consist of individually adjustable spread control vanes housed within a rotatable drum.
4. The drum pivot mechanism shall incorporate a positive positioning detent device to hold field adjusted drum angles of up to thirty degrees off-center. Adjustable vanes shall pivot and maintain blade setting.
5. The outlet mounting frame shall be constructed of formed steel with welded, reinforced corners for added strength.
6. The mounting frame shall be supplied with countersunk screw holes for aesthetic appeal.
7. All components shall have a baked-on powder coat finish.
8. Opposed Blade Damper: The heavy duty, opposed blade balancing damper shall be constructed of a minimum 18 gauge coated, cold rolled steel. The damper frame corners shall overlap and be of welded construction for added

strength. The damper shall be operable from the register face. The damper shall be supplied fitted with a face accessible screw-type blade locking mechanism.

9. The outlet shall be suitable for spiral duct mounting where applicable. The spiral duct frame shall be aluminum construction.

2.8 PRESSURE RELIEF DOORS

- A. Provide pressure relief doors to relieve pressure and prevent structural damage to ductwork or plenums in the event excessive pressure within the air distribution systems should occur. Provide in the supply and return air paths of air handling units.
- B. Doors to open at 8 inches wg static on supply systems and -4 inches wg on return systems.
- C. Doors to automatically close and reset when the static pressure is reduced to less than 4 inches wg on supply systems and -2 inches wg on return systems
- D. Doors to be installed to open outwardly to relieve positive pressure build-up or to open inwardly to prevent damage due to negative pressure.
- E. Construction
 1. 12-ga galvanized steel frame and door.
 2. Polyurethane foam seal around door perimeter.
 3. Negator springs for door closure upon loss of over-pressurization.
 4. 18 x 18 inch size.
- F. Ruskin PRD18 pressure relief door.
- G. Install vertically and level for proper operation.

2.9 LOUVER BLANK-OFF PANELS

- A. Provide blank-off panels behind inactive louver sections.
 1. Double-wall construction with minimum 22-ga galvanized sheet metal and 2-inch-thick rigid insulation.
 2. Paint side facing louver flat black.

2.10 ACOUSTICAL PIPE LAGGING

- A. Acoustical pipe lagging shall be a 1 lb. psf mass loaded vinyl noise barrier with a reinforced-foil face. Nominal thickness of 0.125 inches.
- B. Class A flammability rated; Flame Spread Index less than 15; Smoke Density less than 20.

- C. Accessories for securely mounting acoustical pipe lagging: Foil lag tape, stick pins, welding pins, banding.
- D. Acoustical Performance:

1. Sound Transmission Loss: Per ASTM E 90

Product	Sound Transmission Loss (db) Frequency (Hz)						STC
	125	250	500	1000	2000	4000	
B-10 LAG	15	18	22	27	32	37	27

- E. Products: Sound Seal Model B-10 LAG, or equal.
- F. Install per manufacturer’s recommendations.

2.11 DUCT ELBOW SILENCERS

A. General Requirements:

1. Silencers shall be of the size, configuration, capacity and acoustic performance as scheduled on the drawings. All silencers shall be factory fabricated and supplied by the same manufacturer.
2. Transitions on inlet and outlet will not be accepted. Silencers shall fit the ducting system they are installed in without requiring duct fittings/transitions. Silencer inlet and outlet must match duct dimensions. See contract documents for silencer configuration. Non-basis of design suppliers must submit details of internal geometry of silencers to be supplied.
3. Silencers shall be constructed in accordance with ASHRAE and SMACNA standards for the pressure and velocity classification specified for the air distribution system in which it is installed. Material gauges noted in other sections are minimums. Material gauges shall be increased as required for the system pressure and velocity classification. The silencers shall not fail structurally when subjected to a differential air pressure of 8 inches water gauge.
4. All casing seams and joints shall be lock-formed and sealed or stitch welded and sealed to provide leakage-resistant construction. Airtight construction shall be achieved by use of a duct-sealing compound supplied and installed by the contractor at the jobsite.
5. All perforated steel shall be adequately stiffened to insure flatness and form.
6. Fire-Performance Characteristics: Silencer assemblies, sealants, and acoustical spacer, shall have flame-spread index not exceeding 25 and smoke-developed index not exceeding 50 when tested according to ASTM E 84, NFPA 255 or UL 723.
7. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1-2007.

- B. Rectangular Silencers: Outer casing shall be ASTM A 653/A 653M, G90 galvanized sheet steel. Gauge 22 and Gauge 18 respectively. Inner perforated metal liner: ASTM A 653/A 653M, G90 galvanized sheet steel, Gauge 26 and Gauge 22

C. Principal Sound-Absorbing Mechanism:

1. Dissipative silencers:
 - a. Type with acoustic media. Media shall be of acoustic quality, shot-free glass fiber insulation with long, resilient fibers bonded with a thermosetting resin. Glass fiber density and compression shall be as required to insure conformance with laboratory test data. Glass fiber shall be packed with a minimum of 15% compression during silencer assembly. Media shall be resilient such that it will not crumble or break, and conform to irregular surfaces. Media shall not cause or accelerate corrosion of aluminum or steel. Mineral wool will not be permitted as a substitute for glass fiber.
- D. HTL Casings: Where indicated on the silencer schedule, silencers shall have high transmission loss (HTL) walls externally applied and completely sealed to the silencer casing by the silencer manufacturer to assure quality controlled transmission loss. The HTL walls shall consist of media, airspace, mass and outer protective metal skin, as required, to obtain the specified room noise criteria. Standard acoustical panels will not be accepted as HTL walls. If requested by the Engineer, break-out noise calculations for each air handling and fan system shall be provided with the silencer submittal to insure compliance with the room noise criteria. Break-out noise calculations shall be based on the sound power levels of the specified equipment.
- E. Products: Vibro-Acoustics model RD, RED, or equal.
- F. Install per manufacturer's recommendations.

2.12 DUCT LEAKAGE TESTING

- A. For ducts constructed for 4-incg wg and above:
- B. Use procedures listed in the "HVAC Air Duct Leakage Test Manual".
- C. Provide a report to the Design-Builder of the findings of the duct leakage test.
- D. Coordinate testing with the Commissioning Agent and Construction Manager.

PART 3 - EXECUTION

3.1 GENERAL

- A. Form and erect ductwork to avoid pipes, lighting fixtures, joists, beams, etc., and to maintain head room and clearances required for the project, or as noted. Coordinate locations with work of all Trade Contractors. Verify all dimensions and elevations. Special attention is again directed to the pre-construction layout drawing and coordination requirements of this section.
- B. Provide all offsets and modifications to the duct systems required because of interferences encountered. It is this Contractor's responsibility to avoid this as much as possible by coordinating his work with the work of the other Contractors. If

modifications are necessary, this Contractor shall perform all such modifications and offsets in an approved manner as required for this work, at no additional cost.

- C. Volume dampers or splitter dampers shall operate without rubbing side of ducts or binding. Blades shall be tight on shaft. If dampers are loose and noisy, system will be rejected and damper shall be replaced.
- D. Only one damper regulator will be allowed per multi-blade damper. All multi-blade dampers shall be provided with Vent Fabrics, Inc. parallel blade and opposed blade hardware. Dampers shall be set in a 3/8-inch x 2-inch steel frame.
- E. If, because of obstructions, damper regulation is not possible with the above hardware, regulation shall be accomplished with right angle gear assemblies. Dampers in concealed ductwork shall be operable at concealed regulators.
- F. Provide concealed regulators for volume dampers in concealed ductwork.
- G. Paint inside surface of ductwork for a distance of two feet directly behind air devices, with flat black where sheet metal is visible.

3.2 INSTALLATION OF DUCTWORK

- A. Install ductwork in accordance with arrangements and sizes indicated on the Drawings; construct of the best grade of galvanized steel unless otherwise specified. Include all necessary elbows or square turns with turning vanes of the double-wall galvanized steel air-foil-type, deflectors, dampers, damper quadrants, hangers, etc., and erect in a thorough and workmanlike manner. Rectangular ducts of 14-inch size dimensions and under, and round and oval ducts, shall have radius turns, with inside radius equal to or greater than the dimension of duct in direction of turn, in lieu of turning vanes.
- B. Conceal all ductwork in finished spaces unless indicated otherwise.
- C. All ductwork exposed to view shall be supplied and installed with paint grip galvanizing with final painting of same by the painting Trade Contractor. Painting shall not be a part of this Contractor's work. Do not paint ceiling-hung ductwork in electrical equipment rooms or sensitive production areas and switchrooms.
- D. Form radius elbows with a 1-1/2 ratio of centerline radius of duct dimension in the direction of the turn wherever possible.
- E. Do not install ductwork in or allow to enter or pass through electrical rooms, elevator machine rooms, or spaces housing switchboards, panelboards or distribution boards, except ductwork that serves electrical rooms, elevator machine rooms, or spaces.
- F. Exercise special care to provide tight-fitting well-fabricated, well-braced ductwork systems.
- G. Field assembly rectangular, round or flat oval ductwork as follows:
 - 1. Use caulking-grade joint sealer applied slip joints, or:

2. Use slip joints, couplings, etc., sealed with "shrink-fit" plastic bands, with thermal setting adhesives pre-applied to plastic bands, or:
 3. Use slip joints, couplings, etc., sealed with pressure-sensitive tape.
 4. Isolate dissimilar metals with elastomeric sealant tape or fiber gaskets, and gaskets and washers for bolts.
- H. In ducts 4-inch wg and over ductwork, do not use 2-piece mitered 90-degree elbows with or without vanes unless approved by Design-Builder.
- I. Make all duct connections from hoods, openings, fans, and other devices.

3.3 INSTALLATION COMBINATION FIRE/SMOKE DAMPERS

- A. Install in accordance with manufacturer's instructions as well as all applicable codes.
- B. Seal all dampers at wall openings and between damper and sleeve or duct around one side of damper's downstream face.
- C. 24 volt AC power supply by Electrical Contractor.

3.4 CLEANING

- A. At completion of work and prior to final acceptance, clean all work installed under this Section.

3.5 EQUIPMENT DEMONSTRATION

- A. Prior to final acceptance, inspect, test, and operate satisfactorily, in presence of Design-Builder and representative of the Owner, operation of each piece of equipment and its accessories.
- B. If inspection or test shows defects, replace defective work or material.
- C. Repeat inspections and tests until defects are eliminated.

END OF SECTION 23 30 00

SECTION 23 34 00 – EXHAUST AND VENTILATING FANS

PART 1 - GENERAL

1.1 REFERENCE

- A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION

A. DESCRIPTION OF SYSTEMS

- 1. Roof/Wall centrifugal exhaust fans: Greenheck models: G / GB / CUE / CUBE
- 2. In-line centrifugal fans: Greenheck models: SQ / BSQ

B. ABBREVIATIONS

- 1. AMCA: Air Moving and Conditioning Association.
- 2. ADC: Air Diffusion Council.
- 3. ASHRAE: American Society of Heating, Refrigeration and Air Conditioning Engineers.

1.3 QUALITY ASSURANCE STANDARDS

- A. ADC Standard 1062R2, Air Diffusing Equipment Test Code.
- B. AMCA Standard 210, Test Code for Air Moving Devices.
- C. ASHRAE Standard 70, Method of Testing and Rating the Air Flow Performance of Outlets and Inlets.
- D. NFPA 90-A, Standard for the Installation of Air Conditioning and Ventilating Systems.
- E. UL listed as “Power Ventilator for Smoke Control Systems” (where applicable).

1.4 SUBMITTALS

- A. All submittals shall conform completely to the requirements of the Contract Documents, including all requirements set forth in Division 01 Section “Submittals”.
- B. Shop Drawings: All equipment items specified, including fan curves.
- C. Product Data
 - 1. Dimensional Drawing.

2. Performance data.
3. Fan curves for specific operation, with flow, static pressure, and horsepower.
4. Sound data
5. Dryer venting comprehensive set of interfaced drawings and duct design calculations.

D. Contract Close-Out Information

1. Operating and maintenance data.
2. Owner instruction report.

E. ACCEPTABLE MANUFACTURES

1. Greenheck Fan Corp., Acme, Penn, Loren Cook.

PART 2 - PRODUCTS

2.1 GENERAL

A. Fans - General

1. Performance ratings: Based on laboratory tests conducted in accordance with latest edition of the ASHRAE/AMCA Standard Test Codes. All fans to be AMCA labeled.
2. Ratings: As indicated.
3. Arrangement and drive: As indicated.
4. Provide removable belt guard.
5. Drive sheaves
 - a. Cast iron, split tapered bushings dynamically balanced at factory.
 - b. Provide wide-range variable-speed adjustable sheaves to be used for balancing systems.
 - c. Provide final fixed pitch drive sheaves for proper RPM determined during balancing process.
6. Fans 15 HP and less: Provide with adjustable sheaves.
7. Finish: Applied or as indicated on Drawings.
8. For fans suspended from ceilings, belt-tightening device may be pivoted-type.

2.2 ROOF-MOUNTED / WALL-MOUNTED CENTRIFUGAL EXHAUST FANS

A. Roof Exhaust Fans

1. Centrifugal, direct or belt-driven, curb-mounted-type.
2. Capacity: As scheduled.
3. Fan wheel: Backward-curved, dynamically and statically balanced.
4. AC Induction Motors
 - a. Motor enclosures: Open drip-proof as scheduled

- b. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and furnished at the specific voltage and phase
 - c. Mounted on vibration isolators, out of the airstream
 - d. For motor cooling there shall be fresh air drawn into the motor compartment through an area free of discharge contaminants
 - e. Accessible for maintenance
5. Electronically Commutated Motor
- a. Motor enclosures: Open type
 - b. Motor to be a DC electronic commutation type motor (ECM) specifically designed for fan applications. AC induction type motors are not acceptable. Examples of unacceptable motors are: Shaded Pole, Permanent Split Capacitor (PSC), Split Phase, Capacitor Start and 3 phase induction type motors.
 - c. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and pre-wired to the specific voltage and phase.
 - d. Internal motor circuitry to convert AC power supplied to the fan to DC power to operate the motor
 - e. Motor shall be speed controllable down to 20% of full speed (80% turndown). Speed shall be controlled by either a potentiometer dial mounted at the motor or by a 0-10 VDC signal
6. Shafts and Bearings:
- a. Fan shaft shall be ground and polished solid steel with an anti-corrosive coating
 - b. Bearing shall be selected for a minimum L10 life in excess of 100,000 hours (equivalent to L50 average life of 500,000 hours), at maximum cataloged operating speed
 - c. Bearings are 100 percent factory tested
 - d. Fan Shaft first critical speed is at least 25 percent over maximum operating speed
7. Housing: Extruded or heavy-gage sheet aluminum mounted on rigid support structure
8. Options/Accessories
- a. Provide factory-installed and -wired disconnect device outside motor compartment.
 - b. Provide powered or self-acting backdraft damper.
 - c. Provide 1/2-inch mesh birdscreen on outlet.
 - d. Motor mounted potentiometer dial or Factory-wired, solid-state speed controller, on direct-drive fans.
 - e. Explosion-Proof Units: Provide spark-proof, non-ferrous wheels, spark-proof belt, with explosion-proof motor in separate compartment, arranged for explosive vapor exhaust.
 - f. Provide factory-prefabricated, insulated roof curbs meeting National Roofing Contractor's Association approved standard with nailing strips, etc.

- g. Curb height: Minimum 18-inch, above finished roof. Provide level installation, regardless of roof slope. Type to suit roof construction and provide watertight enclosure.
- h. Cleanout port, grease trap, and hinged access for grease applications.
- i. Finishes as scheduled.
- j. Factory provided Variable Frequency Drives as scheduled.

2.3 IN-LINE CENTRIFUGAL FANS

A. In-Line Centrifugal Fans

- 1. Centrifugal, direct or belt-driven.
- 2. Capacity: As scheduled.
- 3. Fan wheel: Backward-inclined or Forward curved, dynamically and statically balanced
- 4. AC Induction Motors
 - a. Motor enclosures: Open drip-proof as scheduled.
 - b. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and furnished at the specific voltage and phase.
 - c. Mounted on vibration isolators, out of the airstream.
 - d. For motor cooling there shall be fresh air drawn into the motor compartment through an area free of discharge contaminants.
 - e. Accessible for maintenance.
- 5. Electronically Commutated Motor
 - a. Motor enclosures: Open type.
 - b. Motor to be a DC electronic commutation type motor (ECM) specifically designed for fan applications. AC induction type motors are not acceptable. Examples of unacceptable motors are: Shaded Pole, Permanent Split Capacitor (PSC), Split Phase, Capacitor Start and 3 phase induction type motors.
 - c. Motors are permanently lubricated, heavy duty ball bearing type to match with the fan load and pre-wired to the specific voltage and phase.
 - d. Internal motor circuitry to convert AC power supplied to the fan to DC power to operate the motor.
 - e. Motor shall be speed controllable down to 20% of full speed (80% turndown). Speed shall be controlled by either a potentiometer dial mounted at the motor or by a 0-10 VDC signal.
- 6. Shafts and Bearings:
 - a. Fan shaft shall be ground and polished solid steel with an anti-corrosive coating.
 - b. Bearing shall be selected for a minimum L10 life in excess of 100,000 hours (equivalent to L50 average life of 500,000 hours), at maximum cataloged operating speed.
 - c. Bearings are 100 percent factory tested.

- d. Fan Shaft first critical speed is at least 25 percent over maximum operating speed.
7. Housing/Cabinet Construction
- a. Square design constructed of heavy gauge galvanized steel and shall include square duct mounting collars.
 - b. Housing and bearing supports shall be constructed of heavy gauge bolted and welded steel construction to prevent vibration and to rigidly support the shaft and bearing assembly.
8. Options/Accessories
- a. Provide factory-installed and -wired disconnect device outside motor compartment.
 - b. Provide powered, Inlet Vane, or self-acting backdraft damper.
 - c. Belt Guards to cover motor and drive.
 - d. Inlet and/or Outlet guard.
 - e. Factory isolation – free standing or housed Neoprene/rubber/spring sized for weight of the fan.
 - f. Motor mounted potentiometer dial or Factory-wired, solid-state speed controller, on direct-drive fans.
 - g. Extended lube lines.
 - h. Explosion-Proof Units: Provide spark-proof, non-ferrous wheels, spark-proof belt, with explosion-proof motor in separate compartment, arranged for explosive vapor exhaust.
 - i. Finishes as scheduled.
 - j. Factor provided Variable Frequency Drives as scheduled.
 - k. Insulated housing.
 - l. Integral light – for ceiling application.
 - m. Additional control and venting accessories to be scheduled.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install in accord with manufacturer's recommendations and as specified.
- B. All roof-mounted fans are to have their curb caps secured to the roof curbs.
- C. FAN DYNAMIC BALANCING
 - 1. Have fan dynamic balancing for 7.5 hp and above centrifugal fans performed by experience trained mechanics from factory to include following:
 - 2. Inspection of fans to determine if damage has occurred during storage or installation and coordinate repair of any damages.
 - 3. Inspection of fan drives, including bearing and motor mounts.
 - 4. Inspection of tensioning of drive belts on adjustable and fixed pitch sheaves.

5. X-Y dynamic vibration plot on each fan resulting in a properly balanced installation within factory specifications, performed after system has been balanced and final fixed pitch drive sheaves installed.

END OF SECTION 23 34 00

SECTION 23 36 16 – TERMINAL BOXES – DDC CONTROL**PART 1 - GENERAL****DESCRIPTION**

Provide high velocity terminal boxes, complete with direct digitally controlled velocity controller, electric actuator, velocity pressure pickup device, and attenuator section. Provide reheat coils and fans as scheduled on Drawings and specified herein.

Terminal boxes and fan power boxes shall be pressure independent, and suitable for either constant volume or variable volume service as indicated on the Drawings.

All terminal box controls, whether factory or field installed, shall be fully compatible with and communicate seamlessly with the building's temperature control or building automation system described in Division 23 Section "Controls and Instrumentation".

QUALITY ASSURANCE

Standards: American Refrigeration Institute (ARI), National Fire Protection Association (NFPA), and Underwriters' Laboratories (UL).

ARI-880: Performance rating.

RATINGS AND CAPACITIES

Refer to the Drawings for CFM, noise criteria and other design requirements.

MANUFACTURERS

Johnson Controls, Titus, Anemostat, Trane, Price, and Kreuger.

SUBMITTALS

Shop Drawings: All equipment items specified.

Product Data: Terminal units.

Samples: Not required for review.

Reference Submittals: Not required for review.

Contract Close-Out Information

1. Operating and maintenance data.
2. Owner instruction report.

3. Guarantee.

PART 2 - PRODUCTS

TERMINAL BOXES

General Construction: Galvanized steel, 22 gauge minimum, plenum box with 3/8 inch thick, 1.5 lb. density, fiber-free acoustical thermal lining in accordance with UL 181 and NFPA 90A. Fiberglass lining is not acceptable. Casing leakage shall be less than 13 CFM at 6 inches W.G.

Inlet Dampers: Self-seating against a closed cell foam gasket, pivoted on self-lubricating Delrin bearings, mounted directly to the inlet port, and positively connected to a electric operator. Damper leakage not to exceed 8 CFM at 6 inches W.G. in fully closed position.

Controls

1. Each VAV terminal shall include application specific controls with integral microelectronic flow sensors mounted within a NEMA 1 enclosure. The controllers shall have been connected by suitable tubing to a inlet velocity sensor mounted in the inlet to the terminal.
2. An individual transformer shall be furnished on each VAV terminal to provide power for the controller and the contactors for any required fan and electric heaters at 24 Vac at 50/60 Hz.
3. Each controller shall control zone temperature by varying the airflow into the space using a PI control loop with programmable proportional and integral coefficients. Applications requiring supplemental heat shall utilize a separate PI algorithm, with programmable proportional and integral coefficients to maintain heating temperature setpoint.
4. The controllers shall modulate the damper motors to maintain CFM from each terminal in accordance with the cooling/heating requirements calculated by comparing the sensed space temperature with the setpoint and time of day schedule. Zone temperature shall be controlled to +1 degree F. Airflow shall be controlled down to 250 fpm, and shall be read in 25 fpm increments at velocities greater than 500 fpm.
5. Each controller shall have an internal software clock to implement setpoint changes and changes of control state, in accordance with the resident occupancy. The clocks will be synchronized hourly and automatically following power failures, by a battery backed real-time clock located in the system interface.

Damper Operator: Supply suitable bi-directional 24 volt synchronous electric damper actuators. The motors shall have heavy duty gears and shall contain a magnetic clutch which releases when the damper is driven to either extreme. Stall type actuators or DC actuators without current limiting are not acceptable. The operator shall be sized to accurately and smoothly operate the damper through the expected CFM range of the terminal, against a duct static pressure ranging up to the largest external static pressure scheduled on the Drawings.

Sound Attenuator Section: 22 gauge, galvanized steel with insulation lining to match the terminal box lining, 3 foot length minimum (unless noted otherwise on Drawings).

Velocity Pickup: Ring or cross-shaped, multi-point center averaging type velocity pressure pickup shall be provided by Box Manufacturer. Velocity pickup shall amplify the duct velocity pressure, and maintain control accuracy with inlet ducts in any configuration. Single point or a single inline multiple point velocity pickups will not be accepted.

Hot Water Coil

6. Galvanized steel casing, flanged duct connection at unit discharge, 1/2 inch diameter copper tubes, aluminum fins, solder connections, one or two row serpentine coil (refer to scheduled data on Drawings for performance requirements and required number of rows). All coils shall be factory installed.
7. Insulate the entire exposed perimeter of hot water coil.
8. Provide hot water control valve and operator, compatible with terminal box controls.

PART 3 - EXECUTION

INSTALLATION

Support boxes independent of ceiling system. Coordinate with General Trades Contractor.

Provide access as required for maintenance and repair. All boxes located above the ceiling shall be end discharge unless otherwise noted. All boxes shall deliver the air quantities shown on the Drawings at acceptable sound levels.

Make flexible duct and flexible connections at box duct connections. Provide a transition from the full size of each terminal outlet to the discharge ductwork shown on Drawings. Transition shall be tapered with a 60 degree maximum included angle.

Coordinate installation of controls.

Install hot water piping, valves and specialties.

END OF SECTION 23 36 16

SECTION 23 52 16 – CONDENSING BOILERS**PART 1 - GENERAL****1.1 REFERENCE**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 DESCRIPTION

- A. Section includes gas-fired, fire-tube condensing boilers, trim, and accessories for generating hot water.

1.3 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ASME Compliance: Fabricate and label boilers to comply with 2010 ASME Boiler and Pressure Vessel Code.
- C. ASHRAE/IES 90.1 Compliance: Boilers shall have minimum efficiency according to "Gas and Oil Fired Boilers - Minimum Efficiency Requirements."
- D. DOE Compliance: Minimum efficiency shall comply with 10 CFR 430, Subpart B, Appendix N.
- E. UL Compliance: Test boilers for compliance with UL 795. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- F. CSA Compliance: Test boilers for compliance with CSA B51.

1.4 SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for boilers.
 - 2. Include rated capacities, operating characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For boilers, boiler trim, and accessories.

1. Include plans, elevations, sections, mounting and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.

C. Delegated-Design Submittal: For each boiler.

1. Design calculations and vibration isolation base details, signed and sealed by a qualified professional engineer.
 - a. Design Calculations: Calculate requirements for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
 - b. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For boiler, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Other Informational Submittals:

1. ASME Stamp Certification and Report: Submit stamp certificate of authorization, as required by authorities having jurisdiction, and document hydrostatic testing of piping external to boiler.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For boilers to include in emergency, operation, and maintenance manuals.

1.7 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of boilers that fail in materials or workmanship within specified warranty period.

1. Warranty Period for Condensing Boilers:
 - a. Leakage and Materials: 10 years from date of Substantial Completion.

- b. The boiler's pressure vessel is warranted against failure due to thermal shock for the lifetime of the boiler provided the boiler is installed, controlled, operated and maintained in accordance with the installation, operation and maintenance manual.
- c. The pressure vessel and heat exchanger is covered against failures resulting from flue gas corrosion and/or defective material or workmanship for a period of five (5) years from the date of shipment from the factory. Waterside corrosion or scaling is not covered. The manufacturer will repair, replace, exchange or credit at their option, FOB factory, the pressure vessel as defined above, provided this equipment has been installed, operated and maintained by the buyer in accordance with the Installation, Operation and Maintenance Manual.

1.8 DELIVERY

- A. Deliver products to Owner's site. Include all shipping costs in bid (FOB jobsite). Design-Builder's rigger or chosen contractor will unload from truck. Boiler manufacturer and Mechanical Contractor shall coordinate with the rigging contractor all aspects of the rigging requirements.
- B. Rigging to take place per Manufacturer's and Design-Builder's requirements.
- C. A manufacturer's representative shall be required to observe the rigging of the boiler components for conformance with the manufacturer's rigging requirements.
- D. Boilers shall not be stored in areas exposed to weather (outside). Precaution shall be taken to store boiler components as required and recommended by the manufacturer.
- E. Protect units from physical damage. Leave factory shipping covers and protective environmental charges in place until installation by others.

PART 2 - PRODUCTS

2.1 FLOOR-MOUNTED, FORCED-DRAFT, FIRE-TUBE CONDENSING BOILERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. AERCO; A WATTS Brand.
 - 2. Cleaver-Brooks.
 - 3. Fulton Boiler Works, Inc.
- B. Description: Factory-fabricated, -assembled, and -tested, fire-tube, forced-draft, condensing boiler with heat exchanger sealed pressure tight, built on a steel base, including insulated jacket; flue-gas vent; combustion-air intake connections; water supply, return, and condensate drain connections; and controls. Units are to be for water-heating service only.

- C. Primary Heat Exchanger: Corrosion-resistant stainless steel.
- D. Secondary Heat Exchanger: Corrosion-resistant stainless steel.
- E. Combustion Chamber and Flue Pipes: Corrosion-resistant stainless steel or aluminum.
- F. Pressure Vessel: Carbon steel with welded heads and tube connections.
- G. Burner: Natural gas, forced draft.
- H. Blower: Centrifugal fan to operate during each burner-firing sequence and to prepurge and postpurge the combustion chamber.
 - 1. Motors: Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230500 "Common Work Results for HVAC."
 - a. Motor Sizes: Large enough so driven load will not require motor to operate in service factor range above 1.0.
- I. Gas Train: Combination gas valve with manual shutoff and pressure regulator.
- J. Ignition: Direct-spark ignition or silicone carbide hot-surface ignition with 100 percent main-valve shutoff and electronic flame supervision.
- K. Casing:
 - 1. Jacket: Sheet metal, with snap-in or interlocking closures.
 - 2. Control Compartment Enclosures: NEMA 250, Type 1A.
 - 3. Finish: Powder-coated protective finish.
 - 4. Insulation: Minimum 2-inch- thick, mineral-fiber insulation surrounding the heat exchanger.
 - 5. Combustion-Air Connections: Inlet and vent duct collars.

2.2 TRIM

- A. Safety valve(s) shall be ASME Section IV approved side outlet type mounted on the boiler air vent outlet. Size shall be in accordance with code requirements.
- B. Temperature and pressure gauge shall be mounted on the water outlet.
- C. Solid State Low water cut-off probe control with manual reset and test switch.
- D. Manual Reset High Limit Temperature sensor; range not to exceed 210 deg F and shall be an integral device of the Boiler Burner Control and UL Recognized as a limit control.
- E. Outlet water supply sensing probe for operating water limit setpoint.
- F. Return water-sensing probe for operating limit setpoint.

- G. Drain valve
- H. Automatic air vent
- I. Auxiliary low water cutoff
- J. Alarm lights and horn (general alarm light – red, fuel valve light – green, load demand light – white, low water light - amber)
- K. Alarm horn (electronic sounder)
- L. Stack temperature sensor – UL Recognized as a limit control.
- M. Condensate neutralization kit combination tank and trap
- N. Automatic isolation valve, including valve, actuator, and transformer to power isolation valve through the boiler. The valve, actuator, and transformer shall ship loose for field installation and wiring.
 - 1. The isolation valve shall be Bray 2-way resilient seated butterfly valve, model ABL or approved equal, with ANSI 150# flanges, lugged style.
 - 2. The electric actuator shall a Bray Commercial actuator, or approved equal, 24VAC, fail in position, with auxiliary end switch.

2.3 CONTROLS

- A. Boiler operating controls shall include the following devices and features:
 - 1. Control transformer.
 - 2. Set-Point Adjust: All set points shall be adjustable.
 - 3. Electric, factory-fabricated and factory-installed panel to control burner-firing rate, to reset supply-water temperature inversely with outside-air temperature. At 0 deg F outside-air temperature, set supply-water temperature at 140 deg F; at 60 deg F outside-air temperature, set supply-water temperature at 90 deg F.
 - a. Include automatic, alternating-firing sequence for multiple boilers to ensure maximum system efficiency throughout the load range and to provide equal runtime for boilers.
- B. Burner Operating Controls: To maintain safe operating conditions, burner safety controls limit burner operation.
 - 1. High Cutoff: Automatic reset stops burner if operating conditions rise above maximum boiler design temperature.
 - 2. Low-Water Cutoff Switch: Electronic probe shall prevent burner operation on low water. Cutoff switch shall be automatic-reset type.
 - 3. Blocked Inlet Safety Switch: Manual-reset pressure switch factory mounted on boiler combustion-air inlet.
 - 4. Audible Alarm: Factory mounted on control panel with silence switch; shall sound alarm for above conditions.

- C. Building Automation System Interface: Factory install hardware and software to enable building automation system to monitor, control, and display boiler status and alarms.
 - 1. Hardwired Points:
 - a. Monitoring: On/off status, common trouble alarm low-water-level alarm.
 - b. Control: On/off operation, hot-water-supply temperature set-point adjustment.
 - 2. A BACnet communication interface with building automation system shall enable building automation system operator to remotely control and monitor the boiler from an operator workstation. All monitoring and control features, which are available at the local boiler control panel, shall also be available at the remote operator workstation through the building automation system.

2.4 ELECTRICAL POWER

- A. Controllers, Electrical Devices, and Wiring: Electrical devices and connections are specified in electrical Sections.
- B. Single-Point Field Power Connection: Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point field power connection to boiler.
 - 1. House in NEMA 250, Type 12 enclosure.
 - 2. Wiring shall be numbered and color coded to match wiring diagram.
 - 3. Install factory wiring outside of an enclosure in a metal raceway.
 - 4. Field power interface shall be to nonfused disconnect switch.
 - 5. Provide branch power circuit to each motor and to controls with a disconnect switch or circuit breaker.
 - 6. Provide each motor with overcurrent protection.

2.5 VENTING KITS

- A. The flue (exhaust) stack must be AL 29-4C or equivalent material UL-1738/C-UL S636 approved for Category IV condensing, positive pressure applications.
- B. Combustion air shall be through sealed combustion (drawing in fresh air from the outdoors).
 - 1. The air intake piping must be Schedule 40 CPVC or equivalent.
- C. The boiler shall be capable of operating with an exhaust draft not exceeding $-0.04''$ W.C. and a combined air intake and exhaust venting pressure drop not exceeding $+0.35''$ W.C.

2.6 CONDENSATE-NEUTRALIZATION UNITS

- A. Description: Factory-fabricated and -assembled condensate-neutralizing capsule assembly of corrosion-resistant plastic material with threaded or flanged inlet and outlet pipe connections. Device functions to prevent acidic condensate from damaging grain system. It is to be piped to receive acidic condensate discharged from condensing boiler and neutralize it by chemical reaction with replaceable neutralizing agent. Neutralized condensate is then piped to suitable drain.
- B. Capsule features:
 - 1. All corrosion-resistant material.
 - 2. Suitable for use on all natural gas and propane boilers.
 - 3. Includes initial charge of neutralizing agent.
 - 4. Neutralizing agent to be easily replaceable when exhausted.
 - 5. Inlet and outlet pipe connections.
- C. Capsule Configuration:
 - 1. Low-profile design for applications where boiler condensate drain is close to the floor.
 - 2. Easily removed and opened for neutralizing agent replacement.
 - 3. Multiple units may be used for larger capacity.

2.7 SOURCE QUALITY CONTROL

- A. UL Compliance, Gas-Fired: Test gas-fired boilers for compliance with UL 2764. Boilers shall be listed and labeled by a testing agency acceptable to authorities having jurisdiction.
- B. Performance Testing: Test and label boilers for efficiency to comply with AHRI 1500.
- C. Burner and Hydrostatic Test: Factory adjust burner to eliminate excess oxygen, carbon dioxide, oxides of nitrogen emissions, and carbon monoxide in flue gas and to achieve combustion efficiency; perform hydrostatic test.
- D. Test and inspect factory-assembled boilers, before shipping, in accordance with 2017 ASME Boiler and Pressure Vessel Code. Factory test boilers for safety and functionality; fill boiler with water, and fire throughout firing range, to prove operation of all safety components.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine roughing-in for concrete equipment bases, anchor-bolt sizes and locations, and piping and electrical connections to verify actual locations, sizes, and other conditions affecting performance of the Work.

1. Final boiler locations indicated on Drawings are approximate. Determine exact locations before roughing-in for piping and electrical connections.
- B. Examine mechanical spaces for suitable conditions where boilers will be installed.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 BOILER INSTALLATION

- A. Equipment Mounting:
 1. Install boilers on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations.
 2. Comply with requirements for vibration isolation and seismic-restraint devices specified in Section 230548 "Vibration Controls for HVAC Piping and Equipment."
- B. Install gas-fired boilers according to NFPA 54.
- C. Assemble and install boiler trim.
- D. Install electrical devices furnished with boiler but not specified to be factory mounted.
- E. Install control wiring to field-mounted electrical devices.
- F. Assemble unit sections and parts shipped loose or unassembled for shipment purposes. Follow manufacturer's installation recommendations and instructions.

3.3 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to boiler to allow service and maintenance.
- C. Install condensate drain piping to condensate-neutralization unit and from neutralization unit to nearest floor drain. Piping shall be at least full size of connection. Install piping with a minimum of 2 percent downward slope in direction of flow.
- D. Provide boiler manufacturer recommendation manifold pipe and fittings from each boiler to nearest floor drain or as indicated.
- E. Connect gas piping to boiler gas-train inlet with union. Piping shall be at least full size of gas-train connection. Provide a reducer if required.
- F. Connect hot-water piping to supply- and return-boiler tappings with flange at each connection.
- G. Install piping from safety relief valves to nearest floor drain.

- H. Install piping from safety valves to drip-pan elbow and to nearest floor drain.
- I. Boiler Venting:
 - 1. Field fabricate and install boiler vent and combustion-air intake.
 - 2. Utilize vent and intake duct material, size, and configuration as indicated in boiler manufacturer's instructions and to comply with UL 1738.
- J. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- K. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- L. Install electrical devices furnished by manufacturer, but not factory mounted, according to NFPA 70 and NECA 1.
- M. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
 - 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."
 - 2. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.
- N. Install control and electrical power wiring to field-mounted control devices.
- O. Connect control wiring in accordance with Section 260523 "Control-Voltage Electrical Power Cables."
- P. Install nameplate for each control connection, indicating field control panel designation and I/O control designation feeding connection.
 - 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."
 - 2. Nameplate shall be laminated acrylic or melamine plastic signs with a black background and engraved white letters at least 1/2 inch high.

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Perform installation and startup checks according to manufacturer's written instructions.
 - 2. Leak Test: Hydrostatic test. Repair leaks and retest until no leaks exist.

3. Operational Test: Start units to confirm proper motor rotation and unit operation. Adjust air-fuel ratio and combustion.
4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - a. Check and adjust initial operating set points and high- and low-limit safety set points of fuel supply, water level, and water temperature.
 - b. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
- C. Boiler will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports.
- E. Arrange with National Board of Boiler and Pressure Vessel Inspectors for inspection of boilers and piping. Obtain certification for completed boiler units, deliver to Owner, and obtain receipt.
- F. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.5 STARTUP AND TESTING

- A. The Commissioning Agent will observe startup and contractor testing of selected equipment. Coordinate the startup and contractor testing schedules with the Manufacturers representative and Commissioning Agent. Provide a minimum of 7 days prior notice.

3.6 COMMISSIONING

- A. Provide commissioning documentation in accordance with the requirements of Section 23 08 00 – COMMISSIONING OF HVAC SYSTEMS for all inspection, start up, and contractor testing required above and required by the System Readiness Checklist provided by the Commissioning Agent.
- B. Components provided under this section of the specification will be tested as part of a larger system. Refer to Section 23 08 00 – COMMISSIONING OF HVAC SYSTEMS and related sections for contractor responsibilities for system commissioning.

3.7 DEMONSTRATION AND TRAINING

- A. Train Owner's maintenance personnel to adjust, operate, and maintain boilers. Refer to Section 017900 "Demonstration and Training."
 1. Instructor shall be factory trained and certified.
 2. Provide not less than two hours of training.
 3. Train personnel in operation and maintenance and to obtain maximum efficiency in plant operation.

4. Provide instructional videos showing general operation and maintenance that are coordinated with operation and maintenance manuals.
5. Obtain Owner sign-off that training is complete.
6. Owner training shall be held at Project site.

END OF SECTION 23 52 16

SECTION 23 64 26.13 - AIR-COOLED, ROTARY-SCREW WATER CHILLERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes packaged, air-cooled chillers.

1.2 DEFINITIONS

- A. COP: Coefficient of performance. The ratio of the rate of heat removal to the rate of energy input using consistent units for any given set of rating conditions.
- B. DDC: Direct digital control.
- C. EER: Energy-efficiency ratio. The ratio of the cooling capacity given in terms of Btu/h to the total power input given in terms of watts at any given set of rating conditions.
- D. IPLV: Integrated part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 550/590 and referenced to AHRI standard rating conditions.
- E. kW/Ton: The ratio of total power input of the chiller in kilowatts to the net refrigerating capacity in tons at any given set of rating conditions.
- F. NPLV: Nonstandard part-load value. A single-number part-load efficiency figure of merit calculated per the method defined by AHRI 550/590 and intended for operating conditions other than AHRI standard rating conditions.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
- B. Sustainable Design Submittals:
 - 1. Refer to Section 01 81 13 "LEED Sustainable Design Requirements".
- C. Shop Drawings:
 - 1. Include plans, elevations, sections, and attachment details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, drawn to scale, and coordinated with each other, using input from installers of the items involved.
- B. Seismic Qualification Data: Certificates, for chillers, accessories, and components, from manufacturer.
- C. Source quality-control reports.
- D. Field Test Reports: Startup service reports.
- E. Sample warranty.

1.5 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.6 QUALITY ASSURANCE

- A. AHRI Certification: Certify chiller according to AHRI 590 certification program(s).
- B. AHRI Rating: Rate chiller performance according to requirements in AHRI 550/590.
- C. ASHRAE Compliance:
 - 1. ASHRAE 15 for safety code for mechanical refrigeration.
 - 2. ASHRAE 147 for refrigerant leaks, recovery, and handling and storage requirements.
- D. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1.
- E. ASME Compliance: Fabricate and label chiller to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, and include an ASME U-stamp and nameplate certifying compliance.
- F. Comply with NFPA 70.
- G. Comply with requirements of UL and UL Canada and include label by a qualified testing agency showing compliance.

1.7 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace components of chillers that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS**2.1 PERFORMANCE REQUIREMENTS**

- A. Site Altitude: Chiller shall be suitable for altitude in which installed without affecting performance indicated. Make adjustments to affected chiller components to account for site altitude.

2.2 PACKAGED, AIR-COOLED CHILLERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Carrier Global Corporation.
 2. Daikin Applied.
 3. Trane.
- B. Description: Factory-assembled and run-tested chiller complete with base and frame, condenser casing, compressors, compressor motors and motor controllers, evaporator, condenser coils, condenser fans and motors, electrical power, controls, and accessories.
- C. Cabinet:
1. Base: Galvanized-steel base extending the perimeter of chiller. Secure frame, compressors, and evaporator to base to provide a single-piece unit.
 2. Frame: Rigid galvanized-steel frame secured to base and designed to support cabinet, condenser, control panel, and other chiller components not directly supported by base.
 3. Casing: Galvanized steel.
- D. Compressors:
1. Description: Positive displacement, hermetically sealed.
 2. Casing: Cast iron, precision machined for minimum clearance about periphery of rotors.
 3. Rotors: Manufacturer's standard one- or two-rotor design.
 4. Each compressor provided with suction and discharge shutoff valves, crankcase oil heater, and suction strainer.
- E. Service: Easily accessible for inspection and service.
- F. Capacity Control: On-off compressor cycling and modulating slide-valve assembly or port unloaders combined with hot-gas bypass, if necessary, to achieve performance indicated.
1. Maintain stable operation throughout range of operation. Configure to achieve most energy-efficient operation possible.
 2. Operating Range: From 100 to 20 percent of design capacity.

3. Condenser-Air Unloading Requirements over Operating Range: Drop-in, entering condenser-air temperature of 5 deg F drop for each 10 percent in capacity reduction.
- G. Oil Lubrication System: Consisting of pump if required, filtration, heater, cooler, factory-wired power connection, and controls.
1. Provide lubrication to bearings, gears, and other rotating surfaces at all operating, startup, shutdown, and standby conditions including power failure.
 2. Thermostatically controlled oil heater properly sized to remove refrigerant from oil.
 3. Factory-installed and pressure-tested piping with isolation valves and accessories.
 4. Oil compatible with refrigerant and chiller components.
 5. Positive visual indication of oil level.
- H. Vibration Control:
1. Vibration Balance: Balance chiller compressors and drive assemblies to provide a precision balance that is free of noticeable vibration over the entire operating range.
 - a. Overspeed Test: 25 percent above design operating speed.
 2. Isolation: Mount individual compressors on vibration isolators.
- I. Compressor Motors:
1. Hermetically sealed and cooled by refrigerant suction gas.
 2. High-torque, induction type with inherent thermal-overload protection on each phase.
- J. Compressor Motor Controllers:
1. Variable-Frequency Controller:
 - a. Motor controller shall be factory mounted and wired on the chiller to provide a single-point, field-power termination to the chiller and its auxiliaries.
 - b. Description: NEMA ICS 2; listed and labeled as a complete unit and arranged to provide variable speed by adjusting output voltage and frequency.
 - c. Enclosure: Unit mounted, NEMA 250, Type 3R, with hinged full-front access door with lock and key.
 - d. Integral Disconnecting Means: Door-interlocked, UL 489, instantaneous-trip circuit breaker with lockable handle. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 35,000 A.
 - e. Technology: Pulse-width-modulated output suitable for constant or variable torque loads.
 - f. Motor current at start shall not exceed the rated load amperes, providing no electrical inrush.

K. Refrigerant Circuits:

1. Refrigerant: Type as indicated on Drawings.
2. Refrigerant Type: R513A. Classified as Safety Group A1 according to ASHRAE 34.
3. Refrigerant Compatibility: Chiller parts exposed to refrigerants shall be fully compatible with refrigerants, and pressure components shall be rated for refrigerant pressures.
4. Refrigerant Circuit: Each shall include a thermal- or electronic-expansion valve, refrigerant charging connections, a hot-gas muffler, compressor suction and discharge shutoff valves, a liquid-line shutoff valve, a replaceable-core filter-dryer, a sight glass with moisture indicator, a liquid-line solenoid valve, and an insulated suction line.
5. Pressure Relief Device:
 - a. Comply with requirements in ASHRAE 15 and in applicable portions of ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
 - b. ASME-rated, spring-loaded pressure relief valve; single- or multiple-reseating type.

L. Evaporator:

1. Description: Shell-and-tube design.
 - a. Direct-expansion type with fluid flowing through the shell, and refrigerant flowing through the tubes within the shell.
2. Code Compliance: Tested and stamped according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
3. Shell Material: Carbon steel.
4. Shell Heads: Removable carbon-steel heads located at each end of the tube bundle.
5. Fluid Nozzles: Terminated with flanged end connections for connection to field piping.
6. Tube Construction: Individually replaceable copper tubes with enhanced fin design, expanded into tube sheets.

M. Air-Cooled Condenser:

1. Plate-fin coil with integral subcooling on each circuit, rated at 450 psig.
 - a. Construct coil casing of galvanized or stainless steel.
 - b. Construct coils of copper tubes mechanically bonded to aluminum fins.
 - c. Hail Protection: Provide condenser coils with louvers, baffles, or hoods to protect against hail damage.
2. Fans: Direct-drive propeller type with statically and dynamically balanced fan blades, arranged for vertical air discharge.
3. Fan Motors: Totally enclosed nonventilating or totally enclosed air over enclosure, with permanently lubricated bearings. Equip each motor with overload protection integral to either the motor or chiller controls.

4. Fan Guards: Steel safety guards with corrosion-resistant coating.

N. Electrical Power:

1. Factory-installed and -wired switches, motor controllers, transformers, and other electrical devices necessary shall provide a single-point, field-power connection to chiller.
2. House in a unit-mounted, NEMA 250, Type 3R enclosure with hinged access door.
3. Wiring shall be numbered to match wiring diagram.
4. Install factory wiring outside of an enclosure in a raceway.
5. Field-power interface shall be to UL 489, instantaneous-trip circuit breaker with lockable handle.
 - a. Disconnect means shall be interlocked with door operation.
 - b. Minimum withstand rating shall be as required by electrical power distribution system, but not less than 35,000 A.
6. Provide branch power circuit to each motor and to controls with one of the following disconnecting means:
 - a. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
 - b. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit-trip set point.
7. Provide each motor with overcurrent protection.
8. Overload relay sized according to UL 1995 or an integral component of chiller control microprocessor.
9. Phase-Failure and Undervoltage Relays: Solid-state sensing with adjustable settings.
10. Control Relays: Auxiliary and adjustable time-delay relays.
11. For chiller electrical power supply, indicate the following:
 - a. Current and phase to phase for all three phases.
 - b. Voltage, phase to phase, and phase to neutral for all three phases.
 - c. Three-phase real power (kilowatts).
 - d. Three-phase reactive power (kilovolt amperes reactive).
 - e. Power factor.
 - f. Running log of total power versus time (kilowatt-hours).
 - g. Fault log, with time and date of each.

O. Controls:

1. Standalone and microprocessor based.
2. Enclosure: Share enclosure with electrical power devices or provide a separate enclosure.
3. Operator Interface: Multiple-character digital or graphic display with dynamic update of information and with keypad or touch-sensitive display located on front

of control enclosure. In either imperial or metric units, display the following information:

- a. Date and time.
 - b. Operating or alarm status.
 - c. Operating hours.
 - d. Outdoor-air temperature if required for chilled-water reset.
 - e. Temperature and pressure of operating set points.
 - f. Entering and leaving temperatures of chilled water.
 - g. Refrigerant pressures in evaporator and condenser.
 - h. Saturation temperature in evaporator and condenser.
 - i. No cooling load condition.
 - j. Elapsed time meter (compressor run status).
 - k. Pump status.
 - l. Antirecycling timer status.
 - m. Percent of maximum motor amperage.
 - n. Current-limit set point.
 - o. Number of compressor starts.
4. Control Functions:
- a. Manual or automatic startup and shutdown time schedule.
 - b. Entering and leaving chilled-water temperatures, control set points, and motor load limits. Chilled-water leaving temperature shall be reset based on outdoor-air temperature.
 - c. Current limit and demand limit.
 - d. External chiller emergency stop.
 - e. Antirecycling timer.
 - f. Automatic lead-lag switching.
 - g. Variable evaporator flow.
 - h. Thermal storage.
5. Manually Reset Safety Controls: The following conditions shall shut down chiller and require manual reset:
- a. Low evaporator pressure or high condenser pressure.
 - b. Low chilled-water temperature.
 - c. Refrigerant high pressure.
 - d. High or low oil pressure.
 - e. High oil temperature.
 - f. Loss of chilled-water flow.
 - g. Control device failure.
6. Trending: Capability to trend analog data of up to five parameters simultaneously over an adjustable period and frequency of polling.
7. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: view only; view and operate; and view, operate, and service.
8. Control Authority: At least four conditions: Off, local manual control at chiller, local automatic control at chiller, and automatic control through a remote source.

9. Interface with DDC System for HVAC: Factory-installed hardware and software to enable the DDC system for HVAC to monitor, control, and display chiller status and alarms.
 - 1) **point>**.
 - b. ASHRAE 135 (BACnet) communication interface with the DDC system for HVAC shall enable the DDC system for HVAC operator to remotely control and monitor the chiller from an operator workstation. Control features and monitoring points displayed locally at chiller control panel shall be available through the DDC system for HVAC.
- P. Insulation: Closed-cell, flexible elastomeric, thermal insulation complying with ASTM C534, Type I for tubular materials and Type II for sheet materials.
- Q. Accessories:
 1. Factory-furnished, chilled-water flow switches for field installation.
 2. Individual compressor suction and discharge pressure gages with shutoff valves for each refrigerant circuit.
 3. Factory-furnished neoprene isolators for field installation.

2.3 SOURCE QUALITY CONTROL

- A. Perform functional tests of chillers before shipping.
- B. Factory run test each air-cooled chiller with water flowing through evaporator.
- C. Factory performance test air-cooled chillers, before shipping, according to AHRI 550/590.
 1. Test the following conditions:
 - a. Design conditions indicated.
 - b. Reduction in capacity from design to minimum load in steps of 10 with condenser air at design conditions.
 2. Prepare test report indicating test procedures, instrumentation, test conditions, and results. Submit copy of results within one week of test date.
- D. Factory sound test air-cooled chillers, before shipping, according to AHRI 370.
 1. Test the following conditions:
 - a. Design conditions indicated.
 - b. Chiller operating at calculated worst-case sound condition.
 - c. At four point(s) of varying part-load performance to be selected by Owner at time of test.
 2. Prepare test report indicating test procedures, instrumentation, test conditions, and results. Submit copy of results within one week of test date.

- E. Factory test and inspect evaporator and condenser according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
- F. For chillers located outdoors, rate sound power level according to AHRI 370.

PART 3 - EXECUTION

3.1 CHILLER INSTALLATION

- A. Coordinate sizes, locations, and anchoring attachments of structural-steel support structures.
- B. Install chillers on support structure indicated.
- C. Equipment Mounting:
 - 1. Comply with requirements for vibration isolation devices specified in Section 230548 "Vibration Controls for HVAC Piping & Equipment."
- D. Maintain manufacturer's recommended clearances for service and maintenance.
- E. Charge chiller with refrigerant and fill with oil if not factory installed.
- F. Install separate devices furnished by manufacturer and not factory installed.

3.2 CONNECTIONS

- A. Comply with requirements for piping specified in Section 232113 "Hydronic Piping," and Section 232300 "Refrigerant Piping." Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to chiller to allow service and maintenance.
- C. Evaporator Fluid Connections: Connect to evaporator inlet with shutoff valve, strainer, flexible connector, thermometer, and plugged tee with pressure gage. Connect to evaporator outlet with shutoff valve, balancing valve, flexible connector, flow switch, thermometer, plugged tee with shutoff valve and pressure gage, flow meter, and drain connection with valve. Make connections to chiller with a flange.
- D. Connect each chiller drain connection with a union and drain pipe, and extend pipe, full size of connection, to floor drain. Provide a shutoff valve at each connection.

3.3 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.
 - 2. Verify that refrigerant charge is sufficient and chiller has been leak tested.

3. Verify that pumps are installed and functional.
 4. Verify that thermometers and gages are installed.
 5. Operate chiller for run-in period.
 6. Check bearing lubrication and oil levels.
 7. For chillers installed indoors, verify that refrigerant pressure relief device is vented outdoors.
 8. Verify proper motor rotation.
 9. Verify static deflection of vibration isolators, including deflection during chiller startup and shutdown.
 10. Verify and record performance of fluid flow and low-temperature interlocks for evaporator and condenser.
 11. Verify and record performance of chiller protection devices.
 12. Test and adjust controls and safeties. Replace damaged or malfunctioning controls and equipment.
- B. Inspect field-assembled components, equipment installation, and piping and electrical connections for proper assembly, installation, and connection.
- C. Prepare test and inspection startup reports.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain chillers.

END OF SECTION 23 64 26.13

SECTION 23 73 43.19 - OUTDOOR, CUSTOM AIR-HANDLING UNITS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Outdoor, custom air-handling units.

1.2 ACTION SUBMITTALS

A. Product Data: For each air-handling unit.

B. Sustainable Design Submittals:

1. Refer to Section 01 81 13 "LEED Sustainable Design Requirements".

C. Shop Drawings: For each type and configuration of indoor, custom air-handling unit.

1. Prepared by manufacturer's factory employees with review and sign-off by those individuals responsible for manufacturing the air-handling units.
2. Include plans, elevations, sections, and mounting details.
3. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, methods of field assembly, components, and location and size of each field connection.
4. Detail fabrication and assembly of indoor, custom air-handling units, as well as procedures and diagrams.
5. Indicate details of construction with materials description including applicable specified standards and material grades in sufficient detail for reviewers to evaluate point by point compliance with requirements indicated for each air-handling unit.
6. Use actual dimensions of internal equipment in preparing Shop Drawings. Identify mechanical equipment shown on Shop Drawings with equipment designations on Drawings.
7. Thickness and finish of all casing materials with cross references indicated where each is used. Uniquely identify and include information for each different casing construction.
8. Details for each unique casing joint and reinforcing. Indicate wall joints, wall to floor joints, wall to roof joints, floor joints, and roof joints.
9. Roofing details.
10. Assembly details of base and casing for units consisting of multiple sections requiring field assembly.
11. Sizes and dimensioned locations of field connections for ductwork, piping, electrical, and controls.
12. Base and casing penetration and sealing details for factory-installed conduit.

13. Base and casing penetration and sealing details for factory-installed piping including coils.
14. Details of casing connections to field-installed ductwork.
15. Size, shape and layout of base members including localized support of internal components.
16. Base materials, thickness, finishes, lifting provisions, and mounting requirements. Uniquely identify and include information for each different base construction. Clearly indicate for each air-handling unit.
17. Recommended points of field attachment with dimensioned locations.
18. Size and location of each access door, including clearing opening size, with door swing indicated.
19. Size and location of each access panel with service equipment superimposed to show relationship of panel to internal equipment.
20. Drain pans and associated piping, with sizes and locations dimensioned, including relationship to internal equipment.
21. Floor drains and associated piping, with sizes and locations dimensioned, including relation to internal equipment.
22. Coil framework and support including enlarged details showing framework attachment to air-handling unit base, coil attachment to framework, and means for individual coil removal.
23. Mounting details of all internal components, such as fans, filters, and dampers.
24. Hoist rails layout for internal equipment showing size of members, attachments to structure, and serviced equipment superimposed to indicate relationships.
25. Size and location of catwalks, handrails, ladders, and safety cages including construction details and details of attachment to air-handling unit base.
26. Location of receptacles, service lights, and switches.
27. Location of motor controllers and disconnect switches.
28. Size and location of junction boxes used for interface with field electrical power.
29. Point-to-point electrical power wiring diagrams including wire size, conduit size, motor controllers sizes, switch types and ratings, receptacle types and ratings, service light fixture types and ratings.
30. Point-to-point control wiring diagrams including cable types and sizes, conduit sizes, and connected control devices.
31. Point-to-point control tubing diagrams including tubing types and sizes, conduit sizes, and connection controls devices.
32. Control panel drawings drawn to scale showing detailed internal layout.
33. Plans, sections and isometric reviews of hydronic piping systems showing pipe, fittings, flanges, unions, valves, vents, strainers, accessories, specialties and insulation.
34. Indicate code, operating, and maintenance clearances drawn to scale using dashed lines.
35. Indicate weights of internal components, weight of each separately shipped section, and air-handling unit total weight.

D. Comparison Schedule:

1. Submit a schedule to indicate performance of equipment scheduled on Drawings directly compared to performance of submitted equipment.
2. Clearly identify each line in schedule to indicate "Scheduled" where indicating performance scheduled on Drawings and "Submitted" where indicating performance of submitted equipment.

3. Organize schedule to first indicate performance scheduled on Drawings on one line followed by line directly below that indicates performance of submitted equipment.
 4. Comparison schedule shall follow arrangement and organization of scheduled information indicated on Drawings.
 5. Submitted equipment shall have a value for each scheduled value indicated.
- E. Delegated Design Submittals: For vibration isolation indicated to comply with performance requirements and design criteria, including analysis data.

1.3 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, sections, and other details, or BIM model, drawn to scale and coordinated with all building trades.
- B. Source quality-control reports.
- C. Startup service reports.
- D. Field quality-control reports.
- E. Sample warranty.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.5 COORDINATION

- A. Coordinate sizes and locations of concrete bases with actual equipment provided.
- B. Coordinate sizes and locations of structural-steel support members, if any, with actual equipment provided.

1.6 FACTORY VISITS FOR PRODUCT INSPECTION

- A. While units are being manufactured, and during factory normal working hours, allow escorted access to manufacturing facility for Owner and Owner's designated representative to verify product compliance with requirements indicated.
- B. Manufacturer shall provide Owner with written notice at least 45 business days before units go into assembly.
- C. Inspection visits shall be scheduled with manufacturer at least 15 business days before visit.
- D. Personnel making visits for purposes of product inspection shall comply with manufacturer requirements for visitors.

1.7 WARRANTY

- A. Warranty: Manufacturer agrees to repair or replace components of air-handling units that fails in materials or workmanship within specified warranty period.
 - 1. Warranty Period: 1 year(s) from date of Substantial Completion.
- B. Extended warranties include, but are not limited to, the following:
 - 1. Complete Air-Handling Unit: Two years from date of Substantial Completion for entire air-handling unit and longer where indicated for individual components.
 - 2. Air-Handling Unit Casing: 25 years from date of Substantial Completion.
 - 3. Air-Handling Unit Roofing: 25 years from date of Substantial Completion.
 - 4. Motors: Two years from date of Substantial Completion
 - 5. Heat Wheels: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.
- B. NFPA Compliance: Comply with NFPA 90A for design, fabrication, and installation of air-handling units and components.
- C. ASHRAE 62.1 Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."
- D. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."
- E. Delegated Design: Engage a qualified professional specialist, as defined in Section 014000 "Quality Requirements," to design air-handling units, vibration isolation, including comprehensive engineering analysis, using performance requirements and design criteria indicated.
- F. Casing Structural Performance:
 - 1. Unit construction: Double wall galvanized steel.
 - 2. Floor: Capable of withstanding positive/negative 8 inches wg of internal static pressure, without exceeding a deflection of L/300 of span.
 - 3. Walls and Roof: Capable of withstanding positive/negative 8 inches wg of internal static pressure, without exceeding a midpoint deflection of L/200 of span.
- G. Casing Leakage Performance:
 - 1. Casing shall leak less than 0.5% of design CFM at +/-12" w.g. static pressure and have deflection less than L/250.

- H. Casing Thermal Performance:
1. Surface Condensation: Air-handling manufacturer shall evaluate potential for condensation and design and manufacture entire unit casing to prevent condensation at most extreme operating conditions encountered.
 2. Thermal Break: Incorporate a thermal break at each through metal path to prevent condensation from occurring on interior and exterior of casing.
 3. U-Value: Overall U-value or equivalent R-value of casing shall not exceed governing codes and ASHRAE/IES 90.1 while considering the effects of metal-to-metal contact and thermal bridging in calculations.
- I. Air Tunnel Aerodynamic Performance: Position air-handling unit internal components and transition between internal components to maintain uniform airflow; minimize sound levels and energy consumption. Use methods indicated and other means to ensure compliance.
1. Use turning vanes if necessary to direct the air path.
 - a. Design, manufacture, and install vanes in accordance with applicable requirements in ASHRAE and SMACNA guidelines, handbooks, and standards.
 - b. Install vanes firmly in place so that no vane movement occurs at worst-case airflow capacity possible.
 2. Use fan inlet and discharge transitions and other devices to maximize system regain and minimize airborne sound levels.
 3. Center system components such as coils, fans, and filters, vertically and horizontally, in the airstream.
 4. Maintain spacing between components such that airflow patterns to adjacent components are as uniform as possible and that component "dead spots" or "jetted areas" are avoided.
 5. Design and install internal structural supports, piping, and conduit that do not block airflow and impede performance of coils, fans, filters, and other unit components, and service space clearances.
- J. Air-Handling Unit Acoustical Performance:
1. Radiated Noise: Noise radiated from air-handling unit casing shall not exceed following sound pressure levels when measured 3 feet away from any exterior surface of unit. Sound pressure levels indicated in each octave band are in decibels (dB) (reference 20 μ Pa).
 - a. 63 Hz: <Insert value> dB.
 - b. 125 Hz: <Insert value> dB.
 - c. 250 Hz: <Insert value> dB.
 - d. 500 Hz: <Insert value> dB.
 - e. 1000 Hz: <Insert value> dB.
 - f. 2000 Hz: <Insert value> dB.
 - g. 4000 Hz: <Insert value> dB.
- K. Casing Acoustical Performance:

1. Sound Absorption: Minimum acceptable sound absorption coefficient and noise reduction coefficient (NRC) of perforated inside casing assemblies when tested by an independent testing laboratory in accordance with ASTM C423 and ASTM E795:
 - a. 125 Hz: <Insert value> dB.
 - b. 250 Hz: <Insert value> dB.
 - c. 500 Hz: <Insert value> dB.
 - d. 1000 Hz: <Insert value> dB.
 - e. 2000 Hz: <Insert value> dB.
 - f. 4000 Hz: <Insert value> dB.
 - g. NRC: <Insert value>.

- L. Safety:
 1. Comply with OSHA regulations.
 2. Exposed sharp edges and corners of metal shall be protected or rounded to prevent injury to personnel not wearing gloves.
 3. Cover exposed ends of screws with plastic or metal covers to prevent injury to personnel coming in contact with screws.

- M. Serviceability:
 1. Hoisting Provisions: Fans and motors weighing more than 200 lb to have full-length hoist rails mounted over the equipment to facilitate service, removal, and replacement.
 2. Mounting Location: Install internal components in readily accessible locations to facilitate ease of service and replacement.
 3. Service Access:
 - a. Internal components shall be serviceable through access sections with doors indicated on Drawings.
 - b. Internal components shall be removable and replaceable through access doors or panels.
 - c. Review requirements for access doors and panels indicated and recommend additional access doors and panels if required for uninhabited service, removal, and replacement of components.
 4. Tripping Hazards: Floors in accessible sections of air-handling unit shall be free of standing seams, reinforcing, supports, or section splits located in the walking path that is capable of causing a tripping hazard. Locate section splits immediately adjacent to internal walls.

- N. Quality: Type and thickness of materials indicated are the minimum acceptable. Provide better-quality materials of a heavier thickness if required to comply with performance requirements indicated.
 1. If manufacturer's standard construction exceeds requirements indicated, use manufacturer's standard construction.

2. If manufacturer's standard construction does not comply with requirements indicated, modify manufacturer's standard construction to comply with requirements.
- O. Vibration Performance: Air-handling unit manufacturer shall evaluate vibration of internal components installed inside of air-handling units and include internal vibration isolation required to limit the vibration transmitted to the building at a low enough level that vibration is not perceived by building occupants.

2.2 CAPACITIES AND CHARACTERISTICS

- A. See equipment schedules on Drawings.

2.3 OUTDOOR, CUSTOM AIR-HANDLING UNITS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Daikin Applied .
 2. Nortek Air Solutions.
 3. Trane Custom.
- B. Unit Arrangement And Configuration:
 1. Arrangement: Project-specific arrangement and configuration of air-handling units indicated on Drawings. Do not deviate from requirements indicated.
 2. Mounting Requirements: Units mounted on vibration isolation roof curbs.
 3. Multiple Sections, Splits: Air-handling unit manufacturer to determine number of sections and location of section splits required for each air-handling unit in accordance with the following criteria:
 - a. Physical size and weight of each section, on-site path of travel, and methods for erection and installation. Air-handling manufacturer to review criteria with Installer before preparing Shop Drawings.
 - b. Maximize physical size of each air-handling unit section considering, shipping, moving, erecting, and installation.
 - c. Minimize the number of air-handling unit sections requiring field assembly. Preference is for single-piece air-handling units where possible.
- C. Air-Handling Unit Base:
 1. Performance:
 - a. Air-handling unit manufacturer shall design and assemble air-handling unit casing and internal components for attachment and support by air-handling unit structural base.
 - b. Design air-handling units to be lifted from only the air-handling unit structural base and not the casing.

- c. Support air-handling units from only the perimeter base unless otherwise indicated on Drawings.
 - d. Air-handling unit manufacturer to size and locate intermediate structural base supports as required to comply with structural performance indicated for air-handling unit floors.
 - e. Level base before factory assembly of air-handling unit casing and internal components to ensure proper fit and alignment.
2. Structural Member Size:
- a. Air-handling unit manufacturer shall select size of base members and construction of base to withstand the rigors of loading, unloading, shipping, and rigging without damage to air-handling unit components or misalignment of factory-assembled components.
 - b. Depth and weight of structural members shall be selected by air-handling unit manufacturer to comply with performance requirements indicated.
 - c. Depth of perimeter base members is not less than size indicated on Drawings.
3. Structural Member Spacing: Positioned as required to comply with requirements indicated, but not to exceed 24 inches.
4. Materials: structural carbon steel, ASTM A36/A36M.
5. Carbon-Steel Finish: Carbon-steel bases shall be shot-blasted, cleaned, prepared, and hot-dip galvanized after fabrication.
6. Welding Filler Metals: Comply with AWS welding codes for welding materials appropriate for thickness and chemical analysis of material being welded.
- a. Use welding materials with corrosion properties equal to material being welded.
7. Welding Procedures:
- a. Structural Welding Codes: AWS D1.1/D1.1M for carbon steel.
 - b. Join structural members to one another using continuous welds.
 - c. After welding and fabrication, deburr and grind exposed welds to provide smooth surfaces free of sharp edges.
8. Penetrations through Base Perimeter: Sealpipe, tubing, and conduit penetrations through base perimeter members to provide a watertight assembly.
9. Section Joints: Air-handling units consisting of multiple sections for field assembly shall be joined with structural joining plates.
- a. Joining plate material type to match base.
 - b. Joining plate of thickness required to join sections without resulting in a permanent deflection, minimum 1/2 inch thick.
 - c. Continuously weld joining plates to each mating end of base.
 - d. Joining plates shall not extend beyond outer edge of adjoining base.
 - e. Plates to include at least three equally spaced holes for field connection using factory-furnished threaded hardware of a nominal diameter of at least 1/2 inch.

10. Lifting Provisions: Air-handling unit manufacturer to design and install lifting lugs of size and location required to comply with performance requirements indicated.
11. Curb Cap:
 - a. For air-handling units installed on a continuous perimeter curb, provide air-handling unit base with a continuous structural angle counterflashing.
 - b. Angle shall extend down vertical face of curb to completely cover wood nailer.
 - c. Coordinate inside dimension of angle counterflashing with curb dimension and roofing. Provide adequate clearance between angle counterflashing and roofing over curb.

D. Unit Casings:

1. Casing Assembly:
 - a. Appearance:
 - 1) Exposed exterior surfaces of casing shall have a neat and finished appearance free of standing seams, exposed reinforcing, and other casing protrusions more than 0.25 inch beyond the exterior skin surface.
 - 2) Interior surfaces of casing shall have a neat and finished appearance free of standing seams, exposed reinforcing, and other casing protrusions more than 0.25 inch beyond the skin surface.
 - b. Dissimilar Metals: Isolate dissimilar metals that are in contact to prevent galvanic action and corrosion.
 - c. Framing and Supports: Interconnect and support individual casing wall and roof panels using either formed panel construction or framed construction with structural support members. For framed casing construction, materials used to construct casing of structural support members shall be as follows:
 - 1) Casings with Aluminum Outer and Inner Skins: Aluminum extrusions in accordance with ASTM B211 Alloy 6063 T6.
 - 2) Casings with Galvanized-Steel Outer and Inner Skins: Galvanized steel.
 - 3) Casings with Galvanized-Steel Outer Skin and Aluminum or Stainless Steel Inner Skins: Stainless steel.
 - 4) Casings with Stainless Steel Outer and Inner Skins: Stainless steel.
 - d. Seals: Seal interior and exterior joints and seams to make casing air- and watertight. Trim factory-applied sealant flush with adjacent surface.
 - e. Double-Wall Casings: Consisting of insulation sandwiched between an outer and inner metal wall. Use double-wall casings to construct air-handling units unless septum casings are required.
 - f. Septum Casings: Triple-wall construction consisting of a solid metal inner wall sandwiched between insulation layers that are covered with metal walls. Use septum casings for applications having performance requirements that are not achievable with double-wall casings.
 - g. Penetrations: Seal voids around conduit, piping and tubing penetrations.

- h. Floors: Route conduit, pipe, and tube within a floor-mounted pipe sleeve.
 - 1) Sleeve:
 - a) Fabricate sleeve of aluminum or stainless steel pipe.
 - b) Extend top of sleeve above adjacent floor surface to prevent standing water on floor from entering annular space of sleeve.
 - c) Seal weld sleeve to top of floor for an air- and watertight seal.
 - d) Seal annular void of sleeve using an adjustable compression seal.

- i. Floor Openings with Metal Grating:
 - 1) Factory install walk-on safety gratings over any floor opening large enough to create a safety hazard for operators including, but not be limited to, supply-, return-, and exhaust-air openings.
 - 2) Bar Grating:
 - a) Materials: Use hot-dip galvanized-steel grating for galvanized-steel floors.
 - b) Air-handling unit manufacturer shall select depth and thickness of grating bars to limit deflection to 1/360 of span when subjected to a dynamic load of not less than 500 lb.
 - c) Industry-standard welded grating with bars at least 1-1/2 inches deep by at least 3/16 inch thick with nominal 1-3/16-inch main bar spacing and 4-inch cross bar spacing.
 - d) Source: Product manufacturer specializing in metal gratings.
 - e) Grating bearing surface shall extend beyond clear opening in floor at least 2 inches.
 - 3) Mounting Frame:
 - a) Mount grating in a continuous structural angle or bar frame so no ends of grating bars are exposed. Top of frame to be flush with top of grating.
 - b) Secure grating to frame with threaded hardware so grating does not move when walked on but can be easily removed from top to gain access behind grating.
 - c) Continuously weld mounting frame to air-handling unit floor.
 - d) For applications with automatic dampers installed at floor openings, elevate height of mounting frame and grating to enclose entire damper assembly including jackshaft so walk-on surface of grating is above damper assembly.

- j. Waterproof Floors: Continuously weld floor joints, seams, and penetrations to completely seal floor. Roll all edges of floor up at least 1 inch to create a shallow tub capable of holding standing water.

- k. Duct Connections - Direct to Casing: Frame and reinforce unit casing around perimeter of unit duct openings to accommodate direct attachment of field-installed ductwork. Coordinate requirements with Installer to accommodate field connection.

- I. Duct Connections - Elevated Off Casing:
 - 1) Terminate with angle flange face elevated 3 inches from exterior surface of casing.
 - 2) Flange Thickness: 0.25 inch.
 - 3) Flange face with holes located not more than 4 inches o.c., starting at corners, and sized for 0.375-inch- diameter, field-installed hardware.
 - 4) Size flange face to mate to full face of duct flange.
 - a) Clear inside dimension of unit connection to match clear inside dimension of duct.
 - b) For connections to acoustically lined ducts, increase unit flange face to accommodate thickness of liner so end of duct liner is concealed by air-handling unit flange.
2. Materials for Outer Skin of Casing Walls and Roofs:
 - a. Galvanized-Steel Solid Sheet: ASTM A653/A653M; G90 coating; minimum (nominal) 18 gauge thick.
 - b. Application: See Drawings for application of different materials indicated.
3. Materials for Inner Skin of Casing Walls and Roofs:
 - a. Galvanized-Steel Solid and Perforated Sheet: ASTM A653/A653M; G90 coating, minimum (nominal) 18 gauge thick.
 - b. Application: See Drawings for application of different materials indicated.
4. Materials for Floor Walking Surface:
 - a. Galvanized-Steel Solid Sheet: ASTM A653/A653M; G90 coating; minimum (nominal) 14 gauge thick.
 - b. Carbon-Steel Diamond Treadplate: ASTM A786/A786M, painted finish; minimum (nominal) 0.125 inch thick.
 - c. Application: See Drawings for application of different materials indicated.
5. Materials for Underside of Floor Insulation:
 - a. Galvanized-Steel Solid Sheet: ASTM A653/A653M; G90 coating, minimum (nominal) 16 gauge thick.
 - b. Application: See Drawings for application of different materials indicated.
6. Materials for Internal Walls:
 - a. Galvanized-Steel Solid Sheet: ASTM A653/A653M; G90 coating; minimum (nominal) 16 gauge thick.
 - b. Application: See Drawings for application of different materials indicated.
7. Surfaces in Contact with Airstream:
 - a. Comply with ASHRAE 62.1 and NFPA 90A.

- b. Glass or mineral-fiber insulation installed behind perforated metal shall be encapsulated to prevent insulation fibers from entering the airstream by using a tightly woven glass cloth material that does not impact the acoustical absorption properties of insulation.
8. Insulation for Casing Walls and Roofs Not Exposed to Airstream:
 - a. Materials Not Exposed to Airstream: injected or sprayed polyurethane foam or polyurethane foam board insulation with a minimum nominal density of 2 lb/cu. ft..
 - b. R-Value: Minimum R-25.
 - c. Thickness: 4 inches.
 - d. Insulation shall completely fill the casing cavity so no voids exist and provide mid-span, no-through metal, internal thermal break design.
9. Insulation for Casing Walls and Roofs Exposed to Airstream:
 - a. Materials Exposed to Airstream: Glass or mineral-fiber board insulation with a minimum density of 2 lb/cu. ft..
 - b. R-Value: Minimum R-8.
 - c. Thickness: Minimum 2 inches.
 - d. Insulation shall completely fill the casing cavity so no voids exist.
10. Insulation for Casing Floors:
 - a. Materials: injected or sprayed polyurethane foam or polyurethane foam board insulation with a minimum nominal density of 2 lb/cu. ft..
 - b. R-Value: Minimum R-8.
 - c. Thickness: Minimum 2 inches.
 - d. Insulation shall completely fill the casing cavity so no voids exist.
11. Access Doors:
 - a. Application: Install access doors in air-handling units at locations indicated on Drawings.
 - b. Adjustment: Design doors for field adjustment capable of maintaining specified leakage rate.
 - c. Mounting Height: Install bottom of door frame within 2 inches of air-handling unit floor walking surface.
 - d. Performance: Leakage as required to satisfy overall unit leakage performance indicated, but not more than 1.0 cfm per door when tested at 10 inches wg.
 - e. Fabrication: Formed and reinforced, constructed of same materials and thicknesses as casing.
 - f. Swing: Arrange doors to be opened against pressure, unless otherwise indicated on Drawings.
 - g. Frame: galvanized steel or stainless steel with welded mitered corners.
 - h. Handles:
 - 1) Secure door closed using not less than twolatches with handles located at quarter points along door height.

- 2) If three latches with handles are included, install one at midpoint of door height and equally space others.
 - 3) Air-handling unit manufacturer has option to use a multipoint latching mechanism that is operable from a single door handle located at midpoint of door height, but secures door to frame at top, bottom, and handle location.
 - 4) Include door handles on outside and inside of door to allow operator access to open and close door from outside and inside of unit.
 - 5) Field adjustable to accommodate changes to fit and gasket compression.
 - 6) Durable product capable of withstanding repeated opening and closing of door while operating under design pressure without damage.
- i. Hinges: minimum of three hinges or full-length, concealed, stainless steel piano hinge.
 - j. Gasket:
 - 1) Design: Specially formed with an internal air chamber specifically designed to seal on two surfaces without taking a permanent set.
 - 2) Dual Gaskets: Primary and secondary gasket.
 - 3) Location: Install gaskets around entire perimeter of doors or frames.
 - 4) Material: EPDM, neoprene, or santoprene.
 - 5) Protection: Seat gasket in a protective metal ribbed chamber integral to door or door frame to protect gasket from damage by operator incidental contact.
 - 6) Service: Field replaceable.
 - 7) Adhesive-backed tape-type gaskets adhered to a single flat surface are unacceptable.
 - k. Size of Door Frame Clear Opening: Large enough to allow for unobstructed access for inspection and maintenance of air-handling unit's internal components.
 - 1) Width: At least 18 inches clear inside of door frame.
 - 2) Height: Full clear height of unit casing up to a maximum height of 60 inches clear inside of door frame.
 - 3) Door sizes indicated on Drawings.
 - l. Safety Latches and Stops:
 - 1) Safety Latches: Install safety latch with retainers on outward swing doors that do not open against pressure to allow restricted travel for purpose of pressure relief and so that doors do not open uncontrollably due to inside pressure.
 - 2) Stops: Install cushioned door stops on inward swinging doors where necessary to limit door travel that could potentially damage the door or internal components.
 - m. Locks: Include each access door with an integral key lock. Pad locks are unacceptable.

- 1) Incorporate key lock into door handle where feature is available.
- 2) A common key shall be used to lock and unlock access doors of all air-handling unit(s).
- 3) Include two keys.
- 4) Lock access doors at factory to ensure that unauthorized access is in place before air-handling unit packaging and shipment.

n. Nameplates:

- 1) On each access door, include a nameplate defining the access to service within. Nameplates shall be included for, but not be limited to, the following:
 - a) Dampers.
 - b) Filters.
 - c) Cooling Coils.
 - d) Heating Coils.
 - e) Electric Heaters.
 - f) Heat Wheels.
 - g) Supply Fans.
 - h) Exhaust Fans.
 - i) Return Fans.
 - j) Humidifiers.
 - k) Air-handling unit designation.
 - l) Where door access is to multiple components, list all components accessed. For example: Filter/Cooling Coil.
 - m) For each door that does not open against static pressure, include a warning sign stating: "DANGER: DOOR UNDER PRESSURE. DO NOT OPEN WITH FAN ON."
- 2) Lettering Size and Style: At least 1-inch- high, block style.
- 3) Material: Lettering engraved in black plastic on a white plastic back. Engraving shall penetrate through black plastic so lettering reads white.
- 4) Attachment: Attach nameplates to door using high-strength bonding cement and stainless steel screws.
- 5) Mounting Location:
 - a) For access doors without windows, locate top of nameplate 6 inches from top of door and center in door width.
 - b) For access doors with windows, locate nameplate directly above window frame and center in door width.
 - c) Align nameplates of all doors for uniform placement.

12. Access Panels:

- a. Performance: Leakage as required to satisfy overall unit leakage performance indicated.
- b. Fabrication: Formed and reinforced panels of same material and thickness as casing.

- c. Fasteners: Adjustable, reusable type for multiple operations without degradation due to reuse. Do not use screws capable of stripping.
 - d. Arrangement: Panels removable from exterior side of casing.
 - e. Gasket: EPDM, neoprene, or santoprene similar to access doors, applied around entire perimeter of panels or frames.
 - f. Location and Size:
 - 1) Coils and Electric Heaters: Oversized access panel to allow removal and replacement without impacting adjacent casing.
 - 2) Fans: Oversized access panel to allow removal and replacement of entire fan assembly including base without impacting adjacent casing.
 - 3) Heat Wheels and Heat Exchangers: Oversized access panel to allow removal and replacement of internal components without impacting adjacent casing.
 - 4) Humidifiers: Oversized access panel to allow removal and replacement without impacting adjacent casing.
 - g. Nameplates:
 - 1) On each access panel, include a nameplate defining the access to service within. Nameplates shall be included for, but not be limited to, the following:
 - a) Cooling Coils.
 - b) Heating Coils.
 - c) Electric Heaters.
 - d) Heat Wheels.
 - e) Fixed Plate Exchangers.
 - f) Humidifiers.
 - g) Supply Fans.
 - h) Exhaust Fans.
 - i) Return Fans.
13. Standing-Seam Metal Roof: Construct air-handling unit roof casing with standing seams designed for waterproof roofing applications.
- a. Construct air-handling unit roof using same materials and finish as walls.
 - b. Slope roof away from primary access side of unit at not less than 1 percent.
 - c. For air-handling units shipped in multiple sections, include standing-seam joiners at each split with adhesive, hardware, and cover strips for field joining by Installer.
14. Roofing Membrane:
- a. Cover entire roof with a roofing membrane. Extend membrane down sides of unit a sufficient distance to provide a waterproof roof assembly and secure in place with a metal flashing matching casing material and finish.
 - 1) Roofing membrane shall have an elongation of at least 450 percent when tested in accordance with ASTM D412.

- 2) Roofing membrane shall not become brittle at temperatures down to minus 40 deg F.
 - b. Slope unit roof away from primary access side of unit at a slope in accordance with roofing manufacturer's written instructions, but not less than 1 percent.
 - c. Application: Factory or field applied as determined by air-handling unit manufacturer; in accordance with roof manufacturer's written instructions.
 - 1) Field-applied roofing to be supervised by an air-handling unit manufacturer's factory service representative.
15. Liquid-Applied Roofing:
- a. Cover entire roof with a liquid-applied roofing. Extend liquid-applied roofing down sides of unit a sufficient distance to provide a waterproof roof assembly and cover sides with a metal flashing matching casing material and finish.
 - 1) Cured roofing shall have an elongation of at least 500 percent at 77 deg F and at least 300 percent at 0 deg F, when tested in accordance with ASTM D412.
 - 2) Roofing shall not become brittle at temperatures down to minus 40 deg F.
 - b. Slope unit roof away from primary access side of unit at a slope in accordance with roofing manufacturer's written instructions, but not less than 1 percent.
 - c. Application: Factory or field applied as determined by air-handling unit manufacturer; in accordance with roof manufacturer's written instructions.
 - 1) Field-applied roofing to be supervised by an air-handling unit manufacturer's factory service representative.
16. Service Corridors:
- a. Description: Integral walk-in service corridors with heated temperature-controlled indoor environment for weather-protected service access to unit access doors and factory-installed piping electrical and controls.
 - b. Size and Arrangement: As indicated on Drawings.
 - c. Construction: Base, floor, walls, and roof to match air-handling unit.
 - d. Access Doors:
 - 1) Width: Minimum 36-inch clear inside frame opening.
 - 2) For double-door applications, include door frames with removable center mullions for unrestricted access.
 - e. Electrical: Factory install and wire service lights with switches and receptacles.

- f. Indoor Environmental Control: Factory install HVAC equipment required to thermostatically controlled indoor environment to maintain following indoor conditions:
 - 1) Minimum Temperature: 50.
 - g. Field Connections to Factory-Installed Piping, Electrical, and Controls: Arranged to make field connections to factory terminations inside of service. Frame openings in air-handling unit floor to accommodate field connections.
- E. Internal Structural Supports:
- 1. General:
 - a. Air-handling unit manufacturer shall design and assemble air-handling unit internal structural supports for attachment and support by air-handling unit structural base.
 - b. Factory install structural supports for internal support casing if required to comply with casing structural performance.
 - c. Factory install hoist beams and rails over equipment to comply with performance requirements for service.
 - 2. Structural Member Size and Spacing:
 - a. Size: Air-handling unit manufacturer shall select size of members and construction to do the following:
 - 1) Withstand the rigors of loading, unloading, shipping and rigging without damage to air-handling unit components or misalignment of factory-assembled casing and components.
 - 2) Comply with performance requirements indicated.
 - b. Spacing: Positioned as required to comply with requirements.
 - 3. Materials: structural carbon steel, ASTM A36/A36M structural stainless steel, ASTM A276/A276M, Type 304L or structural stainless steel, ASTM A276/A276M, Type 316L.
 - a. Structural Supports: Angle channel I or W beam shapes or tube shapes selected by air-handling unit manufacturer for application.
 - b. Hoist Beams for Internal Components (Spanning Full Width of Unit): I or W beam shapes.
 - 4. Carbon-Steel Finish, Mill Galvanized: Mill-galvanized carbon steel with weld damaged areas cleaned, prepared, and painted with galvanized paint after fabrication.
 - 5. Carbon-Steel Finish: Carbon-steel bases shall be shot-blasted, cleaned, prepared, and painted or hot-dip galvanized after fabrication.
- F. Factory-Manufactured, Vibration Isolation Roof Curbs:

1. General:

- a. Curb mounted rooftop units shall be isolated on roof top spring isolation curb consisting of galvanized curb sections with integral vertical and laterally restrained isolators formed to fit the contractor supplied rooftop equipment. The spring isolation curb and acoustical treatment package shall provide a space and adjacent space noise criteria of NC 35 within the areas of the building.

The noise control manufacturer shall provide the following acoustical and pressure drop calculations, as part of the submittal package complete with a stamp from a professional engineer, to demonstrate that the resultant noise level in the indoor occupied space served by AHU-8,9,10 shall meet the above noise criteria through the following noise paths:

- 1) Supply Air Noise
- 2) Return Air Noise
- 3) Duct Breakout Noise
- 4) Supply Air Pressure Drop Including System Effects
- 5) Return Air Pressure Drop Including System Effects

- b. If the noise level in the occupied spaces exceeds the specified noise criteria level, it will be the financial responsibility of the noise control manufacture to provide product and labor to achieve the specified criteria. The current schedule is based on the sound power levels of the "basis of design" air handling units. Additional noise control required as a result of the purchase of noisier air handling units will be the financial responsibility of the purchasing Contractor.

The total noise contribution from other sources other than the AHU's must be at least 5 dB below the specified noise criteria. Use sound power levels of actual equipment to be installed on project. Analysis shall include breakout noise calculations.

- c. If products other than those of the basis of design manufacturer are supplied on the project, the purchasing Contractor assumes full performance, project schedule and monetary responsibility for meeting the project noise criteria, including any retrofit work that may be required.
- d. The silencers and the Custom Solution Noise Control Spring Isolation Roof Curb shall be built complete by the noise control manufacturer as an integral unit.

2. Construction

- a. The curb shall bear directly on the roof structure and shall be flashed and waterproofed into the roof's membrane waterproofing system by the installing contractor.
- b. The curb shall be constructed from a minimum of 16 ga G90 galvanized perimeter steel with a factory attached wood nailer. The perimeter steel seams shall be continuously welded. The galvanized perimeter curb steel shall be attached to a structural steel frame that incorporates a minimum of 4 restrained spring isolators that supports the rooftop unit.

- c. The curb shall have factory installed lifting points
- d. Curb sides and ends shall be capable of accepting 51 mm (2") external insulation furnished and installed by the roofing contractor or factory installed.
- e. The isolation springs shall be of the vertical and laterally restrained type. The springs shall be designed to be laterally stable and properly selected to provide minimum specified deflection with 50% additional travel to solid. Isolation springs shall be powder coated for corrosion resistance and have a minimum static spring deflection of 2 inches as scheduled.
- f. The isolation shall allow 6 mm (1/4") movement before resisting wind loads in any lateral direction.
- g. The perimeter of the curb shall have a flexible neoprene air and weather seal joining the upper and lower curb sections. There shall also be a continuous closed cell sponge material above the top of the spring isolation curb to provide a waterproof seal between the rooftop units.
- h. The spring isolation curb structure shall be shipped pre-assembled. Additional acoustic accessories shall be shipped loose for field installation.
- i. Curb shall be supplied with PE stamped, IBC compliant overturn calculations for site specific wind and seismic conditions.
- j. All acoustic installation hardware shall be provided by the isolation curb manufacturer.

G. Centrifugal Plenum Fans:

1. Operating Performance:

- a. Air-handling unit manufacturer shall account for, and include in, submitted fan selections any static pressure drops associated with unit, and system effect due to fan operating in the air-handling unit.
 - 1) Add additional static pressure to fan scheduled total static pressure.
 - 2) If fan motor horsepower is increased, notify Architect.
- b. Fans shall have sharply rising pressure characteristics at operating point and stable in operation. Fan horsepower characteristics shall be self-limiting and non-loading.
- c. Fan speed, brake horsepower, and sound power levels indicated are maximum acceptable.
- d. Motor horsepower, airflow rate, and static pressure are minimum acceptable. Motor horsepower shall be capable of handling maximum horsepower of fan at scheduled speed.
- e. Fan air performance ratings shall be based on tests in accordance with ASHRAE 51/AMCA 51 and AMCA 210.
- f. Base fans sound ratings on AMCA 300 and calculation methods in accordance with AMCA 301.
- g. At a minimum, fans shall have AMCA class indicated on Drawings.
 - 1) Fan operating limits shall be in accordance with AMCA 99 for AMCA class indicated.
 - 2) If AMCA class is not indicated, use AMCA 99 as basis for determining AMCA class.

- 3) AMCA class selected shall be capable of accommodating a plus 10 percent increase to fan static pressure indicated on Drawings.
- h. Motor starting torque shall exceed fans speed-torque requirements.
2. Vibration Balance:
 - a. Each fan/motor assembly shall be factory balanced to AMCA 204, BV-5, Balance Quality Grade G1.0 or better through entire operating speed range from minimum speed to maximum speed. If minimum speed is not indicated on Drawings, assume minimum speed to be 10 percent of design speed.
 - b. Identify and record each speed and speed range within the fan operating range that could cause potential vibration problems.
 - c. Submit test reports as an information submittal for Project record.
3. Operation and Service Requirements:
 - a. Each fan/motor assembly shall be capable of lock-out/tag-out procedure without interrupting operation of other fans in air-handling unit.
 - b. Design and incorporate features to permit safe, rapid, and economical maintenance.
4. Fan Base:
 - a. Mount fan, motor, and drive on a structural-steel or an aluminum base; except, where indicated on Drawings, install fan on a concrete-filled inertia base.
 - b. Include base and vibration isolators in accordance with requirements indicated.
 - c. Electrically weld the base.
 - d. Size and design the base construction to withstand the rigors of shipping and rigging.
 - e. Include the base with lifting lugs or holes.
 - f. Construct base with gusseted brackets to accommodate spring isolators indicated.
5. Fan Panel:
 - a. Construct fan panel of aluminum or powder-coated steel.
 - b. Support fan wheel and bearings from a structural aluminum or powder-coated steel framework.
 - c. Reinforce and brace fan panel to prevent vibration and pulsation.
 - d. Include stiffeners to form a rigid panel that is free of structural resonance and vibration.
6. Fan Inlet and Wheel Cone:
 - a. Precision-spun or die-formed, matched inlet and wheel cone to ensure streamlined airflow into the wheel and full loading of blades.
 - b. Inlet and wheel cones shall be hyperbolic.

- c. Inlet cone shall be a single piece, constructed of aluminum or powder-coated carbon steel.
 - d. Fasten inlet cone to fan panel using bolts, nuts and washers to provide a positive and secure attachment that can be field removable.
 - e. Inlet cones that are held in place using retaining clips are unacceptable.
7. Fan Wheel:
- a. Fan blades shall be a true hollow airfoil shape, continuously welded to backplate and wheel cone.
 - b. Construct blades of aluminum, reinforced for AMCA fan class and operating conditions scheduled.
 - c. Design blades to provide smooth and aerodynamic airflow over all surfaces of blade.
 - d. Construct fan hubs of cast aluminum or cast-iron ASTM A48/A48M Class 20A and better, with integral bracing for extra strength and stiffness.
 - 1) Castings shall be sound and free of shrink holes, blow holes, cracks, scale, blisters, or other similar injurious defects.
 - 2) Clean surfaces of castings by blasting, pickling, or other standard method.
 - 3) Mold-parting fins and remains of gates and risers shall be chipped, filed, and ground flush.
 - 4) Design hubs to maintain a high resistance to fatigue and low relative wheel imbalance.
 - e. Hubs shall be keyed and setscrewed to shaft for positive attachment.
 - f. Construct the wheel backplates of aluminum.
 - g. Statically and dynamically balance fan wheel before fan is assembled.
 - h. Select entire rotating assembly so first critical speed is at least 30 percent greater than fan design speed and at least 20 percent greater than maximum AMCA class speed.
8. Fan Drive:
- a. Direct drive, arrangement 4 in accordance with AMCA 99 for single-width, single-inlet fans.
 - b. Adjust wheel width and diameter to match motor speed while providing performance scheduled.
 - c. Fasten fan wheel directly to motor shaft using a key and setscrew as previously specified.
 - d. Construct motor base and pedestal of aluminum or powder-coated carbon-steel plate.
 - e. Fan Speed Limitation: Fan speed at design conditions indicated shall not exceed speed on motor nameplate for direct-drive applications. Do not select fans to operate at motor speeds greater than motor nameplate.
9. Protective Screens: Factory furnish and install protective screens on fan inlet and discharge.
- a. Expanded metal welded to a painted carbon-steel or stainless steel frame.

- b. Screens shall comply with OSHA requirements.
 - c. Screens shall be constructed of stainless steel.
 - d. Fasten screens to fan frame for easy removal by maintenance personnel.
10. Welding:
- a. Use AWS- or ASME-certified welders to weld materials required by application.
 - b. All welds shall be continuous full penetration welds.
11. Hardware: Hex-head, high-strength 300 series stainless steel.
12. Nameplates:
- a. Construct nameplates and rotation arrows of aluminum or 300 series stainless steel.
 - b. Securely fasten nameplate and rotation arrow to fan housing using pins or sheet metal screws.
 - c. Locate nameplates in a highly visible location on motor side of fan.
 - d. Engrave the following information on nameplate:
 - 1) Manufacturer, address, phone number, and website address.
 - 2) Manufacturer model number.
 - 3) Serial number.
 - 4) Manufacturing date.
 - 5) Fan size.
 - 6) Fan schedule equipment designation (may be listed on a separate nameplate if there is insufficient space).
 - 7) Design airflow.
 - 8) Design static pressure.
 - 9) Design fan speed.
 - 10) AMCA fan class.
 - e. Air-Handling Unit Factory Assembly:
 - f. Internal Access: Include each fan with internal access from upstream sides as indicated on Drawings.
 - g. Removal and Replacement: Each fan shall be independently removable and replaceable through a removable access panel installed in air-handling unit casing.
 - h. Fan Supports:
 - 1) Construct a freestanding and self-supporting structural framework to support each fan individually from and independent of adjacent fans.
 - 2) Construct frame work from aluminum, galvanized steel, or stainless steel.
- H. Fan Motors:
- 1. Standard: Comply with NEMA MG 1 unless more stringent requirements are indicated.
 - 2. Description: NEMA MG 1,, as required to comply with capacity and torque characteristics; medium-induction motor.

- a. Performance:
 - 1) Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.
 - 2) Efficiency: NEMA Premium Efficiency rating complying with NEMA MG 1.
 - 3) Motor Horsepower: Minimum size as indicated on Drawings. Motor shall operate fan under all conditions indicated without exceeding motor nameplate and without use of motor service factor.
 - 4) Inverter-Duty Rating: Comply with minimum requirements of Class F or Class H insulation, suitable for "inverter-duty" or "drive-duty" applications in accordance with NEMA MG 1. Motor operation through a variable-frequency controller shall not adversely affect the motor performance, operation, useful life, and warranty.
 - 5) Service Factor: 1.15.
 - 6) Temperature Rise: Match insulation rating.
3. Enclosure Type: TEFC.
4. Shaft Grounding System:
 - a. Shaft grounding system to protect bearings from induced voltage.
 - b. Shaft grounding system shall have low drag (less than 0.05 percent of motor horsepower), and shall operate for a minimum of three years without periodic maintenance or adjustments.
 - c. Mounting: External or internal to motor enclosure.
5. Frame:
 - a. Frames with integrally cast feet unless other requirements of driven equipment require a different arrangement.
 - b. Frame, front and back end brackets, and front and back end bearing intercaps constructed of cast iron, ASTM A48/A48M, Class 25 or better.
6. Rotor:
 - a. Fabricate rotor frame from die-cast aluminum, copper, or associated alloys.
 - b. Key rotors to motor shaft.
 - c. Rotating assembly shall be dynamically balanced to within limits defined in NEMA MG 1.
 - d. Motors shall have the entire rotating assembly between bearing inner caps coated with a corrosion-resistant coating.
7. Stator:
 - a. Copper windings shall be spike resistant to withstand 1600 peak V.
 - b. Entire wound and insulated stator coated with a coating to protect against moisture and corrosion.
8. Shaft:

- a. Solid shaft fabricated of Type 304 stainless steel, accurately turned, ground and polished, and inspected for accuracy.
 - b. End of shaft with drilled hole for use in field measurements.
9. Bearings:
- a. Grease-lubricated ball or roller bearings.
 - b. ABMA 11 L-10 motor bearing life of 100,000 hours.
 - c. Bearing Lubrication:
 - 1) Factory lubricate motor bearings using a premium moisture-resistant polyurea thickened grease with rust inhibitors suitable for extreme operating temperatures encountered.
 - 2) Coordinate special requirements that may impact lubrication and include appropriate lubrication.
 - d. Grease Fittings:
 - 1) Equip each bearing housing with an easily accessible grease inlet.
 - 2) Fit grease inlets with a grease fitting and protective fitting cap.
 - 3) Equip inlets with an automatic grease relief fitting to prevent excessive greasing.
 - 4) Equip each bearing housing with grease drain and threaded plug.
10. Conduit Box:
- a. Material same as frame.
 - b. For motor frames 365T and below, furnish conduit boxes sized with internal volumes in accordance with NEMA MG 1.
 - c. For motor frames larger than 365T, furnish conduit boxes one size larger than NEMA MG 1.
 - d. Coordinate the location and mounting of conduit box with driven equipment manufacturer.
 - e. Factory mount conduit box on motor.
11. Grounding: NRTL-listed clamp-type grounding lug mounted in conduit box.
12. Motor Leads:
- a. Non-wicking type, Class F temperature rating or better and permanently numbered over entire length for identification.
 - b. Lead terminals shall be manufacturer's standard.
13. Condensate Drains:
- a. Motor with drain holes at the lowest point for drainage of condensate.
 - b. Each drain hole with a threaded removable plug.
14. TEFC Motor Fans: Corrosion-resistant construction, non-sparking, metallic or non-metallic, bi-directional, and keyed to shaft.
- a. Motor Fan Cover: Steel.

15. Hardware: Hex-head, high-strength, zinc-plated carbon steel or stainless steel.
 16. Lifting Eyebolts: Eyebolt threaded into frame receptacle and design to prevent moisture and other foreign material from entering motor cavity when eyebolt is removed.
 17. Nameplates:
 - a. Construct nameplates of aluminum or stainless steel and attach to motor frame with aluminum, stainless steel, or brass drive pins.
 - b. Engrave or stamp data on the nameplate.
 - c. At a minimum, include nameplate data in accordance with NEMA MG 1. Also include ABMA bearing designation for the drive and opposite end bearing.
 18. Paint: Successfully pass 500-hour salt spray test for corrosion in accordance with ASTM B117.
- I. Vibration Isolation:
1. General:
 - a. Provide fans inside air-handling units with base and vibration isolation indicated on Drawings.
 2. Inertia Bases:
 - a. Description: Reinforced structural base designed for concrete infill with integral bolting provisions for fan mounting.
 - b. Design and Performance:
 - 1) Weight of inertia base including concrete infill a minimum of 1.5 times the operating weight of fan.
 - 2) Base thickness not less than 1/12 of longest span.
 - 3) Minimum base thickness is as follows:
 - a) Up to 15 HP: 6 inches.
 - b) 20 to 50 HP: 8 inches.
 - c. Construction:
 - 1) Base Materials: Structural carbon steel, ASTM A36/A36M.
 - a) Carbon-Steel Finish, Mill Galvanized: Mill-galvanized carbon-steel bases with weld-damaged areas cleaned, prepared, and painted with galvanized paint after fabrication.
 - b) Carbon-Steel Base Finish: Carbon-steel bases cleaned in accordance with SSPC SP-1, and hot-dip galvanized after fabrication.
 - 2) Reinforcing Bars: Carbon steel, ASTM A615/A615M, sized for a maximum stress of 20,000 psi when subjected to both static and dynamic loads, and welded in place.

- 3) Floor: Design inertia base with solid floor in bottom for concrete placement after base installation. Seal to prevent leakage or seepage.
 - a) Galvanized-Steel Solid Sheet: ASTM A653/A653M; G90 coating, minimum (nominal) 18 gauge thick.
 - b) Stainless Steel Solid Sheet: ASTM A240/A240M or ASTM A480/A480M; Type 304; No. 2D finish; minimum (nominal) 18 gauge thick.
 - 4) Isolator Brackets: Gusseted, height-saving brackets.
 - 5) Welding Filler Metals: Comply with AWS welding codes for welding materials appropriate for thickness and chemical analysis of material being welded.
- d. Air-Handling Unit Factory Assembly: Install fans with inertia bases where indicated on Drawings.
- 1) Coordinate placement of inertia bases with design of air-handling unit structural base. Make provisions for attachment and support.
 - 2) Coordinate inertia base mounting provisions with spring isolators.
3. Spring Isolators:
- a. Performance:
 - 1) Deflection: Minimum deflection indicated on Drawings. Use a greater deflection if required to maintain an isolator efficiency of at least 98 percent under all operating conditions encountered. Calculate isolator efficiency using actual support conditions considering the rigidity of structure.
 - 2) Laterally stable freestanding open-spring mounting.
 - 3) Spring diameter not less than 0.8 of compressed spring height at rated load and in the installed and operating condition.
 - 4) Reserve travel to solid shall be equal to a minimum of 50 percent of rated deflection and in no case less than 25 percent of rated deflection in an installed and operating condition.
 - 5) Ratio of horizontal stiffness to vertical stiffness equal to approximately one.
 - 6) Design and install so that ends of springs remain parallel.
 - 7) Select springs that are non-resonant with equipment related frequencies and natural frequencies of support structure.
 - 8) Springs shall not take a permanent set when compressed to coil bind.
 - b. Construction:
 - 1) Coat springs with PVC or neoprene. Color-code springs to allow positive identification after installation.

- 2) Construct baseplates, spring retainers, and other components of galvanized carbon steel or stainless steel. Etch and paint aluminum components.
 - 3) Use nuts, bolts, and washers and other associated hardware constructed of stainless steel.
 - 4) Isolators with integral leveling bolts.
 - 5) Baseplates with holes and isolation grommets for bolting.
 - 6) Bond nominal 1/4-inch- thick, neoprene friction pad to baseplate.
4. Thrust Restraints:
- a. In sets of two or more, thrust restraints shall consist of springs in series with neoprene isolators.
 - b. Coordinate and select deflection of thrust restrains with equipment being restrained.
 - c. Thrust restraints complete with rods and adjustment nuts, plus angle brackets and backing plates for attachment to substrate and equipment being restrained.
5. Elastomeric Grommets:
- a. Elastomeric grommets shall be a combination of neoprene washer and bushing.
 - b. Elastomer shall be 56-durometer maximum.
 - c. Grommets formed to prevent bolts from directly contacting the secured item.
6. Flexible Connections:
- a. Construct flexible connection galvanized-steel or stainless steel edges firmly attached to waterproof and fire-retardant fabric.
 - b. Fabric shall be 6 inches wide or more.
 - c. Suitable for operation in extreme temperatures encountered.
 - d. NRTL listed for application and complying with NFPA 90A.
7. Air-Handling Unit Factory Assembly:
- a. Use precompression -type height-saving brackets with isolators having 2-1/2 inch deflection or greater, to limit exposed bolt length.
 - b. Install spring isolators plumb and adjust isolators that are not plumb under operating conditions to make plumb.
 - c. Adjust isolators to prevent stress transfer to equipment.
 - d. Verify that installed isolators and mounting systems permit equipment motion in all directions.
 - e. Restrain fans with isolated thrust resistors to limit displacement to 1/4 inch. Design for the maximum lateral thrust the fan can develop.
 - f. Adjust or include additional resilient restraints to flexibly limit fan lateral motion to 1/4 inch during startup and operation of equipment.
 - g. Anchor restraints to fixed supports having a stiffness greater than the thrust encountered.

- h. Include at least 2-inch operating clearance between fan bases and walking surface of air-handling unit floor. Before startup, clean out foreign matter between bases and equipment to prevent short circuit.
 - i. Flexible Connections:
 - 1) Install flexible connections at connections to fans.
 - 2) Install flexible connections in accordance with SMACNA standards and manufacturer's written instructions.
 - 3) Make fabric joints on the flat run, not the corners, with overlap to provide an area sufficient to make a positive seal.
 - 4) Apply adhesive between fabric layers.
 - 5) Attach connections using screws or bolts.
 - 6) Reinforce fabric if required to keep fabric from collapsing and impacting airflow into fan.
- J. Hydronic Coils:
- 1. Sourcing Option: In lieu of sourcing hydronic coils from a specialty coil manufacturer, air-handling unit manufacturer has option to furnish in-house hydronic coils that achieve equal or better performance while complying with other requirements indicated.
 - 2. General: Provide air-handling units with hydronic coils where indicated on Drawings.
 - 3. Description: Plate fin coils constructed of staggered tubes mechanically expanded into continuous collars that are die formed into plate fins.
 - 4. Design and Performance:
 - a. Capacities, face area, and number of rows indicated on Drawings are minimum acceptable.
 - b. Air pressure drop, water pressure drop, fin spacing, and face velocity indicated on Drawings are the maximum acceptable.
 - c. Coils shall be counterflow design, air to fluid. Fluid supply shall enter air leaving side of coil and exit air entering side.
 - d. Design coils to be drainable.
 - 1) Coils shall have all circuits drainable when coils are installed in horizontal position and level.
 - 2) Coil supply header shall be furnished with a drain connection at lowest point on header.
 - e. Design coils to be self-venting.
 - 1) Supply connection near bottom of supply header.
 - 2) Return connection near top of return header.
 - 3) Furnish coil returnheader with a vent connection at highest point on header.
 - f. Coils supply and return piping connections on same end of coil.
 - g. Coils shall be rated for system operating pressures and temperatures encountered by installation, but not less than 200 psig.
 - h. Coil selection criteria, unless otherwise indicated on Drawings, are as follows:

- 1) Face Velocity: Maximum of 500 fpm.
 - 2) Fluid Tube Velocity (at Design Flow Rate):
 - a) Maximum: 6 fps.
 - b) Minimum: 3 fps.
 - 3) Fluid Header Velocity: Maximum of 6 fps.
 - a) Fin Height: Maximum of 48 inches.
 - b) Fin Spacing: Maximum of 12 fins per inch.
 - i. Cooling coils shall have no moisture carryover at design conditions. Install moisture eliminators on discharge face of coil if it is necessary to eliminate moisture carryover.
5. Casing and Tube Sheets:
- a. Depth: Extend coil casing and tube sheets a minimum of 1/2 inch beyond face of fins on both entering and leaving side.
 - b. Casing and Tube Sheet Materials:
 - 1) Cooling Coils: Stainless steel, ASTM A240/A240M or ASTM A480/A480M, Type 304L or Type 316L, No. 2D finish.
 - 2) Heating Coils:
 - a) Stainless steel, ASTM A240/A240M or ASTM A480/A480M, Type 304L or Type 316L, No. 2D finish.
 - b) Galvanized steel, ASTM A653/A653M, G90 coating.
 - c. Top and Bottom Casings:
 - 1) Flange face minimum of 1-1/2 inches; double flange edge for rigidity and ease of removal with secondary flange face minimum of 1/2 inch.
 - 2) Thickness:
 - a) Coils with Fin Length of up to 72 Inches: Minimum of 16 gauge thick.
 - b) Coils with Fin Length Exceeding 72 Inches: Minimum of 16 gauge thick.
 - d. End Tube Sheets:
 - 1) Tube sheet holes rolled to prevent chaffing of tubes during thermal expansion and contraction.
 - 2) Flange face minimum of 1-1/2 inches.
 - 3) Thickness: Minimum of 16 gauge thick.
 - e. Intermediate Tube Sheets:
 - 1) Tube sheet holes rolled to prevent chaffing of tubes during thermal expansion and contraction.

- 2) Space intermediate tube sheets a maximum of 48 inches o.c. and locate to provide equal spacing between tube sheet across coil tube length.
 - 3) Flange face minimum of 1/2 inch.
 - 4) Thickness: Minimum of 16 gauge thick.
- f. Holes: Include number, size, and location of holes in casing and end tube sheets required for coil installation.
6. Fins:
- a. Materials:
 - 1) Aluminum: 0.0075 inch thick.
 - b. Collars: Full collars for accurate fin spacing and maximum tube contact while leaving no surface of tube exposed.
 - c. Fin Configuration: Flat face fins without ripples.
7. Headers:
- a. Construct header of seamless copper, ASTM B75/B75M drawn temper of diameter and wall thickness based on coil size, flow rate, design pressure, design temperature, and circuiting.
 - b. Tube-to Header Connections: Tube-to-header holes shall intrude inward so landed surface area is three times the core tube thickness, to provide enhanced header to tube joint integrity. Tubes shall evenly extend within the ID of the header no more than 0.12 inch.
 - c. Header Top and Bottom Caps: End caps shall be die-formed and installed on the ID of header such that the landed surface area is three times the header wall thickness.
 - d. Drains: Include low point of supply header with a NPS 1/2 drain connection. Extend copper or red brass pipe through air-handling unit casing and terminate end with male national pipe threads (MNPT). Pipe shall be threaded on both ends to facilitate easy field removal and replacement.
 - e. Vents: Include high point of return header with a NPS 1/2 vent connection. Extend copper or red brass pipe through air-handling unit casing and terminate end with MNPT. Pipe shall be threaded on both ends to facilitate easy field removal and replacement.
 - f. Supply and Return Connections:
 - 1) Terminate ends with MNPT.
 - 2) Connections to header shall be either copper tube with brazed ASME B16.18 threaded male adapters or red brass pipe with machine-threaded MNPT connections. Pipe shall extend through air-handling unit casing and be threaded on both ends to facilitate easy field removal and replacement.
 - 3) Connections NPS 2-1/2 and larger shall have a bronze ASME 16.24 threaded flanges attached to threaded connections to provide for a flanged field connection. Select flange class, Class 150 or Class 300, for system pressure and temperature encountered.

- g. Protect openings of supply, return, vent, and drain connections with a threaded cap to prevent entry of dirt into the coil.
8. Tubes:
 - a. Material: Copper, ASTM B75/B75M annealed temper or ASTM B280 drawn temper; 90/10 cupronickel alloy, ASTM B122/B122M.
 - b. Tube Nominal Diameter: 1/2 or 5/8 inch before expanding, selected to provide performance indicated.
 - c. Tube Nominal Wall Thickness: As required by performance, minimum of 0.025 inch thick.
9. Tube Return Bends: 180-degree bends brazed to tubes; material, wall thickness, and nominal diameter to match tubes.
 - a. Tube Return Bend Nominal Wall Thickness: As required by performance, minimum of 0.025 inch thick.
10. Brazing: High-temperature brazing alloy with not less than 5 percent silver when brazing like non-ferrous materials together and more than 30 percent silver when brazing ferrous to non-ferrous materials.
11. Comply with Section 230546 "Coatings for HVAC" for corrosion-resistant coating. See Drawings for coils requiring a corrosion-resistant coating.
12. Coatings: Where indicated on Drawings, coat coils with one of the following coatings for additional corrosion protection:
 - a. Baked phenolic.
 - b. Cathodic epoxy.
 - c. Water-based flexible epoxy polymer.
 - d. Water-based synthetic flexible polymer.
13. Hardware: Use hex-head bolts, nuts, and washers constructed of Type 304 or Type 316 stainless steel.
14. Nameplate: Aluminum or stainless steel nameplate with brass or stainless steel chain for each coil, with the following data engraved or embossed:
 - a. Manufacturer name, address, telephone number, and website address.
 - b. Manufacturer model number.
 - c. Serial number.
 - d. Manufacturing date.
 - e. Coil identification (indicated on Drawings).
 - f. Coil fin length.
 - g. Coil fin height.
 - h. Coil weight with fluid/without fluid.
 - i. Coil casing material and thickness.
 - j. Coil fin material and thickness.
 - k. Coil tube material and thickness.
 - l. Coil header material and thickness.
15. Cleaning: Residual manufacturing oils and solid contaminants shall be removed internally and externally by completely submersing the coil in an environmentally

- acceptable degreasing solution that is chemically compatible with the coil material.
16. Air-Handling Unit Factory Assembly:
- a. Coil Connections: Extend each coil connection through casing access panel and terminate connections, approximately 4 inches beyond exterior face of access panel, and seal each penetration as indicated. Casing access panels shall be removed and reinstalled with coils installed inside air-handling units.
 - b. Internal Access: Include each coil with internal access from downstream and upstream sides as indicated on Drawings.
 - c. Removal and Replacement: Each coil shall be independently removable and replaceable through a removable access panel installed in air-handling unit casing.
 - d. Supports for Coils:
 - e. Construct a freestanding and self-supporting structural framework to support each coil individually from and independent of adjacent coils.
 - f. Construct framework for cooling coils, from aluminum or stainless steel structural shapes.
 - g. Construct frame work for heating coils from aluminum or stainless steel structural shapes.

K. Drain Pans:

1. General:
 - a. Include a drain pan for each cooling and heating coil and at other locations indicated.
 - b. Continuously weld drain pan seams, joints, and mitered corners to make the assembled drain pan watertight.
 - c. Drain pans shall be located under the entire coil and provide full coil coverage including coil return bends and headers.
 - d. Slope drain pans in multiple directions toward low point drain connection at a uniform slope of at least 1 percent from high point to low point.
 - e. Include stainless steel blank-offs to prevent air from bypassing around coil.
2. Bottom Drain Pans:
 - a. Mounting Location, Recessed in Floor: Air-handling unit manufacturer has option to recess bottom drain pan into the floor or install drain pan above air-handling unit floor walking surface.
 - b. Mounting Location, Above Floor: Bottom drain pan shall be installed above air-handling unit floor walking surface. Do not recess drain pan into unit base.
 - c. Grating: Install removable stainless steel grating on top of drain pan.
 - d. Material: 300 series stainless steel ASTM A240/A240M or ASTM A480/A480M, a minimum of 16 gauge thick.
 - e. Minimum Depth: 1.5 inches.
 - f. Extend drain pan beyond air entering face of coil casing at least 3 inches.
 - g. Extend drain pan beyond air leaving face of coil casing at least 12 inches.

- 1) Where moisture eliminators are required to prevent moisture carryover, extend drain pan beyond leaving face of moisture eliminator in lieu of the leaving face of coil.
- h. Drain Pan Connection:
 - 1) Stainless steel threaded half-coupling welded to lowest point of drain pan.
 - 2) Location: See Drawings.
 - 3) Minimum Nominal Connection Size: NPS 1.
- i. Drain Pipe:
 - 1) Air-handling unit manufacturer to connect full size drain pipe to each drain pan connection. Option to use one of following pipe materials:
 - a) Copper tube with threaded male adapter, brazed or soldered to ends.
 - b) Stainless steel pipe with threaded MNPT ends.
 - 2) Extend drain pipe and terminate 3 inches beyond exterior face of casing.
- L. Electric Heaters:
 1. General:
 - a. Provide air-handling units with electric heaters where indicated on Drawings.
 - b. NRTL listed for zero clearance to combustible surface, regardless of heater capacity.
 2. Design and Performance:
 - a. Heaters and installation shall comply with NFPA 70.
 - b. Scheduled capacity (kW) is minimum acceptable.
 - c. Air pressure drop and face velocity are maximum acceptable.
 - d. Rate heaters output capacity at voltage, phase, and hertz indicated on Drawings.
 - e. Arrange capacity control to minimize stratification.
 - f. Equally balance heater electrical load for each step across all three phases.
 - g. Part-Load Operation: Include multiple heaters configured in a series arrangement with operation staged if required for uninterrupted heater operation over the full range of air-handling unit airflow down to the minimum airflow indicated.
 3. Heating Elements:
 - a. Open Elements:

- 1) Open-coil resistance wire of 80 percent nickel and 20 percent chromium; supported and insulated by floating ceramic bushings recessed into casing openings, fastened to supporting brackets, and mounted in a frame.
 - 2) Safety Screens: Install safety screens to protect operators from accidentally coming in direct connect with elements.
- b. Finned Tubular Elements:
- 1) Coiled resistance wire of 80 percent nickel and 20 percent chromium; center-mounted and surrounded by compacted magnesium-oxide powder in tubular-steel sheath; with spiral-wound, copper-plated, steel fins continuously brazed to sheath.
 - 2) Finish finned tubular elements with a baked-on aluminum paint, and mount in a frame.
 - 3) Each element individually removable from terminal box.
 - 4) Use threaded stainless steel element terminals and hardware.
4. Frame: Galvanized or stainless steel; include intermediate element support brackets equally spaced at a maximum of 36 inches o.c. across heater element length.
5. Terminal Box/Control Panel: Unit or remote mounting arrangement indicated on Drawings; with disconnection means and overcurrent protection.
- a. Enclosure: NEMA 250, Type 1 or Type 12 enclosure complying with UL 50.
 - b. Full face hinged door.
 - c. Factory insulate base of terminal box to prevent condensation from occurring within box.
 - d. Mount terminal box control panel on exterior surface of air-handling unit casing. Gasket and seal air-handling unit cabinet penetrations.
 - e. Install a laminated elementary wiring diagram on inside face of heater control panel door or in another protected location than visible be service personnel. Wiring diagram shall match installation.
6. Controls:
- a. Safety Controls: Each heater with following factory-mounted safety controls:
 - 1) Disk-type thermal cutout switch with automatic reset.
 - 2) Primary linear thermal limit cutout switch with automatic reset.
 - 3) Secondary linear thermal limit cutout switch with local manual reset.
 - 4) Airflow Proving Switch: Diaphragm-operated pressure differential type; with pressure range selected to ensure reliable operation throughout full range of air-handling unit airflow down to minimum airflow indicated.
 - b. Staging Control: Magnetic contactors for switching stages of heat except for air-handling units located in occupied spaces, include mercury contactors for switching stages of heat.

- c. SCR Control: Silicon-controlled rectifier (SCR) for 100 percent stepless capacity control.
 - d. Remote Monitoring and Control: Include control devices necessary to interface with remote-control signals including the following:
 - 1) Heater on/off control.
 - 2) Monitoring heater on/off status.
 - 3) High-temperature alarm.
 - 4) Low-airflow alarm.
 - 5) Heater capacity control.
7. Electrical:
- a. Single-Point Field Power Connection: Install and wire the heater to accommodate a single field electrical connection for electrical power.
 - b. Disconnecting Means: Provide each heater with a main electrical power, door mounted and interlocking, and disconnecting means to prevent access into panel, unless switched in the off position.
 - 1) Nonfused disconnect switch with lockable handle.
 - 2) Minimum Short-Circuit Current Rating: As required by electrical power distribution system, but not less than 42,000 A.
 - c. Factory install and wire branch circuit fusing, or circuit breakers in accordance with NFPA 70.
 - d. Pilot Lights: Include labeled pilot lights on face of control panel for the following:
 - 1) Power on.
 - 2) Low-airflow alarm.
 - 3) High-temperature alarm.
 - 4) One for each stage on.
 - e. Terminations: Wire terminations and field interface terminations to labeled terminal strips.
 - f. Control Transformer: Size control circuit transformer for required load, plus 75 VA.
 - g. Labeling: Label each electrical device with a laminated phenolic tag.
 - h. Use only NRTL-labeled electrical components.
8. Nameplate: Include the following data:
- a. Manufacturer name, address, telephone number, and website address.
 - b. Manufacturer model number.
 - c. Serial number.
 - d. Manufacturing date.
 - e. Coil identification (indicated on Drawings).
9. Air-Handling Unit Factory Assembly:

- a. Support individual heater assemblies within unit from a structural framework constructed of galvanized steel or stainless steel.
 - b. Provide each heater assembly with access from upstream sides.
 - c. Make provisions in arrangement and installation to mitigate uneven airflow patterns within unit for proper heater operation.
- M. Cartridge Filters:
1. Description: Factory-fabricated, dry, extended-surface, disposable, air filters with media formed in mini-pleats and arranged in a V-shape pattern.
 2. Performance:
 - a. Filtration Efficiency, ASHRAE 52.2 MERV Rating: 13.
 - b. Energy Cost Index: Five star rating.
 - c. Initial Air Pressure Drop: With face velocity of 500 fpm, clean filter pressure drop shall not exceed the following:
 - 1) MERV 11 and MERV 11A: 0.21 inch wg.
 - 2) MERV 13 and MERV 13A: 0.25 inch wg.
 - 3) MERV 14 and MERV 15A: 0.27 inch wg.
 - 4) MERV 16 and MERV 16A: 0.60 inch wg.
 - d. Manufacturer-Recommended Final Air Pressure Drop: 1.0 inches wg.
 - e. Pressure Differential without Failure: 10 inches wg.
 - f. Temperature Rating: 175 deg. F.
 3. Certification:
 - a. AHRI: Tolerances in accordance with AHRI 850 (I-P) and AHRI 851 (SI).
 - b. ASHRAE: Tested and rated in accordance with ASHRAE 52.2.
 - c. UL: UL 900 listed.
 4. Size:
 - a. Nominal size of individual filters indicated on Drawings:
 - b. Nominal Filter Size:
 - 1) Face: 24 by 24 inches.
 - 2) Depth: 12 inches.
 - c. Actual Filter Size: Suitable for installation in an industry-standard filter holding frame.
 5. Filter Media Surface Area: Each filter shall contain at least 200 sq. ft. for a filter with a nominal 24-by-24-inch face.
 6. Construction:
 - a. Media: Microfine glass media formed into mini-pleats and arranged in V-shape patterns.
 - b. Media Frame: Plastic or corrosion-resistant metal.
 - c. Adhesive: Fire-retardant bonding adhesive where bonding media to frame.

- N. Pleated Panel Filters:
 - 1. Description: Factory-fabricated, self-supported, extended-surface, pleated, panel-type, disposable air filters.
 - 2. Performance:
 - a. Filtration Efficiency, ASHRAE 52.2 MERV Rating: 8.
 - b. Energy Cost Index: Five star rating.
 - c. Initial Air Pressure Drop: With face velocity of 500 fpm, clean filter pressure drop shall not exceed the following:
 - 1) MERV 8 and MERV 8A:
 - a) Depth 1 Inch (25 mm): 0.23 inch wg.
 - b) Depth 2 Inches (50 mm): 0.31 inch wg.
 - c) Depth 4 Inches (100 mm): 0.27 inch wg.
 - 2) MERV 9 and MERV 9A:
 - a) Depth 2 Inches (50 mm): 0.30 inch wg.
 - b) Depth 4 Inches (100 mm): 0.27 inch wg.
 - d. Manufacturer-Recommended Final Air Pressure Drop: 1.0 inch wg.
 - e. Pressure Differential without Failure: 2 inches wg.
 - f. Temperature Rating: 200 deg F.
 - 3. Certification:
 - a. AHRI: Tolerances in accordance with AHRI 850 (I-P) and AHRI 851 (SI).
 - b. ASHRAE: Tested and rated in accordance with ASHRAE 52.2.
 - c. UL: UL 900 listed.
 - 4. Filter Media Surface Area: Each filter shall contain the following minimum media surface area for a filter with a nominal 24-by-24-inch face:
 - a. Depth 1 Inch (25 mm): 9.8 sq. ft..
 - b. Depth 2 Inches (50 mm): 17.3 sq. ft..
 - c. Depth 4 Inches (100 mm): 27.7 sq. ft..
 - 5. Construction:
 - a. Media: Cotton and synthetic blend of fibers arranged in a series of pleats attached to and supported by a corrosion-resistant welded-wire grid. Coat media with an antimicrobial agent.
 - b. Filter Media Casing: High wet strength (28-point) beverage board that is bonded around the periphery to eliminate air bypass.
 - 1) Diagonal support members across upstream and downstream filter face constructed of same material as casing shall ensure pleat spacing and stability.
 - c. Adhesive: Fire-retardant bonding adhesive where bonding media to casing.

O. ASHRAE-Rated Filter Holding Frames:

1. Filter Holding Frames for ASHRAE-Rated Filters:

- a. Fabricate filter holding frames with mitered corners and reinforce frame to maintain a durable, rugged, true square shape.
- b. Construct frames of galvanized or stainless steel. Use stainless steel frames in applications exposed to corrosive airstreams.
- c. For applications with pre-filter and final filters sharing the same filter holding frame, frames shall be suitable for supporting and holding both pre-filter and final filters in frame with both filters serviceable from upstream (entering air) side.
- d. Frame Depth: At least 2.75 inches.
- e. Gaskets: Continuous, suitable for same operating temperature as filters.
- f. Filter Clips: Each filter holding frame with spring clip fasteners at each corner. Spring clips shall allow filters to be removed and replaced without use of tools.
- g. Frames shall be industry-standard size to provide interchangeability of filters from other manufacturers.

2. Air-Handling Unit Factory Installation:

- a. Air-handling unit manufacturer shall furnish filters and provide filter holding frames, retaining clips, and filter support structures.
- b. Furnish filter quantity, size, type, and performance indicated on Drawings.
- c. Install filter frames in a flat vertical position for horizontal airflow.
- d. Install holding frames in accordance with manufacturer's written instructions and to prevent passage of unfiltered air. Include additional gaskets as necessary.
- e. Secure individual holding frames together to build a multiple filter bank.
- f. Construct galvanized-steel or stainless steel support structure to hold frames and filters.
 - 1) Design support structure for maximum system operating pressures encountered equal to fan shutoff pressure.
 - 2) Design and fabricate support structure to limit deflection across filter bank to 1/360 of the span when subjected to a 200-lb lateral force applied at any point on the filter holding frame assembly.

P. Filter Gauges:

1. Provide a gauge to indicate pressure differential between entering and leaving side of each filter bank. Panel filter bank separate from cartridge filter bank.
 - a. Where multiple filters share a common frame, include a separate gauge for each filter bank.
 - b. Include a metal spacer constructed of same material as filter frame for one of the filters installed in filter bank to accommodate pressure differential measure across both upstream and downstream filters.
2. Gauge shall have a nominal 4-inch- diameter face.

3. Select range of gauge to be approximately twice the dirty filter pressure drop.
4. Provide each gauge with vent valves to allow for re-zeroing the gauge without removing tubing connections.
5. Include static pressure sensors on entering and leaving side of each filter bank.
6. Air-Handling Unit Factory Assembly:
 - a. Mount each filter gauge on exterior surface of unit casing near associated filter sections.
 - b. Mount center of gauges 60 inches above bottom of air-handling unit structural base.
 - c. Connect static pressure sensors to filter gauges using copper or stainless steel tubing and compression type fittings.
 - d. Support tubing at intervals not greater than 60 inches o.c.

Q. Automatic Dampers:

1. General: Provide air-handling units with automatic dampers where indicated on Drawings.
 - a. Unless otherwise indicated, use parallel-blade configuration for two-position control, for equipment isolation service, and when mixing two airstreams. For other applications, use opposed-blade configuration.
 - b. Factory assemble multiple damper sections to provide a single damper assembly of size required by application.
 - c. Damper actuator shall be factory installed by damper manufacturer as integral part of damper assembly. Coordinate actuator location and mounting requirements with damper manufacturer.

2. Rectangular Dampers with Aluminum Blades:
 - a. Performance:
 - 1) Leakage: AMCA 511, Class 1A. Damper leakage rate shall meet or exceed current ASHRAE 90.1 standard.
 - 2) Pressure Drop: 0.05 inch wg at 1500 fpm across a 24-by-24-inch damper when tested in accordance with AMCA 500-D, figure 5.3.
 - 3) Velocity: Up to 4000 fpm.
 - 4) Temperature: Minus 40 to plus 185 deg F.
 - 5) Pressure Rating: Damper close-off pressure equal to fan shutoff pressure with a maximum blade deflection of 1/200 of blade length.
 - 6) Damper shall have AMCA seal for both air leakage and air performance.

 - b. Construction:
 - 1) Frame:
 - a) Material: ASTM B211, Alloy 6063 T5 extruded-aluminum profiles, 0.07 inch thick.
 - b) Hat-shaped channel with integral flange(s). Flange mating face shall be a minimum of 1 inch.
 - c) Width not less than 5 inches.

- 2) Blades:
 - a) Hollow, airfoil, extruded aluminum.
 - b) Parallel- or opposed-blade configuration as required by application.
 - c) Material: ASTM B211, Alloy 6063 T5 aluminum, 0.07 inch thick.
 - d) Width not to exceed 6 inches.
 - e) Length as required by close-off pressure, not to exceed 48 inches.
 - 3) Seals:
 - a) Blades: Replaceable, mechanically attached extruded silicone, vinyl, or plastic composite.
 - b) Jams: Stainless steel, compression type; or replaceable, mechanically attached extruded silicone.
 - 4) Axles: 0.5-inch- diameter stainless steel, mechanically attached to blades.
 - 5) Bearings:
 - a) Molded synthetic or stainless steel sleeve mounted in frame.
 - b) Where blade axles are installed in vertical position, include thrust bearings.
 - 6) Linkage:
 - a) Concealed in frame.
 - b) Constructed of aluminum and stainlesssteel.
 - c) Hardware: Stainless steel.
 - 7) Additional Corrosion Protection for Corrosive Environments:
 - a) Include anodized finish for aluminum surfaces in contact with airstream. Anodized finish shall be a minimum of 0.0007 inch thick.
 - b) Axles, damper linkage, and hardware shall be constructed of Type 316L grade stainless steel.
- c. Airflow Measurement: Where indicated, include damper assembly with integral airflow monitoring.
- 1) Zero- to 10-V dc or 4- to 20-mA scaled output signal for remote monitoring of actual airflow.
 - 2) Accuracy shall be within 2 percent of actual flow rate between the range of minimum and design airflow. For applications with a large variation in range between the minimum and design airflow, configure damper sections and flow measurement assembly as required to comply with stated accuracy over the entire modulating range.
 - 3) Include a straightening device as part of flow measurement assembly to achieve the specified accuracy with configuration indicated.
 - 4) Suitable for operation in untreated and unfiltered air.

- 5) Include temperature and altitude compensation and correction to maintain accuracy over temperature range encountered at site altitude.
 - 6) Include automatic zeroing feature.
- d. Airflow Control: Where indicated, provide damper assembly with integral airflow measurement and control.
- 1) A factory-furnished and -calibrated controller shall be programmed, in nonvolatile EPROM, with application-specific airflow set point and range.
 - 2) Controller and actuator shall communicate to control the desired airflow.
 - 3) Controller shall receive a 0- to 10-V dc input signal and report a 0- to 20-mA output signal that is proportional to airflow.
 - 4) Airflow measurement and control range shall be suitable for operation between 150 to 2000 fpm.
 - 5) Ambient Operating Temperature Range: Minus 40 to plus 140 deg F.
 - 6) Ambient Operating Humidity Range: 5 to 95 percent relative humidity, noncondensing.
 - 7) Provide unit with control transformer rated for not less than 85 VA. Include transformer with primary and secondary protection and primary disconnecting means. Coordinate requirements with field power connection.
 - 8) Include screw terminals for interface to field wiring.
 - 9) Factory mount electronics within a NEMA 250, Type 1 painted steel enclosure.
3. Rectangular Dampers with Insulated Aluminum Blades:
- a. General: Unless otherwise indicated on Drawings, install insulated aluminum blade dampers in applications where dampers close to outdoors.
 - b. Performance:
 - 1) Leakage: AMCA 511, Class 1A. Leakage shall not exceed 3 cfm/sq. ft. against 1-inch wg differential static pressure and shall not exceed 4.9 cfm/sq. ft. against 4-inch wg differential static pressure at minus 40 deg F.
 - 2) Pressure Drop: 0.1 inch wg at 1500 fpm across a 24-by-24-inch damper when tested in accordance with AMCA 500-D, figure 5.3.
 - 3) Velocity: Up to 4000 fpm.
 - 4) Temperature: Minus 100 to plus 185 deg F.
 - 5) Pressure Rating: Damper close-off pressure equal to fan shutoff pressure with a maximum blade deflection of 1/200 of blade length.
 - 6) Damper shall have AMCA seal for both air leakage and air performance.
 - c. Construction:
 - 1) Frame:
 - a) Material: ASTM B211, Alloy 6063 T5 extruded-aluminum profiles, 0.08 inch thick.

- b) C-shaped channel with integral flange(s). Mating face shall be a minimum of 1 inch.
 - c) Width not less than 4 inches.
 - d) Entire frame shall be thermally broken by means of polyurethane resin pockets, complete with thermal cuts.
 - e) Damper frame shall be insulated with polystyrofoam on four sides.
- 2) Blades:
- a) Hollow shaped, extruded aluminum.
 - b) Blades shall be internally insulated with expanded polyurethane foam and shall be thermally broken. Complete blade shall have an insulating factor of R-2.29 and a temperature index of 55.
 - c) Parallel- or opposed-blade configuration as required by application.
 - d) Material: ASTM B211, Alloy 6063 T5 aluminum, 0.08 inch thick.
 - e) Width not to exceed 6 inches.
 - f) Length as required by close-off pressure, not to exceed 48 inches.
- 3) Seals: Blade and frame seals shall be of flexible silicone and secured in an integral slot within the aluminum extrusions. Option to use stainless steel compression-type frame seals..
- 4) Axles: 0.44-inch- diameter stainless steel, mechanically attached to blades.
- 5) Bearings:
- a) Bearings shall be composed of a celcon inner bearing fixed to axle, rotating within a polycarbonate outer bearing inserted in the frame, resulting in no metal-to-metal or metal-to-plastic contact.
 - b) Where blade axles are installed in vertical position, include thrust bearings.
- 6) Linkage:
- a) Concealed in frame.
 - b) Constructed of aluminum and stainlesssteel.
 - c) Hardware: Stainless steel.
- 7) Additional Corrosion Protection for Corrosive Environments:
- a) Include anodized finish for aluminum surfaces in contact with airstream. Anodized finish shall be a minimum of 0.0007 inch thick.
 - b) Axles, damper linkage, and hardware shall be constructed of Type 316L stainless steel.
4. Damper Actuators:

a. General:

- 1) Actuators shall operate related damper(s) with sufficient reserve power to provide smooth modulating action or two-position action and proper speed of response at velocity and pressure conditions to which damper is subjected.
- 2) Actuators shall produce sufficient power and torque to close off against the maximum system pressures encountered. Actuators shall be sized to close off against the fan shutoff pressure as a minimum requirement.
- 3) Total damper area operated by an actuator shall not exceed 80 percent of manufacturer's maximum area rating.
- 4) Include one actuator for each damper assembly where possible. Multiple actuators required to drive a single damper assembly shall operate in unison.
- 5) Avoid use of excessively oversized actuators, which could overdrive and cause linkage failure when the damper blade has reached either its full open or closed position.
- 6) Use jackshafts and shaft couplings in lieu of blade-to-blade linkages when driving axially aligned damper sections.
- 7) Include mounting hardware and linkages for connecting actuator to damper.
- 8) Select actuators to fail in desired position in the event of a power failure.
- 9) Actuator Fail Positions: As indicated below:
 - a) Exhaust Air: Close.
 - b) Outdoor Air: Close.
 - c) Supply Air: Open.
 - d) Return Air: Open.
 - e) .

b. Type: Motor operated, with or without gears, electric and electronic.

c. Voltage:

- 1) Voltage selection is delegated to professional designing control system.
- 2) Actuator shall deliver torque required for continuous uniform movement of controlled device from limit to limit when operated at rated voltage.
- 3) Actuator shall function properly within a range of 85 to 120 percent of nameplate voltage.

d. Construction:

- 1) Less Than 100 W: Fiber or reinforced nylon gears with steel shaft, copper alloy or nylon bearings, and pressed steel enclosures.
- 2) 100 up to 400 W: Gears ground steel, oil immersed, shaft-hardened steel running in bronze, copper alloy, or ball bearings. Operator and gear trains shall be totally enclosed in dustproof cast-iron, cast-steel, or cast-aluminum housing.

- 3) Greater Than 400 W: Totally enclosed reversible induction motors with auxiliary hand crank and permanently lubricated bearings.
- e. Field Adjustment:
- 1) Spring return actuators shall be easily switchable from fail open to fail closed in the field without replacement.
 - 2) Provide gear-type actuators with an external manual adjustment mechanism to allow manual positioning of the damper when actuator is not powered.
- f. Two-Position Actuators: Single direction, spring return, or reversing type.
- g. Modulating Actuators:
- 1) Capable of stopping at all points across full range, and starting in either direction from any point in range.
 - 2) Control Input Signal:
 - a) Proportional: Actuator drives proportional to input signal and modulates throughout its angle of rotation. Suitable for 0- to 10- or 2- to 10-V dc and 4- to 20-mA signals.
 - b) Pulse-Width Modulation (PWM): Actuator drives to a specified position in accordance with a pulse duration (length) of signal from a dry-contact closure, triac sink, or source controller.
 - c) Programmable Multifunction:
 - d) Control input, position feedback, and running time shall be factory or field programmable.
 - e) Diagnostic feedback of hunting or oscillation, mechanical overload, mechanical travel, and mechanical load limit.
 - f) Service data, including at a minimum, number of hours powered, and number of hours in motion.
- h. Position Feedback:
- 1) Equip two-position actuators with limits switches or other positive means of a position indication signal for remote monitoring of open and close position.
 - 2) Equip modulating actuators with a position feedback through current or voltage signal for remote monitoring.
 - 3) Include a position indicator and graduated scale on each actuator indicating open and closed travel limits.
- i. Fail-Safe:
- 1) Where indicated, provide actuator to fail to an end position.
 - 2) Internal spring return mechanism to drive-controlled device to an end position (open or close) on loss of power.
 - 3) Batteries, capacitors, and other non-mechanical forms of fail-safe operation are acceptable only where uniquely indicated.
- j. Integral Overload Protection:

- 1) Provide against overload throughout the entire operating range in both directions.
- 2) Electronic overload, digital rotation sensing circuitry, mechanical end switches, or magnetic clutches are acceptable methods of protection.

k. Damper Attachment:

- 1) Unless otherwise required for damper interface, provide actuator designed to be directly coupled to damper shaft without need for connecting linkages.
- 2) Attach actuator to damper drive shaft in a way that ensures maximum transfer of power and torque without slippage.
- 3) Bolt and setscrew method of attachment is acceptable only if included with at least two points of attachment.

l. Temperature and Humidity:

- 1) Temperature: Suitable for operating temperature range encountered by application with minimum operating temperature range of minus 20 to plus 120 deg F.
- 2) Humidity: Suitable for humidity range encountered by application; minimum operating range shall be from 5 to 95 percent relative humidity, noncondensing.

m. Enclosure:

- 1) Suitable for ambient conditions encountered by application.
- 2) Provide actuator enclosure with a heater and controller where required by application.
- 3) NEMA 250, Type 2 for all applications except.
- 4) NEMA 250, Type 4 or Type 4X for applications.

n. Stroke Time: Select operating speed to be compatible with equipment and system operation.

- 1) Operate damper from fully closed to fully open within 15 seconds.
- 2) Operate damper from fully open to fully closed within 15 seconds.
- 3) Move damper to failed position within 15 seconds.
- 4) Actuators operating in smoke-control systems shall comply with governing code and NFPA requirements.

o. Sound:

- 1) Spring Return: 62 dBA.
- 2) Non-Spring Return: 45 dBA.

R. Smoke Dampers:

1. General: Air-handling unit manufacturer shall furnish and factory install smoke dampers inside air-handling units where indicated on Drawings.
2. Rectangular Smoke Dampers with Aluminum Blades:

- a. General: Air-handling unit manufacturer shall furnish and factory install smoke dampers inside air-handling units where indicated on Drawings.
 - b. Performance:
 - 1) Leakage: In accordance with UL 555S, Class 1.
 - 2) Pressure Drop: 0.05 inch wg at 1500 fpm across a 24-by-24-inch damper when tested in accordance with AMCA 500-D, figure 5.3.
 - 3) Velocity: Up to 4000 fpm.
 - 4) Temperature: 250 deg F.
 - 5) Pressure Rating: 8.0 inches wg.
 - c. Certification: NRTL listed and labeled in accordance with UL 555S, Class 1.
 - d. Construction:
 - 1) Frame:
 - a) Material: ASTM B211, Alloy 6063 T5 extruded-aluminum profiles, 0.07 inch thick.
 - b) Hat-shaped channel with integral flange(s). Flange mating face shall be a minimum of 1 inch.
 - c) Width not less than 5 inches.
 - 2) Blades:
 - a) Hollow, extruded airfoil shape.
 - b) Material: ASTM B211, Alloy 6063 T5 aluminum, 0.07 inch thick.
 - c) Width not to exceed 6 inches.
 - d) Length as required by close-off pressure, not to exceed 48 inches.
 - 3) Seals:
 - a) Blades: Replaceable, mechanically attached extruded silicone.
 - b) Jams: Stainless steel, compression type.
 - 4) Axles: 0.5-inch- diameter stainless steel, mechanically attached to blades.
 - 5) Bearings:
 - a) Molded synthetic or stainless steel sleeve mounted in frame.
 - b) Where blade axles are installed in vertical position, include thrust bearings.
 - 6) Linkage:
 - a) Concealed in frame.
 - b) Constructed of aluminum and stainless steel.
 - c) Hardware: Stainless steel.
3. Rectangular Smoke Dampers with Galvanized-Steel Blades:

- a.
- b. General: Air-handling unit manufacturer shall furnish and factory install smoke dampers inside air-handling units where indicated on Drawings.
- c. Performance:
 - 1) Leakage: In accordance with UL 555S, Class 1.
 - 2) Pressure Drop: 0.07 inch wg at 1500 fpm across a 24-by-24-inch damper when tested in accordance with AMCA 500-D, figure 5.3.
 - 3) Velocity: Up to 4000 fpm.
 - 4) Temperature: 250 deg F.
 - 5) Pressure Rating: 8.0 inches wg.
- d. Certification: NRTL listed and labeled in accordance with UL 555S, Class 1.
- e. Construction:
 - 1) Frame:
 - a) Material: Galvanized steel, minimum 0.06 inch thick.
 - b) Hat-shaped channel with integral flange(s). Flange mating face shall be a minimum of 1 inch.
 - c) Width not less than 5 inches.
 - 2) Blades:
 - a) Hollow, airfoil shape.
 - b) Material: Galvanized steel, minimum 0.06 inch thick.
 - c) Width not to exceed 6 inches.
 - d) Length as required by close-off pressure, not to exceed 48 inches.
 - 3) Seals:
 - a) Blades: Replaceable, mechanically attached extruded silicone.
 - b) Jams: Stainless steel, compression type.
 - 4) Bearings:
 - a) Stainless steel sleeve type mounted in frame.
 - b) Where blade axles are installed in vertical position, include thrust bearings.
 - 5) Linkage:
 - a) Concealed in frame.
 - b) Constructed of galvanized steel.
 - c) Hardware: Steel with corrosion-resistant finish.
- f. Actuator:

- 1) Type: Electric, with electrical characteristics compatible with field power supply.
- 2) Action: modulating or two position.
- 3) Control Signal: Individual damper assemblies with multiple actuators shall be factory wired to operate in unison from a single control signal.
- 4) Fail Position: Closed or open, as indicated on Drawings.
- 5) Mounting on Damper: External.
- 6) Quantity: Provide each damper assembly with least number of actuators possible for application.
- 7) Speed of Response:
 - a) Damper blade operation shall have a controlled movement of at least 5 seconds when travelling from open to close to reduce the potential for damage to duct system and connected equipment.
 - b) Damper closure shall not be instantaneous under any condition.
 - c) Operating time for completion of 90-degree damper travel, from open to close, or from close to open, shall not exceed the more stringent of the following: NFPA references indicated, governing codes, 15 seconds

g. Blade Position Switches:

- 1) Provide damper assemblies with limit switches to provide remote indication of damper blade positions.
- 2) Provide separate limit switches for remote indication of damper blade open position and damper blade closed position.
- 3) Actuators equipped with remote position indication as an integral part of actuator is acceptable in lieu of separate limit switches only if actuator with integral remote position indication is NRTL listed in accordance with UL 555S.

S. Heat Wheels:

1. Performance:

- a. Heat wheels shall be engineered by manufacturer to provide a highly reliable, low-maintenance product for use under continuous operation over an extended operating period of not less than 20 years. Provide supporting documentation if requested to show how features of product design comply with performance indicated.
- b. Products with ratings that exceed indicated pressure drop, fall short of sensible and latent recovery performance indicated, or transfer contaminants in excess of requirements indicated are unacceptable and should not be submitted for review and approval.
- c. Fully-assembled and -installed heat wheel shall be suitable for use in air systems that supply air to tenant occupied space and shall comply with NFPA 90A and governing building codes.

2. Testing and Certification:

- a. Thermal Performance: Certification by a qualified independent testing organization documenting the following:
 - 1) Sensible and latent recovery efficiencies conducted in accordance with ASHRAE 84 with results presented in accordance with ASHRAE 84 and AHRI 1060 (I-P) and AHRI 1061 (SI).
 - 2) Sensible, latent, and pressure loss performance over a range of operating points as required by ASHRAE 84 and specifically for actual airflow conditions required by Project.
 - b. Cross Contamination: Cross-contamination performance reports to validate compliance with requirements indicated.
 - 1) Testing shall be performed in a test facility complying with ASHRAE 84 for tracer gas testing.
 - c. Flame and Smoke: NRTL test report listing flame-spread index and smoke-developed index of media when tested in accordance with ASTM E84 to comply with requirements indicated.
 - d. Microbial Resistance: Test report documenting ability of wheel faces and transfer media to actively limit microbial growth.
 - 1) Testing completed by a qualified research institution or testing laboratory using common live bacterial cultures to document antimicrobial performance with 95 percent mortality effectiveness.
 - e. Corrosion Resistance: Test report summarizing acid resistance effectiveness of media face coating completed in accordance with ASTM corrosion-test methodologies.
3. Rotors:
- a. Construct rotor media of aluminum base material precoated with a desiccant before forming into honeycomb media structure consisting of circular spiral layers.
 - b. Aluminum base material shall be at least 0.0015 inch thick before coating.
 - c. Media layers shall be joined together using adhesive to bond between flat and corrugated media layers.
 - d. Media Coating:
 - 1) Coat media surfaces with a non-migrating solid adsorbent desiccant layer before forming into the structure to ensure that all surfaces are coated.
 - 2) Desiccant coating shall be inorganic and use a 3 Angstrom molecular sieve to achieve desired 3 Angstrom selectivity, excluding contaminants larger than 3 Angstroms while effectively transferring water vapor.
 - 3) In addition to desiccant coating applied to aluminum substrate, cover two faces of rotor with a two-part polymer coating specifically chosen for chemical resistance and corrosion protection. Coating shall be selected to provide life expectancy indicated when exposed to airstreams encountered.

- 4) Media exposed to airstream shall exhibit effective antimicrobial action to protect against development and spread of microbial contaminants.
 - 5) Rotor media with applied coatings and adhesive shall have a flame-spread index of 0 and a smoke-developed index of 5 when tested in accordance with ASTM E84.
- e. Media depth shall be determined by heat wheel manufacturer to achieve performance indicated.
 - f. Media shall not transfer pollutants typically encountered in an indoor air environment having room operations and functions indicated.
 - g. Media shall be cleanable without degrading performance over time.
 - h. Dry particles up to 800 microns shall pass freely through the media.
 - i. Provide segmented rotor media to allow for field installation and replacement of one section at a time without requiring side access. Removal and replacement shall be made while facing rotor media face.
 - j. Rotor media shall be held in place by a rigid structural spoke system made of extruded aluminum.
 - k. Coat exposed surfaces of aluminum spoke system for corrosion protection.
 - l. Rotor structural spoke system shall be designed and manufactured to provide for field installation of media without possibility of media deformation or misfit.
 - m. Media shall be secured within structural spoke system by mechanical means, relying on a formed friction fit without use of adhesives or silicone.
 - n. Rotors that cannot be installed in air-handling units as a single complete factory assembly coming from heat wheel manufacturer shall be remotely assembled by trained factory service personnel that are employed by heat wheel manufacturer.
4. Purge Sector:
- a. Factory-set, field-adjustable purge sector designed to limit cross contamination to less than 0.04 percent of that of exhaust airstream concentration into supply airstream.
 - b. Factory-set, field-adjustable purge sector designed to eliminate cross contamination of exhaust airstream into supply airstream.
5. Seals:
- a. Maintenance-free "non-contact" type to eliminate wear, excessive drag, and resulting added horsepower required for motor drive system, while still being capable of resisting high-pressure differences.
 - b. Equip rotor with labyrinth seals, which at no time shall make contact with any rotating surface of rotor face.
 - 1) Seals shall be field adjustable and set to within factory-specified tolerances.
 - 2) Provide multi-pass seals with four labyrinth stages for optimum performance or alternative design with documented test results showing comparable performance.

- c. Seal shall be secured to housing either by an extruded-aluminum strip with adjustment slots for fastening bolts to the casing frame or by using adjustable clips. Clips shall be made of stainless steel or other noncorrosive material to resist corrosion and possible damage to transfer media.
6. Shafts:
- a. Shaft supporting rotor between bearings shall be one piece, solid steel, accurately turned, ground, polished, and ring gauged for accuracy.
 - b. Machine and polish shaft within bearing contact area to comply with bearing manufacturer's written recommended tolerances.
 - c. Use a dial indicator to inspect shafts for roundness and straightness.
 - d. Coat exposed surfaces of shaft with a corrosion-inhibitive coating.
 - e. Shaft shall be machined to provide a shoulder against bearings for a positive locked position to eliminate any lateral movement of rotor due to axial bearing loads.
7. Bearings:
- a. Support rotor shaft by two pillow block tapered roller bearings designed for an ABMA 11 L-10 life of at least 200,000 hours.
 - b. Bearings shall be maintainable and replaceable without removal of rotor from its casing or media from spoke support system.
 - c. Grease fittings for each bearing shall be easily accessible and within view of bearing.
 - d. Reverse Rotation: Clutch bearing and extended shaft, or equivalent alternative, to prevent reverse rotation and ensure that wheel can only rotate in direction commensurate with effective purge operation.
8. Frame and Housing:
- a. Design frame to limit deflection of rotor due to air pressure loss to less than 0.03125 inch, as measured at the outer radius, during maximum rated airflow condition when exposed to a wheel pressure differential of 25 percent above design conditions.
 - b. Construct rigid frame of welded structural galvanized steel or stainless steel.
 - c. Designed and manufactured in one, two, or more sections as required by application to provide a rigid structure, when completely assembled, capable of supporting rotor.
 - 1) For horizontal airflow applications, support rotor at each end only with no additional support under center.
 - 2) For vertical airflow applications, provide one additional bottom center support.
 - 3) Clearly mark each section of multiple section units for easy installation.
 - d. Construct housing of galvanized-steel or stainless steel formed sheets designed to prevent corrosion.

- e. Housing shall be reinforced as required to provide a solid mounting surface of peripheral and radial seals, to maintain a fixed distance between rotor surface and any housing part.
 - f. There shall be no special requirement to provide air-handling unit casing side access for future rotor removal and service. All rotor service shall be performed from inside air-handling unit at face of rotor.
 - g. Requirements for Painted Frame and Housing:
 - 1) Comply with painting manufacturer's written preparation and application requirements.
 - 2) Treat galvanized steel that is not phosphatized with a phosphate rinse to ensure that paint adheres.
 - 3) Apply rust-inhibiting primer before applying finishing coats.
 - 4) Apply multiple coats to achieve dry film thickness required for protection indicated.
 - 5) Finish coat color to be Selected by Architect.
 - 6) Painted products shall have no deterioration when subjected to the following:
 - a) Salt spray test in accordance with ASTM B117 with 5 percent salt solution fog at 95 deg F for a period of 500 hours.
 - b) Acid-resistance test in accordance with ASTM D3260 with 15-minute exposure to 10 percent hydrochloric acid at room temperature.
9. Motor and Drive Assembly:
- a. Motor Enclosure: Totally enclosed.
 - b. Motor nameplate horsepower shall exceed maximum load of driven assembly.
 - c. Multiple belt-drive assembly shall be automatically tensioned and arranged to eliminate any side-to-side movements and slippage.
 - d. Motor and drive assembly shall be easily accessible and visible for inspection and maintenance.
 - e. Drive assembly, except motor, shall have a life expectancy of 45,000 hours.
10. Variable-Frequency Controller:
- a. Variable-speed control of rotor through a variable-frequency controller.
 - b. Digital programming with a manual-speed adjustment on the front face of controller.
 - c. Rotor drive system shall allow for a turndown ratio of 80:1 (20 to 0.25 rpm).
 - d. Controller with switchable control either locally on front of controller or remotely by a control system.
 - e. Controller with a motor-rated disconnect switch or circuit breaker having a withstanding rating greater than that required by field electrical power system, but not less than 42,000 A.
 - f. Controller mounted in a NEMA 250, Type 4 enclosure.

11. Rotation Sensor: Proximity-type rotation sensor and target to provide rotational speed (rpm) analog signal and wheel stop digital alarm signal for interface to remote-control system.
12. Monitoring and Control:
 - a. Single-Source Responsibility: Heat wheel manufacturer shall provide a complete monitoring and control package for heat wheel with controller, local display, operator interface, sensors, switches, transmitters, accessories, components, devices, and programming for a complete and operating heat wheel to ensure that responsibility for heat wheel and its operation resides with one source.
 - b. Enclosure:
 - 1) House controller and control devices in a NEMA 250, Type 4 enclosure.
 - 2) Enclosure with LCD screen to allow viewing and changing parameters.
 - 3) Enclosure with full front face hinged door and lockable handle.
 - 4) Air-handling unit manufacturer shall mount enclosure of outside of air-handling unit casing in vicinity of heat wheel.
 - c. DDC with the following:
 - 1) Conversion of temperature and relative humidity readings into grains, dew point, and enthalpy.
 - 2) Calculation and reporting of real-time unit effectiveness.
 - 3) Calculation and reporting of accumulation of energy (Btu) recovered over time.
 - 4) With user input of energy costs, calculation and accumulation of dollars saved over time.
 - 5) An alarm output if wheel is not rotating and not rotating in correct direction.
 - 6) Programming for integration of enthalpy-based summer-winter change over, frost prevention and supply temperature control such that they also function correctly as the wheel speed is modulated.
 - 7) Communications and data transfer for remote monitoring and control through ASHRAE 135 (BACnet) interface.
 - 8) Option to achieve conversion and calculations indicated is for heat wheel manufacturer to employ building controls provider, to provide a field-installed DDC with LCD to be mounted directly adjacent to heat wheel manufacturer monitoring and control enclosure.
 - d. Four, field-mounted, high-precision dry-bulb temperature and either wet-bulb temperature or humidity sensors shall be provided by heat wheel manufacturer to air-handling unit manufacturer for factory mounting in accordance with heat wheel manufacturer's written instructions to measure dry-bulb temperature and either wet-bulb temperature or humidity at each of four energy wheel airstreams.
 - 1) Sensors shall be wired to controller or controller expander board located within enclosure.

- e. Wheel Rotation: Rotation detector module to detect a rotating wheel, and correct direction of rotation and speed.
 - f. Active Monitoring and Control of Purge: Manufacturer's standard method to ensure that proper purge operation is maintained actively in response to changes in system airflows and pressures that normally occurs with a variable-volume system and where pressure changes appreciably due to filter loading and damper modulation.
13. Air-Handling Unit Factory Assembly:
- a. Internal Access: Provide each heat wheel with internal access from downstream and upstream sides as indicated on Drawings.
 - b. Removal and Replacement: Each heat wheel shall be independently removable and replaceable through a removable access panel installed in air-handling unit casing.
 - c. Drain Pans: In applications capable of formation of frost, install condensate drain pans to collect and drain water to exterior of air-handling unit casing.
 - d. Supports for Heat Wheel:
 - 1) Construct a freestanding and self-supporting structural framework to support each heat wheel individually from and independent of adjacent heat wheels.
 - 2) Construct frame work from aluminum, galvanized-steel, or stainless steel structural shapes.
 - e. Comply with heat wheel manufacturer's written installation instructions.
- T. Air-Handling Unit Factory Drain Piping And Piping Insulation:
- 1. General:
 - a. Air-handling unit manufacturer to factory install piping inside air-handling units.
 - b. If more than one material is listed, material selection is by air-handling unit manufacturer.
 - 2. Copper Tubing:
 - a. Tubing: Drawn-temper, ASTM B88, Type L or Type DWV in accordance with ASTM B306.
 - b. Fittings: Wrought-copper and copper alloy, ASME B16.22, pressure fittings.
 - c. Unions: Cast-copper-alloy, MSS SP-123, hexagonal-stock body; female NPT threaded ends.
 - d. Solder Filler Metals: ASTM B32, lead-free alloys, and water-flushable flux in accordance with ASTM B813.
 - 3. Floor Drain Piping:
 - a. Schedule 40 aluminum or stainless steel pipe with threaded ends or copper tube with soldered threaded male adapters.

- b. Factory install a dedicated drain pipe for each floor drain and extend pipe to access side of air-handling unit.
 - 1) Terminate pipe with a threaded pipe cap 3 inches beyond exterior face of air-handling unit casing. Threaded pipe cap material to match pipe material.
 - 2) Pipe size to match size of floor drain connection.
- 4. Drain Pan Piping:
 - a. Schedule 40 aluminum or stainless steel pipe with threaded ends or copper tube with soldered threaded male adapters.
 - b. Factory install drain piping for drain pan(s). Install a dedicated drain pipe for each drain pan serving different air-handling unit internal components. Where multiple drain pans serve like components interconnect drain piping to a single drain pipe for field connection.
 - 1) Where interconnecting cooling coil condensate drain pans from upstream and downstream sides of cooling coil, provide pipe with a water seal trap configured to prevent air bypass.
 - 2) Terminate pipe with a threaded pipe cap 3 inches beyond exterior face of air-handling unit casing. Threaded pipe cap material to match pipe material.
 - 3) Drain pipe size to match size of drain pan connection.
- 5. Piping Insulation:
 - a. Factory insulate bottom cooling coil drain pan pipe with 1-inch- thick, flexible elastomeric insulation where pipe is located under and outside of the air-handling unit casing but within the air-handling unit base.
- U. Air-Handling Unit Factory Hydronic Piping and Piping Insulation:
 - 1. Chilled-Water Piping:
 - a. Design Pressure and Temperature: See Drawings.
 - b. Pipe: ASME B36.10M, carbon steel ASTM A53/A53M, with beveled or plain ends; seamless longitudinal joints, Grade B; standard weight.
 - c. Fittings, Threaded: Malleable iron, ASME B16.3; Class 150.
 - d. Fittings, Butt Welded: ASME B16.9, wrought-steel ASTM A234/A234M, Grade WPB, seamless or welded, wall thickness to match adjoining pipe.
 - e. Flanges, Weld: Weld-neck, forged carbon-steel, ASME B16.5; Class 150.
 - f. Unions, Threaded: Malleable iron, ASME B16.39; Class 150.
 - g. Strainers: Y-pattern; body and cap constructed of cast-iron, ASTM A126, Class B, removable basket constructed of Type 304 or Type 316 stainless steel with openings not larger than 0.032 inch; Class 125.
 - h. Valves:
 - 1) Ball: Two-piece with threaded ends, MSS SP-110, 600 WOG; cast-bronze or forged copper-alloy body, stainless steel vented ball,

- corrosion-resistant plastic-coated handle, extended stem, and stationary outer sleeve to protect insulation vapor seal.
- 2) Butterfly: Lugged body; MSS SP-67; cast-iron, ductile-iron, or cast-steel body; stainless steel disk, EPDM seat, and lever or gear operator; rated for system pressure, but not less than 250-psig bi-directional dead-end shutoff with downstream flange removed.
- 3) Check: Globe-style, MSS SP-125; cast-iron ASTM A126 body, stainless steel spring, and bronze seat; Class 125.

- i. Vents: Cast-iron body, stainless steel float, NPS 1/2 or larger inlet connection.
- j. Flow Meters: In-line electromagnetic type with integral display and accuracy within 3 percent of reading.
- k. Pressure Gauges: Bourdon-tube, ASME B40.100 with Grade A accuracy; metal case with nominal 4-1/2-inch shatter-resistant glass face and NPS 1/2 threaded brass connection.
- l. Test Plugs: Brass or stainless steel body with core inserts and gasketed and threaded cap, extension for insulation; threaded NPS 1/2 connection.
- m. Thermometers: Bi-metal actuated, ASME B40.200 with 1 percent accuracy; adjustable-angle stainless steel case with nominal 5-inch shatter-resistant glass face. Include thermometers with stainless steel extended-neck thermowells.
- n. Air-Handling Unit Factory Assembly: Factory install a complete piping system inside air-handling units as indicated on Drawings.
 - 1) NPS 2 and smaller with threaded fittings, strainers, and valves. Larger sizes with welded joints, fittings, and flanges for valves and strainers.
 - 2) Arrange piping with sufficient clearance between piping and other components to accommodate removal and replacement of installed components.
 - 3) Gradually slope piping for venting and drainage.
 - 4) Include threaded drain connections and ball valves with threaded hose-end, cap, and chain at all low points in piping.
 - 5) Comply with requirements indicated on Drawings.
 - 6) Make connections to coils with a flange or union.
 - 7) Connect to each coil inlet with shutoff valve, test plug, strainer pressure gauge and thermometer.
 - 8) Connect to each coil outlet with balancing valve, test plug, pressure gauge thermometer flow meter and shutoff valve.
 - 9) Connect each coil drain connection with a drain valve, which is full size of drain connection.
 - 10) Connect each coil vent connection with automatic vent, which is full size of vent connection.
 - 11) Include with each strainer a blowdown connection consisting of a nipple and threaded ball valve with threaded hose-end, cap, and chain.

- 2. Chilled-Water Piping Insulation and Identification:
 - a. Insulation: Preformed, cellular glass; minimum 2 inches thick.

- b. Adhesive: Compatible with insulation material and recommended in writing by insulation manufacturer.
- c. Jacket: PVC, color selected by Architect, 20 mils thick.
- d. Air-Handling Unit Factory Assembly: Continuously insulate and vapor seal piping system throughout its entire length. Insulate all surface capable of forming condensation.
 - 1) Install high-density insulation insert products, consisting of two 180-degree halves, at pipe hangers and supports. Material density sufficient to accommodate loading without deformation.
 - 2) Insulation thickness determined by air-handling unit manufacturer to comply with governing codes, ASHRAE/IES 90.1, and minimum thickness indicated and to prevent condensation.
 - 3) Insulate piping system only after successful completion of pressure tests.
 - 4) Install adhesive-backed acrylic identification labels indicating pipe size service and direction of flow at multiple locations sufficient for operators to easily follow the flow path. Each branch pipe should have at least one label.

3. Heating Water Piping:

- a. Design Pressure and Temperature: See Drawings.
- b. Pipe: ASME B36.10M, carbon steel ASTM A53/A53M, with beveled or plain ends; seamless longitudinal joints, Grade B; standard weight.
- c. Fittings, Threaded: Malleable iron, ASME B16.3; Class 150.
- d. Fittings, Butt Welded: ASME B16.9, wrought-steel ASTM A234/A234M, Grade WPB, seamless or welded, wall thickness to match adjoining pipe.
- e. Flanges, Weld: Weld-neck, forged carbon-steel, ASME B16.5; Class 150.
- f. Unions, Threaded: Malleable iron, ASME B16.39; Class 150.
- g. Strainers: Y-pattern; body and cap constructed of cast-iron, ASTM A126, Class B, removable basket constructed of Type 304 or Type 316 stainless steel with openings not larger than 0.032 inch; Class 125.
- h. Valves:
 - 1) Ball: Two-piece with threaded ends, MSS SP-110, 600 WOG; cast-bronze or forged copper-alloy body, stainless steel vented ball, corrosion-resistant plastic-coated handle, and extended stem.
 - 2) Butterfly: Lugged body; MSS SP-67; cast-iron, ductile-iron, or cast-steel body; stainless steel disk, EPDM seat, and lever operator; rated for system pressure, but not less than 250-psig bi-directional dead-end shutoff with downstream flange removed.
 - 3) Check: Globe-style, MSS SP-125; cast-iron ASTM A126 body, stainless steel spring, and bronze seat; Class 125.
- i. Vents: Cast-iron body, stainless steel float, NPS 1/2 or larger inlet connection.
- j. Flow Meters: In-line electromagnetic type with integral display and accuracy within 3 percent of reading.

- k. Pressure Gauges: Bourdon-tube, ASME B40.100 with Grade A accuracy; metal case with nominal 4-1/2-inch shatter-resistant glass face and NPS 1/2 threaded brass connection.
 - l. Test Plugs: Brass or stainless steel body with core inserts and gasketed and threaded cap, extension for insulation; threaded NPS 1/2 connection.
 - m. Thermometers: Bi-metal actuated, ASME B40.200 with 1 percent accuracy; adjustable-angle stainless steel case with nominal 5-inch shatter-resistant glass face. Include thermometers with stainless steel extended-neck thermowells.
 - n. Air-Handling Unit Factory Assembly: Factory install a complete piping system inside air-handling units as indicated on Drawings.
 - 1) NPS 2 and smaller with threaded fittings, strainers, and valves. Larger sizes with welded joints, fittings, and flanges for valves and strainers.
 - 2) Arrange piping with sufficient clearance between piping and other components to accommodate removal and replacement of installed components.
 - 3) Gradually slope piping for venting and drainage.
 - 4) Include threaded drain connections and ball valves with threaded hose-end, cap, and chain at all low points in piping.
 - 5) Comply with requirements indicated on Drawings.
 - 6) Make connections to coils with a flange or union.
 - 7) Connect to each coil inlet with shutoff valve, test plug, strainer pressure gauge and thermometer.
 - 8) Connect to each coil outlet with balancing valve, test plug, pressure gauge thermometer flow meter and shutoff valve.
 - 9) Connect each coil drain connection with a drain valve, which is full size of drain connection.
 - 10) Connect each coil vent connection with automatic vent, which is full size of vent connection.
 - 11) Include each strainer with a blowdown connection consisting of a nipple and threaded ball valve with threaded hose-end, cap, and chain.
4. Heating Water Piping Insulation and Identification:
- a. Insulation: Preformed, cellular glass; minimum 2 inches thick.
 - b. Adhesive: Compatible with insulation material and recommended in writing by insulation manufacturer.
 - c. Jacket: PVC, color selected by Architect, 20 mils thick.
 - d. Air-Handling Unit Factory Assembly: Continuously insulate and seal piping insulation system throughout its entire length.
 - 1) Install high-density insulation insert products, consisting of two 180-degree halves, at pipe hangers and supports. Material density sufficient to accommodate loading without deformation.
 - 2) Insulation thickness determined by air-handling unit manufacturer to comply with governing codes, ASHRAE/IES 90.1, and minimum thickness indicated and to prevent condensation.

- 3) Insulate piping system only after successful completion of pressure tests.
- 4) Install adhesive-backed acrylic identification labels indicating pipe size service and direction of flow at multiple locations sufficient for operators to easily follow the flow path. Each branch pipe should have at least one label.

5. Piping Hangers and Supports:

- a. Finish: Galvanized metallic coatings including pregalvanized, hot-dip galvanized, or electro-galvanized.
- b. Hangers: MSS-SP-58, Type 1.
- c. Supports: MSS-SP-58, Type 4, Type 24, or Type 37.
- d. Threaded Rods: Continuous-thread rod, nuts, and washer made of galvanized steel or stainless steel.
- e. Strut: MFMA-4, continuous slotted stainless steel, Type 304 channel with inturred lips.
- f. Air-Handling Unit Factory Assembly:
- g. Ridgely support piping from internal structure in accordance with governing codes and MSS SP-58.

V. Drains:

1. Floor Drains:

- a. Drain Body: Fabricate floor drain body of NPS 4 or larger aluminum or stainless pipe and weld a plate of same material to the bottom. Option to fabricate an aluminum or stainless steel rectangular box drain at least 4 by 4 inches of material at least 0.1 inch thick.
- b. Drain Connection: Weld a nominal NPS 2 half coupling in side of drain body located within 1 inch from bottom.
- c. Drain Cover: Perforated plate, at least 0.1 inch thick, or grating, fabricated from aluminum or stainless steel. Drain cover shall be supported and secured in place by drain body, but not fastened to drain body with fasteners.
- d. Fluid Seal: Seal floor drain body to air-handling unit floor for a watertight installation.
- e. Mounting: Recess floor drain body into structural base. Top of floor drain to be slightly recessed below air-handling unit finished floor for unobstructed gravity flow from floor into drain.
- f. Application:
 - 1) Install floor drains in air-handling unit floors at locations indicated on Drawings.

W. Factory-Assembled Electrical:

1. Factory install service light fixtures and switches, and receptacles for each air-handling unit.
 - a. Locate in a convenient and field-accessible location.

- b. Installation shall comply with NFPA 70.
 - c. Wire, Conduit, and Enclosures:
 - 1) Minimum Conduit Size: 3/4 inch.
 - 2) Materials: Metal, with a corrosion-resistant finish.
 - 3) Supports: Support conduits, boxes, and enclosures using corrosion-resistant fastening hardware constructed of stainless steel.
 - 4) Conduit: Locate conduit inside the air-handling unit casing. Conduit installed on exterior of air-handling unit casing is unacceptable.
 - 5) Wire: Copper, rated for 600 V, solid wire for size No. 10 AWG and smaller and stranded wire for larger sizes.
 - 6) Minimum Wire Size: No. 12 AWG.
 - 7) Each circuit shall have a ground wire.
 - 8) Install wire in conduit.
 - d. Boxes, Conduit Outlet Bodies, and Enclosures:
 - 1) Located in Airstream: NEMA 250, Type 4X.
 - 2) Located in Service Corridor: NEMA 250, Type 4.
 - e. Seals: Seal pathways to prevent air leakage between air-handling unit exterior and interior, and between internal component sections.
 - f. Service Lighting Applications:
 - 1) Provide quantity of 20-A branch circuits required to power service light fixtures.
 - 2) For air-handling units consisting of multiple stacked tiers, provide separate circuits for top and bottom tiers of air-handling units.
 - 3) Factory install a main disconnect switch for interfacing air-handling power for service lighting with single-point field power wiring connection.
 - g. Receptacle Applications:
 - 1) Factory wire receptacles to a main disconnect switch for interfacing air-handling power for receptacles with a single-point field power wiring connection.
2. Main Disconnect Switches: Factory-install main disconnect switch mounted on air-handling unit casing exterior for interface of factory power wiring with field power wiring.
- a. Specification Grade; "Heavy Duty Type"; "quick-make," "quick-break" construction.
 - b. Three pole, nonfused.
 - c. 600 V rated.
 - d. Minimum Short-Circuit Current Rating: As required by electrical power distribution system, but not less than 42,000 A.
 - e. Enclosure:
 - 1) Located in Service Corridor: NEMA 250, Type 4.

- f. Operating handle shall be of box-mounted type that directly drives switch mechanism.
 - g. Disconnect switch shall use a flange-operated visible blade that is close coupled to a vertical-lift-type handle that achieves a positive visible indication of disconnect with cover open or closed.
 - h. Disconnect switch shall have a defeatable, front-accessible, mechanical interlock to prevent opening of cover when switch is in "ON" position, and to prevent turning switch "ON" when the door is open.
 - i. Include a solid neutral as required by authorities having jurisdiction.
 - j. Disconnect switch shall have a ground lug for ground wire termination.
 - k. Operating handle shall be lockable in open position.
 - l. Horsepower rated.
 - m. Feed through or double lugged.
3. Interior Service Light Fixtures:
- a. LED Luminaires:
 - 1) Suitable for wet locations and operation in cold- and hot-temperature extremes encountered; dust and moisture resistant.
 - 2) High-impact, UV-stabilized fiberglass housing and acrylic lens.
 - 3) Light Color: 5000 K.
 - 4) Light Output: 2000 lumens.
 - 5) Driver: 1 percent dimming.
 - b. Vaportight Fixtures:
 - 1) Suitable for wet locations and operation in cold- and hot-temperature extremes encountered; dust and moisture resistant.
 - 2) Cast-aluminum housing and guard with heat-resistant, tempered, clear glass globe.
 - 3) LED A21 Series Lamps:
 - a) Light Color: 5000 K.
 - b) Light Output: 1700 lumens.
 - c. Application:
 - 1) Provide service light fixtures where indicated on Drawings.
4. Toggle Switches for Service Light Fixtures:
- a. Single-Pole Switches, 120/277 V, 20 A: Comply with UL 20 and FS W-S-896.
 - b. Toggle Switch Box and Cover: Mount toggle switch in a metal outlet box with cast-aluminum or stainless steel cover. Weatherproof where exposed to outdoors.
 - c. Application:
 - 1) Factory install switching configuration (single, three way, or four way) required to operate a single service light fixture or group of service

- 2) light fixtures from any access door that opens to respective service light fixtures.
 - 2) Factory install service light switches at locations indicated on Drawings.
5. Receptacles:
- a. Isolated-Ground Duplex Receptacles, 125 V, 20 A:
 - 1) Description: Straight blade; equipment grounding contacts shall be connected only to green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts. Two pole, three wire, and self-grounding.
 - 2) Configuration: NEMA WD 6, Configuration 5-20R.
 - 3) Standards: Comply with UL 498 and FS W-C-596.
 - b. Duplex GFCI Receptacles, 125 V, 20 A:
 - 1) Description: Integral GFCI with "Test" and "Reset" buttons and LED indicator light. Two pole, three wire, and self-grounding.
 - 2) Configuration: NEMA WD 6, Configuration 5-20R.
 - 3) Type: Non-feed through.
 - 4) Standards: Comply with UL 498, UL 943 Class A, and FS W-C-596.
 - c. Receptacle Box and Cover: Mount receptacle in a metal outlet box with cast-aluminum or stainless steel cover. Weatherproof where exposed to outdoors.
 - d. Applications: Factory install a receptacle in a convenient and field-accessible location on air-handling unit exterior of casing at locations indicated on Drawings.
6. Power Supply to Fan Motors:
- a. Factory install a for each fan motor.
 - 1) Locate in a convenient and field-accessible location on unit exterior.
 - 2) Installation shall comply with NFPA 70.
 - 3) Wire, Conduit, and Enclosures:
 - a) Minimum Conduit Size: 3/4 inch.
 - b) Materials: Metal, corrosion resistant.
 - c) Motor Termination: Flexible conduit, NRTL listed, not to exceed 36 inches long.
 - d) Supports: Support conduits, boxes, and enclosures using corrosion-resistant fastening hardware.
 - e) Wire: Copper, rated for 600 V, solid wire for size No. 10 AWG and smaller and stranded wire for larger sizes.
 - f) Minimum Wire Size: No. 12 AWG.
 - g) Each circuit shall have a ground wire.
 - h) Install wire in conduit.

- 4) Boxes, Conduit Outlet Boxes, and Enclosures:
 - a) Located in Airstream: NEMA 250, Type 4X.
 - b) Located in Service Corridor: NEMA 250, Type 4.

7. Disconnect Switches:
 - a. Specification Grade; "Heavy Duty Type"; "quick-make," "quick-break" construction.
 - b. Three pole, nonfused.
 - c. 600 V rated.
 - d. Minimum Short-Circuit Current Rating: As required by electrical power distribution system, but not less than 42,000 A.
 - e. Enclosure:
 - 1) Located in Service Corridor: NEMA 250, Type 4.
 - f. Operating handle shall be of box-mounted type that directly drives switch mechanism.
 - g. Disconnect switch shall use a flange-operated visible blade that is close coupled to a vertical-lift-type handle that achieves a positive visible indication of disconnect with cover open or closed.
 - h. Disconnect switch shall have a defeatable, front-accessible, mechanical interlock to prevent opening of cover when switch is in "ON" position, and to prevent turning switch "ON" when the door is open.
 - i. Include a solid neutral as required by authorities having jurisdiction.
 - j. Disconnect switch shall have a ground lug for ground wire termination.
 - k. Operating handle shall be lockable in open position.
 - l. Horsepower rated.
 - m. Feed through or double lugged.

8. Motor Field Power Junction Box:
 - a. Provide junction box with internal wire terminal block mounted on unit exterior for interface with field power wiring.
 - 1) Provide for each motor not installed with a factory disconnect or controller with integral disconnect.
 - b. Factory install internal wiring and conduit to motor.

9. Motor Controllers:
 - a. NEMA ICS 2, Class A, full-voltage, non-reversing, motor-rated controller.
 - b. Configured for control of single- or multispeed motors as indicated.
 - c. Enclosure: Hinged full-front access door with lock and key.
 - 1) Located in Service Corridor: NEMA 250, Type 4.
 - d. Externally Operated Disconnect: Nonfused disconnect switch with lockable handle.

- e. Short-Circuit Current Rating: As required by electrical power distribution system, but not less than 42,000 A.
 - f. Hand-Off-Auto Switch: Mounted on face of enclosure.
 - g. Push-to-Test Run Status Pilot Lights: NEMA ICS 2, heavy-duty type.
 - h. Control Relays: Time-delay relays.
 - i. Phase-Failure, Phase-Reversal, Undervoltage Relays: Solid-state sensing circuit with adjustable undervoltage setting and isolated output contacts for hardwired connection.
 - j. Elapsed-Time Meters: Numerical readout in hours on face of enclosure.
 - k. Number-of-Starts Counter: Numerical readout on face of enclosure.
10. Variable-Frequency Controllers:
- a. Description: NEMA ICS 2; arranged to achieve motor variable speed by adjusting output voltage and frequency.
 - b. Enclosure: Unit mounted, with hinged full-front access door with lock and key.
 - 1) Located in Service Corridor: NEMA 250, Type 4.
 - c. Externally Operated Disconnect: Nonfused disconnect switch with lockable handle.
 - d. Minimum Short-Circuit Current Rating: As required by electrical power distribution system, but not less than 42,000 A.
 - e. Technology: Pulse-width-modulation (PWM) output with insulated gate bipolar transistors (IGBT); suitable for variable torque loads.
 - f. Controller shall consist of a rectifier converter section, a digital/analog driver regulator section, and an inverter output section.
 - g. Output Rating: Three phase; with voltage proportional to frequency throughout voltage range.
 - h. Output signal shall be programmed to not cause mechanical vibration issues with fan drive assembly.
 - i. Operating Requirements:
 - 1) Input AC Voltage Tolerance: 10 percent.
 - 2) Input frequency tolerance of 60 Hz, plus or minus 2 Hz.
 - 3) Capable of driving full motor load, without derating.
 - 4) Minimum Efficiency: 96 percent at 60 Hz, full load.
 - 5) Minimum Displacement Primary-Side Power Factor: 95 percent.
 - 6) Overload Capability: 1.05 times the full-load current for 7 seconds.
 - 7) Starting Torque: As required by fan and motor drive assembly.
 - 8) Speed Regulation: 1 percent.
 - 9) Speed Range: 10:1 speed range.
 - 10) To avoid equipment resonant vibrations, include critical speed lockout circuitry to allow bands of operating frequency at which controller shall not operate continuously.
 - 11) Capable of being restarted into a motor coasting in either the forward or reverse direction without tripping.
 - j. Controller Adjustability Capabilities: Minimum and maximum output frequency, acceleration and deceleration, and current limit.

- k. Self-Protection and Reliability Features: Subjecting the controller to any of the following conditions shall not result in component failure or need for replacement:
 - 1) Surge suppression.
 - 2) Loss of input signal protection.
 - 3) Critical frequency rejection.
 - 4) Overtemperature.
 - 5) Short circuit at controller output.
 - 6) Ground fault at controller output. Variable-frequency controller shall be able to start a grounded motor.
 - 7) Open circuit at controller output.
 - 8) Input undervoltage.
 - 9) Input overvoltage.
 - 10) Loss of input phase.
 - 11) Reverse phase.
 - 12) AC line switching transients.
 - 13) Instantaneous overload, line to line or line to ground.
 - 14) Sustained overload exceeding 100 percent of controller rated current.
 - 15) Starting a rotating motor.

- l. Motor Protection: Controller shall protect motor against overvoltage and undervoltage, phase loss, reverse phase, overcurrent, overtemperature, and ground fault.
- m. Automatic Reset and Restart:
 - 1) Capable of multiple restarts after controller fault or on return of power after an interruption and before shutting down for manual reset or fault correction.
 - 2) Capable of automatic restart on phase-loss and overvoltage and undervoltage trips.

- n. Visual Indication: On face of controller; indicating the following conditions:
 - 1) Power on.
 - 2) Run.
 - 3) Overcurrent and overvoltage.
 - 4) Motor speed (percentage).
 - 5) Various faults with alarm status.
 - 6) Input kilovolt amperes.
 - 7) Power factor.
 - 8) Input kilowatts and kilowatt-hours.
 - 9) Three-phase input and output voltage.
 - 10) Three-phase input and output current.
 - 11) Output frequency.
 - 12) Elapsed operating time (hours).
 - 13) Diagnostic and service parameters.

- o. Operator Interface: Start-stop and auto-manual selector with manual-speed-control potentiometer.

- p. Hardwired Control Signal Interface: A minimum of two analog inputs (0 to 10 V or 0/4 to 20 mA) and four programmable digital inputs.
- q. Remote Communication Interface: ASHRAE 135 BACnet IP.
- r. Line Conditioning:
 - 1) Input line conditioning.
 - 2) Output filtering.
 - 3) EMI/RFI filtering.
- s. Bypass Controller:
 - 1) Bypass Mode: Field-selectable automatic or manual.
 - a) In automatic mode, include fail-safe control logic to automatically transfer fan motor operation from failed variable-frequency controller to bypass controller.
 - 2) Type: Integrated NEMA ICS 2, Class A, full-voltage, non-reversing, motor-rated controller to operate fan motor if variable-frequency controller is not operational.
 - 3) Arrangement: Configure power supply to bypass controller and variable-frequency controller to completely isolate power to variable-frequency controller while operating fan motor through bypass controller for safe servicing of variable-frequency controller.
 - 4) Enclosure: Install bypass controller in same enclosure as variable-frequency controller.
 - 5) Remote Monitoring: Include control relay for remote indication of bypass controller operation.

X. Smoke Detectors:

- 1. System, Duct Smoke Detectors: For connection to conventional fire-alarm system. Coordinate requirements with Section 284621.13 "Conventional Fire Alarm System."
 - a. Operating at 24-V dc, nominal.
 - b. Detectors shall be four-wire type.
 - c. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
 - d. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
 - e. Integral Visual-Indicating Light: LED type, indicating detector has operated and power-on status.
 - f. Provide multiple levels of detection sensitivity for each sensor, with alarm-verification feature.
 - g. Duct Smoke Detectors: Photoelectric type complying with UL 268A.
 - 1) Remote indication and test station. Operating key switch initiates an alarm test.
 - 2) Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC systems.

- 3) Sampling Tubes: Design and dimensions as recommended by manufacturer for specific size, air velocity, and installation conditions where applied.
 - 4) Relay Fan Shutdown: Rated to interrupt fan motor-control circuit.
2. Nonsystem, Single-Station Duct Smoke Detectors:
- a. Nonsystem smoke detectors shall be listed as compatible with fire-alarm equipment installed or shall have a contact closure interface listed for the connected load.
 - b. Nonsystematic smoke detectors shall meet the monitoring for integrity requirements in NFPA 72.
 - c. Comply with UL 268A; operating at 120 V ac.
 - d. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. The fixed base shall be designed for mounting directly to mounting brackets air-handling unit. Provide terminals in the fixed base for connection to building wiring.
 - 1) Enclosure: NEMA 250, Type 4X; listed for use with the supplied detector.
 - e. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific size, air velocity, and installation conditions where applied.
 - f. Relay Fan Shutdown: Rated to interrupt fan motor-control circuit.
3. Air-Handling Unit Factory Assembly:
- a. Furnish and install smoke detectors inside air-handling units to comply with governing building codes.
 - b. Install smoke detectors in accordance with smoke detector manufacturer's written installation instructions.
 - 1) Sampling tubes shall extend the full width of airstream.
 - 2) Sampling tubes greater than 36 inches long shall be supported on both ends.
 - c. Install smoke detectors within air-handling units in a location that is easily accessible for inspection, repair, and replacement of smoke detector, and in a location that does not hinder access to other internal components.
4. Air-Handling Unit Factory Testing: Functionally test smoke detectors to ensure proper operation in accordance with smoke detector manufacturer's written instructions.
5. Air-Handling Unit Factory Installation of Addressable Smoke Detectors Furnished by Building Fire-Alarm System Supplier:
- a. Where addressable duct smoke detectors are indicated to be installed within air-handling unit casing, air-handling unit manufacturer shall install

- b. duct smoke detector components supplied by building fire-alarm system supplier. Mount duct smoke detector sampling housing on exterior of air-handling unit casing. Locate on accessible side and coordinate with installers before installation.
- c. Seal air-handling unit casing penetrations.
- d. Install duct smoke detector components in accordance with written instructions furnished by supplier.
 - 1) Sampling tubes shall extend the full width of airstream.
 - 2) Sampling tubes greater than 36 inches long shall be supported on both ends.
- e. Photograph installation and transmit photos to fire-alarm system Installer before air-handling unit shipment to ensure proper installation. Fire-alarm system Installer shall review photos and provide written acceptance of installation to air-handling unit manufacturer before air-handling unit shipment.
 - 1) Document date of photos and approval for record purposes.
 - 2) Make corrective measures required by fire-alarm system Installer as required for acceptance.
- f. Coordinate work schedule of air-handling unit manufacturer and fire-alarm system supplier to meet requirements of Project schedule.
- g. See Section 284621.11 "Addressable Fire-Alarm Systems" for additional requirements.

Y. Hardware:

1. Screws:

- a. For Galvanized-Steel Materials: Self-tapping, hex-head, 300 series stainless steel screws with a neoprene gasket encapsulated by a 300 series stainless steel washer.
- b. For Aluminum and Stainless Steel Materials: Self-tapping, hex-head, 300 series stainless steel screws with a neoprene gasket encapsulated by a 300 series stainless steel washer.
- c. Provide protective covers on exposed screws to prevent personnel injury.

2. Bolts, Nuts, and Washers:

- a. For Joining Galvanized and Painted Carbon-Steel Materials: Hex-head, high-strength, 300 series stainless steel.
- b. For Joining Aluminum and Stainless Steel Materials: Hex-head, high-strength, 300 series stainless steel.
- c. Use washers and lock washers at each bolted connection.
- d. Select bolt size and spacing sufficient for load and application.

Z. Welding:

1. Welding Filler Metals: Comply with AWS welding codes for welding materials appropriate for thickness and chemical analysis of material being welded.
 - a. Use welding materials with corrosion properties equal to material being welded.
2. Use welders that are certified to weld at least twice the thickness of the material to be welded. Certification shall be within three months of work being performed.
3. Welds shall be continuous, full-penetration welds unless otherwise indicated. Intermittent welds, stitch welds and tack welds are permitted only in specific applications indicated.
4. Use welders and welding procedures complying with the following:
 - a. Piping Systems: Section IX of the ASME Boiler and Pressure Vessel Code and Section V of ASME B31.1.
 - b. Structural Aluminum: AWS D1.2/D1.2M.
 - c. Structural Carbon Steel: AWS D1.1/D1.1M.
 - d. Structural Stainless Steel: AWS D1.6/D1.6M.
 - e. Sheetmetal: AWS D9.1/D9.1M.

AA. Painting:

1. General:
 - a. Painted OEM components do not require additional coating other than touch-up to damaged areas. Match the touchup coating to surrounding undamaged surfaces.
 - b. Finish miscellaneous surfaces to match continuous surfaces.
 - c. Protect mill galvanized surfaces that are exposed to view, such as raw steel cuts and damage by welding, with multiple coats of matching galvanized paint.
 - d. Protect mill galvanized surfaces that are concealed, such as raw steel cuts and damage by welding, with multiple coats of zinc-rich paint or matching galvanized paint.
 - e. Touch up or entirely repaint surface finishes, damaged during shipment and installation, to the original condition, using original materials and methods.
2. Preparation:
 - a. Submit proposed manufacturer's written preparation and application instructions for information.
 - b. If paint manufacturer's recommended preparation requirements differ from those indicated, use the more stringent requirements.
 - c. Structural carbon steel to be painted shall be deburred, ground smooth, cleaned, and blasted in accordance with SSPC-SP 6/NACE No. 3 or SSPC-SP 10/NACE No. 5.
 - d. Before applying a primer and a finish coat, remove oil and grease from surfaces to be coated using clean rags soaked in thinner in accordance with SSPC-SP 1.
 - e. Treat surfaces to be painted to ensure that paint adheres.

3. Primer:
 - a. Rust-inhibiting type, with a minimum dry film thickness of 1 mil(s) per coat.
 - b. Apply at least two coats of primer to unfinished carbon-steel surfaces and at least one coat of primer to other surfaces.
 - c. Use primer that is compatible with substrate and finish coat.

4. Finish Coat:
 - a. Finish coat painting system shall be alkyd-enamel.
 - b. Use dry film thickness recommended by paint manufacturer for each coat. Total dry film thickness of all finish coats not less than 3 mils.
 - c. Finish coat color shall be selected by Architect and not be limited to manufacturer's standard offering.
 - 1) Submit a written request for color selection and indicate in the request the date color selection must be returned without impacting schedule.

5. Application: Paint the following surfaces with primer and finish coat indicated:
 - a. Unfinished carbon-steel surfaces.
 - b. Exposed mill galvanized-steel surfaces of air-handling unit casing exterior.
 - c. Exposed stainless steel surfaces of air-handling unit casing exterior.

BB. Cleanliness Requirements:

1. General:
 - a. Provide equipment that has been manufactured, shipped, stored, and installed maintaining highest degree of cleanliness possible.
 - b. Owner Cleanliness Inspection: Air-handling unit(s) cleanliness is subject to Owner cleanliness inspection before packaging for shipment.

2. During Manufacturing:
 - a. Clean materials to be free of mill grease, oxidation, dirt, dust, and other impurities before manufacturing and assembly.
 - b. Protect casing materials from contamination during manufacturing and assembly.
 - c. Use sealing materials that do not outgas.
 - d. Provide OEM components and equipment from their respective manufacturers free of grease, oxidation, and dirt. Store OEM components and equipment indoors. Cover and protect OEM components and equipment to maintain cleanliness. Follow OEM instructions for equipment storage.

3. After Manufacturing:

- a. Before shipment, after unit is completely assembled, clean unit inside and out.
 - 1) Vacuum entire inside to remove dirt, dust, and debris using HEPA-filtered vacuum equipment.
 - 2) Purge hard to reach surfaces with dry, oil-free, compressed or bottled nitrogen.
 - 3) Wipe down all surfaces, inside and out, with a residue-free cleaning agent.
 - b. Protect unit to maintain cleanliness.
4. Shipping:
- a. Protect interior and exterior of air-handling unit from exposure to weather dirt, dust, and debris during shipment and rigging.
 - b. Cover openings with puncture-resistant durable coverings to ensure that cleanliness is maintained inside unit while providing an air- and watertight seal.
5. On-Site Storage:
- a. If air-handling unit is to be stored before installation, Installer shall work closely with air-handling unit manufacturer for air-handling unit manufacturer to provide adequate protection at the factory to ensure that cleanliness for both unit interior and unit exterior is maintained. This protection shall remain in place until unit startup is performed.
 - b. For extended periods of storage, provide a means to rotate fan and motor assemblies on a periodic basis (as recommended in writing by manufacturer) without compromising unit cleanliness.

2.4 SOURCE QUALITY CONTROL

A. AHRI Compliance:

1. AHRI 260 (I-P): Air-handling unit sound ratings shall be in accordance with AHRI 260 (I-P), "Sound Rating of Ducted Air Moving and Conditioning Equipment."
2. AHRI 410: Air-handling unit coils shall be rated in accordance with AHRI 410 and shall be listed by AHRI and labeled in accordance with AHRI.
3. AHRI 1060 (I-P) Certification: Air-handling units that include energy wheels shall be rated in accordance with AHRI 1060 (I-P) and shall be listed by AHRI and labeled in accordance with AHRI.

B. AMCA Compliance:

1. AMCA 201: Air-handling unit manufacturer shall evaluate fan's performance within the air-handling unit in accordance with AMCA 201, "Fans and Systems" and account for conditions within the air-handling unit that could be detrimental to fan's performance by adjusting the fan performance indicated on Drawings.

2. AMCA 205 Certification: Air-handling unit fan's fan efficiency grade (FEG) shall be rated in accordance with AMCA 205, "Energy Efficiency Classifications for Fans" and shall bear the AMCA-certified fan efficiency grade seal.
3. AMCA 210 Certification: Air-handling unit fan's air performance shall be rated in accordance with AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating" and shall bear the AMCA-certified air ratings seal.

C. NFPA Compliance:

1. NFPA 70: Electrical components, devices, and accessories shall be listed and labeled by a qualified testing agency, and marked for intended location and application.
2. NFPA 90A: Design, fabrication, and installation of air-handling units and components shall comply with NFPA 90A.

D. UL Compliance:

1. UL 1995 Certification: Where indicated, air-handling unit components shall be NRTL listed and labeled in accordance with UL 1995, "Standard for Safety Heating and Cooling Equipment."

2.5 SOURCE QUALITY CONTROL - AIR-HANDLING UNIT FACTORY TESTS

A. Witness of Testing: Allow Architect Commissioning Agent and Owner access to place where air-handling units are being tested for witness testing.

1. Submit written notification at least 30 days in advance of testing.
2. Schedule testing at mutually agreeable dates and times.

B. Casing Leakage Test:

1. Perform a leak test for each assembled air-handling unit.
2. Follow testing procedures in accordance with ASHRAE 111.
3. Perform leak test before shipping first air-handling unit of unique size and arrangement.
4. Test results shall indicate that units comply with leakage requirements indicated. Make changes to noncompliant air-handling units and retest until units comply with requirements.
5. Prepare test reports in accordance with ASHRAE 111.
6. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

C. Casing Structural Deflection Test:

1. Perform a structural deflection test for each assembled air-handling unit.

2. Pressurize and load air-handling units to the performance criteria indicated for structural deflection. Test air-handling unit floors walls and roofs.
3. Test results shall indicate that units comply with deflection requirements indicated. Make changes to noncompliant air-handling units and retest until units comply with requirements.
4. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

D. Functional Run Test:

1. Run test each unit before shipment.
2. Test and balance fans to comply with vibration requirements indicated.
3. Energize each electrical device to ensure it is operational.
 - a. Take meter readings for volts, amperes, and kVAR on each phase leg of each motor.
 - b. Take meter readings for volts, amperes, and kVAR on each single-phase power connection to field power.
4. Exercise each damper to ensure proper operation.
5. Exercise each access door to ensure proper fit.
6. Exercise each valve to ensure proper operation.
7. Submit a written report for each unit tested. Written report shall include, at a minimum, full name of each person witnessing test, detailed list of each unit component tested, condition observed, and corrective action required. Each line item shall have full name of the person doing the checkout and date and time the checkout was performed.

E. Fan Vibration Test:

1. Perform a fan vibration test for each assembled air-handling unit.
2. Energize each fan within the air-handling unit after air-handling unit final assembly and perform a vibration analysis with fan operating at design speed and at all speeds throughout the range from design to minimum speed.
3. Three vibration measurements shall be taken for each bearing in horizontal, vertical, and axial directions. Vibration measurements shall be recorded and consist of vibration amplitude verses frequency with filter-in.
4. Fan bearing measurement points shall be marked or scribed on bearings for permanent record.
5. Test results shall indicate that units comply with vibration requirements indicated. Make changes to noncompliant air-handling units and retest until units comply with requirements.
6. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date

and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

F. Acoustical Performance Test:

1. Perform an acoustical performance test for each assembled air-handling unit.
2. Air-handling unit acoustic performance shall be verified by factory test in accordance with AHRI 260 (I-P) or AHRI 261 (SI).
3. Air-handling unit supply-air discharge, return-air inlet, and casing radiated sound components shall be measured with air-handling unit operating at design conditions.
4. Testing Location: Perform testing in a location complying with AHRI 220, "Reverberation Room Qualification and Testing Procedures for Determining Sound Power of HVAC Equipment."
 - a. Test location shall be broadband qualified in accordance with AHRI 220 Section 5.1 and discrete frequency qualified in accordance with Section 5.2.
5. Operating conditions used in acoustic testing shall be verified by test in accordance with AMCA 210 in an AMCA-accredited facility.
6. Test results shall indicate that units comply with acoustical requirements indicated. Make changes to noncompliant air-handling units and retest until units comply with requirements.
7. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

G. Airflow Capacity Performance Test:

1. Perform an airflow capacity performance test for each assembled air-handling unit.
2. Operating conditions shall be verified by test in accordance with AMCA 210 in an AMCA-accredited facility.
3. Test results shall indicate that units comply with design airflow requirements indicated. Make changes to noncompliant air-handling units and retest until units comply with requirements.
4. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

- H. Hydronic Piping Systems Testing: Pressure test factory-assembled piping systems with compressed air or water at a pressure to comply with governing codes and ASME B31.9, but not less than design pressure indicated.
 - 1. Test results shall indicate that piping systems are without leaks. Make changes to noncompliant piping systems and retest until units comply with requirements.
 - 2. Submit test reports indicating test location, documentation of test equipment used, test procedures, test results, test date and time, and full names of personnel performing tests and witnesses. If multiple tests are required to achieve compliance for a single air-handling unit, report shall include test date and time, test results, and full names of personnel performing tests and witnesses of each test with a detailed description and photographs of interim corrective measures made before each retest.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Examine air handling units before installation. Reject units with physical damage, and air-handling unit components that are wet, moisture damaged, or mold damaged.
- B. Equipment Mounting: Install air-handling units at locations indicated on Drawings. Unless, otherwise indicated on Drawings, install air-handling units on concrete equipment bases.
 - 1. Units Mounted on Concrete Bases:
 - a. Install air-handling units on cast-in-place concrete equipment bases. Coordinate sizes and locations of concrete bases with actual equipment provided. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
 - b. Level air-handling unit bases using aluminum or stainless steel shims compatible with air-handling unit base material.
 - c. Fill voids between air-handling unit bases and concrete bases using high-strength non-shrink grout.
 - d. Continuously seal between concrete bases and perimeter of air-handling unit bases with nonhardening sealant.
 - 2. Units Mounted to Structural-Steel Supports: Level unit air-handling bases using aluminum or stainless steel shims compatible with air-handling unit base material. Continuously seal between structural supports and air-handling unit bases with nonhardening sealant.
 - 3. Units Mounted Directly to Finished Floors: Level air-handling unit bases using aluminum or stainless steel shims compatible with air-handling unit base material. Continuously seal between floor and perimeter of air-handling unit bases with nonhardening sealant.
 - 4. Suspended Units: Suspend and laterally brace air-handling units from building structure by attaching to only air-handling unit bases at manufacturer-designated locations.

5. Install air-handling units on curbs following air-handling unit manufacturer's written procedures.
 - a. Install gaskets before setting air-handling units on curbs.
 - b. Secure air-handling units to curbs using stainless steel fasteners.
 - c. Install curb and fasten to structure.
 - d. Coordinate curb requirements, attachment, and location before installation.

C. Roof Openings:

1. Provide exact size and location of roof openings to trade installing structural framing and roof structure.
2. Supervise framing of openings to ensure coordinated installation with air-handling units.

D. Seismic Control: Comply with requirements for seismic-control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

E. Equipment Clearances and Access:

1. Arrange installation of air-handling units to provide access space around air-handling units for service and maintenance and for removal and replacement of internal components.
2. Provide clearance and access required by governing codes and NFPA 70.
3. At a minimum, comply with requirements indicated on Drawings and air-handling unit manufacturer's written instructions.

3.2 PROTECTION DURING CONSTRUCTION

A. Exterior Covers: Cover air-handling units during construction with sealed covers to protect air-handling unit casing and externally mounted components from physical damage, dirt, dust and debris, paint splatter, and any other construction materials.

1. Minor physical damage, as determined by Owner, shall be repaired by air-handling unit factory service personnel to factory-finished condition.
2. Replace air-handling units with damage that in any way compromises the performance indicated.

B. Internal Access: Keep access doors locked to maximum extent possible and restrict access to only authorized personnel.

1. Open access doors only during periods authorized work inside air-handling units is required.
2. Coordinate and monitor work inside air-handling units on a shift basis. Lock access doors once work is complete or at the end of each shift.
3. Immediately report unauthorized access and any observed damage to Owner.

3.3 DUCT CONNECTIONS

- A. Connect ducts and plenums to air-handling unit connections.
- B. Connect ducts and plenums to air-handling unit connections with flexible connections.
- C. Provide duct transitions required to make field connections to air-handling units.
- D. Arrange ducts and plenums to provide unobstructed access to inside of air-handling units.

3.4 PIPING CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where installing piping adjacent to air-handling unit, provide unobstructed access to inside of air-handling units for service and maintenance.
- C. Connect piping to air-handling units with flexible connectors.
- D. Drain Pan Piping:
 - 1. Make connections to air-handling unit connections with flanges or unions.
 - 2. Extend drain piping from each air-handling unit connection to nearest equipment or floor drain and arrange piping to maintain clear service aisle paths free of potential tripping hazards.
 - 3. Construct traps near air-handling unit connections to seal airflow from escaping within air-handling unit. Locate traps in a serviceable location that is away from access doors.
 - 4. Install threaded cleanouts at changes in direction.
 - 5. Secure drain piping to structure.
- E. Air-Handling Unit Floor Drain Piping:
 - 1. Make connections to air-handling unit connections with flanges or unions.
 - 2. Extend drain piping from each air-handling unit connection to nearest equipment or floor drain and arrange piping to maintain clear service aisle paths free of potential tripping hazards.
 - 3. Construct traps near air-handling unit connections to seal airflow from escaping within air-handling unit. Locate traps in a serviceable location that is away from access doors.
 - 4. Install threaded cleanouts at changes in direction.
 - 5. Secure drain piping to structure.
- F. Chilled-and Hot-Water Coil Piping:
 - 1. Comply with requirements indicated on Drawings.
 - 2. Make connections to coils with a flange or union.

3. Connect to each coil inlet with shutoff valve, test plug, pressure gauge and thermometer.
4. Connect to each coil outlet with balancing valve, test plug, pressure gauge thermometer flow meter and shutoff valve.
5. Connect each coil drain connection with a drain valve, which is full size of drain connection.
6. Connect each coil vent connection with automatic vent, which is full size of vent connection.

3.5 ELECTRICAL CONNECTIONS

- A. Install field power to each air-handling unit electrical power connection. Coordinate with air-handling unit manufacturer and installers.
- B. Connect wiring in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- C. Ground equipment in accordance with Section 260526 "Grounding and Bonding for Electrical Systems."
- D. Install electrical devices furnished by manufacturer, but not factory mounted, in accordance with NFPA 70 and NECA 1.
- E. Install nameplate for each electrical connection, indicating electrical equipment designation and circuit number feeding connection.
 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."

3.6 CONTROL CONNECTIONS

- A. Install control and electrical power wiring to field-mounted control devices.
- B. Connect control wiring in accordance with Section 260523 "Control-Voltage Electrical Power Cables."
- C. Install nameplate for each control connection, indicating field control panel designation and I/O control designation feeding connection.
 1. Nameplate shall be laminated acrylic or melamine plastic signs, as specified in Section 260553 "Identification for Electrical Systems."

3.7 STARTUP SERVICE

- A. Engage an air-handling unit factory service representative to perform startup service.
 1. Complete installation and startup checks in accordance with manufacturer's written instructions.
 2. Verify that shipping, blocking, and bracing are removed.

3. Verify that unit is secure on mountings and supporting devices and that connections to piping, ducts, controls, and electrical systems are complete. Verify that proper thermal-overload protection is installed in motors, controllers, and switches.
4. Verify proper motor rotation direction, free fan wheel rotation, and smooth bearing operations. Reconnect fan drive system, align belts, and install belt guards.
5. Verify that bearings, pulleys, belts, and other moving parts are lubricated with factory-recommended lubricants.
6. Verify that outdoor- and return-air mixing dampers open and close, and maintain minimum outdoor-air setting.
7. Comb coil fins for parallel orientation.
8. Verify that proper thermal-overload protection is installed for electric heaters.
9. Install new, clean filters.
10. Verify that automatic volume control and fire and smoke dampers in connected duct systems are in fully open position.

B. Starting procedures for air-handling units include the following:

1. Energize motor; verify proper operation of motor, drive system, and fan wheel. Adjust fan to indicated rpm.
2. Measure and record motor electrical values for voltage and amperage.
3. Manually operate dampers from fully closed to fully open position and record fan performance.

C. Heat Wheel Startup Service:

1. After field installation is complete, a final checkout and startup shall be completed to ensure proper purge adjustment, seal adjustment, control settings, and other key operational functions.
2. Service shall be completed by trained factory service personnel employed by heat wheel manufacturer.
3. Submit a report summarizing findings, adjustments made, and final settings.

3.8 ADJUSTING

- A. Adjust damper linkages for proper damper operation.
- B. Comply with requirements in Section 230593 "Testing, Adjusting, and Balancing for HVAC" for air-handling system testing, adjusting, and balancing.
- C. Before turning equipment over to Owner for use, adjust air-handling unit components that require further adjustment for proper operation. Consult air-handling unit manufacturer for instruction.
- D. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

- E. Seasonal Adjustments: Make seasonal visits during warranty period to inspect and review operation of equipment. Make necessary adjustments for components observed to require adjustments for proper operation. Prepare and submit a report to Owner documenting each visit, observations, and any adjustments made.

3.9 CLEANING

- A. Cleaning Schedule: After completing system installation and testing, adjusting, and balancing air-handling unit and air-distribution systems, and after completing startup service, and immediately before Owner use, clean air-handling units to remove foreign material and construction dirt and dust.
- B. Unit Interior: Clean air-handling units internally to factory clean condition. Remove foreign material and construction debris, dirt, and dust.
 - 1. Vacuum clean with HEPA-filtered vacuum and then wipe down with cleaning solution.
 - 2. Clean casing floors, roofs, wall surfaces, access doors, and panels.
 - 3. Clean all internal components, such as, coils, dampers, filter frames, fans, and motors.
 - 4. Clean light fixtures and control devices.
- C. Unit Exterior: Clean external surfaces of air-handling units to factory clean condition. Remove foreign material and construction debris, dirt and dust. Vacuum clean with HEPA-filtered vacuum and then wipe down all surfaces with cleaning solution.
- D. Cleaning Materials: Use cleaning materials and products recommended in writing by air-handling unit manufacturer.
- E. Acceptance: Following unit cleaning submit a written request for review and Owner acceptance.

3.10 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Field Fan Vibration Test:
 - 1. Test after air-handling unit installation is complete.
 - 2. Three vibration readings shall be taken for each bearing in horizontal, vertical, and axial directions. Record each reading including vibration amplitude verses frequency.
 - 3. Modify fans that fail to satisfy performance criteria and retest. For every fan that fails test, another fan shall be tested until all fans tested pass criteria on first attempt.
 - 4. Submit a report for each fan tested indicating air-handling unit designation, fan designation, test equipment, procedures, results, date and time, and full name of personnel performing tests and witnesses.

5. Witness Testing:

- a. Provide written notification at least 30 business days in advance of testing.
- b. Testing shall be conducted in presence of testing and balancing agent.
- c. Other parties such as Commissioning Agent, Architect, and Owner shall be invited to witness testing with attendance being optional.

C. Air-handling unit or components will be considered defective if unit or components do not pass tests and inspections.

D. Prepare test and inspection reports.

3.11 OPERATION DURING CONSTRUCTION

A. Operation of air-handling units for temporary cooling, heating, and ventilation is not allowed without Owner authorization.

1. Submit written request for Owner approval by signature with detailed description of operating procedures to be followed including, but not limited to, the following:

- a. Description of construction activities while units are operating.
- b. Operation:
 - 1) Beginning and ending calendar dates.
 - 2) List each day during week.
 - 3) List start and stop time and hours for each day.
- c. Startup procedures and shut-down procedures.
- d. Provisions for routine monitoring of unit operation.
- e. Provisions to prevent and protect against damage to equipment due to adverse operation such as, low temperature, high temperature, over pressure, fire, smoke, electrical over- and undervoltage and current and electrical fault.
- f. Provisions and safeguards for filtration to keep inside of units from getting dirty.
- g. Record keeping.

2. If approved by Owner, units used for temporary cooling, heating, and ventilation during and before interior finish work is complete shall include an unconditional complete unit labor and parts warranty to extend at least two years after the warranty indicated expires.

3. Interior and exterior of air-handling units shall be cleaned to a factory-cleaned condition and clean condition must be accepted by Owner.

B. Filtration during Temporary Use:

1. Protect air-handling system ducts (exhaust air, outdoor air, and return air) with temporary filters installed and supported to prevent filter media from collapse and bypass of unfiltered air. Temporary media shall be installed at each inlet and

- shall have a published filtration efficiency of MERV 8 in accordance with ASHRAE 52.2.
2. Protect air-handling units with open inlets that are not ducted with temporary filters installed and supported to prevent filter media from collapse and by-pass of unfiltered air. Temporary media shall be installed at each inlet and shall have a published filtration efficiency of MERV 8 in accordance with ASHRAE 52.2.
 3. Do not operate air-handling units until both temporary and scheduled permanent air-handling unit particulate filters are in place. Temporary filters must be installed upstream of permanent filters while units are operating.
 4. Replace temporary and permanent filters used during construction when dirty. After end of temporary use, replace permanent filters with new, clean filters before beginning testing, adjusting and balancing.
- C. Comply with SMACNA 008, "IAQ Guidelines for Occupied Buildings under Construction," for procedures to protect HVAC system.

3.12 DEMONSTRATION

- A. Engage air-handling unit manufacturer factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-handling units.
- B. Training shall include, but not be limited to, procedures and schedules related to performance, safety, startup and shut down, troubleshooting, servicing, preventive maintenance, and how to obtain replacement parts.
1. Access Doors: Adjustment, gasket removal and replacement, handle removal and replacement, and spare parts.
 2. Access Panels: Removal and replacement, adjustment, gasket removal and replacement, and spare parts.
 3. Coils: Cleaning, combing fins, draining, venting, removal, and replacement.
 4. Controls: Calibration, cleaning, operation, service, removal and replacement, and spare parts.
 5. Damper Assemblies: Cleaning, operation, service, removal and replacement, and spare parts.
 6. Drain Pans: Cleaning, removal, and replacement.
 7. Electric Heaters: Cleaning, operation, service, removal and replacement, and spare parts.
 8. Heat Wheels: Cleaning, operation, service, removal and replacement, and spare parts.
 9. Fan and Motor Assemblies: Cleaning, operation, removal and replacement, service, and spare parts.
 10. Filters: Operation, removal and replacement, frame gasket removal and replacement, clip removal and replacement, and spare parts.
 11. Lights, Receptacles and Switches: Cleaning, operation, service, removal and replacement, and spare parts.
- C. Instructor:

1. Instructor shall be factory trained and certified by air-handling unit manufacturer with current training on equipment installed.
 2. Instructor's credentials shall be submitted for review by Commissioning Agent before scheduling training.
 3. Instructor(s) primary job responsibility shall be Owner training.
 4. Instructor(s) shall have not less than three years of training experience with air-handling unit manufacturer and past training experience on at least three projects of comparable size and complexity.
- D. Schedule and Duration:
1. Schedule training with Owner at least 20 business days before first training session.
 2. Training shall occur before Owner occupancy.
 3. Training shall be held at mutually agreed date and time during normal business hours.
 4. Each training day shall not exceed eight hours of training. Daily training schedule shall allow time for a one-hour lunch period and 15-minute break after every two hours of training.
 5. Perform not less than eight hours of training.
- E. Location: Owner to provide a suitable on-site location to host classroom training.
- F. Training Attendees: Assume three people.
- G. Training Attendance Records: For record purposes, document training attendees at start of each new training session. Record date, time, brief description of training covered during the session, attendee's name, signature, phone number, and e-mail address. Submit scanned copy of sign-in sheet to Owner for each training session.
- H. Training Format: Individual training modules to include classroom training followed by hands-on field demonstration and training.
- I. Training Materials: Provide training materials in electronic format to each attendee.
1. Include instructional videos showing general operation and maintenance that are coordinated with operation and maintenance manuals.
- J. Training Video Recording: Video record each classroom training session and submit an electronic copy to Owner before requesting Owner acceptance of training.
- K. Written Acceptance: Obtain Commissioning Agent written acceptance that training is complete and requirements indicated have been satisfied.

END OF SECTION 23 73 43.19

SECTION 23 81 26 - SPLIT-SYSTEM AIR-CONDITIONERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Split-system air-conditioners.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Sustainable Design Submittals:
 - 1. Refer to Section 01 81 13 "LEED Sustainable Design Requirements".
- C. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1.3 INFORMATIONAL SUBMITTALS

- A. Warranty: Sample of special warranty.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and maintenance data.

1.5 QUALITY ASSURANCE

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. ASHRAE Compliance:
 - 1. Fabricate and label refrigeration system to comply with ASHRAE 15, "Safety Standard for Refrigeration Systems."

2. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," Section 6 - "Procedures," and Section 7 - "Construction and System Start-up."

- C. ASHRAE/IES Compliance: Applicable requirements in ASHRAE/IES 90.1.

1.6 WARRANTY

- A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of split-system air-conditioning units that fail in materials or workmanship within specified warranty period.

1. Warranty Period:

- a. For Compressor: One year(s) from date of Substantial Completion.
- b. For Parts: One year(s) from date of Substantial Completion.
- c. For Labor: One year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SPLIT-SYSTEM AIR-CONDITIONERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Carrier Global Corporation.
2. Daikin.
3. Mitsubishi Electric & Electronics USA, Inc.
4. Trane.

- B. Indoor Units (5 tons (18 kW) or Less:

1. Wall-Mounted, Evaporator-Fan Components:

- a. Cabinet: Enameled steel with removable panels on front and ends in color selected by Architect, and discharge drain pans with drain connection.
- b. Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and thermal-expansion valve. Comply with ARI 206/110.
- c. Fan: Direct drive, centrifugal.
- d. Fan Motors:
 - 1) Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements specified in Section 230500 "General Mechanical Requirements."
 - 2) Multitapped, multispeed with internal thermal protection and permanent lubrication.
 - 3) Enclosure Type: Totally enclosed, fan cooled.
 - 4) NEMA Premium (TM) efficient motors as defined in NEMA MG 1.

- 5) Controllers, Electrical Devices, and Wiring: Comply with requirements for electrical devices and connections specified in electrical Sections.
 - 6) Mount unit-mounted disconnect switches on exterior of unit.
- e. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.
- f. Condensate Drain Pans:
- 1) Fabricated with one percent slope in at least two planes to collect condensate from cooling coils (including coil piping connections, coil headers, and return bends) and humidifiers, and to direct water toward drain connection.
 - a) Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
 - b) Depth: A minimum of 1 inch deep.
 - 2) Single-wall, stainless-steel sheet.
 - 3) Drain Connection: Located at lowest point of pan and sized to prevent overflow. Terminate with threaded nipple on one end of pan.
 - a) Minimum Connection Size: NPS 1.
 - 4) Pan-Top Surface Coating: Asphaltic waterproofing compound.
- g. Air Filtration Section:
- 1) General Requirements for Air Filtration Section:
 - a) Comply with NFPA 90A.
 - b) Minimum MERV according to ASHRAE 52.2.
 - c) Filter-Holding Frames: Arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or lifted out from access plenum.

C. Outdoor Units (5 tons (18 kW) or Less)

1. Air-Cooled, Compressor-Condenser Components:
 - a. Casing: Steel, finished with baked enamel in color selected by Architect, with removable panels for access to controls, weep holes for water drainage, and mounting holes in base. Provide brass service valves, fittings, and gage ports on exterior of casing.
 - b. Compressor: Hermetically sealed with crankcase heater and mounted on vibration isolation device. Compressor motor shall have thermal- and current-sensitive overload devices, start capacitor, relay, and contactor.
 - 1) Compressor Type: Scroll.
 - 2) Two-speed compressor motor with manual-reset high-pressure switch and automatic-reset low-pressure switch.
 - 3) Refrigerant: R-410A.

- 4) Refrigerant Coil: Copper tube, with mechanically bonded aluminum fins and liquid subcooler. Comply with ARI 206/110.
 - c. Heat-Pump Components: Reversing valve and low-temperature-air cutoff thermostat.
 - d. Fan: Aluminum-propeller type, directly connected to motor.
 - e. Motor: Permanently lubricated, with integral thermal-overload protection.
 - f. Low Ambient Kit: Permits operation down to 45 deg F.
 - g. Mounting Base: Polyethylene.
- D. Accessories:
1. Control equipment and sequence of operation are specified in Section 230900 "Controls and Instrumentation"
 2. Thermostat: Low voltage with subbase to control compressor and evaporator fan.
 3. Thermostat: Wireless infrared functioning to remotely control compressor and evaporator fan, with the following features:
 - a. Compressor time delay.
 - b. 24-hour time control of system stop and start.
 - c. Liquid-crystal display indicating temperature, set-point temperature, time setting, operating mode, and fan speed.
 - d. Fan-speed selection including auto setting.
 4. Automatic-reset timer to prevent rapid cycling of compressor.
 5. Refrigerant Line Kits: Soft-annealed copper suction and liquid lines factory cleaned, dried, pressurized, and sealed; factory-insulated suction line with flared fittings at both ends.
 6. Drain Hose: For condensate.
 7. Monitoring:
 - a. Monitor constant and variable motor loads.
 - b. Monitor variable-frequency-drive operation.
 - c. Monitor economizer cycle.
 - d. Monitor cooling load.
 - e. Monitor air distribution static pressure and ventilation air volumes.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Install units level and plumb.
- B. Install evaporator-fan components using manufacturer's standard mounting devices securely fastened to building structure.
- C. Install roof-mounted, compressor-condenser components on equipment supports specified in Section 077200 "Roof Accessories." Anchor units to supports with removable, cadmium-plated fasteners.

- D. Equipment Mounting:
 - 1. Install roof-mounted, compressor-condenser components on polyethylene mounting base.
 - 2. Comply with requirements for vibration isolation devices specified in Section 230548.13 "Vibration Controls for HVAC."
- E. Install and connect precharged refrigerant tubing to component's quick-connect fittings. Install tubing to allow access to unit.

3.2 CONNECTIONS

- A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Where piping is installed adjacent to unit, allow space for service and maintenance of unit.

3.3 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- B. Tests and Inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 3. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Remove and replace malfunctioning units and retest as specified above.
- D. Prepare test and inspection reports.

3.4 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain units.

END OF SECTION 23 81 26

SECTION 23 82 36 - FINNED-TUBE RADIATION HEATERS**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section includes hydronic, finned-tube radiation heaters.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Shop Drawings:
 - 1. Include plans, elevations, sections, and details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include details and dimensions of custom-fabricated enclosures.
 - 4. Indicate location and size of each field connection.
 - 5. Indicate location and arrangement of piping valves and specialties.
 - 6. Indicate location and arrangement of integral controls.
 - 7. Include enclosure joints, corner pieces, access doors, and other accessories.
 - 8. Include diagrams for power, signal, and control wiring.
- C. Samples: For each exposed product and for each color and texture specified.

1.3 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

PART 2 - PRODUCTS**2.1 HOT-WATER FINNED-TUBE RADIATION HEATERS**

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Modine.
 - 2. Sterling HVAC Products; a Mestek company.
 - 3. Vulcan Radiator; a Mestek company.
 - 4. Zehnder Rittling.

5. Runtal.
 - B. Performance Ratings: Rate finned-tube radiation heaters according to Hydronics Institute's "I=B=R Testing and Rating Standard for Finned-Tube (Commercial) Radiation."
 - C. Heating Elements: Copper tubing mechanically expanded into flanged collars of evenly spaced aluminum fins resting on element supports. One end of tube shall be belled.
 1. Tube Diameter: See Mechanical Schedules.
 2. Fin Size: See Mechanical Schedules.
 3. Fin Spacing: 40 per foot.
 4. Number of Tiers: 1.
 5. Heat Output: See Mechanical Schedules.
 6. Entering-Air Temperature: 65 deg F.
 7. Average Water Temperature: 150 deg F.
 8. Minimum Water Velocity: 1/2 fps.
 - D. Element Supports: Ball-bearing cradle type to permit longitudinal movement on enclosure brackets.
 - E. Front and Rear Panel: Minimum 0.0428-inch- thick steel.
 - F. Floor-Mounted Pedestals: Conceal insulated piping at maximum 36-inch spacing. Pedestal-mounted back panel shall be solid panel matching front panel. Provide stainless-steel escutcheon for floor openings at pedestals.
 - G. Support Brackets: Locate at maximum 36-inch spacing to support front panel and element.
 - H. Finish: Baked-enamel finish in manufacturer's standard color as selected by Architect.
 - I. Damper: Knob-operated internal damper at enclosure outlet.
 - J. Access Doors: Factory made, permanently hinged with tamper-resistant fastener, minimum size 6 by 7 inches, integral with enclosure.
 - K. Enclosure Style: Flat top.
 1. Top Outlet Grille: Extruded-aluminum linear bar grille; pencil-proof bar spacing.
 - a. Mill-finish aluminum.
 - b. Anodized finish, color as selected by Architect from manufacturer's standard colors.
 - c. Painted to match enclosure.
 2. Enclosure Height: 6 inches.
 3. Enclosure Depth: 5-1/2 inches.
 - L. Accessories: Filler sections, corners, relay sections, and splice plates all matching the enclosure and grille finishes.

PART 3 - EXECUTION

3.1 FINNED-TUBE RADIATION HEATER INSTALLATION

- A. Install units level and plumb.
- B. Install enclosure continuously around corners, using outside and inside corner fittings.
- C. Join sections with splice plates and filler pieces to provide continuous enclosure.
- D. Install access doors for access to valves.
- E. Terminate enclosures with manufacturer's end caps except where enclosures are indicated to extend to adjoining walls.
- F. Install valves within reach of access door provided in enclosure.
- G. Install air-seal gasket between wall and recessed flanges or front cover of fully recessed unit.
- H. Install piping within pedestals for freestanding units.

3.2 CONNECTIONS

- A. Piping installation requirements are specified in Section 232113 "Hydronic Piping". Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Connect hot-water finned-tube radiation heaters and components to piping according to Section 232113 "Hydronic Piping".
 - 1. Install shutoff valves on inlet and outlet, and balancing valve on outlet.
- C. Install control valves as required by Section 230900 "Controls and Instrumentation."
- D. Install piping adjacent to finned-tube radiation heaters to allow service and maintenance.

3.3 FIELD QUALITY CONTROL

- A. Perform the following field tests and inspections:
 - 1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
 - 2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
- B. Units will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 23 82 36

SECTION 23 82 39.13 - CABINET UNIT HEATERS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes: Cabinet unit heaters with centrifugal fans and hot-water coils.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include rated capacities, operating characteristics, furnished specialties, and accessories.
- B. Sustainable Design Submittals:
 - 1. Refer to Section 01 81 13 "LEED Sustainable Design Requirements".
- C. Shop Drawings:
 - 1. Include plans, elevations, sections, and details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - 3. Include location and size of each field connection.
 - 4. Include details of anchorages and attachments to structure and to supported equipment.
 - 5. Include equipment schedules to indicate rated capacities, operating characteristics, furnished specialties, and accessories.
 - 6. Indicate location and arrangement of piping valves and specialties.
 - 7. Indicate location and arrangement of integral controls.
 - 8. Wiring Diagrams: Power, signal, and control wiring.
- D. Samples: For each exposed product and for each color and texture specified.

1.3 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, reflected ceiling plans, and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - 1. Suspended ceiling components.
 - 2. Structural members to which cabinet unit heaters will be attached.
 - 3. Method of attaching hangers to building structure.
 - 4. Size and location of initial access modules for acoustical tile.
 - 5. Items penetrating finished ceiling, including the following:

- a. Lighting fixtures.
- b. Air outlets and inlets.
- c. Speakers.
- d. Sprinklers.
- e. Access panels.

6. Perimeter moldings for exposed or partially exposed cabinets.

B. Field quality-control reports.

1.4 CLOSEOUT SUBMITTALS

A. Operation and maintenance data.

PART 2 - PRODUCTS

2.1 CABINET UNIT HEATERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Modine.
2. Sterling HVAC Products; a Mestek company.
3. Vulcan Radiator; a Mestek company.
4. Trane.

B. Heaters: Factory-assembled and -tested unit complying with AHRI 440.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 PERFORMANCE REQUIREMENTS

A. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

B. ASHRAE/IESNA 90.1 Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

2.3 COIL SECTION INSULATION

A. Insulation Materials:

1. Duct-Liner-Type, Glass-Fiber Insulation: ASTM C1071; surfaces exposed to airstream have aluminum-foil facing to prevent erosion of glass fibers.

- a. Thickness: 1/2 inch.
- b. Thermal Conductivity (k-Value): 0.26 Btu x in./h x sq. ft. at 75 deg F mean temperature.
- c. Fire-Hazard Classification: Maximum flame-spread index of 25 and smoke-developed index of 50 when tested in accordance with ASTM E84.
- d. Adhesive: Comply with ASTM C916 and with NFPA 90A or NFPA 90B.
- e. Airstream Surfaces: Surfaces in contact with the airstream comply with requirements in ASHRAE 62.1.

2.4 CABINETS

- A. Material: Steel with baked-enamel finish with manufacturer's standard paint, in color selected by Architect.
 1. Vertical Unit, Exposed Front Panels: Minimum 0.0528-inch- thick galvanized sheet steel, removable panels with channel-formed edges secured with tamperproof cam fasteners.
 2. Recessed Flanges: Steel, finished to match cabinet.
 3. Control Access Door: Key operated.
 4. Extended Piping Compartment: 8-inch- wide piping end pocket.
 5. False Back: Minimum 0.0428-inch- thick steel, finished to match cabinet.
 6. Outdoor-Air Wall Box: Minimum 0.1265-inch- thick, aluminum, rain-resistant louver and box with integral eliminators and bird screen; aluminum louver with baked-enamel finish in color selected by Architect from manufacturer's standard colors.
 - a. Outdoor-Air Damper: Galvanized-steel blades with edge and end seals and nylon bearings; with electronic, two-position actuators.

2.5 FILTERS

- A. Minimum Efficiency Reporting Value and Average Arrestance": In accordance with ASHRAE 52.2.
- B. Minimum Efficiency Reporting Value: In accordance with ASHRAE 52.2.
- C. Material:
 1. Pleated cotton-polyester media, MERV 7.

2.6 COILS

- A. Hot-Water Coil: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch and rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.

2.7 CONTROLS

- A. Fan and Motor Board: Removable.

1. Fan: Forward curved, double width, centrifugal, directly connected to motor; thermoplastic or painted-steel wheels and aluminum, painted-steel, or galvanized-steel fan scrolls.
 2. Motor: Permanently lubricated, multispeed; resiliently mounted on motor board. Comply with requirements in Section 230500 "Common Work Results for HVAC."
 3. Wiring Terminations: Connect motor to chassis wiring with plug connection.
- B. Factory, Hot-Water Piping Package: ASTM B88, Type L copper tube with wrought-copper fittings and brazed joints. Label piping to indicate service, inlet, and outlet.
1. Two-way, modulating control valve.
 2. Hose Kits: Minimum 400-psig working pressure, and operating temperatures from 33 to 211 deg F. Tag hose kits to equipment designations.
 3. Two-Piece, Ball Valves: Bronze body with full-port, chrome-plated bronze ball; PTFE or TFE seats; and 600-psig minimum CWP rating and blowout-proof stem.
 4. Calibrated-Orifice Balancing Valves: Bronze body, ball type, 125-psig working pressure, 250 deg F maximum operating temperature; with calibrated orifice or venturi, connection for portable differential pressure meter with integral seals, threaded ends, and equipped with a memory stop to retain set position.
 5. Automatic Flow-Control Valve: Brass or ferrous-metal body, 300-psig working pressure at 250 deg F, with removable, corrosion-resistant, tamperproof, self-cleaning piston spring; factory set to maintain constant indicated flow within plus or minus 10 percent of differential pressure range of 2 to 80 psig.
 6. Y-Pattern, Hot-Water Strainers: Cast-iron body (ASTM A126, Class B); 125-psig minimum working pressure; with threaded connections, bolted cover, perforated stainless-steel basket, and bottom drain connection. Include minimum NPS 1/2 threaded pipe and full-port ball valve in strainer drain connection.
 7. Wrought-Copper Unions: ASME B16.22.
- C. Control devices and operational sequences are specified in Section 230923 "Direct Digital Control (DDC) System for HVAC" and Section 230993.11 "Sequence of Operations for HVAC DDC."
- D. Basic Unit Controls:
1. Control voltage transformer.
 2. Unit-mounted thermostat with the following features:
 - a. Heat-off switch.
 - b. Fan on-auto switch.
 - c. Adjustable deadband.
 - d. Exposed set point.
 - e. Exposed indication.
 - f. Deg F indication.
 3. Unit-mounted temperature sensor.
 4. Unoccupied period override push button.
 5. Data entry and access port.
 - a. Input data includes room temperature and occupied and unoccupied periods.

- b. Output data includes room temperature, supply-air temperature, entering-water temperature, operating mode, and status.
- E. Terminal Controller: DDC.
- 1. Scheduled Operation: Occupied and unoccupied periods on seven-day clock with a minimum of four programmable periods per day.
 - 2. Unoccupied Period Override: Two hours.
 - 3. Unit Supply-Air Fan Operations:
 - a. Occupied Periods: Fan runs continuously.
 - b. Unoccupied Periods: Fan cycles to maintain setback room temperature.
 - 4. Heating-Coil Operations:
 - a. Occupied Periods: Modulate control valve to provide heating if room temperature falls below thermostat set point.
 - b. Unoccupied Periods: Start fan and modulate control valve if room temperature falls below setback temperature.
 - 5. Controller is to have volatile-memory backup.
- F. Interface with DDC System for HVAC Requirements:
- 1. Interface relay for scheduled operation.
 - 2. Interface relay to provide indication of fault at central workstation.
 - 3. Interface is to be BAC-net compatible for central DDC system for HVAC workstation and include the following functions:
 - a. Adjust set points.
 - b. Cabinet unit-heater start, stop, and operating status.
 - c. Data inquiry, including supply-air and room-air temperature.
 - d. Occupied and unoccupied schedules.
- G. Electrical Connection: Factory-wired motors and controls for a single field connection.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas to receive cabinet unit heaters for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for piping and electrical connections to verify actual locations before unit-heater installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF CABINET UNIT HEATERS

- A. Install cabinet unit heaters to comply with NFPA 90A.
- B. Suspend cabinet unit heaters from structure with elastomeric hangers. Vibration isolators are specified in Section 230548 "Vibration Control for HVAC Piping and Equipment."
- C. Install wall-mounted thermostats and switch controls in electrical outlet boxes at heights to match lighting controls. Verify location of thermostats and other exposed control sensors with Drawings and room details before installation.
- D. Install new filters in each fan-coil unit within two weeks of Substantial Completion.

3.3 CONNECTIONS

- A. Piping installation requirements are specified in Section 232113 "Hydronic Piping," Drawings indicate general arrangement of piping, fittings, and specialties.
- B. Install piping adjacent to machine to allow service and maintenance.
- C. Connect piping to cabinet unit heater's factory, hot-water piping package. Install the piping package if shipped loose.
- D. Comply with safety requirements in UL 1995.
- E. Unless otherwise indicated, install union and gate or ball valve on supply-water connection and union and calibrated balancing valve on return-water connection of cabinet unit heater.
- F. Ground equipment in accordance with Section 260526 "Grounding and Bonding for Electrical Systems."
- G. Connect wiring in accordance with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
 - 1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
 - 2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.
- B. Units will be considered defective if they do not pass tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 23 82 39.13

SECTION 26 05 19 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Copper building wire.
2. Connectors and splices.

B. Related Requirements:

1. Section 260523 "Control-Voltage Electrical Power Cables" for control systems communications cables and Classes 1, 2, and 3 control cables.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.3 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

PART 2 - PRODUCTS

2.1 COPPER BUILDING WIRE

A. Description: Flexible, insulated, and uninsulated, drawn copper current-carrying conductor with an overall insulation layer or jacket, or both, rated 600 V or less.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:

1. Belden Inc.
2. Encore Wire Corporation.
3. General Cable; Prysmian Group North America.
4. Okonite Company (The).
5. Southwire Company.

C. Standards:

1. Listed and labeled as defined in Chicago Electrical Code, by a qualified testing agency, and marked for intended location and use.
2. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

D. Conductors: Copper, complying with ASTM B3 for bare annealed copper and with ASTM B8 for

stranded conductors.

- E. Conductor Insulation:
 - 1. Type THHN and Type THWN-2: Comply with UL 83.

2.2 CONNECTORS AND SPLICES

- A. Description: Factory-fabricated connectors, splices, and lugs of size, ampacity rating, material, type, and class for application and service indicated; listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
- B. Jacketed Cable Connectors: For steel and aluminum jacketed cables, zinc diecast with set screws, designed to connect conductors specified in this Section.
- C. Lugs: One piece, seamless, designed to terminate conductors specified in this Section.

PART 3 - EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

- A. Feeders:
 - 1. Copper; solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.
- B. Branch Circuits:
 - 1. Copper. Solid for No. 12 AWG and smaller; stranded for No. 10 AWG and larger.

3.2 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

- A. Service Entrance: Type THHN/THWN-2, single conductors in raceway.
- B. Exposed Feeders: Type THHN/THWN-2, single conductors in raceway.
- C. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspace: Type THHN/THWN-2, single conductors in raceway.
- D. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN/THWN-2, single conductors in raceway.
- E. Feeders Installed below Raised Flooring: Type THHN/THWN-2, single conductors in raceway.
- F. Exposed Branch Circuits, Including in Crawlspace: Type THHN/THWN-2, single conductors in raceway.
- G. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN/THWN-2, single conductors in raceway.
- H. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN/THWN-2, single conductors in raceway.
- I. Branch Circuits Installed Below Raised Flooring: Type THHN/THWN-2, single conductors in raceway.

- J. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless steel, wire-mesh, strain relief device at terminations to suit application.

3.3 INSTALLATION, GENERAL

- A. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.
- B. Complete raceway installation between conductor and cable termination points according to Section 260533 "Raceways and Boxes for Electrical Systems" prior to pulling conductors and cables.
- C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.
- D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.
- E. Install exposed cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours where possible.
- F. Support cables according to Section 260529 "Hangers and Supports for Electrical Systems."

3.4 CONNECTIONS

- A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unspliced conductors.
- C. Wiring at Outlets: Install conductor at each outlet, with at least 6 inches of slack.

3.5 IDENTIFICATION

- A. Identify and color-code conductors and cables according to Section 260553 "Identification for Electrical Systems."
- B. Identify each spare conductor at each end with identity number and location of their end of conductor and identify as spare conductor.

3.6 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

- A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.7 FIRESTOPPING

- A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 078413 "Penetration Firestopping."

3.8 FIELD QUALITY CONTROL**A. Tests and Inspections:**

1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors for compliance with requirements.
2. Perform each of the following visual and electrical tests:
 - a. Inspect exposed sections of conductor and cable for physical damage and correct connection according to the single-line diagram.
 - b. Test bolted connections for high resistance using one of the following:
 - 1) Calibrated torque wrench.
 - c. Inspect compression-applied connectors for correct cable match and indentation.
 - d. Inspect for correct identification.
 - e. Inspect cable jacket and condition.
 - f. Insulation-resistance test on each conductor for ground and adjacent conductors. Apply a potential of 500 V(dc) for 300 V rated cable and 1000 V(dc) for 600 V rated cable for a one-minute duration.
 - g. Continuity test on each conductor and cable.

- B. Cables will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports to record the following:

1. Procedures used.
2. Results that comply with requirements.
3. Results that do not comply with requirements, and corrective action taken to achieve compliance with requirements.

END OF SECTION 26 05 19

SECTION 26 05 23 - CONTROL-VOLTAGE ELECTRICAL POWER CABLES**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
 - 1. Control cable.
 - 2. Control-circuit conductors.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.3 INFORMATIONAL SUBMITTALS

- A. Source quality-control reports.
- B. Field quality-control reports.

PART 2 - PRODUCTS**2.1 PERFORMANCE REQUIREMENTS**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Flame Travel and Smoke Density in Plenums: As determined by testing identical products according to NFPA 262, by a qualified testing agency. Identify products for installation in plenums with appropriate markings of applicable testing agency.
 - 1. Flame Travel Distance: 60 inch or less.
 - 2. Peak Optical Smoke Density: 0.5 or less.
 - 3. Average Optical Smoke Density: 0.15 or less.
- C. Flame Travel and Smoke Density for Riser Cables in Non-Plenum Building Spaces: As determined by testing identical products according to UL 1666.
- D. Flame Travel and Smoke Density for Cables in Non-Riser Applications and Non-Plenum Building Spaces: As determined by testing identical products according to UL 1685.

2.2 CONTROL CABLE

A. Paired Cable: NFPA 70, Type CMG.

1. Multi-pair, twisted, No. 18 AWG, stranded (19x30) tinned-copper conductors.
2. PVC insulation.
3. Unshielded.
4. PVC jacket.
5. Flame Resistance: Comply with UL 1685.

B. Plenum-Rated, Paired Cable: NFPA 70, Type CMP.

1. Multi-pair, twisted, No. 18 AWG, stranded (19x30) tinned-copper conductors.
2. PVC insulation.
3. Unshielded.
4. PVC jacket.
5. Flame Resistance: Comply with NFPA 262.

2.3 CONTROL-CIRCUIT CONDUCTORS

A. Class 1 Control Circuits: Stranded copper, Type THHN/THWN-2, complying with UL 83 in raceway.

B. Class 2 Control Circuits: Stranded copper, Type THHN/THWN-2, complying with UL 83 in raceway.

C. Class 3 Remote-Control and Signal Circuits: Stranded copper, Type THHN/THWN-2, complying with UL 83 in raceway.

D. Class 2 Control Circuits and Class 3 Remote-Control and Signal Circuits That Supply Critical Circuits: Circuit Integrity (CI) cable.

1. Smoke control signaling and control circuits.

2.4 SOURCE QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to evaluate cables.

B. Factory test twisted pair cables according to TIA-568-C.2.

C. Cable will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

PART 3 - EXECUTION**3.1 EXAMINATION**

- A. Testcables on receipt at Project site.
 - 1. Test each pair of twisted pair cable for open and short circuits.

3.2 INSTALLATION OF RACEWAYS AND BOXES

- A. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems" for raceway selection and installation requirements for boxes, conduits, and wireways as supplemented or modified in this Section.
 - 1. Outlet boxes for cables must be no smaller than 4-inch square by 2-1/8 inch deep with extension ring sized to bring edge of ring to within 1/8 inch of the finished wall surface.
 - 2. Flexible metal conduit must not be used.
- B. Comply with TIA-569-D for pull-box sizing and length of conduit and number of bends between pull points.
- C. Install manufactured conduit sweeps and long-radius elbows if possible.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

- A. Comply with NECA 1.
- B. General Requirements for Cabling:
 - 1. Comply with TIA-568-C Series of standards.
 - 2. Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems."
 - 3. Terminate all conductors; cable must not contain unterminated elements. Make terminations only at indicated outlets, terminals, and cross-connect and patch panels.
 - 4. Cables may not be spliced and must be continuous from terminal to terminal. Do not splice cable between termination, tap, or junction points.
 - 5. Cables serving a common system may be grouped in a common raceway. Install network cabling and control wiring and cable in separate raceway from power wiring. Do not group conductors from different systems or different voltages.
 - 6. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
 - 7. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems." Install lacing bars and distribution spools.
 - 8. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and

26 05 23 – CONTROL-VOLTAGE ELECTRICAL POWER CABLES - 4

discard cable if damaged during installation and replace it with new cable.

9. Cold-Weather Installation: Bring cable to room temperature before de-reeling. Do not use heat lamps for heating.
10. Pulling Cable: Comply with BICSI ITSIMM, Ch. 5, "Copper Structured Cabling Systems." Monitor cable pull tensions.
11. Support: Do not allow cables to lie on removable ceiling tiles.
12. Secure: Fasten securely in place with hardware specifically designed and installed so as to not damage cables.
13. Provide strain relief.
14. Keep runs short. Allow extra length for connecting to terminals. Do not bend cables in a radius less than 10 times the cable OD. Use sleeves or grommets to protect cables from vibration at points where they pass around sharp corners and through penetrations.
15. Ground wire must be copper, and g r o u n d i n g methods must comply with IEEE C2. Demonstrate ground resistance.

C. Installation of Control-Circuit Conductors:

1. Install wiring in raceways.
2. Use insulated spade lugs for wire and cable connection to screw terminals.
3. Comply with requirements specified in Section 260533 "Raceways and Boxes for Electrical Systems."

D. Installation of Cable Routed Exposed under Raised Floors:

1. Install plenum-rated cable only.
2. Install cabling after the flooring system has been installed in raised floor areas.
3. Below each feed point, neatly coil a minimum of 72 inch of cable in a coil not less than 12 inches in diameter.

3.4 GROUNDING

- A. For data communication wiring, comply with TIA-607-B and with BICSI TDMM, "Bonding and Grounding (Earthing)" Chapter.
- B. For control-voltage wiring and cabling, comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.5 IDENTIFICATION

- A. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Identify data and communications system components, wiring, and cabling according to TIA-606-B; label printers must use label stocks, laminating adhesives, and inks complying with UL 969.
- C. Identify each wire at each end and at each terminal with a number-coded identification

tag. Each wire must have a unique tag.

3.6 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Visually inspect cable jacket materials for UL or third-party certification markings. Inspect cabling terminations to confirm color-coding for pin assignments and inspect cabling connections to confirm compliance with TIA-568-C.1.
 - 2. Visually inspect cable placement, cable termination, grounding and bonding, equipment, and patch cords, and labeling of all components.
- B. End-to-end cabling will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 26 05 23

SECTION 26 05 26 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes grounding and bonding systems and equipment.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product indicated.

1.3 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Plans showing dimensioned locations of grounding features specified in "Field Quality Control" Article, including the following:
 - 1. Ground rods.
 - 2. Ground rings.
- B. Field quality-control reports.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with UL 467 for grounding and bonding materials and equipment.

2.2 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
 - 1. Burndy; Hubbell Incorporated, Construction and Energy.
 - 2. ERICO; nVent.
 - 3. Harger Lightning & Grounding.

2.3 CONDUCTORS

- A. Insulated Conductors: Copper or tinned-copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.
- B. Bare Copper Conductors:

1. Solid Conductors: ASTM B3.
 2. Stranded Conductors: ASTM B8.
 3. Tinned Conductors: ASTM B33.
 4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
- C. Grounding Bus: Predrilled rectangular bars of annealed copper, 1/4 by 4 inch in cross section, with 9/32-inch holes spaced 1-1/8 inch apart. Stand-off insulators for mounting must comply with UL 891 for use in switchboards, 600 V and must be Lexan or PVC, impulse tested at 5000 V.

2.4 CONNECTORS

- A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.
- B. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.
- C. Mechanical-Type Bus-Bar Connectors: Cast silicon bronze, solderless compression-type wire terminals, and long-barrel, two-bolt connection to ground bus bar.
- D. Beam Clamps: Mechanical type, terminal, ground wire access from four directions, with dual, tin-plated or silicon bronze bolts.
- E. Cable-to-Cable Connectors: Compression type, copper, or copper alloy.
- F. Cable Tray Ground Clamp: Mechanical type, zinc-plated malleable iron.
- G. Conduit Hubs: Mechanical type, terminal with threaded hub.
- H. Ground Rod Clamps: Mechanical type, copper or copper alloy, terminal with hex head bolt.
- I. Lay-in Lug Connector: Mechanical type, copper rated for direct burial terminal with set screw.
- J. Service Post Connectors: Mechanical type, bronze alloy terminal, in short- and long-stud lengths, capable of single and double conductor connections.
- K. Signal Reference Grid Clamp: Mechanical type, stamped-steel terminal with hex head screw.
- L. Straps: Solid copper, cast-bronze clamp. Rated for 600 A.
- M. Tower Ground Clamps: Mechanical type, copper or copper alloy, terminal two-piece clamp.
- N. U-Bolt Clamps: Mechanical type, copper or copper alloy, terminal listed for direct burial.
- O. Water Pipe Clamps:
1. Mechanical type, two pieces with stainless steel bolts.
 - a. Material: Die-cast zinc alloy.
 - b. Listed for direct burial.
 2. U-bolt type with malleable-iron clamp and copper ground connector.

2.5 GROUNDING ELECTRODES

- A. Ground Rods: Copper-clad steel, sectional type; 3/4 inch by 10 ft.

PART 3 - EXECUTION

3.1 APPLICATIONS

- A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.
- B. Underground Grounding Conductors: Install bare tinned-copper conductor, No. 2/0 AWG minimum.
 - 1. Bury at least 30 inches below grade.
- C. Grounding Conductors: Green-colored insulation with continuous yellow stripe.
- D. Isolated Grounding Conductors: Green-colored insulation with more than one continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.
- E. Grounding Bus: Install in electrical equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
 - 1. Install bus horizontally, on insulated spacers 2-inch minimum from wall, 6 inch above finished floor unless otherwise indicated.
- F. Conductor Terminations and Connections:
 - 1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
 - 2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
 - 3. Connections to Ground Rods at Test Wells: Bolted connectors.
 - 4. Connections to Structural Steel: Welded connectors.

3.2 GROUNDING AT THE SERVICE

- A. Equipment grounding conductors and grounding electrode conductors must be connected to the ground bus. Install a main bonding jumper between the neutral and ground buses.

3.3 EQUIPMENT GROUNDING

- A. Install insulated equipment grounding conductors with all feeders and branch circuits.
- B. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

- C. Water Heater, Heat-Tracing, and Anti-frost Heating Cables: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.
- D. Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

3.4 INSTALLATION

- A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.
- B. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor and install in conduit.
- C. Ground Rods: Drive rods until the tops are 2 inches below finished floor or final grade unless otherwise indicated.
 - 1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
 - 2. Use exothermic welds for all below-grade connections.
 - 3. For grounding electrode system, install at least three rods spaced at least one-rod length from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.
- D. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.
 - 1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
 - 2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
 - 3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.
- E. Grounding and Bonding for Piping:
 - 1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
 - 2. Water Meter Piping: Use braided -type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
 - 3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

- F. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install tinned bonding jumper to bond across flexible duct connections to achieve continuity.
- G. Grounding for Steel Building Structure: Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 ft. apart.
- H. Ground Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each steel column, extending around the perimeter of building.
 - 1. Install tinned-copper conductor not less than No. 2/0 AWG for ground ring and for taps to building steel.
 - 2. Bury ground ring not less than 24 inches from building's foundation.
- I. Concrete-Encased Grounding Electrode (Ufer Ground): Fabricate according to NFPA 70; using electrically conductive coated steel reinforcing bars or rods, at least 20 ft. long. If reinforcing is in multiple pieces, connect together by the usual steel tie wires or exothermic welding to create the required length.
- J. Connections: Make connections so the possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact are galvanically compatible.
 - 1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
 - 2. Make connections with clean, bare metal at points of contact.
 - 3. Make aluminum-to-steel connections with stainless steel separators and mechanical clamps.
 - 4. Make aluminum-to-galvanized-steel connections with tin-plated copper jumpers and mechanical clamps.
 - 5. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

3.5 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 - 1. After installing the grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
 - 2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
 - 3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, and at individual ground rods. Make tests at ground rods before any conductors are connected.
 - a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
 - b. Perform tests by fall-of-potential method according to IEEE 81.
 - 4. Prepare dimensioned Drawings locating each test well, ground rod and ground -rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order,

and key to the record of tests and observations. Include the number of rods driven and their depth at each location and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

- B. Grounding system will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.
- D. Report measured ground resistances that exceed the following values:
 - 1. Power and Lighting Equipment or System with Capacity More Than 1000 kVA: 3 ohms.
 - 2. Substations and Pad-Mounted Equipment: 5 ohms.
- E. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Architect promptly and include recommendations to reduce ground resistance.

END OF SECTION 26 05 26

SECTION 26 05 29 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Support, anchorage, and attachment components.
2. Fabricated metal equipment support assemblies.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for the following:
 - a. Slotted support systems, hardware, and accessories.
 - b. Clamps.
 - c. Hangers.
 - d. Anchors.
2. Include rated capacities and furnished specialties and accessories.

1.3 INFORMATIONAL SUBMITTALS

A. Welding certificates.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Delegated Design: Engage a qualified structural professional engineer to design hanger and support system.

2.2 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

- A. Steel Slotted Support Systems: Preformed steel channels and angles with minimum 13/32-inch diameter holes at a maximum of 8 inch on center in at least one surface.
 1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
 2. Material for Channel, Fittings, and Accessories: Galvanized steel.

3. Channel Width: Selected for applicable load criteria.
 4. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
- B. Aluminum Slotted Support Systems: Extruded-aluminum channels and angles with minimum 13/32-inch diameter holes at a maximum of 8 inch on center in at least one surface.
1. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
 2. Channel Material: 6063-T5 aluminum alloy.
 3. Fittings and Accessories Material: 5052-H32 aluminum alloy.
 4. Channel Width: Selected for applicable load criteria.
- C. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.
- D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for nonarmored electrical conductors or cables in riser conduits. Plugs must have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. The body must be made of malleable iron.
- E. Structural Steel for Fabricated Supports and Restraints: ASTM A36/A36M steel plates, shapes, and bars; black and galvanized.
- F. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
1. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
 2. Concrete Inserts: Steel or malleable-iron, slotted support system units are similar to MSS Type 18 units and comply with MFMA-4 or MSS SP-58.
 3. Clamps for Attachment to Steel Structural Elements: MSS SP-58 units are suitable for attached structural element.
 4. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM F3125/F3125M, Grade A325.
 5. Toggle Bolts: Stainless steel springhead type.
 6. Hanger Rods: Threaded steel.

PART 3 - EXECUTION

3.1 SELECTION

- A. Comply with the following standards for selection and installation of hangers and supports, except where requirements on Drawings or in this Section are stricter:
1. NECA NEIS 101

2. NECA NEIS 105.
 - B. Comply with requirements in Section 078413 "Penetration Firestopping" for firestopping materials and installation for penetrations through fire-rated walls, ceilings, and assemblies.
 - C. Comply with requirements for raceways and boxes specified in Section 260533 "Raceway and Boxes for Electrical Systems."
 - D. Maximum Support Spacing and Minimum Hanger Rod Size for Raceways: Space supports for EMT, IMC, and ERM as required by the Chicago Electrical Code. The minimum rod size must be 1/4 inch in diameter.
 - E. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
 1. Secure raceways and cables to these supports with single-bolt conduit clamps.

3.2 INSTALLATION OF SUPPORTS

- A. Comply with NECA NEIS 101 for installation requirements except as specified in this article.
- B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. The minimum static design load used for strength determination must be weight of supported components plus 200lb.
- C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
 1. To Wood: Fasten with lag screws or through bolts.
 2. To New Concrete: Bolt to concrete inserts.
 3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
 4. To Existing Concrete: Expansion anchor fasteners.
 5. To Steel: Beam clamps (MSS SP-58, Type 19, 21, 23, 25, or 27), complying with MSS SP-69.
 6. To Light Steel: Sheetmetal screws.
 7. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate.
- D. Drill holes for expansion anchors in concrete at locations and to depths that avoid the need for reinforcing bars.

3.3 CONCRETE BASES

- A. Construct concrete bases of dimensions indicated, but not less than 4 inch larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.
- B. Use 3000 psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 033000 "Cast - in-Place Concrete."
- C. Anchor equipment to concrete base as follows:
 - 1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 2. Install anchor bolts to elevations required for proper attachment to supported equipment.
 - 3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.4 PAINTING

- A. Touchup:
 - 1. Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
 - a. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.
- B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.

END OF SECTION 26 05 29

SECTION 26 05 33 - RACEWAY AND BOXES FOR ELECTRICAL SYSTEMS**PART 1 - GENERAL****1.1 SUMMARY****A. Section Includes:**

1. Type EMT-S raceways and elbows.
2. Type ERMC-S raceways and elbows.
3. Type FMC-S and Type FMC-A raceways.
4. Type LFMC raceways.
5. Type PVC raceways and fittings.
6. Fittings for conduit, tubing, and cable.
7. Threaded metal joint compound.
8. Solvent cements.
9. Surface metal raceways and fittings.
10. Wireways and auxiliary gutters.
11. Metallic outlet boxes, device boxes, rings, and covers.
12. Termination boxes.
13. Cabinets, cutout boxes, junction boxes, pull boxes, and miscellaneous enclosures.
14. Cover plates for device boxes.

B. Related Requirements:

1. Section 260543 "Underground Ducts and Raceways for Electrical Systems" for exterior duct banks, manholes, and underground utility construction.

1.2 ACTION SUBMITTALS**A. Product Data: For the following:**

1. Surface metal raceways.
2. Floor boxes.
3. Cabinets, cutout boxes, and miscellaneous enclosures.

PART 2 - PRODUCTS**2.1 TYPE EMT-S RACEWAYS AND ELBOWS****A. Steel Electrical Metal Tubing (EMT-S) and Elbows:**

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 797 and UL Category Control Number FJMX.
 - 2) Material: Steel.
 - 3) Exterior Coating: Zinc.
 - 4) Interior Coating: Zinc.

- c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.

2.2 TYPE ERMC-S RACEWAYS, ELBOWS, COUPLINGS, AND NIPPLES

- A. Galvanized-Steel Electrical Rigid Metal Conduit (ERMC-S), Elbows, Couplings, and Nipples:
 - 1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 6 and UL Category Control Number DYIX.
 - 2) Exterior Coating: Zinc.
 - 3) Interior Coating: Zinc with organic top coating.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.

2.3 TYPE FMC-S AND TYPE FMC-A RACEWAYS

- A. Steel Flexible Metal Conduit (FMC-S):
 - 1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standard: UL 1 and UL Category Control Number DXUZ.
 - 2) Material: Steel.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.
- B. Aluminum Flexible Metal Conduit (FMC-A):
 - 1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standard: UL 1 and UL Category Control Number DXUZ.
 - 2) Material: Aluminum.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.

- 2) Colors: As indicated on Drawings.

2.4 TYPE FMT RACEWAYS

A. Steel Flexible Metallic Tubing (FMT):

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standard: UL 1652 and UL Category Control Number ILJW.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.

2.5 TYPE LFMC RACEWAYS

A. Steel Liquid tight Flexible Metal Conduit (LFMC-S):

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standard: UL 360 and UL Category Control Number DXHR.
 - 2) Material: Steel.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.

B. Stainless Steel Liquid Tight Flexible Metal Conduit (LFMC-SS):

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standard: UL 360 and UL Category Control Number DXHR.
 - 2) Material: Stainless steel.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.
 - 2) Colors: As indicated on Drawings.

2.6 TYPE PVC RACEWAYS AND FITTINGS

A. Schedule 40 Rigid PVC Conduit (PVC-40) and Fittings:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 651 and UL Category Control Number DZYR.
 - 2) Dimensional Specifications: Schedule 40.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.

B. Schedule 80 Rigid PVC Conduit (PVC-80) and Fittings:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 651 and UL Category Control Number DZYR.
 - 2) Dimensional Specifications: Schedule 80.
 - c. Options:
 - 1) Minimum Trade Size: 3/4 inch.

2.7 FITTINGS FOR CONDUIT, TUBING, AND CABLE

A. Fittings for Type ERM Raceways:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514B and UL Category Control Number DWTT.
 - c. Options:
 - 1) Conduit Fittings for Hazardous (Classified) Locations: UL 1203.

B. Fittings for Type EMT Raceways:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514B and UL Category Control Number FKAV.
 - 2) Material: Steel.
 - 3) Coupling Method: Setscrew coupling. Setscrew couplings with only single screw per conduit are unacceptable.

C. Fittings for Type FMC Raceways:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514B and UL Category Control Number ILNR.

D. Fittings for Type LFMC and Type LFNC Raceways:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514B and UL Category Control Number DXAS.

2.8 ELECTRICALLY CONDUCTIVE CORROSION-RESISTANT COMPOUNDS FOR THREADED CONDUIT

A. Applicable Standards:

1. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and approved by authorities having jurisdiction for application to threaded conduit assemblies.
2. General Characteristics:
 - a. Reference Standards: UL 2419 and UL Category Control Number FOIZ.

2.9 SOLVENT CEMENTS

A. Solvent Cements for Type PVC Raceways and Fittings:

1. Applicable Standards:
 - a. General Characteristics:
 - 1) Reference Standards: As recommended by conduit manufacturer in accordance with UL 514B and UL Category Control Number DWTT.
 - b. Sustainability Characteristics:

2.10 SURFACE METAL RACEWAYS AND FITTINGS

A. Surface Metal Raceways and Fittings with Metal Covers:

1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:

- 1) Reference Standards: UL 5 and UL Category Control Number RJBT.

c. Options:

- 1) Aluminum base with snap-on covers.
- 2) Manufacturer's standard enamel finish in color selected by Design-Builder.
- 3) Wiring Channels: Dual. Multiple channels must be capable of housing a standard 20 to 30 A NEMA device flush within the raceway.

2.11 WIREWAYS AND AUXILIARY GUTTERS

A. Metal Wireways and Auxiliary Gutters:

1. Applicable Standards:

- a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.

b. General Characteristics:

- 1) Reference Standards: UL 870 and UL Category Control Number ZOYX.
- 2) Fittings and Accessories: Include covers, coupling s, of f sets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.
- 3) Finish: Manufacturer's standard enamel finish.

c. Options:

- 1) Degree of Protection: Type 1 for indoor and Type 3R for outdoor unless otherwise indicated.
- 2) Wireway Covers: Screw-cover type for indoor, Flanged-and-gasketed type for outdoor unless otherwise indicated.

2.12 METALLIC OUTLET BOXES, DEVICE BOXES, RINGS, AND COVERS

A. Metallic Outlet Boxes:

1. Description: Box having pry out openings, knockouts, threaded entries, or hubs in either the sides of the back, or both, for entrance of conduit, conduit or cable fittings, or cables, with provisions for mounting outlet box cover, but without provisions for mounting wiring device directly to box.

2. Applicable Standards:

- a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.

b. General Characteristics:

- 1) Reference Standards: UL 514A and UL Category Control Number QCIT.
- 2) Options:Material: Sheet steel or Cast metal.
- 3) Sheet Metal Depth: Minimum 2 inches.
- 4) Cast-Metal Depth: Minimum 2.4 inch.
- 5) Luminaire Outlet Boxes and Covers: Nonadjustable, listed and labeled for attachment of luminaire weighing up to 50 lb.

B. Metallic Conduit Bodies:

1. Description: Means for providing access to interior of conduit or tubing system through one or more removable covers at junction or terminal point. In the United States, conduit bodies are listed in accordance with outlet box requirements.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

C. Metallic Device Boxes:

1. Description: Box with provisions for mounting wiring device directly to box.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.
 - c. Options:
 - 1) Material: Sheet steel or Cast metal.
 - 2) Sheet Metal Depth: minimum 2 inches.
 - 3) Cast-Metal Depth: minimum 2.4 inch.
 - 4) Luminaire Outlet Boxes and Covers: Nonadjustable, listed and labeled for attachment of luminaire weighing up to 50 lb.
 - 5) Paddle Fan Outlet Boxes and Covers: Nonadjustable, designed for attachment of paddle fan weighing up to 70 lb.

D. Metallic Extension Rings:

1. Description: Ring intended to extend sides of outlet box or device box to increase box depth, volume, or both.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

E. Metallic Floor Boxes and Floor Box Covers:

1. Description: Box mounted in floor with floor box cover and other components to complete floor box enclosure.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.

b. General Characteristics:

- 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

F. Metallic Raised-Floor Boxes and Floor Box Covers:

1. Description: Box mounted in raised floor with floor box cover and other components to complete floor box enclosure.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

G. Metallic Recessed Access-Floor Boxes and Recessed Floor Box Covers:

1. Description: Floor box with provisions for mounting wiring devices below floor surface and floor box cover with provisions for passage of cords to recessed wiring devices mounted within floor box.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

H. Metallic Concrete Boxes and Covers:

1. Description: Box intended for use in poured concrete.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL 514A and UL Category Control Number QCIT.

2.13 CABINETS, CUTOUBOXES, JUNCTIONBOXES, PULLBOXES, AND MISCELLANEOUS ENCLOSURES

A. Indoor Sheet Metal Cabinets:

1. Description: Enclosure provided with frame, mat, or trim in which swinging door or doors are or can be hung.
2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number CYIV.

- a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 1.
- B. Indoor Sheet Metal Cutout Boxes:
 - 1. Description: Enclosure that has swinging doors or covers secured directly to and telescoping with walls of enclosure.
 - 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number CYIV.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 1.
- C. Indoor Sheet Metal Junction and Pull Boxes:
 - 1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.
 - 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number BGUZ.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 1.
- D. Indoor Cast-Metal Junction and Pull Boxes:
 - 1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.
 - 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:

- 1) Reference Standards: UL Category Control Number BGUZ.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 1.
- E. Indoor Sheet Metal Miscellaneous Enclosures:
1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards:
 - a) UL 1773 and UL Category Control Number XCKT.
 - b) Non-Environmental Characteristics: UL 50.
 - c) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 1.
- F. Outdoor Sheet Metal Cabinets:
1. Description: Enclosure provided with frame, mat, or trim in which swinging door or doors are or can be hung.
 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number CYIV.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 3R.
- G. Outdoor Sheet Metal Cutout Boxes:
1. Description: Enclosure that has swinging doors or covers secured directly to and telescoping with walls of enclosure.
 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:

- 1) Reference Standards: UL Category Control Number CYIV.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 3R.
- H. Outdoor Sheet Metal Junction and Pull Boxes:
- 1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.
 - 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number BGUZ.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) Degree of Protection: Type 3R.
- I. Outdoor Cast-Metal Junction and Pull Boxes:
- 1. Description: Box with a blank cover that serves the purpose of joining different runs of raceway or cable.
 - 2. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:
 - 1) Reference Standards: UL Category Control Number BGUZ.
 - a) Non-Environmental Characteristics: UL 50.
 - b) Environmental Characteristics: UL 50E.
 - c. Options:
 - 1) degree of Protection: Type 3R.
- J. Outdoor Sheet Metal Miscellaneous Enclosures:
- 1. Applicable Standards:
 - a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
 - b. General Characteristics:

- 1) Reference Standards:
 - a) UL 1773 and UL Category Control Number XCKT.
 - b) Non-Environmental Characteristics: UL 50.
 - c) Environmental Characteristics: UL 50E.

c. Options:

- 1) Degree of Protection: Type 3R.

2.14 COVER PLATES FOR DEVICES BOXES

A. Metallic Cover Plates for Device Boxes:

1. Applicable Standards:

- a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
- b. General Characteristics:
 - 1) Reference Standards: UL 514D and UL Category Control Numbers QCIT and QCMZ.
 - 2) Wallplate-Securing Screws: Metal with head color to match wallplate finish.
- c. Options:
 - 1) Damp and Wet Locations: Listed, labeled, and marked for location and use. Provide gaskets and accessories necessary for compliance with listing.
 - 2) Wallplate Material: 0.040-inch-thick aluminum, anodized or lacquered to prevent corrosion.

B. Nonmetallic Cover Plates for Device Boxes:

1. Applicable Standards:

- a. Regulatory Requirements: Listed and labeled in accordance with the Chicago Electrical Code and marked for intended location and use.
- b. General Characteristics:
 - 1) Reference Standards: UL 514D and UL Category Control Numbers QCIT and QCMZ.
 - 2) Wallplate-Securing Screws: Metal with head color to match wallplate finish.
- c. Options:
 - 1) Damp and Wet Locations: Listed, labeled, and marked for location and use. Provide gaskets and accessories necessary for compliance with listing.
 - 2) Wallplate Material: 0.060 inch thick high-impact thermoplastic (nylon) with smooth finish and color matching wiring device.
 - 3) Color: Ivory, Gray, Red in accordance with NEMA WD 1 unless indicated on Drawings.

PART 3 - EXECUTION

3.1 SELECTION OF RACEWAYS

- A. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with the Chicago Electrical Code for selection of raceways. Consult Architect for resolution of conflicting requirements.
- B. Outdoors:
 - 1. Exposed Conduit: ERM C.
 - 2. Concealed Conduit, Aboveground: ERM C.
 - 3. Direct-Buried Conduit: PVC-40.
 - 4. Concrete-Encased Conduit in Trench: PVC-40.
 - 5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
- C. Indoors:
 - 1. Hazardous Classified Locations: ERM C.
 - 2. Exposed and Subject to Physical Damage: ERM C. Raceway locations include the following:
 - a. Loading docks.
 - b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
 - c. Mechanical rooms.
 - 3. Exposed, Not Subject to Physical Damage: EMT.
 - 4. Concealed in Ceilings and Interior Walls and Partitions: EMT.
 - 5. Damp or Wet Locations: ERM C.
 - 6. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC.
- D. Stub-ups to Above Recessed Ceilings: Provide EMT, IMC, or ERM C for raceways.
- E. Raceway Fittings: Select fittings in accordance with NEMA FB 2.10 guidelines.
 - 1. ERM C and IMC: Provide threaded type fittings unless otherwise indicated.

3.2 SELECTION OF BOXES AND ENCLOSURES

- A. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with the Chicago Electrical Code for selection of boxes and enclosures. Consult Architect for resolution of conflicting requirements.
- B. Degree of Protection:
 - 1. Outdoors:
 - a. Type 3R unless otherwise indicated.
 - b. Locations in-Ground or Exposed to Corrosive Agents: Type 4X.
 - c. Locations in-Ground or Exposed to Corrosive Agents Where Mechanism Must Operate When Ice Covered: Type 3SX.
 - 2. Indoors:

- a. Type 1 unless otherwise indicated.
 - b. Locations Exposed to Corrosive Agents: Type 4X.
- C. Exposed Boxes Installed Less Than 6.5 ft. Above Floor:
1. Provide cast-metal boxes.
 2. Provide exposed cover. Flat covers with angled mounting slots or knockouts are prohibited.

3.3 INSTALLATION OF RACEWAYS

A. Installation Standards:

1. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with the Chicago Electrical Code for installation of raceways. Consult Architect for resolution of conflicting requirements.
2. Comply with the Chicago Electrical Code limitations for types of raceways allowed in specific occupancies and number of floors.
3. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for hangers and supports.
4. Comply with NECA NEIS 101 for installation of steel raceways.
5. Comply with NECA NEIS 111 for installation of nonmetallic raceways.
6. Install raceways square to the enclosure and terminate at enclosures without hubs with locknuts on both sides of enclosure wall. Install locknuts hand tight, plus one-quarter turn more.
7. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to 1-1/4-inch trade size and insulated throat metal bushings on 1-1/2-inch trade size and larger conduits terminated with locknuts.
8. Raceway Terminations at Locations Subject to Moisture or Vibration:
 - a. Provide insulating bushings to protect conductors, including conductors smaller than No. 4 AWG.

B. General Requirements for Installation of Raceways:

1. Complete raceway installation before starting conductor installation.
2. Provide stub-ups through floors with coupling threaded inside for plugs, set flush with finished floor. Plug coupling until conduit is extended above floor to final destination or a minimum of 2 ft. above finished floor.
3. Install no more than equivalent of three 90-degree bends in conduit run. Support within 12 inches of changes in direction.
4. Make bends in raceway using large-radius preformed ells except for parallel bends. Field bending must be in accordance with the Chicago Electrical Code minimum radii requirements. Provide only equipment specifically designed for material and size involved.
5. Conceal conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.
6. Support conduit within 12 inches of enclosures to which attached.
7. Install raceway sealing fittings at accessible locations in accordance with the Chicago Electrical Code and fill them with listed sealing compound. For concealed raceways, install fitting in flush steel box with blank cover plate having finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings in accordance with the

- Chicago Electrical Code.
8. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal interior of raceways at the following points:
 - a. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
 - b. Where an underground service raceway enters a building or structure.
 - c. Conduit extending from interior to exterior of building.
 - d. Conduit extending into pressurized duct and equipment.
 - e. Conduit extending into pressurized zones that are automatically controlled to maintain different pressure set points.
 - f. Where otherwise required by the Chicago Electrical Code.
 9. Do not install raceways or electrical items on "explosion-relief " walls or rotating equipment.
 10. Do not install conduits within 2 inches of the bottom side of a metal deck roof.
 11. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot - water pipes. Install horizontal raceway runs above water and steam piping.
 12. Cut conduit perpendicular to the length. For conduits 2-inch trade size and larger, use roll cutter or a guide to make cut straight and perpendicular to the length. Ream inside of conduit to remove burrs.
 13. Install pull wires in empty raceways. Provide polypropylene or monofilament plastic line with not less than 200 lb. tensile strength. Leave at least 12 inches of slack at both ends of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.
- C. Requirements for Installation of Specific Raceway Types:
1. Types ERM C:
 - a. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound that maintains electrical conductivity to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.
 2. Types FMC, LFMC, and LFNC:
 - a. Comply with NEMA RV 3. Provide a maximum of 72 inch of flexible conduit for equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
 3. Types PVC:
 - a. Do not install Type PVC or Type EPEC conduit where ambient temperature exceeds 122 deg F. Conductor ratings must be limited to 75 deg C except where installed in a trench outside buildings with concrete encasement, where 90 deg C conductors are permitted.
 - b. Comply with manufacturer's written instructions for solvent welding and fittings.
- D. Raceways Embedded in Slabs:
1. Run raceways larger than 1 inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place raceway close to slab support. Secure raceways to reinforcement at maximum 10 ft. intervals.

2. Arrange raceways to cross building expansion joints with expansion fittings at right angles to the joint.
 3. Arrange raceways to ensure that each is surrounded by a minimum of 2 inches of concrete without voids.
 4. Do not embed threadless fittings in concrete unless locations have been specifically approved by Architect.
- E. Stub-ups to Above Recessed Ceilings:
1. Provide EMT or ERMC for raceways.
 2. Provide a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.
- F. Raceway Fittings: Install fittings in accordance with NEMA FB 2.10 guidelines.
1. ERMC-S-PVC: Provide only fittings listed for use with this type of conduit. Patch and seal joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Provide sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
 2. EMT: Provide setscrew, steel fittings. Comply with NEMA FB 2.10.
 3. Flexible Conduit: Provide only fittings listed for use with flexible conduit type. Comply with NEMA FB 2.20.
- G. Expansion-Joint Fittings:
1. Install in runs of aboveground PVC that are located where environmental temperature change may exceed 30 deg F and that have straight-run length that exceeds 25 ft. Install in runs of aboveground ERMC and EMT conduit that are located where environmental temperature change may exceed 100 deg F and that have straight-run length that exceeds 100 ft.
 2. Install type and quantity of fittings that accommodate temperature change listed for the following locations:
 - a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F temperature change.
 - b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
 - c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
 3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F of temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F of temperature change for metal conduits.
 4. Install expansion fittings at locations where conduits cross building or structure expansion joints.
 5. Install expansion-joint fitting with position, mounting, and piston setting selected in accordance with manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.
- H. Raceways Penetrating Rooms or Walls with Acoustical Requirements:
1. Seal raceway openings on both sides of rooms or walls with acoustically rated putty or firestopping.

3.4 INSTALLATION OF SURFACE RACEWAYS

- A. Install surface raceways only where indicated on Drawings.
- B. Install surface raceway with a minimum 2-inch radius control at bend points.
- C. Secure surface raceway with screws or other anchor-type devices at intervals not exceeding 48-inch (mm) and with no less than two supports per straight raceway section. Support surface raceway in accordance with manufacturer's written instructions. Tape and glue are unacceptable support methods.

3.5 INSTALLATION OF BOXES AND ENCLOSURES

- A. Provide boxes in wiring and raceway systems wherever required for pulling of wires, making connections, and mounting of devices or fixtures.
- B. Mount boxes at heights indicated on Drawings. If the mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.
- C. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box, whether installed indoors or outdoors.
- D. Horizontally separate boxes mounted on opposite sides of walls, so they are not in the same vertical channel.
- E. Locate boxes so that cover or plate will not span different building finishes.
- F. Support boxes in recessed ceilings independent of ceiling tiles and ceiling grid.
- G. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for purpose.
- H. Fasten junction and pull boxes to, or support from, building structure. Do not support boxes by conduits.
- I. Set metal floor boxes level and flush with finished floor surface.
- J. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.
- K. Do not install aluminum boxes, enclosures, or fittings in contact with concrete or earth.
- L. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to ensure a continuous ground path.
- M. Boxes and Enclosures in Areas or Walls with Acoustical Requirements:
 - 1. Seal openings and knockouts in back and sides of boxes and enclosures with acoustically rated putty.
 - 2. Provide gaskets for wallplates and covers.

3.6 FIRESTOPPING

- A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.7 PROTECTION

- A. Protect coatings, finishes, and cabinets from damage and deterioration.
 - 1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
 - 2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

3.8 CLEANING

- A. Boxes: Remove construction dust and debris from device boxes, outlet boxes, and floor-mounted enclosures before installing wallplates, covers, and hoods.

END OF SECTION 26 05 33

SECTION 26 05 43 – UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Rigid nonmetallic duct.
 - 2. Duct accessories.
 - 3. Polymer concrete handholes and boxes with polymer concrete cover.

1.3 DEFINITIONS

- A. Direct Buried: Duct or a duct bank that is buried in the ground, without any additional casing materials such as concrete.
- B. Duct: A single duct or multiple ducts. Duct may be either installed singly or as component of a duct bank.
- C. Duct Bank:
 - 1. Two or more ducts installed in parallel, with or without additional casing materials.
 - 2. Multiple ductbanks.
- D. GRC: Galvanized rigid (steel) conduit.
- E. Traffic ways: Locations where vehicular or pedestrian traffic is a normal course of events.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include accessories for handholes.
 - 2. Include underground-line warning tape.
- B. Shop Drawings:
 - 1. Factory-Fabricated Handholes and Boxes Other Than Precast Concrete:
 - a. Include dimensioned plans, sections, and elevations, and fabrication and installation details.
 - b. Include duct entry provisions, including locations and duct sizes.
 - c. Include cover design.
 - d. Include grounding details.

PART 2 - PRODUCTS

2.1 RIGID NONMETALLIC DUCT

- A. Underground Plastic Utilities Duct: Type EPC-40-PVC RNC, complying with NEMA TC 2 and UL 651, with matching fittings complying with NEMA TC 3 by same manufacturer as duct.
- B. Listed and labeled as defined in the Chicago Electrical Code, by a nationally recognized testing laboratory, and marked for intended location and application.

2.2 DUCT ACCESSORIES

- A. Duct Spacers: Factory-fabricated, rigid, PVC interlocking spacers; sized for type and size of duct with which used and selected to provide minimum duct spacing indicated while supporting duct during concreting or backfilling.
- B. Underground-Line Warning Tape: Comply with requirements for underground-line warning tape specified in Section 260553 "Identification for Electrical Systems."

2.3 POLYMER CONCRETE HANDHOLES AND BOXES WITH POLYMER CONCRETE COVER

- A. Description: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.
- B. Standard: Comply with SCTE 77. Comply with tier requirements in "Underground Enclosure Application" Article.
- C. Color: Gray.
- D. Configuration: Units shall be designed for flush burial and have an open bottom unless otherwise indicated.
- E. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
- F. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
- G. Cover Legend: Molded lettering, "ELECTRIC." Insert legend.
- H. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.
- I. Duct Entrance Provisions: Duct-terminating fittings shall mate with entering duct for secure, fixed installation in enclosure wall.

2.4 SOURCE QUALITY CONTROL

- A. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of manholes and boxes for

compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.

1. Strength tests of complete boxes and covers shall be by an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
2. Testing machine pressure gages shall have current calibration certification, complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Coordinate layout and installation of duct, duct bank, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Notify Design-Builder if there is a conflict between areas of excavation and existing structures or archaeological sites to remain.
- B. Coordinate elevations of duct and duct-bank entrances into manholes, handholes, and boxes with final locations and profiles of duct and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct and duct bank will drain to manholes and handholes, and as approved by Design-Builder.

3.2 UNDERGROUND DUCT APPLICATION

- A. Duct for Electrical Cables More Than 600 V: Type EPC-40-PVC RNC, concrete-encased unless otherwise indicated.
- B. Duct for Electrical Feeders 600 V and Less: Type EPC-40-PVC RNC, concrete-encased unless otherwise indicated.
- C. Duct for Electrical Branch Circuits: Type EPC-40-PVC RNC, direct-buried unless otherwise indicated.
- D. Stub-ups: Concrete-encased RNC.

3.3 UNDERGROUND ENCLOSURE APPLICATION

- A. Handholes and Boxes for 600 V and Less:
 1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete. AASHTO HB 17, H-20 structural load rating.
 2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Polymer concrete, SCTE 77, Tier 15 structural load rating.
 3. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Polymer concrete units, SCTE 77, Tier 8 structural load rating.
 4. Cover design load shall not exceed the design load of the handhole or box.

3.4 EARTHWORK

- A. Excavation and Backfill: Comply with Section 31 23 17 - EXCAVATING, BACKFILLING, AND COMPACTING FOR UTILITIES, but do not use heavy-duty, hydraulic-operated, compaction equipment.

3.5 DUCT AND DUCT-BANK INSTALLATION

- A. Where indicated on Drawings, install duct, spacers, and accessories into the duct-bank configuration shown. Duct installation requirements in this Section also apply to duct bank.
- B. Install duct according to NEMA TCB 2.
- C. Slope: Pitch duct a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope duct from a high point between two manholes, to drain in both directions.
- D. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 48 inches, both horizontally and vertically, at other locations unless otherwise indicated.
- E. Joints: Use solvent-cemented joints in duct and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent duct do not lie in same plane.
- F. Building Wall Penetrations: Make a transition from underground duct to GRC at least 10 feet outside the building wall, without reducing duct line slope away from the building and without forming a trap in the line. Use fittings manufactured for RNC-to-GRC transition.
- G. Sealing: Provide temporary closure at terminations of duct with pulled cables. Seal spare duct at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.
- H. Pulling Cord: Install 200-lbf-test nylon cord in empty ducts.
- I. Concrete-Encased Ducts and Duct Bank:
 - 1. Excavate trench bottom to provide firm and uniform support for duct. Prepare trench bottoms as specified in Section 31 23 17 - EXCAVATING, BACKFILLING, AND COMPACTING FOR UTILITIES for pipes less than 6 inches in nominal diameter.
 - 2. Width: Excavate trench 3 inches wider than duct on each side.
 - 3. Depth: Install so top of duct envelope is at least 30 inches below finished grade in areas not subject to deliberate traffic, and at least 36 inches below finished grade in deliberate traffic paths for vehicles unless otherwise indicated.
 - 4. Support duct on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.
 - 5. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and to duct to prevent floating during concreting. Tie the entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
 - 6. Minimum Space between Duct: 3 inches between edge of duct and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and communications ducts.

7. Elbows: Use manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct unless otherwise indicated. Extend encasement throughout length of elbow.
8. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
9. Concrete Cover: Install a minimum of 3 inches of concrete cover between edge of duct to exterior envelope wall, 2 inches between duct of like services, and 4 inches between power and communications ducts.
10. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
 - a. Start at one end and finish at the other, allowing for expansion and contraction of duct as its temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written instructions or use other specific measures to prevent expansion-contraction damage.
 - b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.
11. Pouring Concrete: Comply with requirements in "Concrete Placement" Article in Section 03 30 00 – CAST IN PLACE CONCRETE. Place concrete carefully during pours to prevent voids under and between duct and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Allow concrete to flow around duct and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-installation applications.

J. Direct-Buried Duct and Duct Bank:

1. Excavate trench bottom to provide firm and uniform support for duct. Comply with requirements in Section 31 23 17 - EXCAVATING, BACKFILLING, AND COMPACTING FOR UTILITIES for preparation of trench bottoms for pipes less than 6 inches in nominal diameter.
2. Width: Excavate trench 3 inches wider than duct on each side.
3. Depth: Install top of duct at least 36 inches below finished grade unless otherwise indicated.
4. Set elevation of bottom of duct bank below frost line.
5. Support ducts on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.
6. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and to ducts to prevent floating during concreting. Tie the entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
7. Install ducts with a minimum of 3 inches between ducts for like services and 6 inches between power and communications duct.
8. Elbows: Install manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct direction unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.
9. Install manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct.
 - a. Couple RNC duct to GRC with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
 - b. Stub-ups to Outdoor Equipment: Extend concrete-encased GRC horizontally a

minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.

- 1) Stub-ups shall be flush with finished floor and minimum 3 inches from conduit side to edge of slab.
- c. Stub-ups to Indoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of wall. Install insulated grounding bushings on terminations at equipment.
 - 1) Stub-ups shall be flush with finished floor and no less than 3 inches from conduit side to edge of slab.
10. After installing the first tier of duct, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing the last tier, hand place backfill to 4 inches over duct and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction. Comply with requirements in Section 312317 "Excavating, Backfilling, and Compacting for Utilities" for installation of backfill materials.
 - a. Place minimum 3 inches of sand as a bed for duct. Place sand to a minimum of 6 inches above top level of duct.
 - b. Place minimum 6 inches of engineered fill above concrete encasement of duct.
- K. Underground-Line Warning Tape: Bury nonconducting underground line specified in Section 260553 "Identification for Electrical Systems" no less than 12 inches above all concrete-encased duct and duct banks and approximately 12 inches below grade. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

3.6 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

- A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of duct, and seal joint between box and extension as recommended by manufacturer.
- B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.
- C. Elevation: In paved areas and trafficways, set cover flush with finished grade. Set covers of other handholes 1 inch above finished grade.
- D. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in enclosure.
- E. Field cut openings for duct according to enclosure manufacturer's written instructions. Cut the wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings

to be used, and seal around penetrations after fittings are installed.

- F. For enclosures installed in asphalt paving and subject to occasional, nondeliberate, heavy-vehicle loading, form and pour a concrete ring encircling, and in contact with, enclosure and with top surface screeded to top of box cover frame. Bottom of ring shall rest on compacted earth.
 - 1. Concrete: 3000 psi, 28-day strength with a troweled finish.

3.7 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Demonstrate capability and compliance with requirements on completion of installation of underground duct, duct bank, and utility structures.
 - 2. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for out-of-round duct. Provide a minimum 12-inch-long mandrel equal to duct size minus 1/4 inch. If obstructions are indicated, remove obstructions and retest.
- B. Correct deficiencies and retest as specified above to demonstrate compliance.
- C. Prepare test and inspection reports.

3.8 CLEANING

- A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of duct until duct cleaner indicates that duct is clear of dirt and debris. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.
- B. Clean internal surfaces of manholes, including sump.
 - 1. Sweep the floor, removing dirt and debris.
 - 2. Remove foreign material.

END OF SECTION 26 05 43

SECTION 26 05 44 - SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes:
1. Round sleeves.
 2. Rectangular sleeves.
 3. Sleeve seal systems.
 4. Grout.
 5. Foam sealants.

1.2 ACTION SUBMITTALS

- A. Product Data: For each type of product.

PART 2 - PRODUCTS**2.1 ROUND SLEEVES**

- A. Wall Sleeves, Steel:
1. Description: ASTM A53/A53M, Type E, Grade B, Schedule 40, zinc coated, plain ends and integral waterstop.
- B. Sheet Metal Sleeves, Galvanized Steel, Round:
1. Description: Galvanized-steel sheet; thickness not less than 0.0239 inch; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

2.2 SLEEVE SEAL SYSTEMS

- A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable or between raceway and cable.
1. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
 2. Pressure Plates: Carbon steel.
 3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.3 GROUT

- A. Description: Non-shrink; recommended for interior and exterior sealing openings in non- fire-rated walls or floors.
 - 1. Standard: ASTM C1107/C1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.
 - 2. Design Mix: 5000 psi, 28-day compressive strength.
 - 3. Packaging: Premixed and factory packaged.

2.4 FOAM SEALANTS

- A. Description: Multicomponent, liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam. Foam expansion must not damage cables or crack penetrated structure.

PART 3 - EXECUTION

3.1 INSTALLATION OF SLEEVES FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

- A. Sleeves for Conduits Penetrating Above-Grade, Non-Fire-Rated, Concrete and Masonry-Unit Floors and Walls:
 - 1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
 - a. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall or floor, so no voids remain. Tool exposed surfaces smooth; protect material while curing.
 - b. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint.
 - 2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
 - 3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable, unless sleeve seal system is to be installed.
 - 4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
 - 5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inch above finished floor level. Install sleeves during erection of floors.
- B. Sleeves for Conduits Penetrating Non-Fire-Rated Wall Assemblies:
 - 1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
 - 2. Seal space outside of sleeves with approved joint compound for wall assemblies.

- C. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.
- D. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seal systems. Size sleeves to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.
- E. Underground, Exterior-Wall, and Floor Penetrations:
 - 1. Install steel pipe sleeves with integral waterstops. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve seal system. Install sleeves during construction of floor or wall.

3.2 INSTALLATION OF RECTANGULAR SLEEVES AND SLEEVE SEALS

- A. Install sleeves in existing walls without compromising structural integrity of walls. Do not cut structural elements without reinforcing the wall to maintain the designed weight bearing and wall stiffness.
- B. Install conduits and cable with no crossings within the sleeve.
- C. Fill opening around conduits and cables with expanding foam without leaving voids.
- D. Provide metal sheet covering at both wall surfaces and finish to match surrounding surfaces. Metal sheet must be same material as sleeve.

3.3 INSTALLATION OF SLEEVE SEAL SYSTEMS

- A. Install sleeve seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.
- B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

END OF SECTION 26 05 44

SECTION 26 05 53 - IDENTIFICATION FOR ELECTRICAL SYSTEMS**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Labels.
 - 2. Tapes.
 - 3. Signs.
 - 4. Cable ties.
 - 5. Miscellaneous identification products.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for electrical identification products.
- B. Identification Schedule: For each piece of electrical equipment and electrical system components to be an index of nomenclature for electrical equipment and system components used in identification signs and labels. Use same designations indicated on Drawings.
- C. Delegated-Design Submittal: For arc-flash hazard study.

PART 2 - PRODUCTS**2.1 PERFORMANCE REQUIREMENTS**

- A. Comply with ASME A13.1 and IEEE C2.
- B. Comply with the Chicago Electrical Code.
- C. Comply with 29 CFR 1910.144 and 29 CFR 1910.145.
- D. Comply with ANSI Z535.4 for safety signs and labels.

- E. Comply with NFPA 70E and Section 260573.19 "Arc-Flash Hazard Analysis" requirements for arc-flash warning labels.
- F. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.

2.2 COLOR AND LEGEND REQUIREMENTS

- A. Color-Coding for Phase- and Voltage-Level Identification, 600 V or Less: Use colors listed below for ungrounded service, feeder, and branch-circuit conductors.
 - 1. Color shall be factory applied or field applied for sizes larger than No. 8 AWG if authorities have jurisdiction permit.
 - 2. Colors for 208/120-V Circuits:
 - a. Phase A: Black.
 - b. Phase B: Red.
 - c. Phase C: Blue.
 - 3. Colors for 480/277-V Circuits:
 - a. Phase A: Brown.
 - b. Phase B: Orange.
 - c. Phase C: Yellow.
 - 4. Color for Neutral: White.
 - 5. Color for Equipment Grounds: Green.
 - 6. Colors for Isolated Grounds: Green with two or more yellow stripes.
- B. Warning Label Colors:
 - 1. Identify system voltage with black letters on an orange background.
- C. Warning labels and signs shall include, but are not limited to, the following legends:
 - 1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
 - 2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."
 - 3. Arc Flash and Shock Hazard Warning: Refer to Section 260573.19 for label requirements.
- D. Equipment Identification Labels:
 - 1. Black letters on a white field.

2.3 LABELS

- A. Self-Adhesive Wraparound Labels: Preprinted, 3-mil-thick, vinyl flexible label with acrylic pressure-sensitive adhesive.
 - 1. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating, protective shield over the legend. Labels sized such that the clear shield overlaps the entire printed legend.
 - 2. Marker for Labels:
 - a. Machine-printed, permanent, waterproof, black ink recommended by printer manufacturer.
- B. Self-Adhesive Labels: Vinyl, thermal, transfer-printed, 3-mil-thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.
 - 1. Minimum Nominal Size:
 - a. 1-1/2 by 6 inches for raceway and conductors.
 - b. 3-1/2 by 5 inches for equipment.
 - c. As required by authorities having jurisdiction.

2.4 TAPES AND STENCILS

- A. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; not less than 3 mms thick by 1 to 2 inches wide; compounded for outdoor use.
- B. Underground-Line Warning Tape:
 - 1. Tape:
 - a. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.
 - b. Printing on tape shall be permanent and shall not be damaged by burial operations.
 - c. Tape material and ink shall be chemically inert and not subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.
 - 2. Color and Printing:
 - a. Comply with ANSI Z535.1, ANSI Z535.2, ANSI Z535.3, ANSI Z535 .4, and ANSI Z535.5.
 - b. Inscriptions for Red-Colored Tapes: "ELECTRIC LINE".
 - c. Inscriptions for Orange-Colored Tapes: "TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE".
 - 3. Tape:

- a. Detectable three-layer laminate, consisting of a printed pigmented polyolefin film, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright colored, compounded for direct-burial service.
- b. Width: 3 inches.
- c. Overall Thickness: 5 mils.
- d. Foil Core Thickness: 0.35 mil.
- e. Weight: 28 lb./1000 sq. ft.
- f. Tensile according to ASTM D882: 70 lbf and 4600 psi.

2.5 SIGNS

A. Laminated Acrylic or Melamine Plastic Signs:

1. Engraved legend.
2. Thickness:
 - a. For signs up to 20 sq. in., minimum 1/16 inch thick.
 - b. For signs larger than 20 sq. in., 1/8 inch thick.
 - c. Engraved legend with white letters on a dark gray background.
 - d. Punched or drilled for mechanical fasteners with 1/4-inch grommets in corners for mounting.
 - e. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.6 CABLE TIES

A. General-Purpose Cable Ties: Fungus inert, self-extinguishing, one piece, self-locking, and Type 6/6 nylon.

1. Minimum Width: 3/16 inch.
2. Tensile Strength at 73 Deg F according to ASTM D638: 12,000 psi.
3. Temperature Range: Minus 40 to plus 185 deg F.
4. Color: Black, except where used for color-coding.

B. Plenum-Rated Cable Ties: Self-extinguishing, UV stabilized, one piece, and self-locking.

1. Minimum Width: 3/16 inch.
2. Tensile Strength at 73 Deg F according to ASTM D638: 7000 psi.
3. UL 94 Flame Rating: 94V-0.
4. Temperature Range: Minus 50 to plus 284 deg F.
5. Color: Black.

2.7 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION**3.1 PREPARATION**

- A. Self-Adhesive Identification Products: Before applying electrical identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.2 INSTALLATION

- A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.
- B. Install identifying devices before installing acoustic ceilings and similar concealment.
- C. Verify the identity of each item before installing identification products.
- D. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.
- E. Apply identification devices to surfaces that require finish after completing finish work.
- F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of electrical systems and connected items.
- G. System Identification for Raceways and Cables under 600 V: Identification shall completely encircle cable or conduit. Place identification of two-color markings in contact, side by side.
 - 1. Secure tight to surface of conductor, cable, or raceway.
 - 2. Secure tight to surface of conductor, cable, or raceway.
- H. Auxiliary Electrical Systems Conductor Identification: Identify field-installed alarm, control, and signal connections.
- I. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.
- J. Accessible Fittings for Raceways: Identify the covers of each junction and pull box of the following systems with the wiring system legend and system voltage. System legends shall be as follows:
 - 1. "EMERGENCY POWER."
- K. Self-Adhesive Wraparound Labels: Secure tight to surface at a location with high visibility and accessibility.

- L. Self-Adhesive Labels:
 - 1. On each item, install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.
 - 2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letter s on 1-1/2-inch-high label; where two lines of text are required, use labels 2 inches high.
- M. Marker Tapes: Secure tight to surface at a location with high visibility and accessibility.
- N. Self-Adhesive Vinyl Tape: Secure tight to surface at a location with high visibility and accessibility.
 - 1. Field-Applied, Color-Coding Conductor Tape: Apply in half-lapped turns for a minimum distance of 6 inches where splices or taps are made. Apply the last two turns of tape with no tension to prevent possible unwinding.
- O. Floor Marking Tape: Apply stripes to finished surfaces following manufacturer's written instructions.
- P. UndergroundLine Warning Tape:
 - 1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.
 - 2. Install underground-line warning tape for direct-buried cables and cables in raceways.
- Q. Laminated Acrylic or Melamine Plastic Signs:
 - 1. Attach signs that are not self -adhesive type with mechanical fasteners appropriate to the location and substrate.
 - 2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letters on 1-1/2-inch-high sign; where two lines of text are required, use labels 2 inches high.
- R. Cable Ties: General purpose, for attaching tags, except as listed below:
 - 1. In Spaces Handling Environmental Air: Plenum rated.

3.3 IDENTIFICATION SCHEDULE

- A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide a view of identifying devices.
- B. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations of high visibility. Identify by system and circuit designation.

- C. Accessible Fittings for Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self -adhesive labels containing the wiring system legend and system voltage. System legends shall be as follows:
 - 1. "EMERGENCY POWER."
- D. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use self-adhesive vinyl tape to identify the phase.
 - 1. Locate identification at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.
- E. Control-Circuit Conductor Identification: For conductors and cables in pull and junction boxes, manholes, and handholes, use self-adhesive labels with the conductor or cable designation, origin, and destination.
- F. Control-Circuit Conductor Termination Identification: For identification at terminations, provide self-adhesive labels with the conductor designation.
- G. Auxiliary Electrical Systems Conductor Identification: Self-adhesive vinyl tape that is uniform and consistent with system used by manufacturer for factory-installed connections.
 - 1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.
- H. Locations of Underground Lines: Underground-line warning tape for power, lighting, communication, and control wiring and optical-fiber cable.
- I. Instructional Signs: Self -adhesive labels, including the color code for grounded and ungrounded conductors.
- J. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Self-adhesive labels.
 - 1. Apply to exterior of door, cover, or other access.
 - 2. For equipment with multiple power or control sources, apply to door or cover of equipment, including, but not limited to, the following:
 - a. Power-transfer switches.
 - b. Controls with external control power connections.
- K. Arc Flash Warning Labeling: Self-adhesive labels.
- L. Equipment Identification Labels:
 - 1. Indoor Equipment: Laminated acrylic or melamine plastic sign.
 - 2. Outdoor Equipment: Laminated acrylic or melamine sign.
 - 3. Equipment to Be Labeled:

- a. Panelboards: Typewritten directory of circuits in the location provided by panelboard manufacturer. Panelboard identification shall be in the form of a engraved, laminated acrylic or melamine label.
- b. Enclosures and electrical cabinets.
- c. Switchboards.
- d. Transformers: Label that includes tag designation indicated on Drawings for the transformer, feeder, and panelboards or equipment supplied by the secondary.
- e. Emergency system boxes and enclosures.
- f. Enclosed switches.
- g. Enclosed circuit breakers.
- h. Enclosed controllers.
- i. Variable-speed controllers.
- j. Contactors.
- k. Remote-controlled switches, dimmer modules, and control devices.
- l. UPS equipment.

END OF SECTION 26 05 53

SECTION 26 05 73.13 - SHORT-CIRCUIT STUDIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes a computer-based, fault-current study to determine the minimum interrupting capacity of circuit protective devices.

1.3 DEFINITIONS

- A. Field Adjusting Agency: An independent electrical testing agency with full -time employees and the capability to adjust devices and conduct testing indicated and that is a member company of NETA.
- B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- C. Power System Analysis Software Developer: An entity that commercially develops, maintains, and distributes computer software used for power system studies.
- D. Power Systems Analysis Specialist: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located.
- E. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion of the circuit from the system.
- F. SCCR: Short-circuit current rating.
- G. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.
- H. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

- A. Product Data:
 - 1. For computer software program to be used for studies.

2. Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
 - a. Short-circuit study input data, including completed computer program input data sheets.
 - b. Short-circuit study and equipment evaluation report; signed, dated, and sealed by a qualified professional engineer.
 - 1) Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.
 - 2) Revised one-line diagram, reflecting field investigation results and results of short-circuit study.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data:

1. For Power Systems Analysis Software Developer.
2. For Power System Analysis Specialist.
3. For Field Adjusting Agency.

B. Product Certificates: For short-circuit study software, certifying compliance with IEEE 399.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data:

1. For overcurrent protective devices to include in emergency, operation, and maintenance manuals.
2. The following are from the Short-Circuit Study Report:
 - a. Final one-line diagram.
 - b. Final Short-Circuit Study Report.
 - c. Short-circuit study datafiles.
 - d. Power system data.

1.7 QUALITY ASSURANCE

- A. Study shall be performed using commercially developed and distributed software designed specifically for power system analysis.
- B. Software algorithms shall comply with the requirements of standards and guides specified in this Section.
- C. Manual calculations are unacceptable.

1. Power System Analysis Software Qualifications: Computer program shall be designed to perform short-circuit studies or have a function, component, or add-on module designed to perform short-circuit studies.
 2. Computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.
- D. Power Systems Analysis Specialist Qualifications: Professional engineer licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.
- E. Short-Circuit Study Certification: Short-Circuit Study Report shall be signed and sealed by Power Systems Analysis Specialist.
- F. Field Adjusting Agency Qualifications:
1. Employer of a NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification responsible for all field adjusting of the Work.
 2. A member company of NETA.
 3. Acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE DEVELOPERS

- A. Manufacturers: Subject to compliance with requirements, utilize products by one of the following:
1. EasyPower, LLC (formerly ESA Inc.).
 2. SKM Systems Analysis, Inc.
- B. Comply with IEEE 399 and IEEE 551.
1. Analytical features of power systems analysis software program shall have capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- C. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output.

2.2 SHORT-CIRCUIT STUDY REPORT CONTENTS

- A. Executive summary of study findings.
- B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.
- C. One-line diagram of modeled power system, showing the following:
1. Protective device designations and ampere ratings.

2. Conductor types, sizes, and lengths.
 3. Transformer kilovolt ampere (kVA) and voltage ratings.
 4. Motor and generator designations and kVA ratings.
 5. Switchgear, switchboard, motor-control center, and panelboard designations and ratings.
 6. Derating factors and environmental conditions.
 7. Any revisions to electrical equipment required by the study.
- D. Comments and recommendations for system improvements or revisions in a written document, separate from one-line diagram.
- E. Protective Device Evaluation:
1. Evaluate equipment and protective devices and compare to available short -circuit currents. Verify that equipment withstand ratings exceed available short-circuit current at equipment installation locations.
 2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
 3. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
 4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in standards to 1/2-cycle symmetrical fault current.
 5. Verify adequacy of phase conductors at maximum three -phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
- F. Short-Circuit Study Input Data:
1. One-line diagram of system being studied.
 2. Power sources available.
 3. Manufacturer, model, and interrupting rating of protective devices.
 4. Conductors.
 5. Transformer data.
- G. Short-Circuit Study Output Reports:
1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
 - a. Voltage.
 - b. Calculated fault-current magnitude and angle.
 - c. Fault-point X/R ratio.
 - d. Equivalent impedance.
 2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
 - a. Voltage.
 - b. Calculated symmetrical fault-current magnitude and angle.
 - c. Fault-point X/R ratio.

- d. Calculated asymmetrical fault currents:
 - 1) Based on fault-point X/R ratio.
 - 2) Based on calculated symmetrical value multiplied by 1.6.
 - 3) Based on calculated symmetrical value multiplied by 2.7.
3. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
 - a. Voltage.
 - b. Calculated symmetrical fault-current magnitude and angle.
 - c. Fault-point X/R ratio.
 - d. No AC Decrement (NACD) ratio.
 - e. Equivalent impedance.
 - f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
 - g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

PART 3 - EXECUTION

3.1 POWER SYSTEM DATA

- A. Obtain all data necessary for conduct of the study.
 1. Verify completeness of data supplied on one-line diagram. Call any discrepancies to Architect's attention.
 2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
- B. Gather and tabulate the required input data to support the short-circuit study. Comply with requirements in Section 017839 "Project Record Documents" for recording circuit protective device characteristics. Record data on a Record Document copy of one-line diagram. Comply with recommendations in IEEE 551 as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under direct supervision and control of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification. Data include, but are not limited to, the following:
 1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
 2. Obtain electrical power utility impedance at the service.
 3. Power sources and ties.
 4. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
 5. For reactors, provide manufacturer and model designation, voltage rating, and impedance.

6. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
7. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
8. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
9. Motor horsepower and NEMA MG 1 code letter designation.
10. Conductor sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
11. Derating factors.

3.2 SHORT-CIRCUIT STUDY

- A. Perform study following the general study procedures contained in IEEE 399.
- B. Calculate short-circuit currents according to IEEE 551.
- C. Base study on device characteristics supplied by device manufacturer.
- D. Begin short-circuit current analysis at the service, extending down to system overcurrent protective devices as follows:
 1. To normal system low-voltage load buses where fault current is 10 kA or less.
- E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.
- F. Include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and apply to low- and medium-voltage, three-phase ac systems. Also account for the fault-current dc decrement to address asymmetrical requirements of interrupting equipment.
- G. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and a single line-to-ground fault at each equipment indicated on one-line diagram.
 1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.
- H. Include in the report identification of any protective device applied outside its capacity.

END OF SECTION 26 05 73.13

SECTION 26 05 73.16 - COORDINATION STUDIES**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes computer-based, overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.

1.3 DEFINITIONS

- A. Field Adjusting Agency: An independent electrical testing agency with full -time employees and the capability to adjust devices and conduct testing indicated and that is a member company of NETA.
- B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- C. Power System Analysis Software Developer: An entity that commercially develops, maintains, and distributes computer software used for power system studies.
- D. Power System Analysis Specialist: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located.
- E. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion of the circuit from the system.
- F. SCCR: Short-circuit current rating.
- G. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.
- H. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

A. Product Data:

1. For computer software program to be used for studies.
2. Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
 - a. Coordination-study input data, including completed computer program input data sheets.
 - b. Study and equipment evaluation reports.
3. Overcurrent protective device coordination study report; signed, dated, and sealed by a qualified professional engineer.
 - a. Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data:

1. For Power Systems Analysis Specialist.
2. For Field Adjusting Agency.

B. Product Certificates: For overcurrent protective device coordination study software, certifying compliance with IEEE 399.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For overcurrent protective devices to include in emergency, operation, and maintenance manuals.

1. The following are from the Coordination Study Report:
 - a. Final one-line diagram.
 - b. Final protective device coordination study.
 - c. Coordination study datafiles.
 - d. List of all protective device settings.
 - e. Time-current coordination curves.
 - f. Power system data.

1.7 QUALITY ASSURANCE

- A. Studies shall be performed using commercially developed and distributed software designed specifically for power system analysis.
- B. Software algorithms shall comply with the requirements of standards and guides specified in this Section.

- C. Manual calculations are unacceptable.
- D. Power System Analysis Software Qualifications:
 - 1. Computer program shall be designed to perform coordination studies or have a function, component, or add-on module designed to perform coordination studies.
 - 2. Computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.
- E. Power Systems Analysis Specialist Qualifications: Professional engineer licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.
- F. Field Adjusting Agency Qualifications:
 - 1. Employer of a NETA ETT-Certified Technician Level III responsible for all field adjusting of the Work.
 - 2. A member company of NETA.
 - 3. Acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE DEVELOPERS

- A. Manufacturers: Subject to compliance with requirements, utilize products by one of the following:
 - 1. EasyPower, LLC (formerly ESA Inc.).
 - 2. Operation Technology, Inc.
 - 3. SKM Systems Analysis, Inc.
- B. Comply with IEEE 242 and IEEE 399.
- C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
- D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.
 - 1. Optional Features:
 - a. Arcing faults.
 - b. Simultaneous faults.

- c. Explicit negative sequence.
- d. Mutual coupling in zero sequence.

2.2 COORDINATION STUDY REPORT CONTENTS

- A. Executive summary of study findings.
- B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.
- C. One-line diagram of modeled power system, showing the following:
 - 1. Protective device designations and ampere ratings.
 - 2. Conductor types, sizes, and lengths.
 - 3. Transformer kilovolt ampere (kVA) and voltage ratings.
 - 4. Motor and generator designations and kVA ratings.
 - 5. Switchgear, switchboard, motor-control center, and panelboard designations.
 - 6. Any revisions to electrical equipment required by the study.
 - 7. Study Input Data: As described in "Power System Data" Article.
 - a. Short-Circuit Study Output: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."
- D. Protective Device Coordination Study:
 - 1. Report recommended settings of protective devices, ready to be applied in the field. Use manufacturer's data sheets for recording the recommended setting of overcurrent protective devices when available.
 - a. Phase and Ground Relays:
 - 1) Device tag.
 - 2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value.
 - 3) Recommendations on improved relaying systems, if applicable.
 - b. Circuit Breakers:
 - 1) Adjustable pickups and time delays (long time, short time, and ground).
 - 2) Adjustable time-current characteristic.
 - 3) Adjustable instantaneous pickup.
 - 4) Recommendations on improved trip systems, if applicable.
 - c. Fuses: Show current rating, voltage, and class.
- E. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's

upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:

1. Device tag and title, one-line diagram with legend identifying the portion of the system covered.
2. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
3. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
4. Plot the following listed characteristic curves, as applicable:
 - a. Power utility's overcurrent protective device.
 - b. Medium-voltage equipment overcurrent relays.
 - c. Medium- and low-voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.
 - d. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
 - e. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves.
 - f. Cables and conductors damage curves.
 - g. Ground-fault protective devices.
 - h. Motor-starting characteristics and motor damagepoints.
 - i. Generator short-circuit decrement curve and generator damagepoint.
 - j. The largest feeder circuit breaker in each motor -control center and panelboard.
5. Maintain selectivity for tripping currents caused by overloads.
6. Maintain maximum achievable selectivity for tripping currents caused by overloads on series-rated devices.
7. Provide adequate time margins between device characteristics such that selective operation is achieved.
8. Comments and recommendations for system improvements.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance of the Work. Devices to be coordinated are indicated on Drawings.
 1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 POWER SYSTEM DATA

- A. Obtain all data necessary for conduct of the overcurrent protective device study.

1. Verify completeness of data supplied in one-line diagram on Drawings. Call any discrepancies to Architect's attention.
 2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
- B. Gather and tabulate all required input data to support the coordination study. List below is a guide. Comply with recommendations in IEEE 551 for the amount of detail required to be acquired in the field. Field data gathering shall be under direct supervision and control of the engineer in charge of performing the study and shall be by the engineer or its representative who holds NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification. Data include, but are not limited to, the following:
1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
 2. Electrical power utility impedance at the service.
 3. Power sources and ties.
 4. Short-circuit current at each system bus (three phase and line to ground).
 5. Full-load current of all loads.
 6. Voltage level at each bus.
 7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
 8. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
 9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
 10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
 11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
 12. Maximum demands from service meters.
 13. Busway manufacturer and model designation, current rating, impedance, lengths, size, and conductor material.
 14. Motor horsepower and NEMA MG 1 code letter designation.
 15. Low-voltage cable sizes, lengths, number, conductor material, and conduit material (magnetic or nonmagnetic).
 16. Medium-voltage cable sizes, lengths, conductor material, cable construction, metallic shield performance parameters, and conduit material (magnetic or nonmagnetic).
 17. Data sheets to supplement electrical distribution system one -line diagram, cross -referenced with tag numbers on diagram, showing the following:
 - a. Special load considerations, including starting inrush currents and frequent starting and stopping.

- b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
- c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
- d. Generator thermal-damage curve.
- e. Ratings, types, and settings of utility company's overcurrent protective devices.
- f. Special overcurrent protective device settings or types stipulated by utility company.
- g. Time-current-characteristic curves of devices indicated to be coordinated.
- h. Manufacturer, frame size, interrupting rating in amperes root mean square (rms) symmetrical, ampere or current sensor rating, long -time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
- i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
- j. Switchgear, switchboards, motor-control centers, and panelboards ampacity, and SCCR in amperes rms symmetrical.
- k. Identify series-rated interrupting devices for a condition where the available fault current is greater than the interrupting rating of downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

3.3 COORDINATION STUDY

- A. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.
- B. Comply with IEEE 399 for general study procedures.
- C. Base study on device characteristics supplied by device manufacturer.
- D. Begin analysis at the service, extending down to system overcurrent protective devices as follows:
 - 1. To normal system low-voltage load buses where fault current is 10 kA or less.
- E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.
- F. Transformer Primary Overcurrent Protective Devices:
 - 1. Device shall not operate in response to the following:
 - a. Inrush current when first energized.
 - b. Self-cooled, full-load current or forced-air-cooled, full-load current,

- whichever is specified for that transformer.
 - c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
 - 2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.
 - G. Motor Protection:
 - 1. Select protection for low-voltage motors according to IEEE 242 and NFPA 70.
 - H. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.
 - I. Include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and apply to low- and medium-voltage, three-phase ac systems. Also account for fault-current dc decrement, to address asymmetrical requirements of interrupting equipment.
 - J. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and a single line-to-ground fault at each equipment indicated on one-line diagram.
 - 1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.
 - K. Protective Device Evaluation:
 - 1. Evaluate equipment and protective devices and compare to short-circuit ratings.
 - 2. Adequacy of switchgear, motor-control centers, and panelboard bus bars to withstand short-circuit stresses.
 - 3. Include in the report identification of any protective device applied outside its capacity.
- ### 3.4 FIELD ADJUSTING
- A. Adjust relay and protective device settings according to recommended settings provided by the coordination study. Field adjustments shall be completed by the engineering service division of the equipment manufacturer under the "Startup and Acceptance Testing" contract portion.
 - B. Make minor modifications to equipment as required to accomplish compliance with short-circuit and protective device coordination studies.
 - C. Testing and adjusting shall be by a full-time employee of the Field Adjusting Agency, who holds NETA ETT-Certified Technician Level III or NICET Electrical Power Testing

Level III certification.

1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters. Perform NETA tests and inspections for all adjustable overcurrent protective devices.

3.5 DEMONSTRATION

- A. Engage Power Systems Analysis Specialist to train Owner's maintenance personnel in the following:
 1. Acquaint personnel in fundamentals of operating the power system in normal and emergency modes.
 2. Hand-out and explain the coordination study objectives, study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpreting time-current coordination curves.
 3. For Owner's maintenance staff certified as NETA ETT-Certified Technicians Level III or NICET Electrical Power Testing Level III Technicians, teach how to adjust, operate, and maintain overcurrent protective device settings.

END OF SECTION 26 05 73.16

SECTION 26 05 73.19 - ARC-FLASH HAZARD ANALYSIS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes a computer-based, arc-flash study to determine the arc-flash hazard distance and the incident energy to which personnel could be exposed during work on or near electrical equipment.

1.3 DEFINITIONS

- A. Field Adjusting Agency: An independent electrical testing agency with full -time employees and the capability to adjust devices and conduct testing indicated and that is a member company of NETA.
- B. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
- C. Power System Analysis Software Developer: An entity that commercially develops, maintains, and distributes computer software used for power system studies.
- D. Power Systems Analysis Specialist: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located.
- E. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
- F. SCCR: Short-circuit current rating.
- G. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.
- H. Single-Line Diagram: See "One-Line Diagram."

1.4 ACTION SUBMITTALS

- A. Product Data: For computer software program to be used for studies.
- B. Study Submittals: Submit the following submittals after the approval of system protective devices submittals. Submittals shall be in digital form:
 - 1. Arc-flash study input data, including completed computer program input data sheets.
 - 2. Arc-flash study report; signed, dated, and sealed by Power Systems Analysis Specialist.
 - 3. Submit study report for action prior to receiving final approval of distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data:
 - 1. For Power Systems Analysis Software Developer.
 - 2. For Power System Analysis Specialist.
 - 3. For Field Adjusting Agency.
- B. Product Certificates: For arc-flash hazard analysis software, certifying compliance with IEEE 1584 and NFPA 70E.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data:
 - 1. Provide maintenance procedures in equipment manuals according to requirements in NFPA 70E.
 - 2. Operation and Maintenance Procedures: In addition to items specified in Section 017823 "Operation and Maintenance Data," provide maintenance procedures for use by Owner's personnel that comply with requirements in NFPA 70E.

1.7 QUALITY ASSURANCE

- A. Study shall be performed using commercially developed and distributed software designed specifically for power system analysis.
- B. Software algorithms shall comply with requirements of standards and guides specified in this Section.
- C. Manual calculations are unacceptable.
- D. Power System Analysis Software Qualifications: An entity that owns and markets

computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

1. Computer program shall be designed to perform arc-flash analysis or have a function, component, or add-on module designed to perform arc-flash analysis.
 2. Computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.
- E. Power Systems Analysis Specialist Qualifications: Professional engineer in charge of performing the arc-flash study, analyzing the arc flash, and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.
- F. Arc-Flash Study Certification: Arc-Flash Study Report shall be signed and sealed by Power Systems Analysis Specialist.
- G. Field Adjusting Agency Qualifications:
1. Employer of a NETA ETT-Certified Technician Level III or NICET Electrical Power Testing Level III certification responsible for all field adjusting of the Work.
 2. A member company of NETA.
 3. Acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. EasyPower, LLC (formerly ESA Inc.).
 2. Operation Technology, Inc.
 3. SKM Systems Analysis, Inc.
- B. Comply with IEEE 1584 and NFPA 70E.
- C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

2.2 ARC-FLASH STUDY REPORT CONTENT

- A. Executive summary of study findings.
- B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.

- C. One-line diagram, showing the following:
 - 1. Protective device designations and ampere ratings.
 - 2. Conductor types, sizes, and lengths.
 - 3. Transformer kilovolt ampere (kVA) and voltage ratings, including derating factors and environmental conditions.
 - 4. Motor and generator designations and kVA ratings.
 - 5. Switchgear, switchboard, motor-control center, panelboard designations, and ratings.

- D. Study Input Data: As described in "Power System Data" Article.

- E. Short-Circuit Study Output Data: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."

- F. Protective Device Coordination Study Report Contents: As specified in "Coordination Study Report Contents" Article in Section 260573.16 "Coordination Studies."

- G. Arc-Flash Study Output Reports:
 - 1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each equipment location included in the report:
 - a. Voltage.
 - b. Calculated symmetrical fault-current magnitude and angle.
 - c. Fault-point X/R ratio.
 - d. No AC Decrement (NACD) ratio.
 - e. Equivalent impedance.
 - f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
 - g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

- H. Incident Energy and Flash Protection Boundary Calculations:
 - 1. Arcing fault magnitude.
 - 2. Protective device clearing time.
 - 3. Duration of arc.
 - 4. Arc-flash boundary.
 - 5. Restricted approach boundary.
 - 6. Limited approach boundary.

 - 7. Working distance.
 - 8. Incident energy.
 - 9. Hazard risk category.
 - 10. Recommendations for arc-flash energy reduction.

- I. Fault study input data, case descriptions, and fault-current calculations including a definition of terms and guide for interpretation of computer printout.

2.3 ARC-FLASH WARNING LABELS

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for self-adhesive equipment labels. Produce a 3.5-by-5-inch self-adhesive equipment label for each work location included in the analysis.
- B. Label shall have an orange header with the wording, "WARNING, ARC -FLASH HAZARD," and shall include the following information taken directly from the arc -f lash hazard analysis:
 - 1. Location designation.
 - 2. Nominal voltage.
 - 3. Protection boundaries.
 - a. Arc-flash boundary.
 - b. Restricted approach boundary.
 - c. Limited approach boundary.
 - 4. Arc flash PPE category.
 - 5. Required minimum arc rating of PPE in Cal/cm squared.
 - 6. Available incident energy.
 - 7. Working distance.
 - 8. Engineering report number, revision number, and issue date.
- C. Labels shall be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine Project overcurrent protective device submittals. Proceed with arc -flash study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to arc-flash study may not be used in study.

3.2 ARC-FLASH HAZARD ANALYSIS

- A. Comply with NFPA 70E and its Annex D for hazard analysis study.
- B. Preparatory Studies: Perform the Short-Circuit and Protective Device Coordination studies prior to starting the Arc-Flash Hazard Analysis.
 - 1. Short-Circuit Study Output: As specified in "Short-Circuit Study Output Reports" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260573.13 "Short-Circuit Studies."
 - 2. Coordination Study Report Contents: As specified in "Coordination Study Report Contents" Article in Section 260573.16 "Coordination Studies."

- C. Calculate maximum and minimum contributions of fault-current size.
 - 1. Maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.
 - 2. Calculate arc-flash energy at 85 percent of maximum short-circuit current according to IEEE 1584 recommendations.
 - 3. Calculate arc-flash energy with the utility contribution at a minimum and assume no motor contribution.
- D. Calculate the arc-flash protection boundary and incident energy at locations in electrical distribution system where personnel could perform work on energized parts.
- E. Include low-voltage equipment locations, except equipment rated 240 V ac or less fed from transformers less than 125 kVA.
- F. Calculate the limited, restricted, and prohibited approach boundaries for each location.
- G. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:
 - 1. Fault contribution from induction motors shall not be considered beyond three to five cycles.
 - 2. Fault contribution from synchronous motors and generators shall be decayed to match the actual decrement of each as closely as possible (for example, contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).
- H. Arc-flash energy shall generally be reported for the maximum of line or load side of a circuit breaker. However, arc-flash computation shall be performed and reported for both line and load side of a circuit breaker as follows:
 - 1. When the circuit breaker is in a separate enclosure.
 - 2. When the line terminals of the circuit breaker are separate from the work location.
- I. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

3.3 POWER SYSTEM DATA

- A. Obtain all data necessary for conduct of the arc-flash hazard analysis.
 - 1. Verify completeness of data supplied on one-line diagram on Drawings and under "Preparatory Studies" Paragraph in "Arc-Flash Hazard Analysis" Article. Call discrepancies to Architect's attention.
 - 2. For new equipment, use characteristics from approved submittals under

provisions of action submittals and information submittals for this Project.

3.4 LABELING

- A. Apply arc-flash label on the front cover of each section of the equipment for each equipment included in the study. Base arc-flash label data on highest values calculated at each location.
- B. Each piece of equipment listed below shall have an arc-flash label applied to it:
 - 1. Low-voltage switchboard.
 - 2. Panelboard and safety switch over 250 V.
 - 3. Applicable panelboard and safety switch under 250 V.
 - 4. Control panel.
- C. Note on record Drawings the location of equipment where the personnel could be exposed to arc-flash hazard during their work.
 - 1. Indicate arc-flash energy.
 - 2. Indicate protection level required.

3.5 APPLICATION OF WARNING LABELS

- A. Install arc-flash warning labels under the direct supervision and control of Power System Analysis Specialist.

3.6 DEMONSTRATION

- A. Engage Power Systems Analysis Specialist to train Owner's maintenance personnel in potential arc-flash hazards associated with working on energized equipment and the significance of arc-flash warning labels.

END OF SECTION 26 05 73.19

SECTION 26 08 00 - COMMISSIONING OF ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes commissioning process requirements for ELECTRICAL systems, assemblies, and equipment.
- B. Provide documentation and testing of these systems, as well as training of the Owner's operation and maintenance personnel. Work with the Commissioning Authority and in cooperation with other members of the commissioning team to ensure compliance.
- C. Refer to Section 01 91 13 GENERAL COMMISSIONING REQUIREMENTS for commissioning requirements.
- D. Related Sections:
 - 1. Division 01 Section "General Commissioning Requirements" for commissioning process requirements.
 - 2. Division 23 Sections related to Testing, Adjusting and Balancing (TAB).
 - 3. Division 23 Sections related to Building Direct Digital Control (DDC) System.

1.3 COMMISSIONING

- A. This section governs the commissioning of Electrical systems.
- B. The following systems and equipment shall be commissioned, where applicable.
 - 1. Switchgear/Switchboards
 - 2. Disconnect Switches
 - 3. Circuit Breakers
 - 4. Motor Controllers
 - 5. Automatic Transfer Switches
 - 6. Emergency Power Generators and Distribution Systems
 - 7. Lighting and Lighting Controls
 - 8. Fire Alarm System/Equipment
 - 9. Motors

10. Electric Distribution Power Monitoring System

- C. Refer to Division 01. Section 01 91 13, "General Commissioning Requirements" for the Work related to commissioning of these systems.

PART 2 - PRODUCTS: NOT USED

PART 3 - EXECUTION: NOT USED

END OF SECTION

SECTION 26 09 13 - ELECTRICAL POWER MONITORING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes:
 - 1. Multifunction energy meters.
 - 2. Power monitoring software.
 - 3. Monitoring of power distribution equipment.
 - 4. System operator interfaces.
 - 5. Raceways and boxes.
 - 6. Wires and cables.

1.2 DEFINITIONS

- A. Active Power: The average power consumed by a unit. Also known as "real power."
- B. Analog: A continuously varying signal value, such as current, flow, pressure, or temperature.
- C. Apparent (Phasor) Power: " $S = VI$ " where "S" is the apparent power, "V" is the RMS value of the voltage, and "I" is the RMS value of the current.
- D. Firmware: Software (programs or data) that has been written onto read-only memory (ROM). Firmware is a combination of software and hardware. Storage media with ROMs that have data or programs recorded on them are firmware.
- E. L-G: Line to ground.
- F. L-L: Line to line.
- G. L-N: Line to neutral.
- H. MODBUS TCP/IP: An open protocol for exchange of process data.
- I. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.
- J. N-G: Neutral to ground.
- K. Power Factor: The ratio of active power to apparent power, sometimes expressed in percentage.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for power monitoring and control.

2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For power monitoring equipment.
1. Include plans, elevations, sections, and attachment details.
 2. Include details of equipment assemblies. Indicate dimensions, method of field assembly, components, and location and size of each field connection.
 - a. Attach copies of approved Product Data submittals for products (such as switchboards, switchgear, and motor-control centers) that describe the following:
 - 1) Location of the meters and gateways, and routing of the connecting wiring.
 - 2) Details of power monitoring and control features to illustrate coordination among related equipment and power monitoring and control.
 3. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.
 4. Network naming and numbering scheme.
 5. Include diagrams for power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.
 6. Specifications for workstations.
 7. UPS sizing calculations for workstation.
 8. Surge Suppressors: Data for each device used and where applied.

1.4 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.
- B. Design Data:
1. Manufacturer's system installation and setup guides, with data forms to plan and record options and setup decisions.
 - a. Project Record Drawings of as-built versions of submittal Shop Drawings provided in electronic PDF format on compact disk or portable storage device with a USB interface.
 - b. Testing and commissioning reports and checklists of completed final versions of reports, checklists, and trend logs.
 - c. As-built versions of submittal Product Data.
 - d. Names, addresses, e-mail addresses, and 24-hour telephone numbers of Installer and service representatives for the system and products.
 - e. Operator's manual with procedures for operating control systems including logging on and off, handling alarms, producing point reports, trending data, overriding computer control, and changing set points and variables.
 - f. Programming manuals with description of programming language and syntax, of statements for algorithms and calculations used, of point database creation and modification, of program creation and modification, and of editor use.
 - g. Engineering, installation, and maintenance manuals that explain how to do the following:

- 1) Design and install new points, panels, and other hardware.
 - 2) Perform preventive maintenance and calibration.
 - 3) Debug hardware problems.
 - 4) Repair or replace hardware.
- h. Documentation of programs created using custom programming language including set points, tuning parameters, and object database.
 - i. Backup copy of graphic files, programs, and database on compact disk or portable storage device with a USB interface.
 - j. Complete original-issue documentation, installation, and maintenance information for furnished third-party hardware including computer equipment and sensors.
 - k. Complete original-issue copies of furnished software, including operating systems, custom programming language, workstation software, and graphics software on compact disk or portable storage device with a USB interface.
 - l. Recommended preventive maintenance procedures for system components, including schedule of tasks such as inspection, cleaning, and calibration; time between tasks; and task descriptions.
 - m. Owner training materials.

1.5 COORDINATION

- A. Coordinate features of distribution equipment and power monitoring and control components to form an integrated interconnection of compatible components.
 1. Match components and interconnections for optimum performance of specified functions.
- B. Coordinate Work of this Section with those in Sections specifying distribution components that are monitored or controlled by power monitoring and control equipment.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

- A. Microprocessor-based advanced energy metering of electrical power distribution system(s) that includes the following:
 1. Meters must be permanently installed, record at intervals of 15 minutes or less, and transmit data to a remote location.
 2. Electricity meters must record both consumption and demand. Whole-building electricity meters shall record the power factor.
 3. The data collection system must use a local area network, building automation system, wireless network, or comparable communication infrastructure
 4. The system must be capable of storing all meter data for at least 36 months.
 5. The data must be remotely accessible.
 6. All meters in the system must be capable of reporting hourly, daily, monthly, and annual energy use.
- B. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with UL 61010-1 and marked for intended location and application.
- C. Meet the requirements of LEED v4 Advanced Energy Metering credit.

2.2 PERFORMANCE REQUIREMENTS

A. Multi-Point Metering (MPM) requirements.

1. ANSI C12.20 0.5 accuracy class for sub-metering of loads with 125A, 250A and 400 A solid core current sensors with voltage clamping circuits.
2. The MPM metering modules shall meet ANSI C12.20 0.5 accuracy class.
3. The metering system shall be modular in construction with capacity for up to 60 current channels configurable for 20 three phase, 30 two pole or 60 one pole loads or combination thereof.
4. The MPM design shall permit the use of solid core 100mA sensors, split core 333mV sensors and 5A current transformers on the same MPM.
5. MPM shall support up to 80 channels of pulse metering of other utilities such as Water, Gas, Steam and chilled water.
6. Load Profile intervals shall be configurable as 15, 30 or 60 minutes or controllable from a Demand Synch input.
7. Demand Interval shall be configurable as 15, 30 or 60 minutes.
8. Interval-by-interval data storage of demand readings shall be programmable from 1-60 minutes.
9. Sufficient memory for a minimum of 3 years of 15-minute interval data

B. MPM Configuration

1. MPM shall include a configuration port compatible with a temporary laptop connection such as a USB interface.
2. The MPM shall be field configurable for combinations of 1, 2 or 3 pole sub-meters with the use of intuitive graphical configuration software.

C. Communications Capabilities

1. The MPM shall support two RS-485 MODBUS communications ports to facilitate simultaneous communications to a local HMI display and to a communications gateway.
2. The MPM shall support Ethernet communications including Modbus TCP, BACnet/IP, HTTPS, SFTP, SNMP, SMTP and NTP

D. WEB Enabled Capabilities

1. Embedded configurable WEB server shall support individual operator usernames and passwords.
2. Web pages shall support HTTPS to protect usernames, passwords, and metering data from being transmitted in the clear on communications packets.
3. Energy and Power comparisons between user selectable time periods
4. Three years of 15-minute historical data shall be stored in .csv file formats on an SFTP directory in the embedded device.
5. Circuit dashboards shall support importing of customer one-line or plan view graphic images and configurable MPM hotspot links on the graphic linked to MPM data.
6. Dashboards shall be configurable to support user preferred dashboard views.

E. Metering Data

1. Whole Building Data - The MPM shall report the present value of metering data representing a whole building. Readings for the whole building meter shall include:
 - a. Meter Name (32 Characters)
 - b. Watts, vars and VA per phase and system
 - c. Per phase Volts L-N and Volts L-L

- d. Frequency
 - e. System Power Factor
 - f. kWh, forward and reverse
 - g. kvarh, Q1, Q2, Q3 and Q4
 - h. kVAh imported (Q1,Q4) and exported (Q2,Q3)
 - i. Block interval demand (1-60 minutes programmable)
 - j. Peak interval demand with Date/Time of peak
 - k. Minimum and Maximum readings including date and time of min/max shall be reported for:
 - 1) Watts, vars and VA per phase and system, Per phase Volts L-N and Volts L-L, Frequency and System Power Factor
2. Sub-meter readings - MPM shall report aggregated power and energy readings for combinations of channels configured as three phase, two pole and single pole sub-meters. Readings for the Sub-meters shall include:
 - a. Present RMS readings for Watts, Vars and VA (total)
 - b. W and kWh
 - c. var and kvarh
 - d. kVAh
 - e. Block interval demand (1-60 minutes programmable)
 3. Pulse Input Module – MPM reports for up to 80 Pulse input channels.
- F. Historical Data
1. MPM shall store interval-based Load Profile readings in non-volatile memory which can be retrieved by MPM configuration software or accessed by the Energy Portal Module.
 2. Stored data for the Main System and Submeters.
 3. Stored data for up to 81 configured Pulse Input channel.

2.3 MICROPROCESSOR-BASED METERING EQUIPMENT

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. Eaton. (Power Xpert – Basis of Design)
 2. Schneider Electric USA, Inc. (Power Logic)
- B. Power Xpert Branch Circuit Monitor: Where shown on the drawings, supply a UL listed microprocessor-based Branch Circuit Monitoring System (PXBCM), or approved equal having the specified features, this system shall consist of meter base, and meter module(s) as described below.
1. Capable of metering four-wire wye, three-wire wye, three-wire delta, and single-phase power systems.
 2. The Branch Circuit Monitor shall measure the following operational data for up to 84 branch load circuits.
 - a. Forward and Reverse kWh
 - b. Watts, VA, Amps, Power Factor
 - c. Present and Peak demand readings for Amps, Forward and Reverse Watts
 - d. Maximum Watts, VA, Amps
 3. Branch Circuit monitor shall support upgradeable firmware via communications.
 4. The Branch Circuit Monitor shall have the following ratings:
 - a. Elevation: 0 – 9843 ft (0 – 3000M)
 - b. Ambient temperature range: -4°F – +158°F
 - c. Storage temperature range: -40°F - +185°F
 - d. Humidity: 5% – 95% non-condensing

- e. PXBCM as a component shall have a NEMA 1 rating. When installed in an enclosure it shall have the same rating as its enclosure.
- f. UL 61010-1 3rd edition
- 5. PXBCM Meter Base
 - a. Each PXBCM-MB Meter Base shall support connection of up to 4 Meter Modules in either an MMS Strip or MME External configuration monitoring a total of up to 100 single-phase two-wire AC loads, 48 single-phase three-wire AC loads or 32 three-phase four-wire AC loads or combinations not to exceed 25 poles per meter module.
 - b. The PXBCM-MB shall be equipped with 4-meter module ports. Each port shall provide control power and communications to either a PXBCM-MMS Meter Module Strip or a PXBCM-MME Meter Module External with a maximum cable length of 28ft between each Meter Base and each Meter Module.
 - c. Each PXBCM-MB shall support connection to up to 4 PXBCM-MMS Meter Module Strip or 4 PXBCM-MME Meter Module External, or a combination of up to 4 total PXBCM-MMS and PXBCM-MME each meter module with independent single or three phase voltage metering circuits with inputs up to 277V L-N and 480V L-L.
 - d. PXBCM-MB Power Supply shall be rated for 100-277VAC L-N +/-10% CAT III, 47-63 Hz, 6W.
 - e. The PXBCM-MB embedded WEB server shall support device configuration for to up to 4 PXBCM-MMS Meter Module Strip or 4 PXBCM-MME Meter Module External, or a combination of up to 4 total PXBCM-MMS and PXBCM-MME and display of up to 100 points of metering data. It shall be possible to save device configuration information to a file for archiving and for uploading to PXBCM.
 - f. The PXBCM-MB shall support connection to a pre-configured HMI via RS-485 serial port. The HMI shall not require configuration.
 - g. The PXBCM-MB shall be equipped with LEDs to indicate communications activity and Device/Alarm Status. An LED shall also indicate if Ethernet is configured for DHCP (automatically assigned IP address) or Fixed IP (manually assigned IP address). The PXBCM-MB shall be equipped with 2 rotary switches to assign Modbus Slave ID 1-99.
 - h. The PXBCM-MB shall be equipped with security mode switches to enable the device to operate in a secure mode to prevent tampering with device configuration and resets over comms.
 - i. The PXBCM Meter Base shall automatically sense the type of PXBCM Meter Module connected to each of its 4-meter module ports.
 - j. The Configuration wizard shall support naming and configuration of up to 100 virtual meters by assigning 1-3 channels of current to 1, 2 or 3 pole meters. Virtual meters shall aggregate the channel data assigned to each virtual meter and report the aggregated virtual meter values for:
 - 1) Forward and Reverse Energy
 - 2) Watts, VA, Average Amps and Power Factor
 - 3) Average and Peak demand for Watts and VA
- 6. PXBCM-MMS Meter Module Strip
 - a. PXBCM-MMS Meter Module Strips shall be available in configurations to mount on either the left or right of a panelboard and contain 9, 15, or 21 CTs. Four additional 333mV connections shall be provided on each PXBCM-MMS for Auxiliary 333mV CT connections which can be used to monitor the panel mains or branch circuits. The MMS shall include both load current and voltage metering circuits providing meter data to the Meter Base.
 - b. The PXBCM Meter Module Strip shall be available with either 9 CT's, 15 CT's or 21 CT's per assembly for factory assembly into Panelboards with 18, 30 or 42 poles. PXBCM MMS CT's shall have been rated for up to 100A continuous current monitoring and designed to mount in an Eaton PRL-1a, PRS-2a or PRL-3e Panelboard with 1 inch breaker pole spacing.

- c. The PXBCM Meter Module Strip shall support direct connection of one set of 3 phase nominal metering voltage inputs up to 277V L-N and 480V L-L voltages and shall be rated as CatIII.
 - d. Power and Energy metering shall be performed based on the voltage assignment for each 100A strip mounted CT and 333mV Aux CT current input as configured using the embedded WEB server.
 - e. PXBCM MMS Accuracy of kWh metering on branch circuits shall be rated for ANSI C12.20 0.5 accuracy class as a system, including 100A rated strip mounted solid core current transformers. kWh accuracy for 333mV input auxiliary circuits shall satisfy ANSI C12.20 0.5 class excluding external 333mV sensor performance.
 - f. The PXBCM-MMS shall be UL approved for mounting to the panelboard interior with no interference. Strip placement shall line up 1 inch center CT's with breaker poles and not impede the normal routing of branch circuit conductors in the panel enclosure.
 - g. The PXBCM-MMS shall connect to the PXBCM MB using factory supplied cables.
7. PXBCM-MME Meter Module External
- a. The PXBCM-MME provides the same metering functionality as the PXBCM-MMS but is used for retrofit or non-uniform/high-mix load applications where the PXBCM-MMS strip mounted 100A CT's cannot be applied.
 - b. The PXBCM Meter Module external shall support 25 channels of current using external 333mV current sensors connected to terminal strips on the PXBCM-MME.
 - c. The PXBCM Meter Module External shall support direct connection of one set of 3 phase nominal metering voltage inputs up to 277V L-N and 480V L-L voltages and shall be rated as CatIII.
 - d. Power and Energy metering shall be performed based on the voltage assignment for each 333mV current sensor input as configured using the embedded WEB server.
 - e. PXBCM MMS Accuracy of kWh metering on 333mV input circuits shall satisfy ANSI C12.20 0.5 class excluding external 333mV sensor performance.

2.4 PC OPERATING SYSTEM SOFTWARE

- A. Description: System software must monitor, analyze, display, control, and save the parameters and features available at the connected meter.
- B. Software: Configured to run on a portable laptop computer, a single PC, or a tablet computer, with capability for accessing a single meter at a time, at the location of the meter. System is not connected to LAN.
- C. Minimum Requirements:
 - 1. Real-time multitasking and multiuser [32-] [or] [64-]bit operating system that allows execution of multiple real-time programs and custom program development.
 - 2. Operating system must be capable of operating Microsoft Windows applications.
 - 3. Scheduling software must schedule centrally based time and event, temporary, and exception day programs.

2.5 RACEWAYS AND BOXES

- A. Comply with requirements in Section 260533 "Raceway and Boxes for Electrical Systems" for electrical power wiring and Chicago Electrical Code Class 1 remote-control and signaling circuits.

2.6 WIRES AND CABLES

- A. Electrical Power Wiring: Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
 - 1. Copper conductors are Type THHN/THWN-2.
- B. Control Wiring: Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."
 - 1. Balanced Twisted Pair Cable: 100 ohm, four-pair Category 5e.
 - 2. Workstation Outlets: Four-port-connector assemblies mounted in single or multigang faceplate. Coordinate color and labels with Section 262726 "Wiring Devices."
 - 3. TIA-485 Cable: Paired, two pairs, twisted, No. 22 AWG, stranded (7x30) tinned-copper conductors.
 - 4. Control-Voltage Control Cable: Multiple conductor, color-coded, No. 20 AWG copper, minimum.
 - a. Sheath: PVC; except in plenum-type spaces, use sheath listed for plenums.
 - b. Ordinary Switching Circuits: Three conductors unless otherwise indicated.
 - c. Switching Circuits with Pilot Lights or Locator Feature: Five conductors unless otherwise indicated.
- C. TIA-232 Cable:
 - 1. PVC-Jacketed, TIA-232 Cable: Paired, two pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; PVC jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
 - a. Type CM.
 - b. Flame Resistance: UL 1581, vertical tray.
 - 2. Plenum-Type, TIA-232 Cable: Paired, two pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; plastic jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
 - a. Type CMP.
 - b. Flame Resistance: NFPA 262, flame test.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting performance of the Work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF POWER MONITORING AND CONTROL SYSTEMS

- A. Wiring Method: Install cables in raceways and cable trays except within consoles, cabinets, desks, and counters. Conceal raceway and cables except in unfinished spaces.
- B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
- C. Wiring and Cabling Installation:
 - 1. Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for electrical power wiring.
 - 2. Comply with Section 260523 "Control-Voltage Electrical Power Cables" for control wiring.
- D. Raceways Installation:
 - 1. Comply with Section 260533 "Raceway and Boxes for Electrical Systems" for electrical power wiring and NFPA 70 Class 1 remote-control and signaling circuits.
- E. Identification Installation:
 - 1. Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for electrical power wiring.

3.3 NETWORK NAMING AND NUMBERING

- A. Coordinate with Owner and provide unique naming and addressing for networks and devices.

3.4 GROUNDING

- A. For data communication wiring, comply with BICSI N1.
- B. For control-voltage wiring and cabling, comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Tests and Inspections:
 - 1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
 - 2. Visually inspect balanced twisted pair cabling and optical-fiber cable jacket materials for UL or third-party certification markings. Inspect cabling terminations to confirm color-coding for pin assignments and inspect cabling connections to confirm compliance with TIA-568-C.1.
 - 3. Visually inspect cable placement, cable termination, grounding and bonding, equipment, and patchcords, and labeling of components.
 - 4. Test balanced twisted pair cabling for direct-current loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination, but not after cross-connection.
 - a. Test instruments must meet or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in its "Test Instruments (Normative)" Annex, complying with measurement accuracy

specified in its "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturers for channel or link test configuration.

- b. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide or transfer the data from the instrument to the computer, save as text files, print, and submit.

5. Power Monitoring System Tests.

a. Test Analog Signals:

- 1) Check analog voltage signals using a precision voltage meter at zero, 50, and 100 percent.
- 2) Check analog current signals using a precision current meter at zero, 50, and 100 percent.

B. Nonconforming Work:

1. Wiring and cabling will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.6 MAINTENANCE SERVICE

- A. Beginning at Substantial Completion, maintenance service must include 12 months' full maintenance by manufacturer's authorized service representative. Include quarterly preventive maintenance, repair or replacement of defective components, cleaning, and adjusting as required for proper system operation. Parts and supplies must be manufacturer's authorized replacement parts and supplies.

3.7 TRAINING

A. Attendee Training Manuals:

1. Provide each attendee with a color hard copy of training materials and visual presentations.
2. Hard-copy materials must be organized in a three-ring binder with table of contents and individual divider tabs marked for each logical grouping of subject matter. Organize material to provide space for attendees to take handwritten notes within training manuals.
3. In addition to hard-copy materials included in training manual, provide each binder with a sleeve or pocket that includes a DVD or flash drive with PDF copy of hard-copy materials.

B. On-Site Training:

1. Owner will provide conditioned classroom or workspace with ample desks or tables, chairs, power, and data connectivity for instructor and each attendee.
2. Instructor must provide training materials, projector, and other audiovisual equipment used in training.
3. Provide as much of training located on-site as deemed feasible and practical by Owner.
4. On-site training must include regular walk-through tours, as required, to observe each unique product type installed with hands-on review of operation, calibration, and service requirements.
5. The workstation provided with the system must be used in training. If workstation is not indicated, provide a temporary workstation to convey training content.

- C. At Completion of Training: Staff familiar with the system installed are capable of demonstrating operation of the system during final review.

END OF SECTION 26 09 13

SECTION 26 09 43 - DISTRIBUTED DIGITAL LIGHTING CONTROL SYSTEM

PART 1 GENERAL

1.1 SECTION INCLUDES

- A. Distributed Digital Lighting Control System: System includes
 1. Digital Lighting and Plug Load Controls
 2. Relay Panels
 3. Emergency Lighting Control.

1.2 RELATED SECTIONS

- A. Section 26 51 19 – LED Interior Lighting.
- B. Section 26 52 13 - Emergency and Exit Lighting.

1.3 REFERENCES

- A. Chicago Electrical Code
- B. NEMA - National Electrical Manufacturers Association
- C. FCC emission standards
- D. UL - Underwriters Laboratories, Inc. Listings
- E. UL 2043 - Standard for Fire Test for Heat and Visible Smoke Release for Discrete Products Installed in Air-Handling Spaces.
- F. UL 20 - General Use Switches, Plug Load Controls
- G. UL 924 - Standard for Emergency Lighting and Power Equipment

1.4 DESIGN / PERFORMANCE REQUIREMENTS

- A. Digital Lighting Management System shall accommodate the square-footage coverage requirements for each area controlled, utilizing room controllers, digital occupancy sensors, switches, daylighting sensors and accessories that suit the required lighting and electrical system parameters.
- B. System shall conform to requirements of the Chicago Electrical Code.
- C. System shall comply with FCC emission standards specified in part 15, sub-part J for commercial and residential application.
- D. System shall be listed under UL sections 916 and/or 508.

1.5 SUBMITTALS

- A. Product Data: Manufacturer's data sheets on each product to be used, including:
 1. Catalog sheets and specifications.
 2. Ratings, configurations, standard wiring diagrams, dimensions, colors, service

- condition requirements, and installed features.
- 3. Storage and handling requirements and recommendations.
- 4. Installation instructions.
- B. Shop Drawings: Wiring diagrams for the various components of the System specified including:
 - 1. Composite wiring and/or schematic diagram of each control circuit as proposed to be installed.
 - 2. Show location of all devices, including at minimum sensors, load controllers, and switches/dimmers for each area on reflected ceiling plans.
 - 3. Provide room/area details including products and sequence of operation for each room or area. Illustrate typical acceptable room/area connection topologies.
 - 4. Network riser diagram including floor and building level details. Include network cable specification. Illustrate points of connection to integrated systems. Coordinate integration with mechanical and/or other trades.
- C. Manufacturer's Certificates: Certify products meet or exceed specified requirements.
- D. Closeout Submittals:
 - 1. Project Record Documents: Record actual installed locations and settings for lighting control devices.
 - 2. Operation and Maintenance Manual:
 - a. Include approved Shop Drawings and Product Data.
 - b. Include Sequence of Operation, identifying operation for each room or space.
 - c. Include manufacturer's maintenance information.
 - d. Operation and Maintenance Data: Include detailed information on device programming and setup.
 - e. Include startup and test reports.

1.6 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing of centralized and distributed lighting control systems with a minimum of 10 years documented experience.
- B. Installer Qualifications: Company certified by the manufacturer and specializing in installation of networked lighting control products with minimum three years documented experience.
- C. System Components: Demonstrate that individual components have undergone quality control and testing prior to shipping.

1.7 PRE-INSTALLATION MEETINGS

- A. Convene minimum two weeks prior to commencing Work of this section. Meeting to be attended by Contractor, Architect, system installer, factory authorized manufacturer's representative, and representative of all trades related to the system installation.
- B. Review installation procedures and coordination required with related Work and the following:
 - 1. Confirm the location and mounting of all devices, with special attention to placement of switches, dimmers, and any sensors.
 - 2. Review the specifications for low voltage control wiring and termination.
 - 3. Discuss the functionality and configuration of all products, including sequences of operation, per design requirements.
 - 4. Discuss requirements for integration with other trades.

- C. Inspect and make notes of job conditions prior to installation:
 - 1. Record minutes of the conference and provide copies to all parties present.
 - 2. Identify all outstanding issues in writing designating the responsible party for follow-up action and the timetable for completion.
 - 3. Installation shall not begin until all outstanding issues are resolved to the satisfaction of the Architect.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Store products in a clean, dry space in original manufacturer's packaging in accordance with manufacturer's written instructions until ready for installation.

1.9 PROJECT CONDITIONS

- A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer for optimum results. Do not install products under environmental conditions outside manufacturer's absolute limits.
- B. Do not install equipment until following conditions can be maintained in spaces to receive equipment:
 - 1. Ambient temperature: 32 to 104 degrees F (0 to 40 degrees C).
 - 2. Relative humidity: Maximum 90 percent, non-condensing.

1.10 WARRANTY

- A. Manufacturer shall provide a 5-year limited warranty on products within this installation, except where otherwise noted, and consisting of a one for one device replacement.

PART 2 PRODUCTS

2.1 MANUFACTURERS

- A. Basis of Design: Legrand WattStopper Digital Lighting Management System

2.2 DISTRIBUTED DIGITAL LIGHTING CONTROL SYSTEM

- A. System General: Provide Wattstopper Digital Lighting Management System (DLM) complete with all necessary enclosures, wiring, and system components to ensure a complete and properly functioning system as indicated on the Drawings and specified herein. If a conflict is identified between the Drawing and this Specification, contact the Architect for clarification prior to proceeding.
 - 1. Space Control Requirements: Provide occupancy/vacancy sensors with Manual- or Partial-ON functionality as indicated in all spaces except toilet rooms, storerooms, library stacks, or other applications where hands-free operation is desirable and Automatic-ON occupancy sensors are more appropriate. Provide Manual-ON occupancy/vacancy sensors for any enclosed office, conference room, meeting room, open plan system and training room. For spaces with multiple occupants, or where line-of-sight may be obscured, provide ceiling- or corner-mounted sensors and Manual-ON switches.
 - 2. Task Lighting / Plug Loads: Provide automatic shut off of non-essential plug loads and task lighting in spaces as required by the applicable energy code. Provide Automatic-ON of plug loads whenever spaces are occupied. For spaces with multiple occupants a single shut off consistent with the overhead lighting may be used for the area.
 - 3. Daylit Areas: Provide daylight-responsive automatic control in all spaces (conditioned or unconditioned) where daylight contribution is available as defined by relevant local

building energy code:

- a. All luminaires within code-defined daylight zones shall be controlled separately from luminaires outside of daylight zones.
 - b. Daytime setpoints for total ambient illumination (combined daylight and electric light) levels that initiate dimming shall be programmed in compliance with relevant local building energy codes.
 - c. Multiple-level switched daylight harvesting controls may be utilized for areas marked on drawings.
 - d. Provide smooth and continuous daylight dimming for areas marked on drawings. Daylighting control system may be designed to turn off electric lighting when daylight is at or above required lighting levels, only if system functions to turn lamps back on at dimmed level, rather than turning full-on prior to dimming.
4. Conference, meeting, training, auditoriums, and multipurpose rooms shall have controls that allow for independent control of each local control zone. Rooms larger than 300 square feet shall instead have at least four preset lighting scenes unless otherwise specified. Occupancy / vacancy sensors shall be provided to turn off all lighting in the space. Spaces with up to four moveable walls shall include controls that can be reconfigured when the room is partitioned.
- B. Equipment Required: Lighting Control and Automation system as defined under this section covers the following equipment.
1. Digital Lighting Management (DLM) local network: Free topology, plug-in wiring system (Cat 5e) for power and data to room devices.
 2. Digital Room Controllers: Self-configuring, digitally addressable one, two or three relay plenum-rated controllers for on/off control. Selected models include 0-10 volt or line voltage forward phase control dimming outputs and integral current monitoring capabilities.
 3. Digital Plug Load Controllers: Self-configuring, digitally addressable, single relay, plenum-rated application-specific controllers. Selected models include integral current monitoring capabilities.
 4. Digital Occupancy Sensors: Self-configuring, digitally addressable, calibrated occupancy sensors with LCD display and two-way active infrared (IR) communications.
 5. Digital Switches: Self-configuring, digitally addressable pushbutton on/off, dimming, and scene switches with two-way active infrared (IR) communications.
 6. Digital Daylighting Sensors: Single-zone closed loop, multi-zone open loop and single-zone dual-loop daylighting sensors with two-way active infrared (IR) communications for daylight harvesting using switching, bi-level, tri-level or dimming control.
 7. Configuration Tools: Handheld remote for room configuration and relay panel programming provides two-way infrared (IR) communications to digital devices and allows complete configuration and reconfiguration of the device / room from up to 30 feet away.
 8. Digital Lighting Management (DLM) segment network: Linear topology, BACnet MS/TP network (1.5 twisted pair, shielded) to connect multiple DLM local networks for centralized control.
 9. Network Bridge: Provides BACnet MS/TP-compliant digital networked communication between rooms, panels and the Segment Manager or building automation system (BAS) and automatically creates BACnet objects representative of connected devices.
 10. Segment Manager: BACnet MS/TP-based controller with web browser-based user interface for system control, scheduling, power monitoring, room device parameter administration and reporting.
 11. Programming and Configuration Software: Optional PC-native application capable of

accessing DLM control parameters within a room, for the local network, via a USB adapter, or globally, for many segment networks simultaneously, via BACnet/IP communication.

12. Digital Lighting Management Relay Panel and Zone Controller: Provides up to 8, 24, or 48 mechanically latching relays. Relays include a manual override and a single push-on connector for easy installation or removal from the panel. Panel accepts program changes from handheld configuration tool for date and time, location, holidays, event scheduling, button binding and group programming. Provides BACnet MS/TP-compliant digital networked communication between other lighting controls and/or building automation system (BAS). Zero relay Zone Controller primarily supports Digital Fixture Controller applications.
13. Emergency Lighting Control Unit (ELCU): Allows a standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building.

C. Local Network LMRJ-Series: DLM local network is a free topology lighting control physical connection and communication protocol designed to control a small area of a building.

1. Features of the DLM local network include:
 - a. Plug n' Go automatic configuration and binding of occupancy sensors, switches and lighting loads to the most energy-efficient sequence of operation based upon the device attached.
 - b. Simple replacement of any device in the local DLM network with a standard off the shelf unit without requiring significant commissioning, configuration or setup.
 - c. Push n' Learn configuration to change the automatic configuration, including binding and load parameters without tools, using only the buttons on the digital devices in the local network.
 - d. Two-way infrared communications for control by handheld remotes, and configuration by a handheld tool including adjusting load parameters, sensor configuration and binding, within a line of sight of up to 30 feet from a sensor, wall switch or IR receiver.
2. Digital room devices connect to the local network using pre-terminated Cat 5e cables with RJ-45 connectors, which provide both data and power to room devices. Systems that utilize RJ-45 patch cords but do not provide serial communication data from individual end devices are not acceptable.
3. If manufacturer's pre-terminated Cat5e cables are not used for the installation each cable must be individually tested and observed by authorized service representative following installation.

2.3 DIGITAL LOAD CONTROLLERS (ROOM, PLUG LOAD AND FIXTURE CONTROLLERS)

- A. Digital Load Controllers: Digital controllers for lighting zones, fixtures and/or plug loads automatically bind room loads to the connected control devices in the space without commissioning or the use of any tools. Provide controllers to match the room lighting and plug load control requirements. Controllers are simple to install, and do not have dip switches/potentiometers, or require special configuration for standard Plug n' Go applications. Control units include the following features.
1. Automatic room configuration to the most energy-efficient sequence of operation based upon the devices in the room.
 2. Simple replacement using the default automatic configuration capabilities, a room controller may be replaced with an off-the-shelf device.
 3. Multiple room controllers connected together in a local network must automatically arbitrate with each other, without requiring any configuration or setup, so that

- individual load numbers are assigned starting with load 1 to a maximum of 64, assigned based on each controller's device ID's from highest to lowest.
4. Device Status LEDs to indicate:
 - a. Data transmission
 - b. Device has power
 - c. Status for each load
 - d. Configuration status
 5. Quick installation features including:
 - a. Standard junction box mounting
 - b. Quick low voltage connections using standard RJ-45 patch cable
 6. Based on individual configuration, each load shall be capable of the following behavior on power up following the loss of normal power:
 - a. Turn on to 100 percent
 - b. Turn off
 - c. Turn on to last level
 7. Each load be configurable to operate in the following sequences based on occupancy:
 - a. Auto-on/Auto-off (Follow on and off)
 - b. Manual-on/Auto-off (Follow off only)
 8. Polarity of each load output shall be reversible, via digital configuration, so that on is off and off is on.
 9. BACnet object information shall be available for the following objects:
 - a. Load status
 - b. Schedule state, normal or after-hours
 - c. Demand Response enable and disable
 - d. Room occupancy status
 - e. Total room lighting and plug loads watts
 - f. Electrical current
 - g. Total watts per controller
 - h. Total room watts/sqft.
 - i. Force on/off all loads
 10. UL 2043 plenum rated
 11. Manual override and LED indication for each load
 12. Zero cross circuitry for each load
 13. All digital parameter data programmed into an individual room controller or plug load controller shall be retained in non-volatile FLASH memory within the controller itself. Memory shall have an expected life of no less than 10 years.
 14. Dimming Room Controllers shall share the following features:
 - a. Each load shall have an independently configurable preset on level for Normal Hours and After Hours events to allow different dimmed levels to be established at the start of both Normal Hours and After Hours events.
 - b. Fade rates for dimming loads shall be specific to bound switch buttons, and the load shall maintain a default value for any bound buttons that do not specify a unique value.
 - c. The following dimming attributes may be changed or selected using a wireless configuration tool:
 - 1) Establish preset level for each load from 0-100 percent
 - 2) Set high and low trim for each load
 - 3) Initiate lamp burn in for each load of either 0, 12 or 100 hours
 - d. Override button for each load provides the following functions:
 - 1) Press and release for on/off control
 - 2) Press and hold for dimming control
 - e. Each dimming output channel shall have an independently configurable minimum and maximum calibration trim level to set the dimming range to match

- the true dynamic range of the connected ballast or driver. LED level indicators on bound dimming switches shall utilize this new maximum and minimum trim.
- f. Each dimming output channel shall have an independently configurable minimum and maximum trim level to set the dynamic range of the output within the new 0-100 percent dimming range defined by the minimum and maximum calibration trim.
 - g. Calibration and trim levels must be set per output channel. Devices that set calibration or trim levels per controller (as opposed to per load) are not acceptable.
 - h. All configuration shall be digital. Devices that set calibration or trim levels per output channel via trim pots or dip-switches are not acceptable.
- B. On/Off Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) capable rated for 20A total load
 2. One or two relay configuration
 3. Simple 150 mA switching power supply (Only 4 100 series devices on a Cat 5e local network)
 4. Three RJ-45 DLM local network ports with integral strain relief and dust cover
 5. WattStopper product numbers: LMRC-101, LMRC-102
- C. On/Off/0-10V Dimming KO Mount Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) capable rated for 10A total load
 2. Optional real time current and voltage monitoring (with - M Monitoring option).
 3. One or two relay configurations
 4. Smart 150 mA switching power supply
 5. Two RJ-45 DLM local network ports. Provide molded strain relief ring
 6. One dimming output per relay
 - a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting
 7. Units capable of providing both Class 1 or Class 2 wiring for the 0-10V output
 8. WattStopper product numbers: LMRC-111, LMRC-111-M, LMRC-112, or LMRC-112-M.
- D. On/Off/0-10V Dimming Enhanced Room Controllers shall include:
1. Dual voltage (120/277 VAC, 60 Hz) capable or 347 VAC, 60 Hz. 120/277 volt models rated for 20A total load; 347 volt models rated for 15A total load
 2. Built in real time current monitoring
 3. One, two or three relay configurations
 4. Smart 250 mA switching power supply
 5. Four RJ-45 DLM local network ports. Provide integral strain relief
 6. One dimming output per relay
 - a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting (LMRC-110 series and 210 series).
 7. WattStopper product numbers: LMRC-211, LRMC-212, LRMC-213.
- E. Plug Load Controllers shall include:
1. 120 VAC, 60 Hz rated for 20A total load. Controller carries application-specific UL 20 rating for receptacle control.
 2. One relay configuration with additional connection for unswitched load

3. Configurable additive time delay to extend plug load time delay beyond occupancy sensor time delay (e.g. a 10-minute additive delay in a space with a 20-minute occupancy sensor delay ensures that plug loads turn off 30 minutes after the space is vacated).
4. Factory default operation is Auto-on/Auto-off, based on occupancy
5. Real time current monitoring of both switched and un-switched load (LMPL-201 only)
6. Switching power supply
 - a. Simple 150mA - Only 4 100 series devices on a Cat 5e local network (LMPL-101)
 - b. Smart 250mA (LMPL-201)
7. RJ-45 DLM local network ports
 - a. Three RJ-45 ports (LMPL-101)
 - b. Four RJ-45 ports (LMPL-201)
8. Provide a wireless transmitter that can be connected to any Cat 5e network of the lighting controls that will communicate the room's occupancy state to receptacles mounted in the area with integral relays. Binding of the transmitter to the receptacles shall be accomplished by pressing a test button on the transmitter, and then a test button on the receptacle.
9. WattStopper product numbers:
 - a. Plug Load Controllers: LMPL-101, LMPL-201.
 - b. Wireless Transceiver and Receptacles: WRC-TX-LM, WRC-15-1/2, WRC-20-1/2

2.4 DIGITAL WALL OR CEILING MOUNTED OCCUPANCY SENSOR

- A. Digital Occupancy Sensors shall provide graphic LCD display for digital calibration and electronic documentation. Features include the following:
 1. Digital calibration and pushbutton configuration for the following variables:
 - a. Sensitivity, 0-100 percent in 10 percent increments
 - b. Time delay, 1-30 minutes in 1-minute increments
 - c. Test mode, Five second time delay
 - d. Detection technology, PIR, Ultrasonic or Dual Technology activation and/or re-activation.
 - e. Walk-through mode
 2. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.
 3. Programmable control functionality including:
 - a. Each sensor may be programmed to control specific loads within a local network.
 - b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
 - c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically within a configurable period of time (default 10 seconds) after turning off.
 - d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
 - e. Ultrasonic and Passive Infrared
 - f. Ultrasonic or Passive Infrared
 - g. Ultrasonic only
 - h. Passive Infrared only
 - i. Independently configurable sensitivity settings for passive infrared and ultrasonic technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.

4. One or two RJ-45 port(s) for connection to DLM local network.
 5. Two-way infrared (IR) transceiver to allow remote programming through handheld commissioning tool and control by remote personal controls.
 6. Device Status LEDs, which may be disabled for selected applications, including:
 - a. PIR detection
 - b. Ultrasonic detection
 - c. Configuration mode
 - d. Load binding
 7. Assignment of occupancy sensor to a specific load within the room without wiring or special tools.
 8. Manual override of controlled loads.
 9. All digital parameter data programmed into an individual occupancy sensor shall be retained in non-volatile FLASH memory within the sensor itself. Memory shall have an expected life of no less than 10 years.
- B. BACnet object information shall be available for the following objects:
1. Detection state
 2. Occupancy sensor time delay
 3. Occupancy sensor sensitivity, PIR and Ultrasonic
- C. Units shall not have any dip switches or potentiometers for field settings
- D. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.
- E. WattStopper product numbers: LMPX, LMDX, LMPC, LMUC, LMDC

2.5 DIGITAL WALLSWITCH OCCUPANCY SENSORS

- A. Digital Occupancy Sensors shall provide scrolling LCD display for digital calibration and electronic documentation. Features include the following:
1. Digital calibration and pushbutton configuration for the following variables:
 - a. Sensitivity: 0-100 percent in 10 percent increments
 - b. Time delay: 1-30 minutes in 1-minute increments
 - c. Test mode: Five second time delay
 - d. Detection technology: PIR, Dual Technology activation and/or re-activation.
 - e. Walk-through mode
 - f. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.
 2. Programmable control functionality including:
 - a. Each sensor may be programmed to control specific loads within a local network.
 - b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
 - c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically during the configurable period of time (default 10 seconds) after turning off.
 - d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
 - 1) Ultrasonic and Passive Infrared
 - 2) Ultrasonic or Passive Infrared
 - 3) Ultrasonic only
 - 4) Passive Infrared only
 3. Independently configurable sensitivity settings for passive infrared and ultrasonic

- technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.
4. Two RJ-45 ports for connection to DLM local network.
 5. Two-way infrared (IR) transceiver to allow remote programming through handheld configuration tool and control by remote personal controls.
 6. Device Status LEDs including
 - a. PIR detection
 - b. Ultrasonic detection
 - c. Configuration mode
 - d. Load binding
 7. Assignment of any occupancy sensor to a specific load within the room without wiring or special tools.
 8. Assignment of local buttons to specific loads within the room without wiring or special tools
 9. Manual override of controlled loads
 10. All digital parameter data programmed into an individual wall switch sensor shall be retained in non-volatile FLASH memory within the wall switch sensor itself. Memory shall have an expected life of no less than 10 years.
- B. BACnet object information shall be available for the following objects:
1. Detection state
 2. Occupancy sensor time delay
 3. Occupancy sensor sensitivity, PIR and Ultrasonic
 4. Button state
 5. Switch lock control
 6. Switch lock status
- C. Units shall not have any dip switches or potentiometers for field settings.
- D. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.
- E. Two-button wall switch occupancy sensors, when connected to a single relay dimming room or fixture controller, shall operate in the following sequence as a factory default:
1. Left button
 - a. Press and release - Turn load on
 - b. Press and hold - Raise dimming load
 2. Right button
 - a. Press and release - Turn load off
 - b. Press and hold - Lower dimming load
- F. Low voltage momentary pushbuttons shall include the following features:
1. Load/Scene Status LED on each switch button with the following characteristics:
 - a. Bi-level LED
 - b. Dim locator level indicates power to switch
 - c. Bright status level indicates that load or scene is active
 2. The following button attributes may be changed or selected using a wireless configuration tool:
 - a. Load and Scene button function may be reconfigured for individual buttons (from Load to Scene, and vice versa).
 - b. Individual button function may be configured to Toggle, On only or Off only.
 - c. Individual scenes may be locked to prevent unauthorized change.
 - d. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.

- e. Ramp rate may be adjusted for each dimmer switch.
- f. Switch buttons may be bound to any load on any load controller or relay panel and are not load type dependent; each button may be bound to multiple loads.
- g. WattStopper part numbers: LMPW, LMDW. Available in white, light almond, ivory, grey, red and black; compatible with wall plates with decorator opening.

2.6 DIGITAL WALL SWITCHES

- A. Low voltage momentary pushbutton switches in 1, 2, 3, 4, 5 and 8 button configuration. Wall switches shall include the following features:
 - 1. Two-way infrared (IR) transceiver for use with personal and configuration remote controls.
 - 2. Removable buttons for field replacement with engraved buttons and/or alternate color buttons. Button replacement may be completed without removing the switch from the wall.
 - 3. Configuration LED on each switch that blinks to indicate data transmission.
 - 4. Load/Scene Status LED on each switch button with the following characteristics:
 - a. Bi-level LED
 - b. Dim locator level indicates power to switch
 - c. Bright status level indicates that load or scene is active
 - d. Dimming switches shall include seven bi-level LEDs to indicate load levels using 14 steps.
 - 5. Programmable control functionality including:
 - a. Button priority may be configured to any BACnet priority level, from 1-16, corresponding to networked operation allowing local actions to utilize life safety priority
 - b. Scene patterns may be saved to any button other than dimming rockers. Once set, buttons may be digitally locked to prevent overwriting of the preset levels.
 - 6. All digital parameter data programmed into an individual wall switch shall be retained in non-volatile FLASH memory within the wall switch itself. Memory shall have an expected life of no less than 10 years.
- B. BACnet object information shall be available for the following objects:
 - 1. Button state
 - 2. Switch lock control
 - 3. Switch lock status
- C. Two RJ-45 ports for connection to DLM local network.
- D. Multiple digital wall switches may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration shall be required to achieve multi-way switching.
- E. Load and Scene button function may be reconfigured for individual buttons from Load to Scene, and vice versa.
 - 1. Individual button function may be configured to Toggle, On only or Off only.
 - 2. Individual scenes may be locked to prevent unauthorized change.
 - 3. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.
 - 4. Ramp rate may be adjusted for each dimmer switch.
 - 5. Switch buttons may be bound to any load on any load controller or relay panel and are not load type dependent; each button may be bound to multiple loads.
 - 6. WattStopper product numbers: LMSW-101, LMSW-102, LMSW-103, LMSW-104, LMSW-105, LMSW-108, LMDM-101. Available in white, light almond, ivory, grey, red

and black; compatible with wall plates with decorator opening.

2.7 DIGITAL DAYLIGHTING SENSORS

- A. Digital daylighting sensors shall work with load controllers and relay panels to provide automatic switching, bi-level, or tri-level or dimming daylight harvesting capabilities for any load type connected to the controller or panel. Daylighting sensors shall be interchangeable without the need for rewiring.
1. Closed loop sensors measure the ambient light in the space and control a single lighting zone.
 2. Open loop sensors measure incoming daylight in the space and are capable of controlling up to three lighting zones.
 3. Dual loop sensors measure both ambient and incoming daylight in the space to ensure that proper light levels are maintained as changes to reflective materials are made in a single zone
- B. Digital daylighting sensors shall include the following features:
1. Sensor's internal photodiode shall only measure lightwaves within the visible spectrum. The photodiode's spectral response curve shall closely match the entire photopic curve. Photodiode shall not measure energy in either the ultraviolet or infrared spectrums. Photocell shall have a sensitivity of less than 5 percent for any wavelengths less than 400 nanometers or greater than 700 nanometers.
 2. Sensor light level range shall be from 1-6,553 foot-candles (fc).
 3. Capability of ON/OFF, bi-level or tri-level switching, or dimming, for each controlled zone, depending on the selection of load controller(s) and load binding to controller(s).
 4. For switching daylight harvesting, the photosensor shall provide a field-selectable deadband, or a separation, between the "ON Setpoint" and the "OFF Setpoint" that will prevent the lights from cycling excessively after they turn off.
 5. For dimming daylight harvesting, the photosensor shall provide the option, when the daylight contribution is sufficient, of turning lights off or dimming lights to a field-selectable minimum level.
 6. Photosensors shall have a digital, independently configurable fade rate for both increasing and decreasing light level in units of percent per second.
 7. Photosensors shall provide adjustable cut-off time. Cut-off time is defined by the number of selected minutes the load is at the minimum output before the load turns off. Selectable range between 0-240 minutes including option to never cut-off.
 8. Optional wall switch override shall allow occupants to reduce lighting level to increase energy savings or, if permitted by system administrator, raise lighting levels for a selectable period of time or cycle of occupancy.
 9. Integral infrared (IR) transceiver for configuration and/or commissioning with a handheld configuration tool, to transmit detected light level to wireless configuration tool, and for communication with personal remote controls.
 10. Configuration LED status light on device that blinks to indicate data transmission.
 11. Status LED indicates test mode, override mode and load binding.
 12. Recessed switch on device to turn controlled load(s) ON and OFF.
 13. BACnet object information shall be available for the following daylighting sensor objects, based on the specific photocell's settings:
 - a. Light level
 - b. Day and night setpoints
 - c. Off time delay
 - d. On and off setpoints
 - e. Up to three zone setpoints
 - f. Operating mode - on/off, bi-level, tri-level or dimming

14. One RJ-45 port for connection to DLM local network.
 15. A choice of accessories to accommodate multiple mounting methods and building materials. Photosensors may be mounted on a ceiling tile, skylight light well, suspended lighting fixture or backbox. Standard tube photosensors accommodate mounting materials from 0-0.62 inch thick (LMLS-400, LMLS-500). Extended tube photosensors accommodate mounting materials from 0.62 to 1.25 inches thick (LMLS-400-L, LMLS-500-L). Mounting brackets are compatible with J boxes (LMLS-MB1) and wall mounting (LMLS-MB2). LMLS-600 photosensor to be mounted on included bracket below skylight well.
 16. Any load or group of loads in the room can be assigned to a daylighting zone
 17. Each load within a daylighting zone can be individually enabled or disabled for discrete control (load independence).
 18. All digital parameter data programmed into a photosensor shall be retained in non-volatile FLASH memory within the photosensor itself. Memory shall have an expected life of no less than 10 years.
- C. Closed loop digital photosensors shall include the following additional features:
1. An internal photodiode that measures light in a 100-degree angle, cutting off the unwanted light from bright sources outside of this cone.
 2. Automatic self-calibration, initiated from the photosensor, a wireless configuration tool or a PC with appropriate software.
 3. Automatically establishes application-specific setpoints following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of loads.
 4. WattStopper Product Number: LMLS-400, LMLS-400-L.
- D. Open loop digital photosensors shall include the following additional features:
1. An internal photodiode that measures light in a 60-degree angle (cutting off the unwanted light from the interior of the room).
 2. Automatically establishes application-specific setpoints following manual calibration using a wireless configuration tool or a PC with appropriate software. For switching operation, an adequate deadband between the ON and OFF setpoints for each zone shall prevent the lights from cycling; for dimming operation, a proportional control algorithm shall maintain the design lighting level in each zone.
 3. Each of the three discrete daylight zones can include any non-overlapping group of loads in the room.
 4. WattStopper Product Number: LMLS-500, LMLS-500-L.
- E. Dual loop digital photosensors shall include the following additional features:
1. Close loop portion of dual loop device must have an internal photodiode that measures light in a 100 degree angle, cutting off the unwanted light from sources outside of this con
 2. Open loop portion of dual loop device must have an internal photodiode that can measure light in a 60 degree angle, cutting off the unwanted light from the interior of the room.
 3. Automatically establishes application-specific set-points following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of load.
 4. Device must reference closed loop photosensor information as a base line reference. The device must be able to analyze the open loop photosensor information to determine if an adjustment in light levels is required.

5. Device must be able to automatically commission setpoints each night to provide adjustments to electrical lighting based on changes in overall lighting in the space due to changes in reflectance within the space or changes to daylight contribution based on seasonal changes.
6. Device must include extendable mounting arm to properly position sensor within a skylight well.
7. WattStopper product number LMLS-600

2.8 DIGITAL PARTITION CONTROLS

- A. Partition controls shall enable manual or automatic coordination of lighting controls in flexible spaces with up to four movable walls by reconfiguring the connected digital switches and occupancy sensors.
- B. Coordinate contact closure interface for automatic control via input from limit switches on movable walls specified in Section 10 22 43 - Sliding Partitions.
 1. Operates on Class 2 power supplied by DLM local network.
 2. Includes 24VDC output and four input terminals for maintained third party contract closure inputs.
 3. Input max. sink/source current: 1-5mA
 4. Logic input signal voltage High: > 18VDC
 5. Logic input signal voltage Low: < 2VDC
 6. Four status LEDs under hinged cover indicate if walls are open or closed; supports LMPS-104 as remote status indicator.
 7. Two RJ-45 ports for connection to DLM local network.
 8. WattStopper partnumber: LMIO-102

2.9 HANDHELD CONFIGURATION TOOLS

- A. Provide a wireless configuration tool to facilitate customization of DLM local networks using two-way infrared communications, and/or PC software that connects to each local network via a USB interface.
- B. Features and functionality of the wireless configuration tool shall include but not be limited to:
 1. Two-way infrared (IR) communication with DLM IR-enabled devices within a range of approximately 30 feet.
 2. High visibility organic LED (OLED) display, pushbutton user interface and menu-driven operation.
 3. Must be able to read and modify parameters for load controllers and relay panels, occupancy sensors, wall switches, daylighting sensors, network bridges, and identify DLM devices by type and serial number.
 4. Save up to eight occupancy sensor setting profiles, and apply profiles to selected sensors.
 5. Temporarily adjust light level of any load(s) on the local network, and incorporate those levels in scene setting. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
 6. Adjust or fine-tune daylighting settings established during auto-configuration, and input light level data to complete configuration of open loop daylighting controls.
 7. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
 8. Verify status of building level network devices.
- C. WattStopper Product Numbers: Handheld LMCT-100

2.10 DLM SEGMENT NETWORK

- A. Provide a segment network using linear topology, BACnet-based MS/TP subnet to connect LMCP relay panels for centralized control.
1. Each connected DLM local network shall include a single network bridge (LMBC-300), and the network bridge is the only room-based device that is connected to the segment network.
 2. Network bridges, relay panels and segment managers shall include terminal blocks, with provisions for separate "in" and "out" terminations, for segment network connections.
 3. Segment network utilizes 1.5 twisted pair, shielded, cable supplied by the lighting control manufacturer. Maximum cable run for each segment is 4,000 feet. Conductor-to-conductor capacitance of the twisted pair shall be less than 30 pf/ft and have a characteristic impedance of 120 Ohms.
 4. Network wire jackets are available in high visibility green, white, or black.
 5. Substitution of manufacturer-supplied cable is not permitted and may void the warranty, if non-approved cable is installed, and if terminations are not completed according to manufacturer's specific requirements.
 6. Network signal integrity requires that each conductor and ground wire be correctly terminated at every connected device.
 7. Segment networks shall be capable of connecting to any of the following: BACnet-compliant BAS (provided by others) directly via MS/TP, or BACnet/IP via an NB-ROUTER or LMSM Unit. Systems whose room-connected network infrastructure require gateway devices to provide BACnet data to a BAS are unacceptable.
- B. WattStopper Product Number: LM-MSTP, LM-MSTP-W, LM-MSTP-B, LM-MSTP-DB

2.11 NETWORK BRIDGE

- A. Network bridge module connects a DLM local network to a BACnet-compliant segment network for communication between rooms, relay panels and a segment manager or BAS. Each local network shall include a network bridge component to provide a connection to the local network room devices. Network bridge shall use industry standard BACnet MS/TP network communication and an optically isolated EIA/TIA RS-485 transceiver.
1. Network bridge shall be provided as a separate module connected on the local network through an available RJ-45 port.
 2. Provide Plug n' Go operation to automatically discover room devices connected to the local network and make all device parameters visible to the segment manager via the segment network. No commissioning shall be required for set up of the network bridge on the local network.
 3. Network bridge shall automatically create standard BACnet objects for selected DLM devices to allow any BACnet-compliant BAS to include lighting control and power monitoring features as provided by the DLM devices on each local network. BACnet objects will be created for the addition or replacement of any given DLM device for the installed life of the system. Products requiring that an application-specific point database be loaded to create or map BACnet objects are not acceptable. Systems not capable of providing BACnet data for control devices via a dedicated BACnet Device ID and physical MS/TP termination per room are not acceptable. Standard BACnet objects shall be provided as follows:
 - a. Read/write the normal or after hours schedule state for the room
 - b. Read the detection state of each occupancy sensor
 - c. Read the aggregate occupancy state of the room
 - d. Read/write the On/Off state of loads
 - e. Read/write the dimmed light level of loads

- f. Read the button states of switches
- g. Read total current in amps, and total power in watts through the load controller
- h. Read/write occupancy sensor time delay, PIR sensitivity and ultrasonic sensitivity settings
- i. Activate a preset scene for the room
- j. Read/write daylight sensor fade time and day and night setpoints
- k. Read the current light level, in foot-candles, from interior and exterior photosensors and photocells
- l. Set daylight sensor operating mode
- m. Read/write wall switch lockstatus
- n. Read watts per square foot for the entire controlled room
- o. Write maximum light level per load for demand response mode
- p. Read/write activation of demand response mode for the room
- q. Activate/restore demand response mode for the room

B. WattStopper product numbers:LMBC-300

2.12 LMCP LIGHTING CONTROL PANELS AND LMZC ZONE CONTROLLER

A. Hardware: Provide LMCP lighting control panels in the locations and capacities as indicated on the Drawing and schedules. Each panel shall be of modular construction and consist of the following components:

1. Enclosure/Tub shall be NEMA 1, sized to accept an interior with 1 - 8 relays, 1 - 24 relays and 6 four-pole contactors, or 1 - 48 relays and 6 four-pole contactors.
2. Cover shall be configured for surface or flush wall mounting of the panel as indicated on the plans. LMCP panel cover shall have a hinged and lockable door with restricted access to line voltage section of the panel.
3. Interior assembly shall be supplied as a factory assembled component specifically designed and listed for field installation. Interior construction shall provide total isolation of high voltage (Class 1) wiring from low voltage (Class 2) wiring within the assembled panel. Interior assembly shall include intelligence boards, power supply, DIN rails for mounting optional Class 2 control devices, and individually replaceable latching type relays. Panel interiors shall include the following features:
 - a. 0-10v dimming outputs.
 - b. Removable, plug-in terminal blocks with connections for all low voltage terminations.
 - c. Individual terminal block, override pushbutton, and LED status light for each relay.
 - d. Direct wired switch inputs associated with each relay shall support 2-wire momentary switches only.
 - e. Digital inputs (four RJ-45 jacks) shall support 1-, 2-, 3-, 4-, and 8-button digital switches; digital IO modules capable of receiving 0-5V or 0-10V analog photocell inputs; digital IO modules capable of receiving momentary or maintained contact closure inputs or analog sensor inputs; digital daylighting sensors; and digital occupancy sensors. Inputs are divided into two separate digital networks, each capable of supplying 250mA to connected devices.
 - f. True relay state shall be indicated by the on-board LED and shall be available to external control devices and systems via BACnet.
 - g. Automatically sequenced operation of relays to reduce impact on the electrical distribution system when large loads are controlled simultaneously.
 - h. Group and pattern control of relays shall be provided through a simple keypad interface from a handheld IR programmer. Any set of relays can be associated with a group for direct on/off control or pattern (scene) control via a simple

- programming sequence using the relay override pushbuttons and LED displays for groups 1-8 or a handheld IR programmer for groups 1-99.
- i. Relay group status for shall be provided through LED indicators for groups 1-8 and via BACnet for groups 1-99. A solid LED indicates that the last group action called for an ON state and relays in the group are on or in a mixed state.
4. Single-pole latching relays with modular plug-in design. Relays shall provide the following ratings and features:
 - a. Electrical:
 - 1) 30 amp ballast at 277V
 - 2) 20amp tungsten at 120V
 - 3) 1.5 HP motor at 120V
 - 4) 14,000 amp short circuit current rating (SCCR) at 347V
 - 5) Relays shall be specifically UL 20 listed for control of plug-loads
 - b. Mechanical:
 - 1) Replaceable, 1/2-inch KO mounting with removable Class 2 wire harness.
 - 2) Actuator on relay housing provides manual override and visual status indication, accessible from Class 2 section of panel.
 - 3) Dual line and load terminals each support two #14 - #12 solid or stranded conductors.
 - 4) Tested to 300,000 mechanical on/off cycles.
 5. Isolated low voltage contacts provide for true relay status feedback and pilot light indication.
 6. Power supply shall be a multi-voltage transformer assembly with rated power to supply all electronics, occupancy sensors, switches, pilot lights, and photocells as necessary to meet the project requirements. Power supply to have internal over-current protection with automatic reset and metal oxide varistor protection.
 7. Where indicated, lighting control panels designated for control of emergency lighting shall be provided with factory installed provision for automatic bypass of relays controlling emergency circuits upon loss of normal power. Panels shall be properly listed and labeled for use on emergency lighting circuits and shall meet the requirements of UL924 and the Chicago Electrical Code - Article 700.
 8. Integral system clock shall provide scheduling capabilities for panel-only projects without DLM segment networks or BAS control.
 - a. Each panel shall include digital clock capability able to issue system wide automation commands to up to 11 other panels for a total of 12 networked lighting control panels. Clock shall provide capability for up to 254 independent schedule events per panel for each of the ninety-nine system wide channel groups.
 - b. Clock capability of each panel shall support the time-based energy saving requirements of applicable local energy codes.
 - c. Clock module shall provide astronomic capabilities, time delays, blink warning, daylight savings, and holiday functions and will include a battery backup for clock function and program retention in non-volatile FLASH memory. Clocks that require multiple events to meet local code lighting shut off requirements shall not be allowed.
 - d. Clock capability of each panel shall operate on a basis of ON/OFF or Normal Hours/After Hours messages to automation groups that implement pre-configured control scenarios. Scenarios shall include:
 - 1) Scheduled ON / OFF
 - 2) Manual ON / Scheduled OFF
 - 3) Astro ON / OFF (or Photo ON / OFF)
 - 4) Astro and Schedule ON / OFF (or Photo and Schedule ON / OFF)

- e. User interface shall be a portable IR handheld remote control capable of programming any panel in the system (LMCT-100)
 - f. Clock capability of each panel shall employ non-volatile memory and shall retain user programming and time for a minimum of 10 years.
 - g. Schedules programmed into the clock of any one panel shall be capable of executing panel local schedule or Dark/Light (photocell or Astro) events for that panel in the event that global network communication is lost. Lighting control panels that are not capable of executing events independently of the global network shall not be acceptable.
9. Lighting control panel can operate as a stand-alone system, or can support schedule, group, and photocell control functions, as configured in a Segment Manager controller, via a segment network connection.
10. Lighting control panel shall support digital communications to facilitate the extension of control to include interoperation with building automation systems and other intelligent field devices. Digital communications shall be RS485 MS/TP-based using the BACnet protocol.
- a. Panel shall have provision for an individual BACnet device ID and shall support the full 222 range (0 - 4,193,304). The device ID description property shall be writable via the network to allow unique identification of the lighting control panel on the network.
 - b. Panel shall support MS/TP MAC addresses in the range of 0 - 127 and baud rates of 9600k, 38400k, 76800k, and 115.2k bits per second.
 - c. Lighting control relays shall be controllable as binary output objects in the instance range of 1 - 64. The state of each relay shall be readable and writable by the BAS via the object's present value property.
 - d. Lighting control relays shall report their true on/off state as binary input objects in the instance range of 1 - 64.
 - e. The 99 group Normal Hours/After Hours control objects associated with the panel shall be represented by binary value objects in the instance range of 201 - 299. The occupancy state of each channel group shall be readable and writable by the BAS via the object present value property. Commanding 1 to a channel group will put all relays associated with the channel into the normal hours mode. Commanding 0 or NULL shall put the relays into the after hours mode.
 - f. Setup and commissioning of panel shall not require manufacturer-specific software or a computer. All configuration of the lighting control panel shall be performed using standard BACnet objects or via the handheld IR programming remote. Provide BACnet objects for panel setup and control as follows:
 - 1) Binary output objects in the instance range of 1 - 64 (one per relay) for on/off control of relays.
 - 2) Binary value objects in the instance range of 1 - 99 (one per channel) for normal hours/after hours schedule control.
 - 3) Binary input objects in the instance range of 1 - 64 (one per relay) for reading true on/off state of the relays.
 - 4) Analog value objects in the instance range of 101 - 199 (one per channel group) shall assign a blink warn time value to each channel. A value of 5 shall activate the blink warning feature for the channel and set a 5-minute grace-time period. A value of 250 shall activate the sweep feature for the channel and enable the use of sweep type automatic wall switches.
 - g. Description property for all objects shall be writable via the network and shall be saved in non-volatile memory within the panel.
 - h. BO and BV 1 - 99 objects shall support BACnet priority array with a relinquish

- default of off and after hours respectively. Prioritized writes to the channel BV objects shall propagate prioritized control to each member relay in a way analogous to the BACnet Channel object described in addendum aa. (<http://www.bacnet.org/Addenda/Add-135-2010aa.pdf>)
- i. Panel-aggregate control of relay Force Off at priority 2 shall be available via a single BV5 object. Force On at priority 1 shall be available via a single BV4 object.
 - j. Lockout of all digital switch buttons connected to a given panel shall be command-able via a single BV2 object. The lock status of any connected switch station shall be represented as BV101-196.
11. In addition to the LMCP Relay Panels, an LMZC Zone Controller panel shall be available for zero-relay applications. The panel is designed for applications where LMFC-011 Fixture Controllers or other distributed load controllers are used to switch and/or dim the controlled loads. Key similarities to and differences from the LMCP panel design shall include:
- a. Use the same intelligence board as the LMCP relay panel.
 - b. Shall not include relay driver boards or relays.
 - c. Have a removable interior section to facilitate installation, and a Tub/Cover. Cover is for surface mounting applications only.
 - d. Tub shall have two interior KOs to allow installation of LMPB-100 Power Boosters. Each installed Power Booster can provide an additional 150 mA for either of the two available DLM local networks provided by the LMZC.
 - e. All programming and networking (whether DLM Local Network and/or Segment Network) capabilities in the LMZC Zone Controller shall be similar to capabilities for LMCP relay panels, except for functions designed for panel-mounted HDR relays.
12. To aid in project start up, if LMFC Fixture Controllers are connected to an LMZC Zone Controller, Plug n' Go automatic configuration will establish a unique sequence of operation so that all LMFC-controlled fixtures will turn on to 50 percent output when any digital occupancy sensor detects motion.
13. WattStopper Product Number: Relay Panels: LMCP8, LMCP24 or LMCP48, Zone Controller: LMZC-301.
- B. User Interface: Each lighting control panel system shall be supplied with at least one handheld configuration tool (LMCT-100). As a remote programming interface the configuration tool shall allow setup, configuration, and diagnostics of the panel without the need for software or connection of a computer. User interface shall have the following panel-specific functions as a minimum:
1. Set network parameters including panel device ID, MS/TP MAC address, baud rate and max master range.
 2. Relay Group creation of up to 99 groups. Group creation shall result in programming of all seven key relay parameters for member relays. The seven parameters are as follows: After-hours Override Time Delay, Normal Hours Override Time Delay, Action on Transition to Normal Hours, Action on Transition to After Hours, Sensor Action During Normal Hours, Sensor Action During After Hours, Blink-Warn Time for After Hours.
 3. Program up to 254 separate scheduled events. Events shall occur on seven-day intervals with each day selectable as active or inactive and shall be configurable as to whether the event is active on holidays. Holidays are also defined through the User Interface.
 4. Program up to 32 separate Dark/Light events. Events shall have a selectable source as either calculated Astro with delay, or a digital IO module with an integral 0-5V or 0-10V analog photocell. Dark/Light events shall occur on seven-day intervals with each

- day selectable as active or inactive and shall be configurable as to whether the event is active on holidays.
5. Button binding of digital switches to groups shall be accessible via the handheld IR remote and accomplished from the digital switch station.
 6. Programming of panel location information shall be accomplished by the handheld IR remote and include at a minimum LAT, LON, DST zone, and an approximate city/state location.
 7. WattStopper Product Number: LMCT-100

2.13 SEGMENT MANAGER

- A. For networked applications, the Digital Lighting Management system shall include at least one segment manager to manage network communication. It shall be capable of serving up a graphical user interface via a standard web browser utilizing either unencrypted TCP/IP traffic via a configurable port (default is 80) or 256-bit AES encrypted SSL TCP/IP traffic via a configurable port (default is 443).
- B. Each segment manager shall have integral support for at least three segment networks. Segment networks may alternately be connected to the segment manager via external BACnet-to-IP interface routers and switches, using standard Ethernet structured wiring. Each router shall accommodate one segment network. Provide the quantity of routers and switches as shown on the Drawings.
- C. Operational features of the Segment Manager shall include the following:
 1. Connection to PC or LAN via standard Ethernet TCP/IP via standard Ethernet TCP/IP with the option to use SSL encrypted connections for all traffic.
 2. Easy to learn and use graphical user interface, compatible with Internet Explorer 8, or equal browser. The Segment Manager shall not require installation of any lighting control software on an end-user PC.
 3. Log in security capable of restricting some users to view-only or other limited operations.
 4. Segment Manager shall provide two main sets of interface screens - those used to initially configure the unit (referred to as the config screens), and a those used to allow users to dynamic monitor the performance of their system and provide a centralized scheduling interface. Capabilities using the Config Screens shall include:
 - a. Automatic discovery of DLM devices and relay panels on the segment network(s). Commissioning beyond activation of the discovery function shall not be required to provide communication, monitoring or control of all local networks and lighting control panels.
 - b. Allow information for all discovered DLM devices to be imported into the Segment Manager via a single XML based site file from the WattStopper LMCS Software, significantly reducing the time needed to make a system usable by the end user. Importable information can include text descriptions of every DLM component and individual loads, and automatic creation of room location information and overall structure of DLM network. Info entered into LMCS should not have to be re-entered manually via keystrokes into the Segment Manager
 - c. After discovery, all rooms and panels shall be presented in a standard navigation tree format. Selecting a device from the tree will allow the device settings and operational parameters to be viewed and changed by the user.
 - d. Ability to view and modify DLM device operational parameters. It shall be possible to set device parameters independently for normal hours and after hours operation including sensor time delays and sensitivities, and load response to sensor including Manual-On or Auto-On.

- e. Provide capabilities for integration with a BAS via BACnet protocol. At a minimum, the following points shall be available to the BAS via BACnet IP connection to the segment manager: room occupancy state; room schedule mode; room switch lock control; individual occupancy sensor state; room lighting power; room plug-load power; load ON/OFF state; load dimming level; panel channel schedule state; panel relay state; and Segment Manager Group schedule state control. Any of above items shall be capable of being moved into an "Export Table" that will provide any integrator with only the data they need, and by using the Export Table effectively create a firewall between the integrator's request for info and the overall system performance.
5. Capabilities using the Segment Manager's Dashboard Screens shall include:
 - a. A dynamic "tile" based interface that allows easy viewing of each individual room's lighting and plug load power consumption, and lighting and plug load power density (power consumption information requires Enhanced DLM Room and Plug Load Controllers with integral current transducers such as LMRC-21x). Tiles will be automatically organized according to location so a single tile for the building summarizes all information for tiles beneath it on every floor, in every area, in every room. Tiles use three color coded energy target parameters, allowing an owner to quickly identify rooms that are not performing efficiently. Tiles for rooms with occupancy sensors shall include an icon to indicate whether that room is occupied. Tiles shall be clickable, and when clicked the underlying hierarchical level of tiles shall become visible. Tile interface shall be accessible via mouse, or touch screen devices. Tiles shall be created automatically by the segment manager, based on the information found during the device discovery and/or information included in a file imported in from LMCS (such as tagged descriptions for each room) without any custom programming.
 - b. Ability to set up schedules for DLM local networks (rooms) and panels. Schedules shall be capable of controlling individual rooms with either on/off or normal hours/after hours set controlled zones or areas to either a normal hours or after hours mode of operation. Support for annual schedules, holiday schedules and unique date-bound schedules, as well as astro On or astro Off events with offsets. Schedules shall be viable graphically as time bars in a screen set up to automatically show scheduled events by day, week or month.
 - c. For fixtures that are accessible via the Segment Network, and have CCT capability as specified under paragraph Digital Wall Switch and Timer For Correlated Color Temperature, the Segment Manager will provide schedule functionality similar to the CCT Wall Timer, allowing all CCT fixtures across the entire facility to be scheduled together.
 - d. Ability to provide a simple time vs. power graph based on information stored in each Segment Manager's memory (typically two to three days' data).
 6. If shown on the Drawings, Segment Managers shall be integrated into a larger control network by the addition of a Network Supervisor package. The Supervisor is a server level computer running a version of the Segment Manager interface software with dedicated communication and networking capability, able to pull information automatically from each individual Segment Manager in the network. By using a Supervisor, information for individual Segment Managers can be accessed and stored on the Supervisor's hard drive, eliminating the risk of data being overwritten after a few days because of Segment Manager memory limits.
 7. Segment Manager shall allow access and control of the overall system database via Native Niagara AX FOX connectivity. Systems that must utilize a Tridium Niagara controller in addition to the programming, scheduling and configuration server are not acceptable.

- D. Segment Manager v2.2 and later shall support multiple DLM rooms as follows:
 - 1. Support up to 120 network bridges and 750 digital in-room devices (LMSM-3E).
 - 2. Support up to 200 network bridges and 1,100 digital in room devices, connected via network routers and switches (LMSM-6E).
- E. WattStopper Product Numbers: LMSM-3E, LMSM-6E, LM-SUPERVISOR, NB-ROUTER, NB-SWITCH, NB-SWITCH-8, NB-SWITCH-16.

2.14 PROGRAMMING, CONFIGURATION AND DOCUMENTATION SOFTWARE

- A. PC-native application for optional programming of detailed technician-level parameter information for all DLM products, including all parameters not accessible via BACnet and the handled IR configuration tool. Software must be capable of accessing room-level parameter information locally within the room when connected via the optional LMCI-100 USB programming adapter, or globally for many segment networks simultaneously utilizing standard BACnet/IP communication.
- B. Additional parameters exposed through this method include but are not limited to:
 - 1. Occupancy sensor detection LED disable for performance and other aesthetic spaces where blinking LEDs present a distraction.
 - 2. Six occupancy sensor action behaviors for each controlled load, separately configurable for normal hours and after-hours modes. Modes include: No Action, Follow Off Only, Follow On Only, Follow On and Off, Follow On Only with Override Time Delay, Follow Off Only with Blink Warn Grace Time, Follow On and Off with Blink Warn Grace Time.
 - 3. Separate fade time adjustments per load for both normal and after hours from 0 - 4 hours.
 - 4. Configurable occupancy sensor re-trigger grace period from 0 - 4 minutes separate for both normal hours and after hours.
 - 5. Separate normal hours and after hours per-load button mode with modes including: Do nothing, on only, off only, on and off.
 - 6. Load control polarity reversal so that on events turn loads off and vice versa.
 - 7. Per-load DR (demand response) shed level in units of percent.
 - 8. Load output pulse mode in increments of 1 second.
 - 9. Fade trip point for each load for normal hours and after hours that establishes the dimmer command level at which a switched load closes its relay to allow for staggered On of switched loads in response to a dimmer.
- C. Generation of reports at the whole file, partial file, or room level. Reports include but are not limited to:
 - 1. Device list report: All devices in a project listed by type.
 - 2. Load binding report: All load controller bindings showing interaction with sensors, switches, and daylighting.
 - 3. BACnet points report: Per room Device ID report of the valid BACnet points for a given site's BOM.
 - 4. Room summary report: Device manifest for each room, aggregated by common BOM, showing basic sequence of operations.
 - 5. Device parameter report: Per-room lists of all configured parameters accessible via handheld IR programmer for use with O&M documentation.
 - 6. Scene report: All project scene pattern values not left at defaults (i.e. 1 = all loads 100 percent, 2 = all loads 75 percent, 3 = all loads 50 percent, 4 = all loads 25 percent, 5-16 = same as scene 1).
 - 7. Occupancy sensor report: Basic settings including time delay and sensitivities for all

occupancy sensors.

- D. Network-wide programming of parameter data in a spreadsheet-like programming environment including but not limited to the following operations:
 1. Set, copy/paste an entire project site of sensor time delays.
 2. Set, copy/paste an entire project site of sensor sensitivity settings.
 3. Search based on room name and text labels.
 4. Filter by product type (i.e. LMRC-212) to allow parameter set by product.
 5. Filter by parameter value to search for product with specific configurations.
- E. Network-wide firmware upgrading remotely via the BACnet/IP network.
 1. Mass firmware update of entire rooms.
 2. Mass firmware update of specifically selected rooms or areas.
 3. Mass firmware upgrade of specific products
- F. WattStopper Product Number: LMCS-100, LMCI-100

2.15 EMERGENCY LIGHTING CONTROL DEVICES

- A. Emergency Lighting Control Unit - A UL 924 listed device that monitors a switched circuit providing normal lighting to an area. The unit provides normal ON/OFF control of emergency lighting along with the normal lighting. Upon normal power failure the emergency lighting circuit will close, forcing the emergency lighting ON until normal power is restored. Features include:
 1. 120/277 volts, 50/60 Hz, 20 amp ballast rating
 2. Push to test button
 3. Auxiliary contact for remote test or fire alarm system interface
- B. WattStopper Product Numbers: ELCU-100, ELCU-200.

PART 3 EXECUTION

3.1 PREPARATION

- A. Do not begin installation until measurements have been verified and work areas have been properly prepared.
- B. If preparation is the responsibility of another installer, notify Design-Builder of unsatisfactory preparation before proceeding.
- C. Verify that the required pre-installation meeting specified in Part 1 of this specification has been completed, recorded meeting minutes have been distributed and all outstanding issues noted have been resolved prior to the start of installation.

3.2 INSTALLATION

- A. Install system in accordance with the approved system shop drawings and manufacturer's instructions.
- B. Install all room/area devices using manufacturer's factory-tested Cat 5e cable with pre-terminated RJ-45 connectors.
 1. If pre-terminated cable is not used for room/area wiring, each field-terminated cable shall be tested following installation and testing results submitted to the Manufacturer's Representative for approval prior to proceeding with the Work.
 2. If fixtures have internal DLM Control Modules, ensure that they are also connected with Cat 5e cable.

3. Install all room-to-room network devices using manufacturer-supplied LM-MSTP network wire or wireless devices. Network wire substitution is not permitted and may result in loss of product warranty.
 4. Low voltage wiring topology must comply with manufacturer's specifications.
 5. Route network wiring as indicated on the Drawings as closely as possible. Document final wiring location, routing and topology on as built drawings.
- C. All line voltage connections shall be tagged to indicate circuit and switched legs.
 - D. Test all devices to ensure proper communication.
 - E. Calibrate all sensor time delays and sensitivity to guarantee proper detection of occupants and energy savings. Adjust time delay so that controlled area remains lighted while occupied.
 - F. Provide written or computer-generated documentation on the configuration of the system including room by room description including:
 1. Sensor parameters, time delays, sensitivities, and daylighting setpoints.
 2. Sequence of operation, (e.g. manual ON, Auto OFF. etc.)
 3. Load Parameters (e.g. blink warning, etc.)
 - G. Post start-up tuning - Adjust sensor time delays and sensitivities to meet the Owner's requirements 30 days from beneficial occupancy. Provide a detailed report to the Architect / Owner of post start-up activity.
 - H. Tighten all panel Class I conductors from both circuit breaker and to loads to torque ratings as marked on enclosure UL label.
 - I. All Class II cabling shall enter enclosures from within low-voltage wiring areas and shall remain within those areas. No Class I conductors shall enter a low-voltage area.
 - J. Run separate neutrals for any phase dimmed branch load circuit. Different types of dimming loads shall have separate neutral.
 - K. Verify all non-panel-based lighting loads to be free from short circuits prior to connection to room controllers.
 - L. Remote Access for Network Systems: If "REMOTE ACCESS AND ENHANCED WARRANTY FOR NETWORKED SYSTEMS" is specified in Part 1 of this specification, ensure Segment Manager enclosure is installed in a location with good to excellent cellular phone coverage based on building orientation and geographic location, and mount magnetic antenna for the modem. For cases where alternate mounting locations are not available and a stronger cellular signal is needed, the manufacturer shall offer additional antenna options to improve signal quality. Verify final mounting location with Engineer and Owner prior to proceeding with the Work.

3.3 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Notify Architect and Manufacturer in writing a minimum of 3 weeks prior to system start-up and testing.
- B. Tests and Inspections: Manufacturer's service representative shall perform the following inspections and prepare reports.

1. Verify Class I and II wiring connections are terminated properly by validating system performance.
 2. Set IP addresses and other network settings of system front end hardware per facilities IT instructions.
 3. Verify / complete task programming for all switches, dimmers, time clocks, and sensors.
 4. Verify that the control of each space complies with the Sequence of Operation.
 5. Correct any system issues and retest.
- C. Provide a report in table format with drawings, or using a software file that can be opened in the manufacturer's system software including each room or space that has lighting control installed. Indicate the following:
1. Date of test or inspection.
 2. Loads per space, or Fixture Address identification.
 3. Quantity and Type of each device installed
 4. Reports providing each device's settings.
- 3.4 DEMONSTRATION AND TRAINING
- A. Before Substantial Completion, arrange and provide a one-day Owner instruction period to designated Owner personnel. Set-up, starting of the lighting control system and Owner instruction includes:
1. Confirmation of entire system operation and communication to each device.
 2. Confirmation of operation of individual relays, switches, and sensors.
 3. Confirmation of system Programming, photocell settings, override settings, etc.
 4. Provide training to cover installation, programming, operation, and troubleshooting of the lighting control system.
- 3.5 PRODUCT SUPPORT AND SERVICE
- A. Factory telephone support shall be available at no cost to the Owner following acceptance. Factory assistance shall consist of assistance in solving application issues pertaining to the control equipment.

END OF SECTION 26 09 43

SECTION 26 22 13 - LOW-VOLTAGE DISTRIBUTION TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes distribution, dry-type transformers with a nominal primary and secondary rating of 600 V and less, with capacities up to 1500 kVA.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 - 1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type and size of transformer.
 - 2. Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer.
- B. Shop Drawings:
 - 1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

1.4 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Accredited by NETA.
 - 1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Inspection: On receipt, inspect for and note any shipping damage to packaging and transformer.
 - 1. If manufacturer packaging is removed for inspection, and transformer will be stored after

inspection, re-package transformer using original or new packaging materials that provide protection equivalent to manufacturer's packaging.

- B. Storage: Store in a warm, dry, and temperature-stable location in original shipping packaging.
- C. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.
- D. Handling: Follow manufacturer's instructions for lifting and transporting transformers.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. ABB, Electrification Products Division.
 - 2. Eaton.
 - 3. Siemens Industry, Inc., Energy Management Division.
 - 4. Square D; Schneider Electric USA.
- B. Source Limitations: Obtain each transformer type from single source from single manufacturer.

2.2 GENERAL TRANSFORMER REQUIREMENTS

- A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
- B. Comply with NFPA 70.
 - 1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
- C. Transformers Rated 15 kVA and Larger:
 - 1. Comply with 10 CFR 431 (DOE 2016) efficiency levels.
 - 2. Marked as compliant with DOE 2016 efficiency levels by an NRTL.

2.3 DISTRIBUTION TRANSFORMERS

- A. Comply with the Chicago Electrical Code.
- B. Cores: Electrical grade, non-aging silicon steel with high permeability and low hysteresis losses.
 - 1. One leg per phase.
 - 2. Grounded to enclosure.
- C. Coils: Continuous windings without splices except for taps.

1. Coil Material: Aluminum.
 2. Internal Coil Connections: Brazed or pressure type.
 3. Terminal Connections: Welded.
- D. Enclosure: Ventilated.
1. NEMA 250, Type 1: Core and coil shall be encapsulated within resin compound to seal out moisture and air.
 2. KVA Ratings: Based on convection cooling only and not relying on auxiliary fans.
 3. Wiring Compartment: Sized for conduit entry and wiring installation.
 4. Finish: Comply with NEMA 250.
 - a. Finish Color: Gray weather-resistant enamel.
- E. Taps for Transformers 3 kVA and Smaller: None.
- F. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.
- G. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.
- H. Insulation Class, Smaller Than 30 kVA: 180 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.
- I. Insulation Class, 30 kVA and Larger: 220 deg C, UL-component-recognized insulation system with a maximum of 150 deg C rise above 40 deg C ambient temperature.
- J. Grounding: Provide ground-bar kit or a ground bar installed on the inside of the transformer enclosure.
- K. Wall Brackets: Manufacturer's standard brackets.

2.4 IDENTIFICATION

- A. Nameplates: Engraved, laminated-acrylic or melamine plastic signs for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Section 260553 "Identification for Electrical Systems."
- B. Nameplates: Self-adhesive label for each distribution transformer. Self-adhesive labels are specified in Section 260553 "Identification for Electrical Systems."

2.5 SOURCE QUALITY CONTROL

- A. Test and inspect transformers according to IEEE C57.12.01 and IEEE C57.12.91.
 1. Resistance measurements of all windings at rated voltage connections and at all tap connections.
 2. Ratio tests at rated voltage connections and at all tap connections.
 3. Phase relation and polarity tests at rated voltage connections.
 4. No load losses, and excitation current and rated voltage at rated voltage connections.
 5. Impedance and load losses at rated current and rated frequency at rated voltage connections.

6. Applied and induced tensile tests.
7. Regulation and efficiency at rated load and voltage.
8. Insulation-Resistance Tests:
 - a. High-voltage to ground.
 - b. Low-voltage to ground.
 - c. High-voltage to low-voltage.
9. Temperature tests.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.
- B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.
- C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.
- D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding for Electrical Systems" have been met.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install wall-mounted transformers level and plumb with wall brackets fabricated by transformer manufacturer.
 1. Coordinate installation of wall-mounted and structure-hanging supports with actual transformer provided.
- B. Construct concrete bases according to Section 033000 "Cast-in-Place Concrete" and anchor floor-mounted transformers according to manufacturer's written instructions and requirements in Section 260529 "Hangers and Supports for Electrical Systems."
 1. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
- C. Secure transformer to concrete base according to manufacturer's written instructions.
- D. Secure covers to enclosure and tighten all bolts to manufacturer-recommended torques to reduce noise generation.
- E. Remove shipping bolts, blocking, and wedges.

3.3 CONNECTIONS

- A. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
- B. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
- C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
- D. Provide flexible connections at all conduit and conductor terminations and supports to eliminate sound and vibration transmission to the building structure.

3.4 FIELD QUALITY CONTROL

- A. Perform tests and inspections with the assistance of a factory-authorized service representative.
- B. Small (Up to 167-kVA Single-Phase or 500-kVA Three-Phase) Dry-Type Transformer Field Tests:
 - 1. Visual and Mechanical Inspection.
 - a. Inspect physical and mechanical condition.
 - b. Inspect anchorage, alignment, and grounding.
 - c. Verify that resilient mounts are free and that any shipping brackets have been removed.
 - d. Verify the unit is clean.
 - e. Perform specific inspections and mechanical tests recommended by manufacturer.
 - f. Verify that as-left tap connections are as specified.
 - g. Verify the presence of surge arresters and that their ratings are as specified.
 - 2. Electrical Tests:
 - a. Measure resistance at each winding, tap, and bolted connection.
 - b. Perform insulation-resistance tests winding -to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index: the value of the index shall not be less than 1.0.
 - c. Perform turns-ratio tests at all tap positions. Test results shall not deviate by more than one-half percent from either the adjacent coils or the calculated ratio. If test fails, replace the transformer.
 - d. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.
- C. Remove and replace units that do not pass tests or inspections and retest as specified above.
- D. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

- A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 5 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.
- B. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

- A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION 26 22 13

tar

SECTION 26 24 13 - SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Service and distribution switchboards rated 600 V and less.
2. Surge protection devices.
3. Disconnecting and overcurrent protective devices.
4. Instrumentation.
5. Control power.
6. Accessory components and features.
7. Identification.

B. Related Requirements

1. Section 260573.19 "Arc-Flash Hazard Analysis" for arc-flash analysis and arc-flash label requirements.
2. Section 260913 "Electrical Power Monitoring" for advanced power monitoring requirements.

1.3 ACTION SUBMITTALS

- A. Product Data: For each switchboard, overcurrent protective device, surge protection device, ground-fault protector, accessory, and component.

1. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

- B. Shop Drawings: For each switchboard and related equipment.

1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
2. Detail enclosure types for types other than NEMA 250, Type 1.
3. Detail bus configuration, current, and voltage ratings.
4. Detail short-circuit current rating of switchboards and overcurrent protective devices.
5. Include descriptive documentation of optional barriers specified for electrical insulation and isolation.
6. Detail utility company's metering provisions with indication of approval by utility company.

7. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
8. Include schematic and wiring diagrams for power, signal, and control wiring.

C. Delegated Design Submittal:

1. For arc-flash hazard analysis.
2. For arc-flash labels.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Field Quality-Control Reports:

1. Test procedures used.
2. Test results that comply with requirements.
3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - a. Routine maintenance requirements for switchboards and all installed components.
 - b. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 - c. Time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type but no fewer than two of each size and type.
2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Fuses and Fusible Devices for Fused Circuit Breakers: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.
4. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.
5. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.

6. Indicating Lights: Equal to 10 percent of quantity installed for each size and type but no less than one of each size and type.

1.7 QUALITY ASSURANCE

- A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by the Chicago Electrical CodeE.
- B. Testing Agency Qualifications: Accredited by NETA.
 1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.
- B. Handle and prepare switchboards for installation according to NEMA PB 2.1.

1.9 FIELD CONDITIONS

- A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.
- B. Environmental Limitations:
 1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - a. Ambient Temperature: Not exceeding 104 deg F.
 - b. Altitude: Not exceeding 6600 feet.

1.10 COORDINATION

- A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.11 WARRANTY

- A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboard enclosures, bus work, overcurrent protective devices, accessories, and factory installed interconnection wiring that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Three years from date of Substantial Completion.
- B. Manufacturer's Warranty: Manufacturer agrees to repair or replace surge protection devices that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 SWITCHBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. ABB, Electrification Products Division.
 - 2. Eaton.
 - 3. Siemens Industry, Inc., Energy Management Division.
 - 4. Square D; Schneider Electric USA.
- B. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
- C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in the Chicago Electrical Code, by a qualified testing agency, and marked for intended location and application.
- D. Comply with NEMAPB 2.
- E. Comply with the Chicago Electrical Code.
- F. Comply with UL 891.
- G. Front-Connected, Front-Accessible Switchboards:
 - 1. Main Devices: Fixed, individually mounted.
 - 2. Branch Devices: Panel mounted.
 - 3. Sections front and rear aligned.
- H. Nominal System Voltage: 480Y/277 V.
- I. Main-Bus Continuous: See Drawings.
- J. Indoor Enclosures: Steel, NEMA 250, Type 1.
- K. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.
- L. Barriers: Between adjacent switchboard sections.

- M. Insulation and isolation for main bus of main section and main and vertical buses of feeder sections.
- N. Service Entrance Rating: Switchboards intended for use as service entrance equipment shall contain from one to six service disconnecting means with overcurrent protection, a neutral bus with disconnecting link, a grounding electrode conductor terminal, and a main bonding jumper.
- O. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.
- P. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
- Q. Buses and Connections: Three phase, four wire unless otherwise indicated.
 - 1. Provide phase bus arrangement A, B, C from front to back, top to bottom, and left to right when viewed from the front of the switchboard.
 - 2. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity.
 - 3. Copper feeder circuit-breaker line connections.
 - 4. Ground Bus: Minimum-size required by UL 891, hard-drawn copper of 98 percent conductivity, equipped with mechanical connectors for feeder and branch-circuit ground conductors.
 - 5. Main-Phase Buses and Equipment-Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
 - 6. Disconnect Links:
 - a. Isolate neutral bus from incoming neutral conductors.
 - b. Bond neutral bus to equipment-ground bus for switchboards utilized as service equipment or separately derived systems.
 - 7. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with compression connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
- R. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.

2.2 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
 - 1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 - 2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
 - 3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:
 - a. Instantaneous trip.
 - b. Long- and short-time pickup levels.
 - c. Long- and short-time adjustments.
 - d. Ground-fault pickup level, time delay, and I^2t response.

4. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mAtrip).
5. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mAtrip).
6. MCCB Features and Accessories:
 - a. Standard frame sizes, trip ratings, and number of poles.
 - b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor material.
 - c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.

2.3 INSTRUMENTATION

- A. Where indicated on Drawings, switchboards shall be equipped with integral multi-point metering (MPM) system for metering of all loads fed from the assembly.
 1. Install MPM in switchboard at the factory.
 2. Pre-wire current sensors and interface modules to MPM.
- B. Pre-wire metering voltages and control power connections.
- C. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
 1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
 - a. Phase Currents, Each Phase: Plus or minus 0.5 percent.
 - b. Phase-to-Phase Voltages, Three Phase: Plus or minus 0.5 percent.
 - c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 0.5 percent.
 - d. Megawatts: Plus or minus 1 percent.
 - e. Megavars: Plus or minus 1 percent.
 - f. Power Factor: Plus or minus 1 percent.
 - g. Frequency: Plus or minus 0.1 percent.
 - h. Accumulated Energy, Megawatt Hours: Plus or minus 1 percent; accumulated values unaffected by power outages up to 72 hours.
 - i. Megawatt Demand: Plus or minus 1 percent; demand interval programmable from five to 60 minutes.
 2. Mounting: Display and control unit flush or semi-flush mounted in instrument compartment door.

2.4 CONTROL POWER

- A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control- power transformer.
- B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.
- C. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.5 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
- B. Mounting Accessories: For anchors, mounting channels, bolts, washers, and other mounting accessories, comply with manufacturer's instructions.

2.6 IDENTIFICATION

- A. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.
 - 1. Lift or move panelboards with spreader bars and manufacturer-supplied lifting straps following manufacturer's instructions.
 - 2. Use rollers, slings, or other manufacturer-approved methods if lifting straps are not furnished.
 - 3. Protect from moisture, dust, dirt, and debris during storage and installation.
 - 4. Install temporary heating during storage per manufacturer's instructions.
- B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
- C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work or that affect the performance of the equipment.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install switchboards and accessories according to NEMA PB 2.1.
- B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
 - 1. Install conduits entering underneath the switchboard, entering under the vertical section where the conductors will terminate. Install with couplings flush with the concrete base. Extend 2 inches above concrete base after switchboard is anchored in place.
 - 2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 - 3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 5. Install anchor bolts to elevations required for proper attachment to switchboards.
 6. Anchor switchboard to building structure at the top of the switchboard if required or recommended by the manufacturer.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, straps and brackets, and temporary blocking of moving parts from switchboard units and components.
- D. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.
- E. Install filler plates in unused spaces of panel-mounted sections.
- F. Install overcurrent protective devices, surge protection devices, and instrumentation.
1. Set field-adjustable switches and circuit-breaker trip ranges.
- G. Comply with NECA 1.

3.3 CONNECTIONS

- A. Bond conduits entering underneath the switchboard to the equipment ground bus with a bonding conductor sized per the Chicago Electrical Code.
- B. Support and secure conductors within the switchboard according to the Chicago Electrical Code.
- C. Extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.

3.4 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections with the assistance of a factory-authorized service representative.

- B. Tests and Inspections:
 - 1. Acceptance Testing:
 - a. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit. Open control and metering circuits within the switchboard and remove neutral connection to surge protection and other electronic devices prior to insulation test. Reconnect after test.
 - b. Test continuity of each circuit.
 - 2. Test ground-fault protection of equipment for service equipment per the Chicago Electrical Code.
 - 3. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
 - 4. Correct malfunctioning units on-site where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- C. Switchboard will be considered defective if it does not pass tests and inspections.
- D. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573.16 "Coordination Studies."

3.7 PROTECTION

- A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer's written instructions, until switchboard is ready to be energized and placed into service.

3.8 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories.

END OF SECTION 26 24 13

SECTION 26 24 16 - PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Distribution panelboards.
2. Lighting and appliance branch-circuit panelboards.
3. Fused coordination panelboards.

B. Related Requirements

1. Section 260573.19 "Arc-Flash Hazard Analysis" for arc-flash analysis and arc-flash label requirements.
2. Section 260913 "Electrical Power Monitoring" for advanced power monitoring requirements.

1.3 DEFINITIONS

- A. ATS: Acceptance testing specification.
- B. GFCI: Ground-fault circuit interrupter.
- C. GFEP: Ground-fault equipment protection.
- D. HID: High-intensity discharge.
- E. MCCB: Molded-case circuit breaker.
- F. SPD: Surge protective device.
- G. VPR: Voltage protection rating.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of panelboard.

1. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.
2. Include dimensions and manufacturers' technical data on features, performance,

electrical characteristics, ratings, and finishes.

- B. Shop Drawings: For each panelboard and related equipment.
 - 1. Include dimensioned plans, elevations, sections, and details.
 - 2. Show tabulations of installed devices with nameplates, conductor termination sizes, equipment features, and ratings.
 - 3. Detail enclosure types including mounting and anchorage, environmental protection, knockouts, corner treatments, covers and doors, gaskets, hinges, and locks.
 - 4. Detail bus configuration, current, and voltage ratings.
 - 5. Short-circuit current rating of panelboards and overcurrent protective devices.
 - 6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
 - 7. Include wiring diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For testing agency.
- B. Panelboard Schedules: For installation in panelboards.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - 1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
 - 2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Keys: Two spares for each type of panelboard cabinet lock.
 - 2. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 3. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

1.8 QUALITY ASSURANCE

- A. Manufacturer Qualifications: ISO 9001 or ISO 9002 certified.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Remove loose packing and flammable materials from inside panelboards; install temporary

electric heating (250 W per panelboard) to prevent condensation.

- B. Handle and prepare panelboards for installation according to NEMA PB 1.

1.10 FIELD CONDITIONS

- A. Environmental Limitations:

1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - a. Ambient Temperature: Not exceeding 23 deg F to plus 104 deg F.
 - b. Altitude: Not exceeding 6600 feet.

1.11 WARRANTY

- A. Manufacturer's Warranty: Manufacturer agrees to repair or replace panelboards that fail in materials or workmanship within specified warranty period.
 1. Panelboard Warranty Period: 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PANELBOARDS AND LOAD CENTERS COMMON REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in the Chicago Electrical Code, by a qualified testing agency, and marked for intended location and application.
- B. Comply with NEMA PB 1.
- C. Comply with the Chicago Electrical Code.
- D. Enclosures: Surface-mounted, dead-front cabinets.
 1. Rated for environmental conditions at installed location.
 - a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
 - b. Outdoor Locations: NEMA 250, Type 3R.
 2. Height: 84 inches maximum.
 3. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box. Trims shall cover all live parts and shall have no exposed hardware.
 4. Finishes:
 - a. Panels and Trim: Steel and galvanized steel, factory finished immediately after

- cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
- b. Back Boxes: Galvanized steel.
- E. Incoming Mains:
- 1. Location: Top.
 - 2. Main Breaker: Main lug interiors up to 400 amperes shall be field convertible to main breaker.
- F. Phase, Neutral, and Ground Buses:
- 1. Material: Tin-plated aluminum.
 - a. Plating shall run entire length of bus.
 - b. Bus shall be fully rated the entire length.
 - 2. Interiors shall be factory assembled into a unit. Replacing switching and protective devices shall not disturb adjacent units or require removing the main bus connectors.
 - 3. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
 - 4. Full-Sized Neutral: Equipped with full-capacity bonding strap for service entrance applications. Mount electrically isolated from enclosure. Do not mount neutral bus in gutter.
- G. Conductor Connectors: Suitable for use with conductor material and sizes.
- 1. Terminations shall allow use of 75 deg C rated conductors without derating.
 - 2. Size: Lugs suitable for indicated conductor sizes, with additional gutter space, if required, for larger conductors.
 - 3. Main and Neutral Lugs: Mechanical type, with a lug on the neutral bar for each pole in the panelboard.
 - 4. Ground Lugs and Bus-Configured Terminators: Mechanical type, with a lug on the bar for each pole in the panelboard.
 - 5. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
 - 6. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
- H. NRTL Label: Panelboards or load centers shall be labeled by an NRTL acceptable to authority having jurisdiction for use as service equipment with one or more main service disconnecting and overcurrent protective devices. Panelboards or load centers shall have meter enclosures, wiring, connections, and other provisions for utility metering. Coordinate with utility company for exact requirements.
- I. Future Devices: Panelboards or load centers shall have mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
- 1. Percentage of Future Space Capacity: 10 percent.
- J. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Assembly listed by an NRTL for 100 percent interrupting capacity.
- 1. Panelboards and overcurrent protective devices rated 240 V or less shall have short-circuit ratings as shown on Drawings, but not less than 10,000 A rms symmetrical.

2. Panelboards and overcurrent protective devices rated above 240 V and less than 600 V shall have short-circuit ratings as shown on Drawings, but not less than 14,000 A rms symmetrical.
- K. Where indicated on Drawings, panelboards shall be equipped with integral multi-point metering (MPM) system for metering of all loads fed from the assembly.
1. Install MPM in panelboard at the factory.
 2. Pre-wire current sensors and interface modules to MPM.
 3. Pre-wire metering voltages and control power connections.

2.2 POWER PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB, Electrification Products Division.
 2. Eaton.
 3. Mersen USA.
 4. Siemens Industry, Inc., Energy Management Division.
 5. Square D; Schneider Electric USA.
- B. Panelboards: NEMA PB 1, distribution type.
- C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
1. For doors more than 36 inches high, provide two latches, keyed alike.
- D. Mains: Circuit breaker, Fused switch, Lugs only. See Drawings for type of Main.
- E. Branch Overcurrent Protective Devices: Bolt-on circuit breakers or Plug-in circuit breakers where individual positive-locking device requires mechanical release for removal.
- F. Branch Overcurrent Protective Devices for emergency systems: Fused switches.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB, Electrification Products Division.
 2. Eaton.
 3. Mersen USA.
 4. Siemens Industry, Inc., Energy Management Division.
 5. Square D; Schneider Electric USA.
- B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.
- C. Mains: Circuit breaker and Lugs only. See Drawings for type of Main.
- D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers or Plug-in circuit breakers where individual positive-locking device requires mechanical release for removal.
- E. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

- F. Doors: Door-in-door construction with concealed hinges; secured with multipoint latch with tumbler lock; keyed alike. Outer door shall permit full access to the panel interior. Inner door shall permit access to breaker operating handles and labeling, but current carrying terminals and bus shall remain concealed.

2.4 FUSED COORDINATION PANELBOARDS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. Eaton.
 - 2. Mersen USA.
- B. Ratings
 - 1. Panelboards shall be fully rated for use in systems up to 600VAC with available short circuit current of 200kA RMS symmetrical.
 - 2. Panelboards shall be labeled with a UL short-circuit rating.
- C. Branch Overcurrent Protective Devices: Bolt-on combination circuit breaker/fuse holder, interlocked to prevent fuse from being removed while energized. Suitable for use with Class J and Class CC fuses.

2.5 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

- A. MCCB: Comply with UL 489, with interrupting capacity to meet available fault currents.
 - 1. Thermal-Magnetic Circuit Breakers:
 - a. Inverse time-current element for low-level overloads.
 - b. Instantaneous magnetic trip element for short circuits.
 - c. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
 - 2. Electronic Trip Circuit Breakers:
 - a. RMS sensing.
 - b. Field-replaceable rating plug or electronic trip.
 - c. Digital display of settings, trip targets, and indicated metering displays.
 - d. Multi-button keypad to access programmable functions and monitored data.
 - e. Ten-event, trip-history log. Each trip event shall be recorded with type, phase, and magnitude of fault that caused the trip.
 - f. Integral test jack for connection to portable test set or laptop computer.
 - g. Field-Adjustable Settings:
 - 1) Instantaneous trip.
 - 2) Long- and short-time pickup levels.
 - 3) Long- and short-time adjustments.
 - 4) Ground-fault pickup level, time delay, and I squared T response.
 - 3. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mA trip).
 - 4. GFEP Circuit Breakers: Class B ground-fault protection (30-mA trip).
 - 5. MCCB Features and Accessories:

- a. Standard frame sizes, trip ratings, and number of poles.
- b. Breaker handle indicates tripped status.
- c. UL listed for reverse connection without restrictive line or load ratings.
- d. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.
- e. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and HID lighting circuits.
- f. Rating Plugs: Three-pole breakers with ampere ratings greater than 150 amperes shall have interchangeable rating plugs or electronic adjustable trip units.
- g. Multipole units enclosed in a single housing with a single handle or factory assembled to operate as a single unit.
- h. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle in on or off position.
- i. Handle Clamp: Loose attachment, for holding circuit-breaker handle in on position.

2.6 IDENTIFICATION

- A. Panelboard Label: Manufacturer's name and trademark, voltage, amperage, number of phases, and number of poles shall be located on the interior of the panelboard door.
- B. Breaker Labels: Faceplate shall list current rating, UL and IEC certification standards, and AIC rating.
- C. Circuit Directory: Computer-generated circuit directory mounted inside panelboard door with transparent plastic protective cover.
 1. Circuit directory shall identify specific purpose with detail sufficient to distinguish it from all other circuits.

2.7 ACCESSORY COMPONENTS AND FEATURES

- A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equipment fits in allocated space in, and comply with, minimum required clearances specified in the Chicago Electrical Code.
- B. Receive, inspect, handle, and store panelboards according to NEMA PB 1.1.
- C. Examine panelboards before installation. Reject panelboards that are damaged, rusted, or have been subjected to water saturation.
- D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Comply with NECA 1.
- C. Install panelboards and accessories according to NEMA PB 1.1.
- D. Equipment Mounting:
 - 1. Attach panelboard to the vertical finished or structural surface behind the panelboard.
- E. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.
- F. Mount panelboard cabinet plumb and rigid without distortion of box.
- G. Mount surface-mounted panelboards to steel slotted supports 5/8 inch in depth. Orient steel slotted supports vertically.
- H. Install overcurrent protective devices and controllers not already factory installed.
 - 1. Set field-adjustable, circuit-breaker trip ranges.
 - 2. Tighten bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer's written instructions.
- I. Make grounding connections and bond neutral for services and separately derived systems to ground. Make connections to grounding electrodes, separate grounds for isolated ground bars, and connections to separate ground bars.
- J. Install filler plates in unused spaces.

3.3 IDENTIFICATION

- A. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with requirements in Section 260553 "Identification for Electrical Systems."
- B. Create a directory to indicate installed circuit loads; incorporate Owner's final room designations. Obtain approval before installing. Handwritten directories are not acceptable. Install directory inside panelboard door.
- C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
- D. Device Nameplates: Label each branch circuit device in power panelboards with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections.
 - 1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
- C. Acceptance Testing Preparation:
 - 1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
 - 2. Test continuity of each circuit.
- D. Tests and Inspections:
 - 1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers stated in NETA ATS, Paragraph 7.6 Circuit Breakers. Do not perform optional tests. Certify compliance with test parameters.
 - 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
- E. Panelboards will be considered defective if they do not pass tests and inspections.
- F. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573.16 "Coordination Studies."
- C. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes. Prior to making circuit changes to achieve load balancing, inform Architect of effect on phase color coding.
 - 1. Measure loads during period of normal facility operations.
 - 2. Perform circuit changes to achieve load balancing outside normal facility operation schedule or at times directed by the Architect. Avoid disrupting services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
 - 3. After changing circuits to achieve load balancing, recheck loads during normal facility operations. Record load readings before and after changing circuits to achieve load balancing.
 - 4. Tolerance: Maximum difference between phase loads, within a panelboard, shall not

exceed 20 percent.

END OF SECTION 26 24 16

SECTION 26 27 13 - ELECTRICITY METERING**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes work to accommodate utility company revenue meters, and Owner's electricity meters used to manage the electrical power system.

1.3 ACTION SUBMITTALS

- A. Product Data:
 - 1. For metering infrastructure components.

1.4 QUALITY ASSURANCE

- A. Testing Agency Qualifications: An NRTL.

1.5 COORDINATION

- A. Electrical Service Connections:
 - 1. Coordinate with utility companies and utility-furnished components.
 - a. Comply with requirements of utility providing electrical power services.
 - b. Coordinate installation and connection of utilities and services, including provision for electricity-metering components.

PART 2 - PRODUCTS**2.1 SYSTEM DESCRIPTION**

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- B. Comply with UL 916.

2.2 UTILITY METERING INFRASTRUCTURE

- A. Install metering accessories furnished by the utility company, complying with its requirements.
- B. Current-Transformer Cabinets: Comply with requirements of electrical-power utility company.
- C. Meter Sockets:
 - 1. Comply with requirements of electrical-power utility company.
 - 2. Meter Sockets: Steady-state and short-circuit current ratings shall meet indicated circuit ratings.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with equipment installation requirements in NECA 1.
- B. Install meters furnished by utility company. Install raceways and equipment according to utility company's written instructions. Provide empty conduits for metering leads and extend grounding connections as required by utility company.
- C. Wiring Method:
 - 1. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
 - 2. Minimum conduit size shall be 3/4 inch.

END OF SECTION 26 27 13

SECTION 26 27 26 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Standard-grade receptacles, 125 V, 20 A.
 - 2. GFCI receptacles, 125 V, 20 A.
 - 3. Twist-locking receptacles.
 - 4. Cord and plug sets.
 - 5. Toggle switches, 120/277 V, 20 A.
 - 6. Wall plates.

1.3 DEFINITIONS

- A. AFCI: Arc-fault circuit interrupter.
- B. BAS: Building automation system.
- C. EMI: Electromagnetic interference.
- D. GFCI: Ground-fault circuit interrupter.
- E. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
- F. RFI: Radio-frequency interference.
- G. SPD: Surge protective device.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing-label warnings and instruction manuals that include labeling conditions.

PART 2 - PRODUCTS

2.1 GENERAL WIRING-DEVICE REQUIREMENTS

- A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in the Chicago Electrical Code, by a qualified testing agency, and marked for intended location and use.
- B. Comply with the Chicago Electrical Code.
- C. RoHS compliant.
- D. Comply with NEMA WD 1.
- E. Devices for Owner-Furnished Equipment:
 - 1. Receptacles: Match plug configurations.
 - 2. Cord and Plug Sets: Match equipment requirements.
- F. Device Color:
 - 1. Wiring Devices Connected to Normal Power System: Ivory unless otherwise indicated or required by the Chicago Electrical Code or device listing.
 - 2. Wiring Devices Connected to Emergency Electrical System: Red.
- G. Wall Plate Color: For plastic covers, match device color.
- H. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 STANDARD-GRADE RECEPTACLES, 125 V, 20 A

- A. Duplex Receptacles, 125 V, 20 A:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Arrow Hart, Wiring Devices; Eaton, Electrical Sector.
 - b. Leviton Manufacturing Co., Inc.
 - c. Pass & Seymour; Legrand North America, LLC.
 - d. Wiring Device-Kellems; Hubbell Incorporated, Commercial and Industrial.
 - 2. Description: Two pole, three wire, and self-grounding.
 - 3. Configuration: NEMA WD 6, Configuration 5-20R.
 - 4. Standards: Comply with UL 498 and FS W-C-596.
- B. Tamper-Resistant Duplex Receptacles, 125 V, 20 A:

1. Description: Two pole, three wire, and self-grounding. Integral shutters that operate only when a plug is inserted in the receptacle.
 2. Configuration: NEMA WD 6, Configuration 5-20R.
 3. Standards: Comply with UL 498 and FS W-C-596.
 4. Marking: Listed and labeled as complying with the Chicago Electrical Code, "Tamper-Resistant Receptacles" Article.
- C. Weather-Resistant Duplex Receptacle, 125 V, 20 A:
1. Description: Two pole, three wire, and self-grounding. Integral shutters that operate only when a plug is inserted in the receptacle. Square face.
 2. Configuration: NEMA WD 6, Configuration 5-20R.
 3. Standards: Comply with UL 498.
 4. Marking: Listed and labeled as complying with the Chicago Electrical Code, "Receptacles in Damp or Wet Locations" Article.
- 2.3 GFCI RECEPTACLES, 125 V, 20 A
- A. Duplex GFCI Receptacles, 125 V, 20 A:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Arrow Hart, Wiring Devices; Eaton, Electrical Sector.
 - b. Leviton Manufacturing Co., Inc.
 - c. Pass & Seymour; Legrand North America, LLC.
 - d. Wiring Device-Kellems; Hubbell Incorporated, Commercial and Industrial.
 2. Description: Integral GFCI with "Test" and "Reset" buttons and LED indicator light. Two pole, three wire, and self-grounding.
 3. Configuration: NEMA WD 6, Configuration 5-20R.
 4. Type: Feed through.
 5. Standards: Comply with UL 498, UL 943 Class A, and FS W-C-596.
- 2.4 TWIST-LOCKING RECEPTACLES
- A. Twist-Lock, Single Receptacles, 125 V, 20 A:
1. Configuration: NEMA WD 6, Configuration L5-20R.
 2. Standards: Comply with UL 498.
- B. Twist-Lock, Single Receptacles, 250 V, 20 A:
1. Configuration: NEMA WD 6, Configuration L6-20R.
 2. Standards: Comply with UL 498.
- C. Twist-Lock, Single Receptacles, 208/120 V, 3 Phase, 20A
1. Configuration: NEMA WD 6, Configuration L21-20R.
 2. Standards: Comply with UL 498.
- 2.5 CORD AND PLUG SETS

- A. Match voltage and current ratings and number of conductors to requirements of equipment being connected.
- B. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.
- C. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.6 TOGGLE SWITCHES, 120/277 V, 20 A

- A. Single-Pole Switches, 120/277 V, 20 A:
 - 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. Arrow Hart, Wiring Devices; Eaton, Electrical Sector.
 - b. Leviton Manufacturing Co., Inc.
 - c. Pass & Seymour; Legrand North America, LLC.
 - d. Wiring Device-Kellems; Hubbell Incorporated, Commercial and Industrial.
 - 2. Standards: Comply with UL 20 and FS W-S-896.
- B. Two-Pole Switches, 120/277 V, 20A:
 - 1. Comply with UL 20 and FS W-S-896.
- C. Three-Way Switches, 120/277 V, 20 A:
 - 1. Comply with UL 20 and FS W-S-896.
- D. Four-Way Switches, 120/277 V, 20 A:
 - 1. Standards: Comply with UL 20 and FS W-S-896.

2.7 WALL PLATES

- A. Single Source: Obtain wall plates from same manufacturer of wiring devices.
- B. Single and combination types shall match corresponding wiring devices.
 - 1. Plate-Securing Screws: Metal with head color to match plate finish.
 - 2. Material for Finished Spaces: Smooth, high-impact thermoplastic.
 - 3. Material for Unfinished Spaces: Galvanized steel.
 - 4. Material for Damp Locations: Thermoplastic with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.
- C. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant thermoplastic with lockable cover.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.
- B. Coordination with Other Trades:
 - 1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes, and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
 - 2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
 - 3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
 - 4. Install wiring devices after all wall preparation, including painting, is complete.
- C. Conductors:
 - 1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
 - 2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
 - 3. The length of free conductors at outlets for devices shall comply with the Chicago Electrical Code, Article 300, without pigtails.
 - 4. Existing Conductors:
 - a. Cut back and pigtail or replace all damaged conductors.
 - b. Straighten conductors that remain and remove corrosion and foreign matter.
 - c. Pigtailing existing conductors is permitted, provided the outlet box is large enough.
- D. Device Installation:
 - 1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
 - 2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
 - 3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
 - 4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
 - 5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
 - 6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
 - 7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
 - 8. Tighten unused terminal screws on the device.
 - 9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.
- E. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.
- F. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.
- G. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and

furnishings.

3.2 GFCI RECEPTACLES

- A. Install non-feed-through GFCI receptacles where protection of downstream receptacles is not required.

3.3 IDENTIFICATION

- A. Comply with Section 260553 "Identification for Electrical Systems."
- B. Identify each receptacle with panelboard identification and circuit number. Use hot, stamped, or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.
- C. Essential Electrical System: Mark receptacles supplied from the essential electrical system to allow easy identification using a self-adhesive label.

3.4 FIELD QUALITY CONTROL

- A. Tests for Receptacles:
 - 1. Line Voltage: Acceptable range is 105 to 132 V.
 - 2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
 - 3. Ground Impedance: Values of up to 2 ohms are acceptable.
 - 4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
 - 5. Using the test plug, verify that the device and its outlet box are securely mounted.
 - 6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault-current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.
- B. Wiring device will be considered defective if it does not pass tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 26 27 26

SECTION 26 28 13 - FUSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. Cartridge fuses rated 600 V ac and less for use in the following:
 - a. Control circuits.
 - b. Panelboards.
 - c. Switchboards.
 - d. Enclosed controllers.
 - e. Enclosed switches.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles. Include the following for each fuse type indicated:
 1. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.
 2. Current-limitation curves for fuses with current-limiting characteristics.
 3. Coordination charts and tables and related data.

1.4 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the

following:

1. Bussmann; Eaton, Electrical Sector.
 2. Littelfuse, Inc.
 3. Mersen USA.
- B. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

2.2 CARTRIDGE FUSES

- A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
1. Type RK-1: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
 2. Type RK-5: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
 3. Type CC: 600-V, zero- to 30-A rating, 200 kAIC, time delay.
 4. Type J: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
- C. Comply with NEMA FU 1 for cartridge fuses.
- D. Comply with NFPA 70.
- E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.
- B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.
- C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.
- D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FUSE APPLICATIONS

- A. Cartridge Fuses:

1. Feeders: Class RK1, time delay.
2. Motor Branch Circuits: Class RK1, time delay.
3. Power Electronics Circuits: Class J, highspeed.
4. Other Branch Circuits: Class J, time delay.
5. Control Transformer Circuits: Class CC, time delay, control transformer duty.

3.3 INSTALLATION

- A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

3.4 IDENTIFICATION

- A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION 26 28 13

SECTION 26 28 16 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Fusible switches.
 - 2. Non-fusible switches.
 - 3. Shunt trip switches.
 - 4. Molded-case circuit breakers (MCCBs).
 - 5. Enclosures.

1.3 DEFINITIONS

- A. NC: Normally closed.
- B. NO: Normally open.
- C. SPDT: Single pole, doublethrow.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include nameplate ratings, dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
 - 1. Enclosure types and details for types other than NEMA 250, Type 1.
 - 2. Current and voltage ratings.
 - 3. Short-circuit current ratings (interrupting and withstand, as appropriate).
 - 4. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
- B. Shop Drawings: For enclosed switches and circuit breakers.
 - 1. Include plans, elevations, sections, details, and attachments to other work.
 - 2. Include wiring diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For qualified testing agency.

- B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals.
 - 1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - a. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
 - 2. Fuse Pullers: Two for each size and type.

1.8 FIELD CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 - 1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
 - 2. Altitude: Not exceeding 6600 feet.

1.9 WARRANTY

- A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components that fail in materials or workmanship within specified warranty period.
 - 1. Warranty Period: One year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

- A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.
- B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

- C. Comply with NFPA 70.

2.2 FUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB, Electrification Products Division.
2. Eaton.
3. Siemens Industry, Inc., Energy Management Division.
4. Square D; Schneider Electric USA.

- B. Type HD, Heavy Duty:

1. Single throw.
2. Three pole.
3. 600-V ac.
4. 1200 A and smaller.
5. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses.
6. Lockable handle with capability to accept three padlocks and interlocked with cover in closed position.

- C. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
4. Hookstick Handle: Allows use of a hookstick to operate the handle.
5. Lugs: Mechanical type, suitable for number, size, and conductor material.
6. Service-Rated Switches: Labeled for use as service equipment.

2.3 NONFUSIBLE SWITCHES

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB, Electrification Products Division.
2. Eaton.
3. Siemens Industry, Inc., Energy Management Division.
4. Square D; Schneider Electric USA.

- B. Type HD, Heavy Duty, Three Pole, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

- C. Type HD, Heavy Duty, Three Pole, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:

1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Hookstick Handle: Allows use of a hookstick to operate the handle.
4. Lugs: Mechanical type, suitable for number, size, and conductor material.
5. Service-Rated Switches: Labeled for use as service equipment.

2.4 SHUNT TRIP SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Bussmann; Eaton, Electrical Sector.
2. Littelfuse, Inc.
3. Mersen USA.

B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with Class J fuse block and 200-kA interrupting and short-circuit current rating.

C. Type HD, Heavy-Duty, Three Pole, Single-Throw Fusible Switch: 600-V ac, 100 A; UL 98 and NEMA KS 1; integral shunt trip mechanism; horsepower rated, with clips or bolt pads to accommodate specified fuses; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, with a control power of enough capacity to operate shunt trip, pilot, indicating and control devices.

E. Accessories:

1. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.
2. Form C alarm contacts that change state when switch is tripped.
3. Three-pole, double-throw, fire-safety and alarm relay; 24-V dc coil voltage.
4. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.
5. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
6. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
7. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.5 MOLDED-CASE CIRCUITBREAKERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB, Electrification Products Division.
2. Eaton.
3. Siemens Industry, Inc., Energy Management Division.
4. Square D; Schneider Electric USA.

- B. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.
- C. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit -breaker tripping mechanism for maintenance and testing purposes.
- D. The maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings shall be clearly marked on face of circuit breaker. Circuit breakers shall be 100percent rated.
- E. MCCBs shall be equipped with a device for locking in the isolated position.
- F. Lugs shall be suitable for 194 deg F rated wire, sized according to the 167 deg F temperature rating in the Chicago Electrical Code.
- G. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.
- H. Thermal-Magnetic Circuit Breakers: Inverse time-current thermal element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
- I. Adjustable, Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
- J. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
 - 1. Instantaneous trip.
 - 2. Long- and short-time pickup levels.
 - 3. Long- and short-time time adjustments.
 - 4. Ground-fault pickup level, time delay, and I-squared t response.
- K. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller and let-through ratings less than NEMA FU 1, RK-5.
- L. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.
- M. Ground-Fault Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mAtrip).
- N. Ground-Fault Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mAtrip).
- O. Features and Accessories:
 - 1. Standard frame sizes, trip ratings, and number of poles.
 - 2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.

3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
5. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
6. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
7. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
8. Alarm Switch: One NC contact that operates only when circuit breaker has tripped.
9. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
10. Accessory Control Power Voltage: Integrally mounted, self-powered.

2.6 ENCLOSURES

- A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
- B. Enclosure Finish: The enclosure shall be finished with gray baked enamel paint, electrodeposited on cleaned, phosphatized steel (NEMA 250 Type 1) gray baked enamel paint, electrodeposited on cleaned, phosphatized galvanized steel (NEMA 250 Types 3R, 12), or a brush finish on Type 304 stainless steel (NEMA 250 Type 4-4X stainless steel).
- C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts. NEMA 250 Types 7 and 9 enclosures shall be provided with threaded conduit openings in both endwalls.
- D. Operating Mechanism: The circuit-breaker operating handle shall be directly operable through the front cover of the enclosure (NEMA 250 Type 1). The cover interlock mechanism shall have an externally operated override. The override shall not permanently disable the interlock mechanism, which shall return to the locked position once the override is released. The tool used to override the cover interlock mechanism shall not be required to enter the enclosure in order to override the interlock.
- E. Enclosures designated as NEMA 250 Type 4, 4X stainless steel, 12, or 12K shall have a dual cover interlock mechanism to prevent unintentional opening of the enclosure cover when the circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is open.
- F. NEMA 250 Type 7/9 enclosures shall be furnished with a breather and drain kit to allow their use in outdoor and wet location applications.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine elements and surf aces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

- B. Proceed with installation only after unsatisfactory conditions have been corrected.
 - 1. Commencement of work shall indicate Installer's acceptance of the areas and conditions as satisfactory.

3.2 PREPARATION

3.3 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS

- A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the following environmental ratings.
 - 1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
 - 2. Outdoor Locations: NEMA 250, Type 3R.
 - 3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.

3.4 INSTALLATION

- A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
- C. Comply with mounting and anchoring requirements specified in Section 260548.16 "Seismic Controls for Electrical Systems."
- D. Temporary Lifting Provisions: Remove temporary lifting of eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- E. Install fuses in fusible devices.
- F. Comply with NFPA 70 and NECA 1.

3.5 IDENTIFICATION

- A. Comply with requirements in Section 260553 "Identification for Electrical Systems."
 - 1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 - 2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.6 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections for Switches:

1. Visual and Mechanical Inspection:

- a. Inspect physical and mechanical condition.
- b. Inspect anchorage, alignment, grounding, and clearances.
- c. Verify that the unit is clean.
- d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.
- e. Verify that fuse sizes and types match the Specifications and Drawings.
- f. Verify that each fuse has adequate mechanical support and contact integrity.
- g. Inspect bolted electrical connections for high resistance using one of the two following methods:
 - 1) Use a low-resistance ohmmeter.
 - a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - 2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.
 - a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.
- h. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on the Drawings.
- i. Verify correct phase barrier installation.
- j. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

D. Tests and Inspections for Molded Case Circuit Breakers:

1. Visual and Mechanical Inspection:

- a. Verify that equipment nameplate data are as described in the Specifications and shown on the Drawings.
- b. Inspect physical and mechanical condition.
- c. Inspect anchorage, alignment, grounding, and clearances.
- d. Verify that the unit is clean.
- e. Operate the circuit breaker to ensure smooth operation.
- f. Inspect bolted electrical connections for high resistance using one of the two following methods:
 - 1) Use a low-resistance ohmmeter.
 - a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
 - 2) Verify tightness of accessible bolted electrical connections by calibrated

torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

- a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.
 - g. Inspect operating mechanism, contacts, and chutes in unsealed units.
 - h. Perform adjustments for final protective device settings in accordance with the coordination study.
- 2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 - 3. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- E. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.
 - F. Prepare test and inspection reports.
 - 1. Test procedures used.
 - 2. Include identification of each enclosed switch and circuit breaker tested and describe test results.
 - 3. List deficiencies detected, remedial action taken, and observations after remedial action.

3.7 ADJUSTING

- A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.
- B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573.16 "Coordination Studies."

END OF SECTION 26 28 16

SECTION 26 29 13.03 - MANUAL AND MAGNETIC MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. Manual motor controllers.
2. Enclosed full-voltage magnetic motor controllers.
3. Combination full-voltage magnetic motor controllers.
4. Enclosures.
5. Accessories.
6. Identification.

1.3 DEFINITIONS

- A. CPT: Control power transformer.
- B. MCCB: Molded-case circuitbreaker.
- C. MCP: Motor circuit protector.
- D. NC: Normally closed.
- E. OCPD: Overcurrent protective device.
- F. SCCR: Short-circuit current rating.
- G. SCPD: Short-circuit protective device.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
- B. Shop Drawings: For each type of magnetic controller.

1. Include plans, elevations, sections, and mounting details.
2. Indicate dimensions, weights, required clearances, and location and size of each field connection.
3. Wire Termination Diagrams and Schedules: Include diagrams for signal, and control wiring. Identify terminals and wiring designations and color-codes to facilitate installation, operation, and maintenance. Indicate recommended types, wire sizes, and circuiting arrangements for field-installed wiring, and show circuit protection features. Differentiate between manufacturer-installed and field-installed wiring.
4. Include features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.

C. Product Schedule: List the following for each enclosed controller:

1. Each installed magnetic controller type.
2. NRTL listing.
3. Factory-installed accessories.
4. Nameplate legends.
5. SCCR of integrated unit.
6. For each combination magnetic controller include features, characteristics, ratings, and factory setting of the SCPD and OCPD.

1.5 INFORMATIONAL SUBMITTALS

- A. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For magnetic controllers to include in operation and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
 - a. Routine maintenance requirements for magnetic controllers and installed components.
 - b. Manufacturer's written instructions for testing and adjusting circuit breaker and MCP trip settings.
 - c. Manufacturer's written instructions for setting field-adjustable overload relays.
 - d. Load-Current and Overload-Relay Heater List: Compile after motors have been installed and arrange to demonstrate that selection of heaters suits actual motor nameplate full-load currents.
 - e. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed and arrange to demonstrate that switch settings for motor-running overload protection suit actual motors to be protected.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Indicating Lights: Two of each type and color installed.

2. Auxiliary Contacts: Furnish one spare(s) for each size and type of magnetic controller installed.
3. Power Contacts: Furnish three spares for each size and type of magnetic contactor installed.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Store controllers indoors in clean, dry space with uniform temperature to prevent condensation. Protect controllers from exposure to dirt, fumes, water, corrosive substances, and physical damage.

1.9 FIELD CONDITIONS

- A. Ambient Environment Ratings: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 1. Ambient Temperature: Not less than 23 deg F and not exceeding 104 deg F.
 2. Altitude: Not exceeding 6600 feet for electromagnetic and manual devices.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in the Chicago Electrical Code, by a qualified testing agency, and marked for intended location and use.
- B. UL Compliance: Fabricate and label magnetic motor controllers to comply with UL 508 and UL 60947-4-1.
- C. NEMA Compliance: Fabricate motor controllers to comply with ICS 2.

2.2 MANUAL MOTOR CONTROLLERS

- A. Fractional Horsepower Manual Controllers (FHPMC): "Quick -make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
 1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. ABB, Electrification Products Division.
 - b. Eaton.
 - c. Siemens Industry, Inc., Energy Management Division.
 - d. Square D; Schneider Electric USA.
 2. Configuration: Non-reversing.
 3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button; bimetallic type.

4. Pilot Light: Red.
- B. Integral Horsepower Manual Controllers (IHPMC): "Quick-make, quick-break" toggle or push-button action; marked to show whether unit is off, on, or tripped.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - a. ABB, Electrification Products Division.
 - b. Eaton.
 - c. Siemens Industry, Inc., Energy Management Division.
 - d. Square D; Schneider Electric USA.
 2. Configuration: Non-reversing.
 3. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor; external reset push button; bimetallic type.

2.3 ENCLOSED FULL-VOLTAGE MAGNETIC MOTOR CONTROLLERS

- A. Description: Across-the-line start, electrically held, for nominal system voltage of 600-V ac and less.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB, Electrification Products Division.
 2. Eaton.
 3. Siemens Industry, Inc., Energy Management Division.
 4. Square D; Schneider Electric USA.
- C. Standard: Comply with NEMA ICS 2, general purpose, Class A.
- D. Configuration: Non-reversing.
- E. Contactor Coils: Pressure-encapsulated type.
1. Operating Voltage: Manufacturer's standard, unless indicated.
- F. Control Power:
1. For on-board control power, obtain from line circuit or from integral CPT. The CPT shall have capacity to operate integral devices and remotely located pilot, indicating, and control devices.
- G. Overload Relays:
1. Thermal Overload Relays:
 - a. Inverse-time-current characteristic.
 - b. Class 20 tripping characteristic.
 - c. Heaters in each phase shall be matched to nameplate full-load current of actual

protected motor and with appropriate adjustment for duty cycle.

2. Solid-State Overload Relay:
 - a. Switch or dial selectable for motor-running overload protection.
 - b. Sensors in each phase.
 - c. Class 20 tripping characteristic selected to protect motor against voltage and current unbalance and singlephasing.

2.4 COMBINATION FULL-VOLTAGE MAGNETIC MOTOR CONTROLLER

- A. Description: Factory-assembled, combination full-voltage magnetic motor controller consisting of the controller described in this article, indicated disconnecting means, SCPD and OCPD, in a single enclosure.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. ABB, Electrification Products Division.
 2. Eaton.
 3. Siemens Industry, Inc., Energy Management Division.
 4. Square D; Schneider Electric USA.
- C. Standard: Comply with NEMA ICS 2, general purpose, Class A.
- D. Configuration: Non-reversing.
- E. Contactor Coils: Pressure-encapsulated type.
 1. Operating Voltage: Manufacturer's standard, unless indicated.
- F. Control Power:
 1. For on-board control power, obtain from line circuit or from integral CPT. The CPT shall have capacity to operate integral devices and remotely located pilot, indicating, and control devices.
- G. Overload Relays:
 1. Thermal Overload Relays:
 - a. Inverse-time-current characteristic.
 - b. Class 20 tripping characteristic.
 - c. Heaters in each phase shall be matched to nameplate full-load current of actual protected motor and with appropriate adjustment for duty cycle.
 2. Solid-State Overload Relay:
 - a. Switch or dial selectable for motor-running overload protection.
 - b. Sensors in each phase.
 - c. Class 20 tripping characteristic selected to protect motor against voltage and current unbalance and singlephasing.

H. Fusible Disconnecting Means:

1. NEMA KS 1, heavy-duty, horsepower-rated, fusible switch with clips or bolt pads to accommodate indicated fuses.
2. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

I. Non-fusible Disconnecting Means:

1. NEMA KS 1, heavy-duty, horsepower-rated, non-fusible switch.
2. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

J. MCP Disconnecting Means:

1. UL 489 and NEMA AB 3, with interrupting capacity to comply with available fault currents, instantaneous-only circuit breaker with front-mounted, field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.
2. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

K. MCCB Disconnecting Means:

1. UL 489 and NEMA AB 3, with interrupting capacity to comply with available fault currents; thermal-magnetic MCCB, with inverse-time-current element for low-level overloads and instantaneous magnetic trip element for short circuits.
2. Front-mounted, adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
3. Lockable Handle: Accepts three padlocks and interlocks with cover in closed position.

2.5 ENCLOSURES

- A. Comply with NEMA 250, type designations as indicated on Drawings, complying with environmental conditions at installed location.
- B. The construction of the enclosures shall comply with NEMA ICS 6.
- C. Controllers in hazardous (classified) locations shall comply with UL 1203.

2.6 ACCESSORIES

- A. General Requirements for Control Circuit and Pilot Devices: NEMA ICS 5; factory installed in controller enclosure cover unless otherwise indicated.
 1. Push Buttons, Pilot Lights, and Selector Switches: Standard-duty, except as needed to match enclosure type. Heavy-duty or oil-tight where indicated in the controller schedule.
 - a. Selector Switches: Hand-Auto-Off
 - b. Pilot Lights: Run and Stop.
- B. Motor protection relays shall be with solid-state sensing circuit and isolated output contacts for hardwired connections.
 1. Phase-failure.

2. Phase-reversal, with bicolor LED to indicate normal and fault conditions. Automatic reset when phase reversal is corrected.
3. Under/overvoltage, operate when the circuit voltage reaches a preset value, and drop out when the operating voltage drops to a level below the preset value. Include adjustable time-delay setting.

2.7 IDENTIFICATION

- A. Controller Nameplates: Laminated acrylic or melamine plastic signs, as described in Section 260553 "Identification for Electrical Systems," for each compartment, mounted with corrosion-resistant screws.
- B. Arc-Flash Warning Labels:
 1. Comply with requirements in Section 260573.19 "Arc-Flash Hazard Analysis." Produce a 3.5-by-5-inch self-adhesive equipment label for each work location included in the analysis.
 2. Comply with requirements in Section 260553 "Identification for Electrical Systems." Produce a 3.5-by-5-inch self-adhesive equipment label for each work location included in the analysis. Labels shall be machine printed, with no field-applied markings.
 - a. The label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:
 - 1) Location designation.
 - 2) Nominal voltage.
 - 3) Flash protection boundary.
 - 4) Hazard risk category.
 - 5) Incident energy.
 - 6) Working distance.
 - 7) Engineering report number, revision number, and issue date.
 - b. Labels shall be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine areas and space conditions for compliance with requirements for motor controllers, their relationship with the motors, and other conditions affecting performance of the Work.

3.2 INSTALLATION

- A. Comply with NECA 1.
- B. Wall-Mounted Controllers: Install magnetic controllers on walls with tops at uniform height indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall. For controllers not at walls, provide freestanding racks complying with Section 260529 "Hangers and Supports for Electrical Systems" unless otherwise indicated.

- C. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and the Chicago Electrical Code.
- D. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
- E. Setting of Overload Relays: Select and set overloads on the basis of full-load current rating as shown on motor nameplate. Adjust setting value for special motors as required by the Chicago Electrical Code for motors that are high-torque, high-efficiency, and so on.

3.3 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- B. Perform tests and inspections with the assistance of a factory-authorized service representative.
- C. Tests and Inspections:
 - 1. Comply with the provisions of NFPA 70B, "Testing and Test Methods" Chapter.
 - 2. Visual and Mechanical Inspection:
 - a. Compare equipment nameplate data with drawings and specifications.
 - b. Inspect physical and mechanical condition.
 - c. Inspect anchorage, alignment, and grounding.
 - d. Verify the unit is clean.
 - e. Inspect contactors:
 - 1) Verify mechanical operation.
 - 2) Verify contact gap, wipe, alignment, and pressure are according to manufacturer's published data.
 - f. Motor-Running Protection:
 - 1) Verify overload element rating is correct for its application.
 - 2) If motor-running protection is provided by fuses, verify correct fuse rating.
 - g. Inspect bolted electrical connections for high resistance using one of the two following methods:
 - 1) Use a low-resistance ohmmeter. Compare bolted connection resistance values with values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the

- lowest value.
- 2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data or NETA ATS Table 100.12. Bolt-torque levels shall be according to manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.
- h. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
- 3. Electrical Tests:
 - a. Test motor protection devices according to manufacturer's published data.
 - b. Test circuit breakers as follows:
 - 1) Operate the circuit breaker to ensure smooth operation.
 - 2) For adjustable circuit breakers, adjust protective device settings according to the coordination study. Comply with coordination study recommendations.
 - c. Perform operational tests by initiating control devices.
- D. Motor controller will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

3.5 SYSTEM FUNCTION TESTS

- A. System function tests shall prove the correct interaction of sensing, processing, and action devices. Perform system function tests after field quality control tests have been completed and all components have passed specified tests.
 - 1. Develop test parameters and perform tests for the purpose of evaluating performance of integral components and their functioning as a complete unit within design requirements and manufacturer's published data.
 - 2. Verify the correct operation of interlock safety devices for fail-safe functions in addition to design function.
 - 3. Verify the correct operation of sensing devices, alarms, and indicating devices.
- B. Motor controller will be considered defective if it does not pass the system function tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 26 29 13.03

SECTION 26 33 23.11 - CENTRAL BATTERY EQUIPMENT FOR EMERGENCY LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Interruptible (fast-transfer) central battery equipment.
 - 2. Enclosures.
 - 3. Optional and accessory features.

1.3 DEFINITIONS

- A. DDC: Direct digital control.
- B. IBC: International Building Code.
- C. Interruptible: As used in the Section Text, an of f -line, passive-standby or line-interactive, inverter-only unit, with an intentional interruption of power to the load until an internal transfer switch picks up and transfers the load to the unit's inverter and internal battery source on loss of the "normal" source, and then retransfers to the "normal" source when it is restored. Transfer time can be "slow" (up to approximately 1 second) or "fast" (2-4 ms or 40-50 ms, depending on manufacturer).
- D. LED: Light-emitting diode.
- E. Low Voltage: As defined in CHICAGO ELECTRICAL CODE for circuits and equipment operating at less than 50 V or for remote-control, signaling power-limited circuits.
- F. NiCd: Nickel cadmium.
- G. OCPD: Overcurrent protective device.
- H. PC: Personal computer.
- I. PWM: Pulse-width modulated.
- J. TDD: Total demand (harmonic current) distortion (also listed as "THD" in catalog data by manufacturers).
- K. THD(V): Total harmonic voltage demand.

- L. Uninterruptible: As used in the Section Text, an on-line, double-conversion (rectifier/inverter) unit, with no interruption of power to the load on interruption and restoration of the "normal" source.
- M. UPS: Uninterruptible power supply.
- N. VRLA: Valve-regulated lead acid.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type and rating of central battery equipment unit.
 - 1. Include features, performance, electrical ratings, operating characteristics, shipping and operating weights, shipping splits, and furnished options, specialties, and accessories.
- B. Shop Drawings: For each type and rating of central battery equipment unit.
 - 1. Include plans, elevations, sections, and mounting details.
 - 2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, ventilation requirements, method of field assembly, components, and location and size of each field connection.
 - 3. Include system one-line diagram, internal and interconnecting wiring, and diagrams for power, signal, and control wiring.
 - 4. Include elevation, details, and legends of control and indication displays.
 - 5. Include -circuit current (withstand) rating of unit.

1.5 INFORMATIONAL SUBMITTALS

- A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout, required working clearances, and required area above and around central battery equipment. Show central battery equipment layout and relationships between electrical components and adjacent structural and mechanical elements. Show support locations, type of support, and weight on each support. Indicate field measurements.
- B. Qualification Data: For Installer and testing agency.
- C. Product Certificates: For each type of central battery equipment.
- D. Source quality-control reports.
- E. Field quality-control reports.
- F. Sample Warranty: For special warranty.

1.6 CLOSEOUT SUBMITTALS

- A. Operation and Maintenance Data: For central battery equipment to include in emergency,

operation, and maintenance manuals.

1. Include the following:
 - a. Manufacturer's written instructions for testing central battery equipment.
 - b. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor control modules.
 - c. Manufacturer's written instructions for selecting and setting field-adjustable controls and status and alarm points.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents. Deliver extra materials to Owner.
 1. Fuses: One for every 10 of each type and rating, but no fewer than one of each type.
 2. Output Circuit Breakers: One for every 10 of each type and rating, but no fewer than one of each type.
 3. Output Circuit Breaker Open/Tripped Alarm Contacts: One for every 10 supplied, but no fewer than one of each type.
 4. Cabinet Ventilation Filters: One complete set.
 5. Circuit Board: One spare circuit board for each critical circuit.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
- B. Testing Agency Qualifications: Member company of NETA or an NRTL acceptable to authorities having jurisdiction.
 1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Deliver equipment in fully enclosed vehicles.
- B. Store equipment in spaces having environments controlled within manufacturers' written instructions for ambient temperature and humidity conditions for non-operating equipment.

1.10 FIELD CONDITIONS

- A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
 1. Ambient Temperature: Less than 0 deg F or exceeding 104 deg F, with an average value

- exceeding 95 deg F over a 24-hour period.
- 2. Ambient Storage Temperature: Not less than minus 4 deg F and not exceeding 140 deg F.
- 3. Humidity: More than 95 percent (condensing).
- 4. Altitude: Exceeding 3300feet.

- B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for central battery equipment, including clearances between central battery equipment and adjacent surfaces and other items.

1.11 COORDINATION

- A. Coordinate sizes and locations of concrete bases. Cast anchor-bolt inserts into bases.

1.12 WARRANTY

- A. Special Warranty: Manufacturer agrees to repair or replace central battery equipment that fails in materials or workmanship within specified warranty period. Special warranty, applying to batteries only, applies to materials only, on a prorated basis, for period specified.

- 1. Warranty Period: Include the following warranty periods, from date of Substantial Completion:

- a. Central Battery Equipment (excluding Batteries): Two year(s).

- b. Premium VRLA Batteries:

- 1) Full Warranty: One year(s).
- 2) Pro Rata: 19 years.

PART 2 - PRODUCTS

2.1 INTERRUPTIBLE (FAST-TRANSFER) CENTRAL BATTERY EQUIPMENT

- A. Basis-of-Design Product: Subject to compliance with requirements, provide Myers Emergency Power Systems LLC, Illuminator Series CIII, or comparable product by one of the following:

- 1. ABB, Electrification Products Division.
- 2. Cooper Industries, Inc.

- 3. Dual-Lite.
- 4. Emergi-Lite; a Thomas & Betts brand.
- 5. Lithonia Lighting; Acuity Brands Lighting, Inc.

- B. General Requirements for Interruptible (Fast-Transfer) Central Battery Equipment:

- 1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CHICAGO ELECTRICAL CODE, by a qualified testing agency, and marked for intended

- location and application.
 - 2. NRTL Compliance: Fabricate and label central battery equipment to comply with UL 924.
 - 3. Comply with the CBC, CHICAGO ELECTRICAL CODE, and NFPA 101.
 - 4. Comply with NEMAPE 1.
- C. Performance Requirements:
- 1. Fast-Transfer Central Battery Equipment: Line-interactive (on-line) system. Automatically sense loss of normal ac supply and use a solid-state static switch to transfer load. Transfer in 2-4 ms or less from normal supply to battery-inverter supply.
 - 2. Automatic Operation:
 - a. Normal Conditions: Supply the load with ac power flowing from normal ac power input terminals, bypassing inverter, with battery connected in parallel via rectifier/charger output.
 - b. Abnormal Supply Conditions: If normal ac supply deviates from specified voltage, transfer switch operates and battery supplies constant, regulated ac power through the inverter to the load, with a momentary loss of power to the load.
 - c. If normal power fails, transfer switch operates and battery supplies constant, regulated ac power through the inverter to the load, with a momentary loss of power to the load.
 - d. If a fault occurs in system when being supplied by inverter and current flows in excess of the overload rating of inverter, inverter automatically protects itself against damage from overloads and short circuits by shutting down.
 - e. When normal ac power is restored at input supply terminals of unit, controls automatically retransfer the load back to the normal ac supply, with a momentary loss of power to the load. Rectifier/charger then recharges battery.
 - f. If normal power failure is prolonged (more than 90 minutes), integral low-voltage battery protective circuit disconnects battery and prevents battery from damage due to deep discharge.
 - g. If battery becomes discharged, and when normal ac supply is again available, rectifier/charger recharges battery. When battery is fully charged, rectifier/charger automatically shifts to float-charge mode.
 - h. If battery is disconnected, and normal ac power is available, central battery equipment continues to supply power to the load with no degradation of its regulation of voltage and frequency of output bus.
- D. Unit Operating Requirements:
- 1. Input AC Voltage Tolerance: Plus 10 and minus 15 percent of central battery equipment input voltage rating.
 - 2. Input Frequency Tolerance: Plus or minus 3 percent of central battery equipment frequency rating.
 - 3. Minimum Off-Line Efficiency: 95 percent at 60 Hz, full load.
 - 4. Minimum Displacement Primary-Side Power Factor: 96 percent under any load or operating condition.
 - 5. Ambient Temperature Rating (Other Than Batteries): Not less than 68 deg F and not exceeding 86 deg F.
 - 6. Ambient Storage Temperature Rating (Other Than Batteries): Not less than minus 4 deg F and not exceeding 158 deg F.
 - 7. Ambient Temperature Rating (Batteries): Not less than 32 deg F and not exceeding 104 deg F.

8. Ambient Storage Temperature Rating (Batteries): Not less than 0 deg F and not exceeding 104 deg F.
 9. Humidity Rating: Less than 95 percent (noncondensing).
 10. Altitude Rating: Not exceeding 3300 feet.
 11. Off-Line Overload Capability: 1.1 times the base load current for 60 seconds; minimum of 1.8 times the base load current for three seconds.
- E. Inverter and Controls Logic: Microprocessor based, isolated from all power circuits; provides complete self-diagnostics, periodic automatic testing and reporting; with alarms.
- F. Controls and Indication:
1. Status Indication: Door-mounted, labeled LED indicators or digital screen displaying the following conditions:
 - a. Normal power available.
 - b. Status of system.
 - c. Battery charging status.
 - d. On battery power.
 - e. System fault.
 - f. External fault.
- G. Self-Protection and Reliability Features:
1. Input transient protection by means of surge suppressors to provide protection against damage from supply voltage surges as defined in IEEE C62.45, Category B and C.
 2. Integral, programmable, self-diagnostic and self-test circuitry; with alarms and logging.
 3. Battery deep-discharge and self-discharge protection; with alarms.
 4. Battery self-test circuitry; with alarms and logging.
- H. Integral Input Disconnecting Means and OCPD: Thermal-magnetic circuit breaker, complying with UL 489.
1. Integrated Equipment Minimum Short-Circuit Current (Withstand) Rating: 65 kA.
- I. Inverter:
1. Description: Solid-state, high-frequency, PWM type, with the following operational features:
 - a. Automatically regulate output voltage to within plus or minus 5 percent, for all load ranges and for maximum 25 percent step-load changes; regulation may increase to 8 percent for 100 percent step-load changes.
 - b. Automatically regulate output frequency to within plus or minus 1 Hz, from no load to full load, at unity power factor, over the operating range of battery voltage.
 - c. Inverter Overload Capability: 115 percent for 10 minutes; 150 percent surge for 10 seconds.
 - d. Load Power Factor: 0.5 lead to 0.5 lag.
 - e. Brownout Protection: Produces rated power without draining batteries when input voltage is down to 75 percent of normal.
- J. Rectifier/Battery Charger:

1. Description: Solid state, variable rate, temperature compensated; automatically maintains batteries in fully charged condition when normal power is available.
2. Maximum Battery Recharge Time from Fully Discharged State: 24 hours.
3. Low-voltage disconnect circuit reduces battery discharge during extended power outages, monitors battery voltage, and disconnects inverter when battery voltage drops to no less than 85.7 percent of nominal voltage.

K. Batteries:

1. Description: Premium VRLA batteries.
 - a. Capable of sustaining full-capacity output of inverter unit for minimum of 90 minutes.
2. Battery Disconnect and OCPD: Manufacturer's standard.

L. Maintenance Bypass Systems:

1. Maintenance Bypass Mode:
 - a. Internal; manual operation only; bypasses central battery equipment power circuits (inverter and static transfer switch); requires local operator selection at central battery equipment. Transfer and retransfer shall be break-before-make, with temporary disrupting power to the load.
2. Bypass Overload Capability: 1.5 times the base load current.

M. Integral Output Disconnecting Means and OCPD:

1. Multiple-Output OCPDs: Thermal-magnetic circuit breakers, complying with UL 489; voltage rating matching unit output voltage rating.

2.2 ENCLOSURES

A. Central Battery Equipment Enclosures: NEMA 250, to comply with environmental conditions at installed location.

1. Dry and Clean Indoor Locations: Type 1 steel cabinets with access to components through hinged doors with flush tumbler lock and latch.
2. Finish: Manufacturer's standard baked-enamel finish over corrosion-resistant prime treatment.

2.3 SOURCE QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to evaluate central battery equipment fabricator's quality-control and testing methods.

B. Testing: Test and inspect central battery equipment according to UL 924.

- C. Factory Tests: Test and inspect assembled central battery equipment according to UL 924. Affix standards organization's label. Include the following:
 - 1. Functional test and demonstration of all functions, controls, indicators, sensors, and protective devices.
 - 2. Full-load test.
 - 3. Transient-load response test.
 - 4. Overload test.
 - 5. Power failure test.
- D. Central battery equipment will be considered defective if it does not pass tests and inspections.
- E. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Receive, inspect, handle, and store central battery equipment according to NECA 411.
- B. Examine areas, surfaces, and substrates to receive central battery equipment, with Installer present, for compliance with requirements for installation tolerances, structural support, ventilation, temperature, humidity, and other conditions affecting performance of the Work.
 - 1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment will be installed before installation begins.
- C. Examine equipment before installation. Reject equipment that is wet, moisture damaged, or mold damaged.
- D. Examine roughing-in for electrical connections to verify actual locations of connections before installation.
- E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Coordinate layout and installation of central battery equipment with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
- B. Floor-Mounted Central Battery Equipment: Install central battery equipment on 4-inch nominal-thickness concrete base. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
 - 1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
 - 2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 4. Install anchor bolts to elevations required for proper attachment to supported equipment.
- C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
- D. Comply with NECA 1.
- E. Wiring Methods:
1. Install conductors and cables concealed in accessible ceilings, walls, and floors where possible.
 2. Conceal raceway and cables except in unfinished spaces.
 3. Provide plenum-rated cable, where installed exposed or in open cable tray, within environmental airspaces, including plenum ceilings.
 4. Comply with requirements for cable trays specified in Section 260536 "Cable Trays for Electrical Systems."
 5. Comply with requirements for raceways and boxes specified in Section 260533 "Raceways and Boxes for Electrical Systems."
- F. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.3 CONNECTIONS

- A. Connections: Interconnect system components. Make connections to supply and load circuits according to manufacturer's wiring diagrams unless otherwise indicated.
- B. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
1. Separately Derived Systems: Make grounding connections to grounding electrodes and bonding connections to metallic piping systems as indicated; comply with CHICAGO ELECTRICAL CODE.
- C. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.4 INSTALLATION OF CONTROL WIRING

- A. Install wiring between central battery equipment and remote devices. Comply with requirements in Section 260523 "Control-Voltage Electrical Power Cables."
- B. Bundle, train, and support wiring in enclosures.

3.5 IDENTIFICATION

- A. Identify central battery equipment, components, and control wiring. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
 2. Label central battery equipment with engraved nameplates.
 3. Label each separate cabinet, for multicabinet units.
 4. Label each enclosure-mounted control and pilot device.
- B. Operating Instructions: Frame printed operating instructions for central battery equipment, including control sequences and emergency procedures. Fabricate frame of finished metal, and cover instructions with clear acrylic plastic. Mount on front of central battery equipment units.

3.6 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
- C. Perform tests and inspections.
- D. Acceptance Testing Preparation:
1. Inspect and Test Each Component:
 - a. Inspect wiring, components, connections, and equipment installations. Test and adjust components and equipment.
 - b. Test insulation resistance for all external branch circuit, feeder, control, and alarm wiring connected to central battery equipment element and component.
 - c. Test continuity of each circuit.
- E. Tests and Inspections:
1. Inspect central battery equipment, wiring, components, connections, and equipment installation. Test and adjust components and equipment.
 2. Test insulation resistance for all external branch circuit, feeder, control, and alarm wiring connected to central battery equipment element and component.
 3. Test continuity of each circuit.
 4. Verify that input voltages and frequencies at central battery equipment locations are within voltage and frequency limits specified in Part 2. If outside this range, notify Design-Builder before closing input OCPDs.
 5. Perform a load-duration test at rated voltage and rated output current to verify the correct functional operation of the unit under full-load stable operating conditions for the minimum time limits required by UL 924. Monitor and record ambient temperature and temperatures within the unit.
 6. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
 7. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
- F. Central battery equipment will be considered defective if it does not pass tests and inspections.
- G. Prepare test and inspection reports, including a certified report that identifies central battery

equipment and describes all test results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.7 STARTUP SERVICE

- A. Engage a factory-authorized service representative to perform startup service.
 - 1. Complete installation and startup checks according to manufacturer's written instructions.

3.8 ADJUSTING

- A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.
- B. Set field-adjustable switches, auxiliary relays, and other adjustable parts.
- C. Adjust the trip settings of thermal-magnetic circuit breakers with adjustable, instantaneous-trip elements; install fuses if not factory installed.
- D. Set the automatic system test parameters.
- E. Set field-adjustable, circuit-breaker trip ranges as specified in Section 260573.16 "Coordination Studies."

3.9 PROTECTION

- A. Temporary Heating: Apply temporary heat to maintain temperature according to manufacturer's written instructions until controllers are ready to be energized and placed into service.
- B. Replace central battery equipment whose interiors have been exposed to water or other liquids prior to Substantial Completion.

3.10 DEMONSTRATION

- A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain central battery equipment, and to use and reprogram microprocessor-based control, monitoring, and display functions.

END OF SECTION 26 33 23.11

SECTION 26 51 19 - LED INTERIOR LIGHTING**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 1. Downlight.
 2. Highbay, linear.
 3. Linear industrial.
 4. Recessed, linear.
 5. Strip light.
 6. Surface mount, nonlinear.
 7. Suspended, linear.
 8. Suspended, nonlinear.
 9. Materials.
 10. Luminaire support.

1.3 DEFINITIONS

- A. CCT: Correlated color temperature.
- B. CRI: Color Rendering Index.
- C. Fixture: See "Luminaire."
- D. IP: International Protection or Ingress Protection Rating.
- E. LED: Light-emitting diode.
- F. Lumen: Measured output of lamp and luminaire, or both.
- G. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS

- A. Product Data: For each type of product.
 1. Arrange in order of luminaire designation.
 2. Include data on features, accessories, and finishes.
 3. Include physical description and dimensions of luminaires.
 4. Include emergency lighting units, including batteries and chargers.
 5. Include life, output (lumens, CCT, and CRI), and energy-efficiency data.

6. Photometric data and adjustment factors based on laboratory tests IES LM-79 and IES LM-80.
 - a. Manufacturers' Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

B. Shop Drawings: For nonstandard or custom luminaires.

1. Include plans, elevations, sections, and mounting and attachment details.
2. Include details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.

C. Product Schedule: For luminaires and lamps. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Luminaires.
2. Suspended ceiling components.
3. Partitions and millwork that penetrate the ceiling or extend to within 12 inches of the plane of the luminaires.
4. Structural members to which equipment or luminaires will be attached.
5. Initial access modules for acoustical tile, including size and locations.
6. Items penetrating finished ceiling, including the following:
 - a. Other luminaires.
 - b. Air outlets and inlets.
 - c. Speakers.
 - d. Sprinklers.
 - e. Access panels.
 - f. Ceiling-mounted projectors.

B. Qualification Data: For testing laboratory providing photometric data for luminaires.

C. Product Certificates: For each type of luminaire.

D. Product Test Reports: For each type of luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For luminaires and lighting systems to include in operation and maintenance manuals.

1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.

1.7 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 - 1. Drivers: One of each type and rating installed.
 - 2. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
 - 3. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE

- A. Luminaire Photometric Data Testing Laboratory Qualifications:
 - 1. Luminaire manufacturer's laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.
- B. Provide luminaires from a single manufacturer for each luminaire type.
- C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

1.9 DELIVERY, STORAGE, AND HANDLING

- A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.10 WARRANTY

- A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
- B. Warranty Period: Five year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Ambient Temperature: 41 to 104 deg F.
 - 1. Relative Humidity: Zero to 95 percent.
- B. Altitude: Sea level to 1000 feet.

2.2 LUMINAIRE REQUIREMENTS

- A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in the Chicago Electrical Code, by a qualified testing agency, and marked for intended location and application.
- B. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels

where they will be readily visible to service personnel, but not seen from normal viewing angle s when lamps are in place.

1. Label shall include the following lamp characteristics:
 - a. "USE ONLY" and include specific lamp type.
 - b. Lamp diameter, shape, size, wattage, and coating.
 - c. CCT and CRI.

C. Recessed luminaires shall comply with NEMA LE 4.

2.3 DOWNLIGHT

A. See Luminaire Schedule for description.

B. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. UL Listing: Listed for damp location.
4. Recessed luminaires shall comply with NEMA LE 4 and shall be Chicago Approved.

2.4 HIGHBAY, LINEAR

A. See Luminaire Schedule for description.

B. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. UL Listing: Listed for damp location.

2.5 HIGHBAY, NONLINEAR.

A. See Luminaire Schedule for description.

B. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. UL Listing: Listed for damp location.

2.6 LINEAR INDUSTRIAL.

A. See Luminaire Schedule for description.

B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. With integral mounting provisions.

D. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.

2.7 RECESSED, LINEAR.

A. See Luminaire Schedule for description.

B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leak age under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. Chicago Approved for plenum.
4. NEMA LE 4.

2.8 STRIP LIGHT.

A. See Luminaire Schedule for description.

B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping of luminaire without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. UL Listing: Listed for damp location.

2.9 SURFACE MOUNT, LINEAR.

A. See Luminaire Schedule for description.

B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. Standards:

1. ENERGY STAR certified.
2. RoHS compliant.
3. UL Listing: Listed for damp location.

2.10 SURFACE MOUNT, NONLINEAR

- A. See Luminaire Schedule for description.
- B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- C. Standards:
 - 1. ENERGY STAR certified.
 - 2. RoHS compliant.
 - 3. UL Listing: Listed for damp location.

2.11 SUSPENDED, LINEAR

- A. See Luminaire Schedule for description.
- B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- C. Standards:
 - 1. ENERGY STAR certified.
 - 2. RoHS compliant.
 - 3. UL Listing: Listed for damp location.

2.12 SUSPENDED, NONLINEAR

- A. See Luminaire Schedule for description.
- B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Components are designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
- C. Standards:
 - 1. ENERGY STAR certified.
 - 2. RoHS compliant.
 - 3. UL Listing: Listed for damp location.

2.13 MATERIALS

- A. Metal Parts:
 - 1. Free of burrs and sharp corners and edges.
 - 2. Sheet metal components shall be steel unless otherwise indicated.
 - 3. Form and support to prevent warping and sagging.

- B. Steel:
 - 1. ASTM A36/A36M for carbon structural steel.
 - 2. ASTM A568/A568M for sheet steel.
- C. Stainless Steel:
 - 1. Manufacturer's standard grade.
 - 2. Manufacturer's standard type, ASTM A240/240M.
- D. Galvanized Steel: ASTM A653/A653M.
- E. Aluminum: ASTM B209.

2.14 METAL FINISHES

- A. Variations in finishes are unacceptable in the same piece. Variations in finishes of adjoining components are acceptable if they are within the range of approved Samples and if they can be and are assembled or installed to minimize contrast.

2.15 LUMINAIRE SUPPORT

- A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.
- B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as luminaire.
- C. Wires: ASTM A641/A641M, Class 3, soft temper, zinc-coated steel, 12 gage.
- D. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
- B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before luminaire installation.
- C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

- A. If approved by the Design-Builder, use selected permanent luminaires for temporary lighting. When construction is sufficiently complete, clean luminaires used for temporary lighting and install new lamps.

3.3 INSTALLATION

- A. Comply with NECA 1.
- B. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.
- C. Supports:
 - 1. Sized and rated for luminaire weight.
 - 2. Able to maintain luminaire position after cleaning and relamping.
 - 3. Provide support for luminaire without causing deflection of ceiling or wall.
 - 4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and a vertical force of 400 percent of luminaire weight.
- D. Flush-Mounted Luminaires:
 - 1. Secured to outlet box.
 - 2. Attached to ceiling structural members at four points equally spaced around circumference of luminaire.
 - 3. Trim ring flush with finished surface.
- E. Wall-Mounted Luminaires:
 - 1. Do not attach luminaires directly to gypsum board.
- F. Suspended Luminaires:
 - 1. Ceiling Mount:
 - a. Two 5/32-inch-diameter aircraft cable supports adjustable to 10 feet in length.
 - 2. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
 - 3. Stem-Mounted, Single-Unit Luminaires: Suspend with twin-stem hangers. Support with approved outlet box and accessories that hold stem and provide damping of luminaire oscillations. Support outlet box vertically to building structure using approved devices.
 - 4. Do not use ceiling grid as support for pendant luminaires. Connect support wires or rods to building structure.
- G. Ceiling-Grid-Mounted Luminaires:
 - 1. Secure to any required outlet box.
 - 2. Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.
- H. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for wiring connections.

3.4 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

- A. Perform the following tests and inspections:
 - 1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.
 - 2. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery power and retransfer to normal.
- B. Luminaire will be considered defective if it does not pass operation tests and inspections.
- C. Prepare test and inspection reports.

END OF SECTION 26 51 19

SECTION 26 52 13 - EMERGENCY AND EXIT LIGHTING**PART 1 - GENERAL****1.1 SUMMARY****A. Section Includes:**

1. Emergency lighting.
2. Exit signs.
3. Materials.
4. Luminaire support components.

1.2 DEFINITIONS

- A. Correlated Color Temperature (CCT): The absolute temperature, measured in kelvins, of a blackbody whose chromaticity most nearly resembles that of the light source.
- B. Color Rendering Index (CRI): Measure of the degree of color shift that objects undergo when illuminated by the light source as compared with the color of those same objects when illuminated by a reference source.
- C. Lumen (lm): The SI derived unit of luminous flux equal to the luminous flux emitted within a unit solid angle by a unit point source (1 lm = 1 cd-sr).

1.3 ACTION SUBMITTALS**A. Product Data:**

1. For each type of emergency lighting unit, exit sign, and emergency lighting support.
 - a. Include data on features, accessories, and finishes.
 - b. Include physical description of unit and dimensions.
 - c. Battery and charger for light units.
 - d. Include life, output of luminaire (lumens, CCT, and CRI), and energy efficiency data.
 - e. Include photometric data and adjustment factors based on laboratory tests by, or under supervision of, qualified luminaire photometric testing laboratory, for each luminaire type.

1.4 INFORMATIONAL SUBMITTALS

- A. Product Certificates: For each type of luminaire.
- B. Product Test Reports: For each luminaire for tests performed by, or under supervision of, qualified luminaire photometric testing laboratory.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.6 WARRANTY

- A. Special Installer Extended Warranty for Emergency and Exit Lighting: Installer warrants that fabricated and installed emergency luminaires and exit signs, including batteries, perform in accordance with specified requirements and agrees to repair or replace components and assemblies that fail to perform as specified within extended warranty period.
 - 1. Extended Warranty Period: Two year(s) from date of Substantial Completion; full coverage for labor, materials, and equipment.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR EMERGENCY LIGHTING

- A. Electrical Components, Devices, and Accessories: Listed and labeled in accordance with Chicago Electric Code and UL 924, by qualified electrical testing laboratory recognized by authorities having jurisdiction and marked for intended location and application.
- B. Comply with NFPA 101.
- C. Comply with NEMA LE 4 for recessed luminaires.
- D. Chicago Approved.

2.2 EXIT SIGNS

- A. General Characteristics: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
- B. Internally Lighted Sign:
 - 1. Refer to Luminaire Schedule for description.
 - 2. Chicago Approved
 - 3. Options:
 - a. Operating at nominal voltage of 277V(ac).
 - b. Lamps for AC Operation:
 - 1) LEDs; 50,000 hours minimum rated lamp life.

2.3 MATERIALS

- A. Metal Parts:
 - 1. Free of burrs and sharp corners and edges.
 - 2. Sheet metal components must be steel unless otherwise indicated.
 - 3. Form and support to prevent warping and sagging.
- B. Doors, Frames, and Other Internal Access:

1. Smooth operating, free of light leakage under operating conditions.
2. Designed to permit relamping without use of tools.
3. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

2.4 METAL FINISHES

- A. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within range of approved Samples and are assembled or installed to minimize contrast.

2.5 LUMINAIRE SUPPORT COMPONENTS

- A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for conditions affecting performance of luminaires.
- B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before luminaire installation.
- C. Examine walls, floors, roofs, and ceilings for suitable conditions where emergency lighting luminaires will be installed.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.
- B. Install lamps in each luminaire.
- C. Supports:
 1. Sized and rated for luminaire weight.
 2. Able to maintain luminaire position when testing emergency power unit.
 3. Provide support for luminaire and emergency power unit without causing deflection of ceiling or wall.
 4. Luminaire-mounting devices must be capable of supporting a horizontal force of 100 percent of luminaire and emergency power unit weight and vertical force of 400 percent of luminaire weight.
- D. Wall-Mounted Luminaire Support:

1. Attached to structural members in walls.
2. Do not attach luminaires directly to gypsum board.

E. Suspended Luminaire Support:

1. Pendants and Rods: Where longer than 48 inch (1200 mm), brace to limit swinging.
2. Stem-Mounted, Single-Unit Luminaires: Suspend with twin-stem hangers. Support with approved outlet box and accessories that hold stem and provide damping of luminaire oscillations. Support outlet box vertically to building structure using approved devices.
3. Do not use ceiling grid as support for pendant luminaires. Connect support wires or rods to building structure.

3.3 IDENTIFICATION

- A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

- A. Field tests and inspections must be witnessed by Design-Builder.
- B. Tests and Inspections:
1. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to emergency power and retransfer to normal.
- C. Nonconforming Work:
1. Luminaire will be considered defective if it does not pass operation tests and inspections.
 2. Remove and replace defective units and retest.
- D. Prepare test and inspection reports.

3.5 ADJUSTING

- A. Adjustments: Within 12 months of date of Substantial Completion, provide on-site visit to do the following:
1. Inspect luminaires. Replace lamps, exit signs, and luminaires that are defective.
 - a. Parts and supplies must be manufacturer's authorized replacement parts and supplies.
 2. Conduct short-duration tests on all emergency lighting.

3.6 PROTECTION

- A. Remove and replace luminaires and exit signs that are damaged or caused to be unfit for use by construction activities.

END OF SECTION 26 52 13

SECTION 27 00 01 - COMMON WORK RESULTS FOR COMMUNICATIONS**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, Division 27 Specification Sections apply to all sections.
- B. Obtain the latest City of Chicago Design and Construction Standards document(s) from the Owner. Comply with all Owner-specific requirements in addition to requirements set forth in these specifications and accompanying drawings. Should there be a conflict, the Owner's standards shall take precedence, unless prevailing codes and regulations mandate otherwise.
- C. Related Drawings
 - a. All Civil Drawings
 - b. All Electrical Site Drawings
 - c. All Technology (T-Series) Drawings

1.2 GENERAL DIRECTION

- A. Submittal of a bid indicates that the contractor has examined the drawings, specifications, and had an opportunity to visit the site to be able to provide a comprehensive complete bid.
- B. The intent of these specifications and the accompanying drawings is to provide complete and workable systems as shown, specified and required by applicable codes. Interpret these specifications in conjunction with the drawings and provide all work described. If work is shown on drawings and not mentioned in the specifications, or vice versa, it is to be included in the work the same as though clearly set forth by both. Should there be a conflict between the specifications and drawings, provide the greater quantity or better quality. Immediately notify owner's representative and design professional of such conflicts.
- C. The drawings that accompany these specifications are diagrammatic and although size and location of equipment is drawn to scale, wherever possible make use of submittal data and verify all dimensions on site. They do not show every conduit, offset or pull / junction box which may be required to install work in the space provided and avoid conflicts. Follow the drawings as closely as is practical and install additional pull / junction boxes and offsets where required by site conditions and codes at no additional cost. Install all new work in such manner as to conform to the structure, avoid obstructions, provide required service clearances and preserve headroom. Do not scale from drawings, measurements shall be taken in the field.

- D. Coordinate all new work with all other contractors and installers in addition to existing building obstructions and install accordingly. Refer to coordination drawings of other trades. Comply with requirements of architectural drawings including but not limited to mounting height and locations.
- E. Fully research peculiarities and limitations of space available for installation of work with materials being provided. Work around material lead times to not extend project schedule.
- F. Complete work, or part(s) thereof, at times as may be designated by the Owner's Representative, so that it can be used for temporary or permanent use. Do not construe such use of the system as an acceptance of it by Owner.
- G. During mobilization or construction, if an abnormal condition is uncovered either with existing conditions, equipment loads, submittal data, etc. bring these to the attention of the Design Professional for review.
- H. Owner's Representative or Design Professional may relocate fixtures, devices, equipment, etc. prior to installation within a 20-foot limit at no additional charge.
- I. Phasing - Where the scope of work dictates that the project shall be constructed in phases, all costs shall be incurred by this contractor for any temporary work required so that previous phases can be operational while construction is being done to adjacent spaces.

1.3 GENERAL STANDARDS

- A. Provide work in compliance with applicable provisions of the following standards. Provide listing and labeling for all electrical materials, marked for respective intended uses, from UL or other Nationally Recognized Testing Laboratory (NRTL) that is acceptable to applicable Authorities Having Jurisdiction (AHJs).
- B. Provide materials, installation methods, workmanship, testing, etc., in strict accordance with the latest edition of applicable standards and adopted codes, including (but not limited to) the following.
 - 1. International Building Code
 - 2. State Building Code and applicable amendments
 - 3. State Energy Code
 - 4. Utility company requirements and standards as applicable
 - 5. All provisions and requirements of NFPA (National Fire Protection Association)
 - 6. National Electrical Code (NEC), NFPA 70
 - 7. Life Safety Code, NFPA 101
 - 8. Local governmental and other prevailing codes and ordinances
 - 9. ADA/ADAAG requirements (American with Disabilities Act) including all applicable Standards for Accessible Design.
 - 10. UL (Underwriters Laboratories Inc.)
 - 11. ETL (Intertek Testing Services NA, Inc.)
 - 12. CSA (CSA Group Testing and Certification Inc.)
 - 13. FM (Factory Mutual Insurance Company)
 - 14. ASME (American Society of Mechanical Engineers)

15. NEMA (National Electrical Manufacturers Association).
16. NECA (National Electrical Contractors Association)
17. IP (International Protection Rating / Ingress Protection Rating)

1.4 PERMITS AND REGULATIONS

- A. Obtain and pay for permits, fees, certificates of inspection and approval, etc. required for this branch of the work. Furnish Owner with certificates of final inspection and approval prior to final acceptance of this branch of the work.
- B. Laws and regulations which bear upon or affect the various branches of this work shall be complied with by this contractor and are hereby made a part of this contract.

1.5 DEFINITIONS

- A. Furnish - Procure, supply and deliver to project site, ready for installation, install and warrant (unless indicated otherwise on documents). Include warranty expenses.
- B. Install - Assemble, wire and connect loose-shipped components on site. Place in position for service or use, including material, labor, accessories, services, and testing. Wire, connect, and render fully operational for intended use.
- C. Provide - Furnish and Install. Similar Terms: "include", "shall", "equip with", "consisting of"
- D. Equal or Equivalent - Determination of equivalency to be made by design professional for all products not listed as basis-of-design.
- E. Substantial Completion - Where frontend documentation does not define, products and systems must be fully installed as designed, tested, adjusted, labeled, and functionally demonstrated to owner.
- F. High Voltage: For the sake of this Division, greater than 70.7vac RMS; greater than 100vac P-P; greater than 49vdc.
- G. Low Voltage: For the sake of this Division, less than or equal to 70.7vac RMS; less than 100vac P-P; less than or equal to 49vdc.
- H. Structured Cabling: A standardized repetitive passive physical infrastructure of cables, conductors, terminations, hardware and supporting products that together are used to enable the conveyance of signals, information, and data between different locations. Such systems are commonly constructed in accordance with standards published by various standards organizations, including but not limited to the TIA, EIA and BICSI. In some cases, specialized derivatives of these standards are constructed to meet specialized system needs. Common usages of structured cabling systems include such things as computer or data networks (including wireless infrastructure), telephone systems, building automation systems, electronic safety and security systems, and building intercommunications systems. The structured cabling system does not include any active electronic equipment.

- I. Audio-Visual / Audio and Video Systems Work: That portion of the Project that involves the supply, installation, programming, or testing of products whose fundamental purpose is the reproduction, pickup, storage, transporting, processing, control of audio and/or video signals. Scope of this definition includes all incidentals that are regularly and fundamentally required to provide complete and working systems from the small and simple to the large and complex.

1.6 REQUESTS FOR INFORMATION

- A. See Section 01 25 13 – Request for Interpretations

- B. Acronyms and Abbreviations:

1. ADA: Americans with Disabilities Act.
2. ANSI: American National Standards Institute.
3. AWG: American Wire Gauge.
4. BICSI: Building Industry Consulting Services International.
5. BOM: Bill of Materials.
6. Bps: Bits per second.
7. LEC: Local Exchange Carrier.
8. dB: Decibel.
9. Device ID: A system specific label assigned to a product to uniquely identify it within a given a system.
10. DSL: Digital Subscriber Line.
11. EF: Entrance Facility.
12. EIA: Electronics Industries Association.
13. EMI: Electromagnetic Interference.
14. ER: Equipment Room (a type of Communications Room).
15. Gb/s (Gbps): Gigabits per second.
16. GHz: Gigahertz.
17. IDF: Intermediate Distribution Frame (Replaced by TR).
18. IEEE: Institute of Electrical and Electronics Engineers.
19. ISO: International Organization for Standardization.
20. ISP: Internet Service Provider.
21. LAN: Local Area Network.
22. MAC: Media Access Control.
23. Mb/s (Mbps): Megabits per second.
24. MDF: Main Distribution Frame (Replaced by ER).
25. MHz: Megahertz.
26. MPLS: Multi Protocol Label Switching.
27. OFCI: Owner Furnished Contractor Installed.
28. OFE: Owner Furnished Equipment.
29. OFOI: Owner Furnished Owner Installed.
30. PoE: Power over Ethernet.
31. PSTN: Public Switched Telephone Network.
32. QoS: Quality of Service.
33. RAID: Random Array of Inexpensive Disks.
34. RAM: Random Access Memory.
35. RFC: Request for Comment.
36. RFI: Request for Information/ Radio Frequency Interference.
37. RFP: Request for Proposal.

- 38. RFQ: Request for Quotation.
- 39. SNMP: Simple Network Management Protocol.
- 40. SSD: Solid State Drive.
- 41. TB: Terabyte.
- 42. TCP: Transmission Control Protocol.
- 43. TCP/IP: Transmission Control Protocol/Internet Protocol.
- 44. TIA: Telecommunications Industries Association.
- 45. TR: Telecommunications Room (a type of Communications Room)
- 46. VoIP: Voice over Internet Protocol.

- C. Provide the services of locally licensed and authorized electrician(s) to perform that portion of the Work of this Division that is required by the applicable codes and/or the AHJ to be performed by licensed electrician(s).

1.7 ADMINISTRATION

- A. See Section 01 31 00 Project Management and Coordination

1.8 WARRANTY / GUARANTEE

- A. Provide a warranty/guarantee in written form as part of O&M manual stating that all work, materials, equipment and parts are warranted to be free of defect for a minimum period of one year from the date of Substantial Completion. Warranty period and requirements may be expanded in drawings or subsequent specification sections. Repair or replace (owner's option) any defects or failures at no cost to the owner within the warranty period. Issues arising within warranty period must be attended to in a timely manner and in no case exceed four (2) working days. State this in writing as part of O&M manual. Replace defective items to the satisfaction of the Owner's Representative and the Design Professional.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Materials, apparatus and equipment shall bear the Underwriter's Laboratory, Inc. label (or other nationally recognized testing laboratory label) where regularly supplied, and as additionally required by Code or the Contract Documents.
- B. Products furnished shall be new, full weight and of the best quality. Similar supplied materials shall be of the same type and from the same manufacturer.
- C. If a specified product is discontinued by the manufacturer and is no longer available for purchase, replacement product of equal or greater value, performance and function as the discontinued Basis of Design product shall be furnished. The replacement product shall be from the same manufacturer as the Basis of Design product unless written permission has been granted by the Designer. The Contractor is solely responsible for

researching and submitting proposed replacement product. The final decision as to whether a Contractor proposed replacement is acceptable lies solely with the Designer.

- D. Substitute products shall only be considered if the Contractor has strictly adhered to the guidelines set forth under “Substitutions” as defined in this Section.

2.2 BASIS OF DESIGN

- A. Some of the Contract Documents are prepared on the basis of specific products that are designated as the “Basis of Design.”
- B. The Basis of Design products for the Work of this Division are designated explicitly within the specifications, and in the case of some products, designated by brand and model on the Drawings.
 - 1. Where a product brand and model is expressly identified on the Drawings, this product represents the Basis of Design for that instance of the product in the associated system.
- C. The combination of Basis of Design products and the interconnection thereof collectively represent a work that includes the feature set and performance intended by the Designer and the Owner. The specifications may identify additional manufacturers whose equipment may be used in the system, provided the use of such products achieves the same capabilities and performance as that of the specified combination of the Basis of Design products.
 - 1. Due to the varied and integrated nature of modern communications products, there is no guarantee that any single product manufactured by any one of the listed additional manufacturers will be an exact equivalent to a single Basis of Design product in terms of functionality, capability or performance. Therefore, where the use of substitute product is considered, the product shall be verified by the substituting party to include the capabilities, features and performance as that of the Basis of Design product.
 - 2. Work of the Contract shall include covering the cost of additional products and labor necessary to achieve the same end results as would be achieved by using the specified combination of Basis of Design products, including additional costs for coordination, modifications to the building, pathway modifications, casework and furniture modifications, power modifications, licensing, or anything else that may cause additional expense to the Owner.
 - 3. In addition, costs incurred by the Owner’s design team to accommodate such changes shall be the responsibility of the party making the substitution.

2.3 SUBSTITUTIONS

- A. A substitution is the use of any product other than that identified as the “Basis of Design,” the “Standard of Quality,” or an “Additional Approved Product.”
- B. Substitutions require pre-bid approval. Only substitutions authorized via addendum shall be considered.
- C. Substitutions are considered on a product-by-product and model specific basis.

- D. Substitution Submittal Requirements:
1. Substitution requests must be received by the Designer sufficiently in advance of the scheduled bid date to allow time for review and issuance of an Addendum. If the timing of the request does not permit an Addendum, substitution shall not be considered or acceptable.
 2. Substitution requests shall consist of the following for each proposed substitution:
 - a. Substitution Request Letter
 - b. Product Datasheets/Brochures
- E. Costs that result from the use of substitute products and/or Additional Approved Manufacturer(s), including costs for additional equipment, coordination, accessories, modules, interface products, cables, software, and programming, as well as costs for any additional labor, materials, and products incurred by other trades or members of the project Design Team or Owner, are the sole responsibility of the Contractor making the substitution. This includes costs that may not be incurred or known until after Contract award or Work execution. Such costs shall be deducted from final sum payable to the Contractor.
- F. Post Contract award substitutions may be considered, but only if the proposed substitution includes substantial additional benefit to the Owner. Post award substitutions are considered solely at the discretion and convenience of the Designer. For a post Contract award substitution to be considered, one or more of the following shall apply:
1. The Designer initiates the request for substitution.
 2. A basis of design product has become discontinued and is no longer available, and as a result, the use of a substitute product has become a necessity to meet the Owner's objectives for the Project. See "Discontinued Products."
 3. The request for substitution is accompanied by a proposal that identifies the benefits to the Owner, including a fair-market Contract price reduction.

2.4 DISCONTINUED PRODUCTS

- A. The availability of products shall be verified by the Contractor prior to submitting pricing for Work of the Contract.
- B. In the event that a specified product is discontinued at any time and becomes unavailable for use on the Project, provide a replacement product deemed acceptable to the Designer. Replacement product shall be of equal or greater value, performance and functionality.
1. Replacement product shall be from the basis of design manufacturer, from one of the additional product manufacturers identified for the product within the Section, or from another manufacturer deemed acceptable to the Designer.
- C. The cost for the supply and installation of suitable replacement product is the sole responsibility of the Contractor.
- D. Replacement products are considered substitutions and require Designer review and authorization. See "Substitutions."

PART 3 - EXECUTION

3.1 WORK AND WORKMANSHIP

- A. Provide labor, materials, equipment, and services necessary for complete installation of systems required to comply with the requirements of authorities having jurisdiction (AHJ), as indicated within the Contract Documents.
- B. Work shall be functional and complete in every detail, including items required to complete the system, regardless of whether each necessary item is fully enumerated in the Specifications or shown on the Drawings.
- C. Contractor and Subcontractors shall be knowledgeable of the details of Work to be performed by other trades and take necessary steps to integrate and coordinate Work of this Division with that of other Divisions and other trades.
- D. Wherever tables or schedules show quantities, they shall not be interpreted to represent the total contract quantity requirement, but instead a portion of the Contract requirement. The Contractor shall be responsible for the higher quantity communicated by the Drawings, within the Specifications and on the schedules/tables. Seek clarification from the Designer should a discrepancy be found.
- E. The Designer and Owner's Representative may, at their sole discretion, condemn or reject any Work, materials, or equipment not in accordance with the Contract Documents or the manufacturer's specifications or drawings reviewed by the Designer or Owner.
- F. Work or equipment that is rejected shall be removed and replaced to the satisfaction of the Owner and Designer at the Contractor's expense. Work or equipment that is rejected shall be so stated in writing by the Owner or Designer.
- G. Work shall fully comply with the Contract Documents and manufacturer's recommended installation guidelines.
- H. Work shall be performed with the best practices of the trade for performance, functionality, safety, endurance and aesthetics.
- I. Coordinate ordering and installation of equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.
- J. Where mounting heights are not detailed or dimensioned, install systems, materials and equipment to provide the maximum headroom possible. Consult the Designer for direction.
- K. Supply scaffolding, rigging, hoisting and services necessary for erection and delivery of equipment and apparatus furnished into the premises. These items shall be removed from premises when no longer required.
- L. Work shall be installed level and plumb, parallel and perpendicular to prevailing building lines, except as expressly detailed otherwise or required for proper form, function or Designer-intended operation.

- M. Specialty tools shall be used for assembly, installation, termination, and removal of products as recommended by the product manufacturer.

3.2 TESTING

A. General:

1. Upon complete physical installation of products, align, balance, and adjust equipment to make it usable to the Owner for the intended purpose, and ensure compliance with the Contract Documents.
2. Test each system and each component thereof, and correct deficiencies prior to scheduling acceptance testing.
3. Replace malfunctioning or damaged products with new product, following immediately with retesting until satisfactory performance and specification compliant conditions are achieved.

B. Operational Testing:

1. Perform operational testing of supplied products individually and collectively to verify conformance with the Contract Documents, to ensure compliance with the product manufacturer's published specifications, and as additionally necessary for the system to meet the intended purpose.

C. Performance Testing:

1. Perform measurements and testing necessary to demonstrate performance compliance.

3.3 TRAINING

- A. Training shall be supplied for each Section of this Division and for each unique system provided.

- B. The Owner shall have the right to use the total allocated training for a period of 1 year following final completion of onsite work, solely at its discretion.

- C. Training shall be supplied as expressly identified within individual Sections. Where training requirements are not otherwise expressly identified, the Contractor shall furnish a minimum of two (2) hours per unique system, per Section. The Contractor shall presume that at least two (2) discrete trips to the project site shall be required per unique system to conduct training.

- D. Training dates and times shall be coordinated with the Owner's designated training representative(s).

E. Training shall cover the following:

1. Normal system use and operation.
2. Procedures and schedules involved in troubleshooting and performing routine preventative maintenance.
3. Other facets as identified in individual Sections.

- F. Agenda and relevant training handouts shall be prepared and distributed to attendees at each training session.

- G. A sign-in sheet shall be created and used for each training session. The sheet shall identify the following, at a minimum:
 - 1. Specification Section reference and system(s) being trained.
 - 2. Date and starting time of the session.
 - 3. Signatures of attendees.
 - 4. Ending time of the session, along with a separate owner signature certifying the ending time.
 - 5. Training outline/agenda.

- H. Recording of Sessions:
 - 1. Recordings shall be supplied on DVD video format media playable in standard consumer grade reproduction appliance. Recordings do not need to be professionally edited but shall feature intelligible audio and a clear image of the subject trainer and any supplemental visual content material to the training.
 - 2. Recordings shall be turned over and signed for by an Owner's training representative at the end of each session. A copy of a signed delivery receipt shall be included as part of the closeout documentation.
 - 3. Contractor shall require each attendee to sign-in at the start of each training session. The sign-in form shall summarize the training conducted, specification section reference and system being trained on, as well as the starting time and duration of training. Following training, a representative of the Owner shall sign the form, acknowledging the same. Contractor shall retain the original copy of these forms and turn over a photocopy of the form to the Owner's representative as evidence of training. Training conducted without this official record of training shall not be considered as part of the Contractor's training obligation.

- I. For a training session to count towards the training obligation, each of the following shall be met:
 - 1. Training occurs after Training Submittal review.
 - 2. Training session outlines / agenda are distributed at the session.
 - 3. Quality Assurance requirements for the instructor have been met.
 - 4. Training occurs after the system / section is complete and working as intended by the Contract Documents, usually following Acceptance Testing. Training in advance of this requires Designer approval.
 - 5. Sign-in sheets are used, completed, and retained for the session.
 - 6. A master log of training conducted for the project is maintained.

END OF SECTION 27 00 01

SECTION 27 00 02 - QUALITY ASSURANCE FOR COMMUNICATIONS

PART 1 - GENERAL

1.1 SUBMITTAL REQUIREMENTS

- A. Quality Assurance:
 - 1. Quality Assurance: General Qualifications.

1.2 SUMMARY

- A. Section Includes:
 - 1. Quality Assurance requirements for Work of this Division.
- B. Related Requirements
 - 1. Related Sections
 - a. All Division 27 Sections.

1.3 QUALITY ASSURANCE

- A. General Qualifications:
 - 1. Business history of the last five (5) contiguous years performing work of similar type, value and scope as that required of the Contract Documents.
 - 2. Capable of demonstrating through valid references and other means that it has successfully completed no less than six (6) projects of similar type, monetary size, and scope of work within the last twenty-four (24) calendar months.
 - 3. A "Factory-authorized" reseller (e.g., distributor, dealer, integration partner, value-added reseller, channel partner) for the products furnished for each Section.
 - 4. House substantial business operations within a 300-mile radius of the project site.
 - 5. Employ full-time service staff based within a 50-mile radius of the project site.
 - 6. Financial Disclosure of the Contractor: Prior to contract award, upon request.
- B. Superintendent/Project Manager Qualifications:
 - 1. Furnish the services of an experienced superintendent/project manager who shall be constantly in charge of the Work, together with a qualified foreman and technical specialists to properly install, connect, adjust, start, operate and test the Work involved.
 - 2. Qualifications are subject to the review and acceptance by the Designer and Owner. Unless the Designer and Owner grant prior permission, the same superintendent/project manager shall be utilized throughout the duration of the Project and shall remain responsible for the complete scope of the Work.
- C. Subcontractor Qualifications:
 - 1. If the Contractor, as a singular entity, does not meet 100-percent of the quality assurance requirements for each specification section, the Contractor shall enlist the services of qualified subcontractors to perform the Work of those specific

section(s). This includes, but is not limited to, the supply of the products for the Section and the supply of the project engineering services, preparation of shop drawings and section submittals, technical installation labor, training, warranty, post-installation support and service.

2. The Contractor shall ensure that each subcontractor supplies the services of a project manager to represent its interests at the same project meetings in which the Contractor participates.
3. The Designer and Owner reserve the right to disqualify the use of any subcontractor that does not meet the quality assurance requirements set forth in these specifications. Should a subcontractor be disqualified, the Contractor shall supply the services of a different subcontractor that complies with the published quality assurance requirements. The Contractor is solely responsible for costs incurred as a result. It is therefore incumbent upon the Contractor to pre-qualify subcontractor choice(s) prior to submitting pricing for work.
4. To achieve quality assurance compliance, an equipment vendor that is not performing the technical installation labor associated with work of a Section shall not be considered a subcontractor.

D. Training Qualifications:

1. Personnel conducting training shall be knowledgeable of the product, system and technology on which they train. Personnel shall be factory trained, factory certified and/or otherwise recognized by the Designer as possessing sufficient experience and knowledge in the subject area.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 QUALITY ASSURANCE SUBMITTALS

- A. Provide documentation that demonstrates the qualification for each requirement articulated in this Section and in compliance with Section 01 33 0.

END OF SECTION 27 00 02

SECTION 27 00 03 - OWNER'S STANDARDS DOCUMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, Division 01 Specification Sections, Division 27, and Division 28 (if applicable) Specification Sections apply to this Section.

1.2 SUMMARY

- A. This Section includes the current version of the **City of Chicago Requirements for Cabling Infrastructure, dated 2019**. Comply with the requirements of this Section which shall be referred to as the "Owner's Standards Document."
- B. Related Requirements:
1. The requirements of the Contract Documents and the Owner's Standards Document shall be additive. E.g., if the Contract Documents require cables to be labeled, and the Owner's standards do not indicate labeling, labeling shall be provided as specified in the Contract Documents.
 2. Where other Division 27 and Division 28 Specification Sections and this Section (i.e., the Owner's Standards Document) are in direct conflict, the Owner's Standards Document shall supersede the requirements of other Division 27 and Division 28 Section(s). E.g., if the Contract Documents require cables to be labeled, and the Owner's Standards Document expressly states do not label cables, the Documents are in direct conflict and the Owner's Standards Document shall supersede the Contract Documents.

PART 2 - OWNER'S STANDARDS DOCUMENT

City of Chicago Requirements for cabling Infrastructure

The following pages are meant to service as a guideline for any new voice or data infrastructure work performed on city of Chicago facilities. Working in conjunction with the Department of Innovation and Technology and the Department of Fleet and Facility Management (2FM) the following pages are meant to act as a guide to implement local area network (LAN) technology in a consistent way. This document is the network wiring standards established for the City of Chicago including a standardized cabling system and physical topology for our network.

The audience for the manual is anyone involved in network wiring projects.

. The benefits of following the standardized system include:

- Maintaining district wide consistency and standardization to promote efficient maintenance by city personnel.

- Supporting multi-vendor equipment
- Simplifying moves, additions, and changes
- Allowing for future applications -- “future proofing” the cabling system for any forthcoming technologies
- Saving time and money in cable maintenance.

In summary, network wiring which follows these standards should provide excellent infrastructure to support LANs and backbone wiring from the Main Distribution Frame (MDF) Room to the work stations. All work done In City of Chicago facilities must meet Chicago building codes, and must be coordinated with the department of Fleet and Facility Management (2FM). Installations are to be done to comply with BICSI standards. All the guidelines listed herein are subject to change to meet specific needs if requested.

MDF/IDF layout

Digital photos of MDF's and IDF's are to be submitted at the completion of the project. These closet specifications are for all closets including the IDF's and the MDF. The Construction is to be no smaller than 8' x 8' with exception of netpop. Door should swing out and not into the closet if possible, and width of door must meet industry standards. Network closets are to be accessible from hallway areas and not located inside other rooms. At least one 4' x 8' raised $\frac{3}{4}$ " fire-rated plywood or plywood which is painted with at least two coats of fire resistant white paint shall be in each closet and the location will be determined by Network Services staff member. Closets are not to be shared with other building services, such as electrical and custodial. Reasoning is due to potential EMF interference and possible threat of damage to the equipment and wiring. Telecommunications closets shall not contain any type of sink, be used as janitorial supplies storage or be used general storage areas (books, furniture, etc.). Floors in telecommunications rooms shall be sealed concrete or tile. Carpeted floors are unacceptable due to the potential for static electricity and the subsequent threat of damage to network distribution equipment.

1. Where possible, telecommunication closets will be stacked on each floor.
2. Each telecommunications closet will have a minimum of three (3) four inch Sleeved core holes between floors. Empty core holes will be properly fire-stopped according to Chicago code.
3. All cables shall have a minimum of 15 foot service loops inside the MDF or in the ceiling above it, and shall have a minimum of 6 inch service loop at the workstation outlet. (inside the box)
4. Adequate lighting is required throughout the closet space. .
5. All metal components (racks, ladder tray, etc) are to be properly grounded per Chicago Electrical Code and industry standards.
6. All racks need to be bolted to the floor.

7. Electrical in each IDF is to include:

- (2) 120V 20AMP circuits with duplex receptacles the Location of these outlets will be determined by placement of rack and telephone equipment.
8. All closets need ventilation, exhaust fans are acceptable.
9. Provide a minimum of (1) 2" conduit should be provided from MDF to basement IDF
10. Provide a minimum (1) 7' 19" standard 2 post rack in each IDF.
11. Provide a copper grounding bus bar with #6 MNG.

Riser fiber cabling

The Data Network fiber cable risers consist of a composite of multi-mode and fiber cables terminated to EIA/TIA standards using rack-mounted nineteen inch (19.00") patch panels. The number of fiber pairs from the MDF to each IDF will be minimum 6 multimode strands. All connectors will be dual LC style. All fiber is to be labeled with P-Touch or similar electronic device. Handwritten labeling is not acceptable. Electronic and hard copy test results are to be provided. Contractor is to be certified in fiber termination. All newly installed Fiber is to be 50 micron. All patch cords, hardware and associated accessories must be 50micron as well. 62.5 micron can only be used if specified by 2FM and or DOIT. Fiber is to be terminated in 19" racks complete with vertical and horizontal wire management. Fiber is to be terminated at the top of the rack unless otherwise specified. Network Services. A service loop of 30 feet of fiber is to left inside the MDF and be properly secured and dressed.

Voice Network:

Due to the city wide VOIP migration it may be acceptable to provide the 3rd (Blue cable) for each location on a patch panel in the typical 568B wiring configuration and tested to meet BICSI/TIA EIA standards for cat 6 cable. **OR** Category 6A may be supplied with a 2 cable configuration with approval from 2fm, **OR** in cases where the traditional PBX based system is to be used the following standards should be applied. The voice network backbone will be traditional 100 pr cat 3 copper cable. The cabling from the workstation for the voice is punched on 110 Blocks on the plywood in the IDF. Copper for voice services is to be terminated on category 6 or higher with appropriate 110 blocks on a raised backboard. All cables are to be terminated according to EIA/TIA 568-A Cat 6 standards. Station locations are to be terminated to the right of the riser pair terminations. All riser and station terminations are to be electronically labeled with a P-touch or similar device, no handwritten labeling is accepted. Riser cables will be terminated on 110 style punch down blocks. Punch-down order should follow traditional USOC color code order for multi-pair telephone cables punched on 110 Blocks. The amount of riser cable to IDF will be dependent upon the amount of stations needed to be fed + 25%

An electronic CAD drawing accurately reflecting all cable drop locations and corresponding labeling must be submitted to DOIT and 2FM.

Voice/Data Workstations, Conduits, Wiremold and Outlets:

All cable drops must have a minimum of 1 voice (category 6) and 2 data (category 6 or higher) unless specified differently by Network Services. The color of the cable and matching jacks should be as follows: 1 Red cat 6, 1 White Category 6, and 1 Blue category or 1 White and 1 Blue Category 6A cable. From the systemax gigaspeed product line made by Commscope or equivalent in performance. Example: Outlets models MGS400 for Cat 6 and MGS600 for Category 6A. All cabling for data should meet or exceed 1 Gigabit, or 10 Gigabit performance respectively between the patch panel IDF and work stations. Any office space greater than 8' x 8' should have a minimum of 2 cable drops (STOs or LOCs) if not specified on print with 3 copper cables (1 voice and 2 data or 3 Data in the case of VOIP). Locations of the cable drops are to be on opposite sides of the room, enclosed within the walls and conduit provided to each location. Metal conduit is to be one 3/4" at a minimum. Any unused conduits are to have a pull string left in place. Any unused gang openings will be filled with a blank module filler*. In the event that the cabling cannot be run behind the walls, wire mold or exposed conduit may be used if signed off on by 2FM project manager., i.e. existing concrete walls . The height of the network location is to meet industry cable standards or determined by the architect. Each cable drop will be labeled with IDF and numerically from 001-999. The drop # is determined by walking into the room and numbering the cable drops from left to right working in a clockwise direction. All labels are to be electronically labeled with a P-touch or similar device, no handwritten labeling is accepted.

Patch Panels

Patch Panels must be category 6 and must be labeled to match field labeling. Patch panels shall be 48 port in size. Each rack unit taken up by a patch panel must be accompanied by an equivalent amount of horizontal wire management with covers. Generally patch cords are supplied by DOIT, but if requested must fit within wire management, be of correct length, category, and be installed in a neat and workman like manner.

Cable and outlet color code

- Wireless access point (AP) pulls are to be 1 category 6 **grey** in color.
- Time clock pulls (if required) are to be done with category 6 cabling **yellow** in color.
- Camera cables are to be done with category 6 cabling **purple** in color terminated on a separate patch panel in the telecommunications closet.
- Work station voice cables are to be done with category 6 cabling **blue** in color
- Work station Data cables are to be done with category 6 cabling **Red** in color for Primary outlet and **White** in color for the secondary outlet.
- If colored conduit is required it should be **White** in color. • Outlet color should match cable color

Certification Requirements:

The Telecommunications contractor must be an approved Commscope or other Certified Installer (CI) A copy of certification documents must be submitted with the quote in order for such quote to be valid. The Telecommunications contractor is responsible for workmanship and installation practices in accordance with Commscope or other pre-approved manufacturer's recommendations.

PART 3 - EXECUTION (NOT USED)

END OF SECTION 27 00 03

SECTION 27 01 00 - OPERATION AND MAINTENANCE OF COMMUNICATIONS**PART 1 - GENERAL****1.1 SUBMITTAL REQUIREMENTS**

- A. Closeout
 - 1. Operation and Maintenance Manual: For equipment and systems to include in operation and maintenance manuals.
- B. Shop Drawings
 - 1. As-Built Drawings: For recording installed conditions that deviate from design documents.

1.2 OPERATION AND MAINTENANCE MANUAL

- A. The contents of operating and maintenance manual shall include the following:
 - 1. Project Information Cover: Title of Project; Name and address of Owner, Design Professionals, Contractor of Record and Subcontractor; System name and specification references.
 - 2. Index: Contents of the manual.
 - 3. Warranty Statements: Furnish a warranty statement for each system, reiterating the terms of warranty identified within the Contract Documents, and identifying how the Owner is to obtain warranty service. Clearly identify which products are covered by Manufacturer warranties beyond the Contractor required minimum warranty period. The term of manufacturer warranty shall also be identified (e.g., 1-year parts and labor). Identify the date that the warranty for the system starts. This date shall be the date listed on the Certificate of Substantial Completion (if one was issued to the contractor specifically for the system) or the date listed on the Notice of Final Completion. Supply standard out-of-warranty service rates and service contact information.
 - 4. Bill of Materials: List of products supplied, and serial numbers of each product.
 - 5. Product Datasheets and Shop Drawings: Manufacturer datasheets and shop drawings for each product and system supplied.
 - 6. Manufacturer Owner / User Manuals: Manufacturer's Owner's or User's manual for each product, and Manufacturer's Installation instructions and other documentation supplied with the product.
 - 7. Extra Material Schedule:
 - a. Complete spare parts schedule for components of equipment furnished, which are not factory generic information, but accurate for the equipment provided.
 - b. Itemized list of each piece of communications, architectural and Owner equipment having communications connections with termination locations; also, list related expendable equipment required for each item as applicable.
 - 8. Maintenance Procedures: Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; testing, aligning and adjusting instructions.

9. Function and Operating Descriptions: Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
10. Operating Procedures: Manufacturer's printed operating procedures including start-up, break-in, normal operating instructions, regulation, control, stopping, shutdown, and emergency instructions.
11. Include Product Certificates, Source quality-control test reports and Field Quality-Control Reports
12. Test Reports and Checklists: Test reports, checklists, and other forms generated and completed for the Project.
13. Training Information: Copy of training outlines/agendas, training session handouts, training sign-in sheets, and signed delivery receipt for each training session recording; Separate USB drive, labeled, for audio/video-recorded instructions to Owner, for operations and maintenance for each system.
14. As-Built Drawings.
15. Software: Application and operating software documentation; Software licenses; Software service agreements; Manufacturer's operating specifications; design user's guide for software and hardware; Editable configuration files for system equipment; Software source code used in supplied products; Compiled versions of configuration files and source code; IP addresses of products configured to have static IP addresses; MAC addresses of products featuring network communication ports (wired and/or wireless); Network device names for products configured for DHCP; Software required for reviewing and editing supplied files.

1.3 AS-BUILT DRAWINGS

- A. Obtain two complete sets of communications prints and use them to provide progress record drawings which are separate, clean, prints reserved for the purpose of showing a complete picture of the work as actually installed (including routing of conduit and cables). These drawings also serve as work progress report sheets. Make notations, neat and legible thereon daily as work proceeds. Make these drawings available for inspection at all times and keep them at the job at a location designated by the Owner's Representative.
- B. Maintain the clean, undamaged set of prints of drawings as well as a set of submittal drawings and coordination drawings. Mark the sets to show the actual installation where the installation varies from the Documents as originally shown. Include locations of underground and concealed items if placed other than shown on the Documents. Where shop drawings are used, record a cross-reference at the corresponding location on the Drawings. Give particular attention to concealed elements that would be difficult to measure and record at a later date.
- C. Show changes in: size, type, capacity, etc., of material, device or piece of equipment, location of device or piece of equipment; location of outlet or source of building service systems; routing of piping, conduit, or other building services. Record location of concealed equipment, by indication of measured dimensions to each line from readily identifiable and accessible walls, column lines or corners of building. Indicate approved substitutions, modifications, and actual equipment and materials installed.

- D. Affix near the title block on each drawing the Contractor's Company Name(s), signature of Contractor's Representative(s) and current date.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 INSTRUCTION OF THE OWNER'S PERSONNEL

- A. Provide instruction in the proper operation and maintenance of equipment that requires routine servicing. Include the following:
1. Review of operation and maintenance manuals.
 2. Required tools.
 3. Extra Materials.
 4. Cleaning.
 5. Hazards.
 6. Warranties and maintenance agreements.
- B. Demonstrate equipment and systems operation including the following:
1. Start-up.
 2. Shut-down.
 3. Emergency conditions.
 4. Safety procedures.
 5. Setpoint and schedule adjustments.
 6. Economy and efficiency adjustments.

END OF SECTION 27 01 00

SECTION 27 05 01 - BASIC MATERIALS & METHODS**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes: Requirements applicable to work of this Division.
 - 1. Basic materials, methods and installation guidelines applicable to the installation of all communication systems.

1.2 QUALITY ASSURANCE

- A. Explosives
 - 1. Use of explosives at the project site shall not be permitted.
- B. Welding
 - 1. Welding at the project site, where necessary, shall be performed only by persons licensed to perform such work at the project site(s). Welding shall require a permit and the approval of the Owner's Representative. Request for permission to perform onsite welding shall be submitted in writing through designated project channels.

PART 2 - PRODUCTS**2.1 CABLE BUNDLING HARDWARE**

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Hellermann Tyton.
 - 2. Millepede, Inc.
 - 3. Panduit.
 - 4. Velcro.
- B. General: Provide reusable, adjustable cable straps.
 - 1. Hook and Loop Fastener:
 - a. Shall be utilized within all cabinets and racks and below the ceiling of Telecommunications and Equipment rooms.
 - b. Provide plenum rated ties in plenum environments.
 - c. Minimum cable strap width shall be 3/4-inch.
 - d. Basis of Design: Velcro One-Wrap Qwik Ties.
- C. Nylon Plastic Cable Management Ties:
 - 1. Not to be used within cabinets or racks or below the ceiling line in Telecommunications or Equipment rooms.
 - 2. Provide plenum rated tie in plenum environments.

3. Outdoor ties shall be Weather and ultraviolet resistant.
4. Sized as necessary for the quantity of cables.
5. Cable tie shall have no sharp edges when cut.
6. Basis of Design: Panduit PLT series.

PART 3 - EXECUTION

3.1 COORDINATION

- A. High Voltage Wiring
 1. Review all high voltage provisions for This Contractor's work with the Division 26 electrical contractor. Coordinate specific device termination, loading and circuiting requirements with the electrical contractor.
- B. Coordinate installation of new pathways with parties and the Work that will utilize the pathways, prior to installation.
- C. Review pre-existing pathways prior to installation of the Work, and report to the Designer any discrepancies between specified pre-existing pathway conditions and actual existing pathway conditions.
- D. Participate in coordination efforts through the preparation of shop drawings and details prior to fabrication or installation of any products. Coordinate actual clearance requirements of installed products.
- E. Begin coordination immediately upon award of contract. Coordinate the Work with other parties and adjust equipment locations accordingly. Participate in the preparation of coordination drawings.
- F. Devices and equipment shall be located symmetrical with architectural elements and shall be installed at the heights and locations shown on the Drawings. If a height or location is in question, seek immediate clarification from the Designer.
- G. Evaluate the Contract Documents and existing conditions to gain an understanding of the peculiarities and limitations of the spaces where the Work is to be performed. The final Work shall be accessible for servicing. Although the locations of equipment and conduit may be shown on the Drawings in certain positions, the architectural details and conditions existing on the Project shall guide the Contractor, coordinating the Work with that of others. Provide necessary offsets to provide a neat workmanlike arrangement.
- H. The Drawings are generally diagrammatic and indicate the design intent, required sizes, points of termination and, in some cases, suggested routes of raceways. However, it is not intended that the Drawings indicate fully coordinated routing and placement or necessary offsets.
- I. Refer to each Drawing, including enlarged plans, elevations, sections, and details for additional information that may include dimensions and greater resolution and notes that serve to refine the intent and further assist and guide installation.

- J. Work in harmony with other parties performing work at the project site so as not to cause any delays in pouring concrete or erecting masonry walls. Consult each Contract Drawing, including those predominately used by other trades, before installing Work so as to ensure that performance of Work will not interfere with or be adversely affected by Work of others.
- K. Attend each regularly scheduled project meeting as well as any special meetings called to coordinate and/or resolve special issues that arise during the course of the Project.
- L. Conflicts in equipment and materials shall be corrected prior to installation. Should there be a conflict with drawings of other trades, work with the other trades to correct the conflict while coordinating the Project (prior to installation). If a conflict cannot be resolved, seek the direction of the Owner's representative. Refer to the drawings used by other trades for details, dimensions and locations of their work and route around their work so as not to conflict. Work installed that creates a conflict shall be removed and readjusted to the satisfaction of the Owner's representative at the Contractor's expense.

3.2 INSTALLATION

A. General:

1. Cabling installed within open ceilings shall be ran in conduit or fully concealed from view behind the building structure.
2. Work installed in finished areas shall be concealed.
3. Sequence, coordinate, and integrate installations of communications materials and equipment with the work of other trades for efficient flow of the Work.
4. Install systems, materials, and equipment to conform to reviewed submittal data, including coordination drawings.
5. Install systems, materials, and equipment level and plumb, parallel and perpendicular to other building systems and architectural/structural components (prevailing building lines), except as expressly detailed otherwise or required for proper form, function or Designer intended operation. Except where otherwise specified, detailed or directed by the Designer, install visible products level to within 1/8-inches per 100-feet.
6. Install equipment to facilitate servicing, maintenance, and repair or replacement of equipment components. Connect equipment for ease of disconnecting, with minimum of interference with other installations.
7. Install systems, materials, and equipment giving right-of-way priority to systems required to be installed at a specified slope.
8. Protect the structure, furnishings, finishes, and adjacent materials not indicated or scheduled to be removed.
9. Verify dimensions by field measurements. Take measurements and be responsible for exact size and locations of all openings required for the installation of work. Figured dimensions are reasonably accurate and should govern in setting out work. Where detailed method of installation is not indicated or where variations exist between described work and approved practice, direction of the owner's representative on job shall be followed.
10. If during construction it becomes apparent that certain minor changes in layout would result in a neater appearance or better arrangement, such alterations shall be made as part of the Contract. Designer's review shall be obtained before making such changes.

11. Workmanship throughout shall conform to the standards of best practice. Marks, dents or finish scratches shall not be permitted on any exposed materials, fixtures or fittings. Interiors of panels and equipment boxes shall be left clean.
- B. Cabling
1. Use caution not to exceed the manufacturer allowed bending radius for cables and not to compromise the integrity of the cables during installation by pulling cable management devices too tightly, damaging cables. Raceway/cabling bending radii shall be minimum as directed by cable manufacturer. Use pulling compound or lubricant where necessary to ensure cable does not experience tension beyond manufacturer limits during installation. Compounds used shall be compatible with the cable and pathway products and shall not cause deterioration of either.
 2. Where indicated, provide color-coded jackets to identify runs of different systems.
 - a. See related specifications and drawings for applicable color coding.
 3. Neatly route cables parallel and perpendicular to building architectural lines.
 - a. Cables and cable assemblies shall be run as straight as possible and symmetrical (perpendicular to or parallel with) with architectural items and at a consistent elevation. Work installed diagonal to building members shall not be permitted.
 4. Neatly comb out multiple cable bundled runs to remove tangling and crossing of cables within the bundles. Neatly dress all cable work and provide vertical and horizontal cable management (or other approved method) for properly dressing all work at racks, control panels, backboards etc. See detail(s) if applicable.
 - a. To avoid Alien Crosstalk, do not cinch UTP cables into tight bundles.
 5. Cable shall be installed within approved pathways. Cables not installed within raceway, cable tray or ladder rack shall be supported by discrete cable supports. Support cables at box and faceplate.
 6. All penetrations to walls and floors designed to shall include metal sleeves. All sleeves shall be mechanically secured in place and sealed between the sleeve and structure. Apply firestop to the interior of the sleeve.
 7. Loosely bundle cables within racks, ladder racks, cable trays and in discrete cable supports. Utilize reusable cable bundling hardware. Utilize plenum-rated hardware in plenum spaces.
 8. Plenum-rated cable ties shall be used wherever wire ties are permitted and wherever plenum rated cable is used.
 9. Cable ties shall never be used in a manner that causes deformation of the cable jacket, damage to the cable, or has any adverse effect on the usability, specifications or longevity of the cable(s) on which it is applied.
 10. Velcro type wire ties shall be used in non-plenum spaces; in equipment racks; in rack cabinets, and; in related equipment housing enclosures and backboards.
- C. Cable Support
1. All cables shall be supported/anchored every 5 feet (or less) and within 12" of device boxes, outlets, racks/cabinets and cable tray.
 2. Use J-Hook type cable supports for all cables run outside of conduit or cable tray. Bridle rings shall not be used for Communications Technology cables.
 - a. Use separate J-Hook cable support systems for cables belonging to different systems and for cables carrying different operating levels. See Cable Separation guidelines in this section.
 3. Loosely secure cables at each J-Hook.

4. Cables shall not be directly or indirectly supported by a suspended ceiling or any other surface, support, material or structure not permissible for this use by all applicable codes and standards.
5. Cable pathway
 - a. Use and positioning
 - 1) Pathway shall be installed to form a reusable pathway system.
 - 2) Totally enclosed raceways (i.e. conduit, wireway, etc.) shall be utilized to span in-accessible or working spaces (i.e. offices, classrooms, etc.).
 - 3) Cable trays and discreet cable supports shall be utilized to support cables.
 - a) To form an open-top reusable pathway
 - b) Shall be used in accessible ceiling cavities and areas not accessible by the public (i.e. mechanical and service areas).
 - c) Shall follow corridors unless specifically noted otherwise.
 - d) Shall provide usable clearances above, below and beside for access space for the re-use of the pathway. Minimum 6" below and beside and 12" above.

D. Cable Separation:

1. Low-voltage cables shall be kept as far from electrical cables and equipment as possible. Avoid running low-voltage cables parallel to medium and high-voltage cables. When parallel runs cannot be avoided, keep low-voltage cables at least 24 inches away and cross cables at 90 degrees to minimize the risk of interference
2. Low-voltage cables shall not be permitted in the same conduit with high-voltage electrical cables.
3. Avoid running low-voltage cables any closer than 24 inches to any ballast type lighting fixture or other high RF energy producing device.
4. Cables for each system shall be installed separately and isolated from cables from other systems.
5. Cables carrying signals of different types and different nominal operating levels shall be kept separated to reduce the risk of undesirable interference and cross-talk between cables.
 - a. As a general rule, for each 25dBV difference in nominal operating level between cables, provide at least 6 inches of separation. Example 1: Cables with a 75dBV level difference between them shall be separated by 18 inches or greater. Example 2: Cables with a 13dBV difference between them shall be separated by 3 inches or greater.
 - b. Contractor shall provide additional separation to prevent and to remedy any crosstalk that adversely affects the performance and usability of the system, or that exceeds specific crosstalk performance guidelines defined elsewhere in these specifications.
 - c. Provide greater separation than this guideline where the contractor believes and/or determines it is necessary to prevent or remedy interference between cables.
6. Keep length of parallel runs to a minimum. Cross cables of different nominal levels at 90 degrees.
7. In common areas where cables from multiple systems are run in general proximity to one another, cables from each system shall be labeled to identify the system the cables serve.

8. Additional pathway devices/systems shall be provided as required to comply with cable separation requirements, including, but not limited to, conduits, sleeves, discrete pathway devices and cable tray.
- E. Cable Splices:
1. Splices shall not be permitted in any cable except where expressly specified and/or approved by the Designer.
 2. In cases where splices are specified and/or otherwise reviewed and permitted, splices shall be made within UL listed junction or device boxes. Open air connections shall not be permitted.
- F. Cable Terminations:
1. Termination types shall correctly match cable and device termination. As an illustration, if “spade lug” type of termination is appropriate, then the spade lug cable entry size shall match the cable used. The spade lug shall also have the correct stud size to match the terminal to which it is connected. Terminations shall be completed with tools designed and sized for the specific application and connector.
 2. Where field installed cables connect to manufactured products via pig-tails or connectorized cable assemblies, terminations shall be made within the product enclosure or within a UL approved box. Exposed and open air splices shall not be permitted.
- G. Strain Relief:
1. Permanently installed cables shall be properly secured with an approved device. Strain relief shall be applied typically within 6 inches from the point of entry into a product enclosure, junction box, pull box, or device box. When properly applied, the strain relief device shall not damage the cable being secured and shall not permit movement of the cable in any way that may adversely affect the long-term integrity of nearby connections.
- H. Identification:
1. General:
 - a. Identification shall be in English, except as otherwise noted.
 - b. Where identification is applied to surfaces that require a finish, install identification after the surface finish is applied.
 - c. Labeling products, color, sizes, nomenclature and location of the identification product are subject to the review of the Designer.
 2. Cables:
 - a. Each cable shall be uniquely labeled at each end.
 - b. Labels shall be permanent and feature computer generated type-written text.
 - c. Label text shall be bold-type and clearly readable by a person with average sight, and under the lighting conditions typical within the area of installation.
 - d. Labels shall be applied approximately 4-6 cable-inches from the point of termination.
 - 1) Adjust application to make legible during service/maintenance of system.
 - e. Systems cables installed for “Future Use” shall be clearly identified as such at both ends. Such cables shall be labeled to identify where the opposite end of the cable can be found.
 - 1) Not applicable for Structured Cabling for voice/data connectivity.

- f. Each cable installed shall be recorded on the as-built drawings.
- 3. Boxes:
 - a. Junction boxes and pull boxes shall be labeled on their interior and on their exterior covers with the identity of the system(s) the box serves along with the function of the box. Interior markings shall be made using permanent marker. Permanent marker may also be used on the cover of boxes installed in concealed areas (above accessible ceilings, for example). Exposed boxes shall be labeled with engraved plastic labels. Labels shall closely match the color of the box.
 - b. Device boxes, when first installed, shall be identified on its interior as to the system(s) served and the device(s) the box will contain.
 - 1) Where conduit feeding the device box is concealed, label the exterior of the conduit with permanent marker.
- 4. Equipment Racks, Cabinets, Enclosures:
 - a. Equipment racks and enclosures shall be labeled.
 - b. The nomenclature, color, size, installed location, and type of labels are subject to the Designer's review.
- 5. System Equipment:
 - a. Each individual instance of system equipment shall be labeled.
 - b. Front panel controls of equipment shall be labeled with nomenclature meaningful to the end user based on the intended use of the equipment in the system. Examples include, but are not limited to:
 - 1) Label router/matrix control panels with system specific input/output names.
 - 2) Label patch panels with meaningful input/output destination names.
 - 3) Label mixer input and output controls to identify the signal source and destination.
 - c. Professionally prepared, installed and readily visible "cheat sheets" may be acceptable under select circumstances with the approval of the Designer.
 - d. The nomenclature, color, size, installed location, and type of labels are subject to the Designer's review and approval.
- I. High Voltage Cabling (greater than 70.7 Volts):
 - 1. Cabling that carries voltages higher than 70.7 Volts RMS AC or DC shall be installed and terminated by persons licensed to perform such work.
- J. Plates and Panels:
 - 1. Box covers and faceplates shall be installed flush against the surface over which it is mounted. There shall be no visible gap between the backside of a plate/panel and the wall, ceiling or floor; there shall be no visible gap between the backside of plate/panel and a surface mount box to which the plate/panel mounts). Advanced craftsmanship and construction techniques shall be employed where necessary to achieve this.
 - a. The same shall apply to other wall and ceiling mounted products.
 - 2. Plates and panels shall be installed with all screw holes filled and fastened securely.
- K. Device Boxes, Pull-Boxes, Junction Boxes:
 - 1. Boxes installed in walls and ceilings shall be installed so that the box does not stand proud (protrude out beyond) of the finished surface. Boxes shall be installed such that when the mounted devices and cover plates are installed, the backside

of the cover plate rests flush with the finished surface of the wall or ceiling. Advanced craftsmanship and construction techniques shall be employed where necessary to achieve this.

3.3 GROUNDING

- A. Equipment shall be properly bonded to ground for the safety of personnel and property and as additionally necessary to satisfactory performance of the equipment.
- B. Comply with Section "Grounding and Bonding for Communications."

3.4 CUTTING, PATCHING AND SEALING

- A. General:
 - 1. Perform cutting as required for the execution of the Work. Unless directed otherwise in the field, provide related patching and painting to match surrounding methods, materials and colors. Any damage caused during the progress of Work shall be remediated. Perform cutting, fitting, and patching and materials as required to:
 - a. Uncover Work to provide for installation of ill-timed Work.
 - b. Remove and replace defective Work.
 - c. Remove and replace Work not conforming to requirements of the Contract Documents.
 - d. Remove samples of installed Work as specified for testing.
 - e. Install equipment and materials within existing structures.
 - 2. Upon written instructions from the Owner's representative, uncover and restore Work to provide for observation of concealed Work by Owner's representative or by inspection by the Authority Having Jurisdiction.
 - 3. During cutting and patching operations, protect adjacent installations (e.g., structure, finishes, and furnishings). Where applicable, provide and maintain temporary partitions or dust barriers adequate to prevent the spread of dust and dirt to system components and components of other trades.
 - 4. Patch surfaces and building components using new materials matching existing materials and using experienced Installers. Refer to Division 01 for definition of experienced "Installer" or determine qualifications as directed in the field by the Owner's representative.
 - 5. Patching through fire rated walls and enclosures shall not diminish the rating of that wall or enclosure. Materials used for patching shall be installed to meet or exceed the smoke and fire rating of the respective surface being patched.
 - 6. Neatly cut and drill openings in walls and floors where openings are required for installation of the Work. Secure the approval of the Owner's Representative before cutting and drilling in existing facilities. Neatly patch any openings created.
 - 7. Cutting and patching shall be held to a minimum by arranging with other parties for sleeves and openings before construction is started.
 - 8. Provide factory-assembled watertight wall and floor seals, of types and sizes required, suitable for sealing around conduit, pipe, or tubing passing through concrete floors and walls. Construct seals with steel sleeves, malleable iron body, neoprene sealing grommets and rings, metal pressure rings, pressure clamps, and cap screws.

9. Pipe sleeves shall be fabricated from Schedule 40 rigid, heavy wall, full weight galvanized steel pipe; remove burrs. Use sleeves which are two standard sizes larger than conduit passing through respective sleeve.
10. Provide sleeve seals for piping that penetrates foundation walls below grade, or through exterior walls or roofs. Caulk between sleeve and pipe with non-toxic, UL-classified caulking material to ensure watertight seal. Elsewhere provide mechanical type seals, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.
11. Install standard Schedule 40 black steel pipe sleeves two sizes larger than pipes passing through floors, bearing walls, fire walls and masonry construction. Furnish and set forms required in masonry walls or foundation to accommodate pipes.

B. Grout:

1. Provide non-shrink, nonmetallic grout, pre-mixed, factory-packaged, non-staining, non-corrosive, and non-gaseous grout, recommended for interior and exterior applications.

C. General Joint Sealer Application:

1. Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
2. Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.
3. Clean affected surfaces, joints, etc. immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.
4. Apply sealant primer to substrates as recommended by manufacturer. Protect adjacent areas from spillage and migration of sealant, using masking tape. Remove tape immediately after tooling without disturbing seal.
5. Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
6. Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.
7. Colors for exposed seals shall be as selected by the Owner's representative from manufacturer's standard colors.

3.5 FIRESTOPPING

- A. Penetrations created in support of any work of this Division shall be firestopped in accordance with locally applicable codes as acceptable to the Authority Having Jurisdiction.

END OF SECTION 27 05 01

SECTION 27 05 26 - GROUNDING AND BONDING FOR COMMUNICATIONS**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - 2. Product Datasheets.
- B. Shop Drawings:
 - 1. Interconnectivity diagram, representing the total system as it is planned to be installed.
 - 2. Details and locations of components with description and routing of interconnecting cabling.
 - 3. Labeling schema.
- C. Closeout Submittals:
 - 1. System test results.
 - 2. Product Datasheets, one for each product.
 - 3. As-Built Drawings:
 - a. Interconnectivity diagram, representing the total system as it is installed.
 - b. Details and locations of components with description and routing of interconnecting cabling.
 - c. Labeling schema.

1.2 SUMMARY

- A. Section Includes:
 - 1. Grounding and Bonding System for Communications, including:
 - a. Copper Conductors.
 - b. Busbars.
 - c. Grounding/Bonding termination devices.
 - d. Mounting, connection and supporting hardware.

1.3 REFERENCES

- A. Definitions:
 - 1. Bonding: The joining of metallic parts to form an electrically conductive path.
 - 2. Bonding conductor (BC): A conductor that joins metallic parts to form an electrically conductive path.
 - 3. Bonding backbone conductor (BBC): The conductor that interconnects elements of the telecommunications grounding infrastructure.
 - 4. Common bonding network: Set of metallic components that are interconnected to form the principle means for effectively bonding equipment inside a building to the grounding electrode system.

5. Ground: A conducting connection, whether intentional or accidental, between an electrical circuit (e.g., telecommunications) or equipment and the earth, or to some conducting body that serves in place of earth.
 6. Grounding Electrode Conductor (GEC): Conductor used to connect the grounding electrode to the equipment grounding conductor, or to the grounded conductor of the circuit at the service equipment, or at the source of a separately derived system.
 7. Mesh Bonding Network: Bonding network to which all associated equipment (e.g., cabinets, racks, frames, trays, pathways) are connected using a bonding grid, connected to multiple points on the common bonding network.
 8. Primary bonding busbar PBB: A busbar placed in a convenient and accessible location and bonded, by means of the telecommunications bonding conductor, to the buildings service equipment (power) ground (formerly known as the telecommunications main grounding busbar TMGB).
 9. Secondary bonding busbar SBB: A common point of connection for telecommunications system and equipment bonding to ground, and located in the distributor room (formerly known as the telecommunications grounding busbar TGB).
 10. Telecommunications bonding backbone (TBB): A conductor that interconnects the telecommunications main grounding busbar (PBB) to the telecommunications grounding busbar(s) (SBB).
 11. Telecommunications bonding conductor (TBC): A conductor that interconnects the telecommunications bonding infrastructure to the building's service equipment (power) ground.
 12. Telecommunications equipment bonding conductor (TEBC): A conductor that connects the telecommunications main grounding busbar (PBB) or telecommunications grounding busbar (SBB) to equipment racks or cabinets.
- B. Reference standards:

1.4 SYSTEM DESCRIPTION

- A. The system shall provide Standards and Code compliant bonding of products to ground for the safety of equipment, personnel and property and for the stable and reliable operation of connected equipment.
 1. The system shall be configured to ensure proper operation of equipment. The system shall not result in ground currents that adversely affect the performance of the connected systems using the system.
 2. The system shall derive its main ground connection from the Electrical Grounding Electrode System as defined by the NEC, the same electrode system used to establish the main/common ground for the building electrical system.
 3. The system shall connect to Electrical Grounding Electrode System at a single point. Coordinate and comply with Section 260526 "Grounding and Bonding for Electrical Systems" where applicable.
 4. The system shall be visually verifiable and adequately sized to handle expected currents safely, directing potentially damaging currents away from sensitive network equipment.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.
- B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 1. Chatsworth.
 2. Erico Electrical Products.
 3. Harger Lightning & Grounding
 4. Storm Power Components.
 5. Panduit.
 6. Thomas and Betts
- C. Bonding and grounding connectors shall be Listed for the application (e.g., above ground, direct buried, bonding to the metal frame of a building).

2.2 BUSBARS

- A. Primary Bonding Busbar (PBB) (Formerly TMGB):
 1. UL Listed.
 2. Electro-tin plated to inhibit corrosion.

3. 1/4-inch thick (minimum) copper bar.
 4. Insulated stand-offs.
 5. For use with matched Listed lugs and hardware.
 6. 4 inches high (minimum) by 20 inches wide (minimum).
 7. Comply with BICSI and TIA/EIA-607-B requirements.
 8. Provide hole spacing to match Panduit LCC series two-hole lugs.
 9. Basis of Design: Panduit GB4B0624TPI-1.]
- B. Secondary Bonding Busbar (SBB)(Formerly TGB):
1. UL Listed.
 2. Electro-tin plated to inhibit corrosion.
 3. 1/4-inch thick (minimum) copper bar.
 4. Insulated stand-offs.
 5. For use with matched Listed lugs and hardware.
 6. 2 inches high (minimum) by 20 inches wide (minimum).
 7. Comply with BICSI and TIA/EIA-607-B requirements.
 8. Provide hole spacing to match Panduit LCC series two-hole lugs.
 9. Basis of Design: Panduit GB2B0312TPI-1.
- C. Rack Bonding Busbar Kits:
1. Optimized for installation on 19-inch racks or cabinets meeting EIA-310-D.
 2. Available pre-assembled with mounting screws.
 3. Electro-tin plated to inhibit corrosion.
 4. Provide quantities of busbars to handle a quantity of two-hole connectors equal to a minimum of one-half of the total rack units (RUs).
 5. Provide hole spacing to match Panduit LCC series two-hole lugs.
 6. Basis of Design: Panduit RGRB19U (minimum) for threaded rail fasteners and Panduit RGRB19CN for cage nut rail fasteners.

2.3 TERMINATIONS AND HARDWARE

- A. Conductor Terminations – Compression Lugs:
1. Two-hole lugs long barrel type, with window.
 2. Shall meet TIA/EIA-607-B requirements for network systems grounding applications.
 3. Tin-plated copper to inhibit corrosion.
 4. Long barrel to maximize the number of crimps, providing premium wire pull-out strength and electrical performance.
 5. Color coded on barrel for correct die selection.
 6. Inspection window to assure full conductor insertion.
 7. Available with NEMA and BICSI hole sizes and spacing.
 8. UL Listed.
 9. Basis of Design: Panduit LCC series.
- B. Conductor HTAP Kits:
1. Used as a splice or to tap smaller conductors into larger continuous conductors.
 2. Tin-plated to inhibit corrosion.
 3. Slotted design to assist assembly.
 4. Matching clear covers with UL 94V-0 flame rating.
 5. Color coded for correct die selection.

6. UL Listed.
 7. Basis of Design: Panduit HTCT series and CLRCVR series.
- C. Conductor CTAP (splice):
1. Used for copper-to-copper splicing or pigtail tap splicing.
 2. Manufactured from high conductivity wrought copper. Tin-plated to inhibit corrosion and oxidation.
 3. Ribbed design for high strength.
 4. Color coded for correct die selection.
 5. UL Listed.
 6. Basis of Design: Panduit CTAPF series.
- D. Grounding Clamps for Conduit:
1. Creates electrical bond for copper conductor parallel to, or at a right angle to a rod, tube or pipe.
 2. Made from high strength, electrolytic cast bronze.
 3. High strength silicon bronze hardware providing long-term, reliable assembly.
 4. Accommodates wide range of pipe, tube, rod and conductor sizes.
 5. UL Listed for grounding and bonding with AWG conductor and suitable for direct burial in earth or concrete.
 6. Basis of Design: Panduit GPL series.
- E. Universal Structure Grounding Clamps:
1. Bonds structural steel (e.g., steel beams, steel columns) to bonding network.
 2. Universal, fitting a wide-range of standard (angled) and wide flange structural members.
 3. Provides a mounting pad suitable for a two-hole compression lug.
 4. UL Listed.
 5. Basis of Design: Panduit GUBC500-6.
- F. Split Bolts:
1. Tin-plated to inhibit corrosion and bond to galvanized wire baskets and Flex Tray.
 2. Manufactured from high strength copper alloy to resist corrosion and provide premium electrical and mechanical performance.
 3. Utilizes pressure bar to connect securely to range of conductor combinations.
 4. UL Listed.
 5. Basis of Design: Panduit SBC series.
- G. Auxiliary Cable Brackets (Conductor Pathway):
1. Used for mounting telecommunications bonding conductors outside of cable tray.
 2. Supports grounding conductors in the telecommunications room, allowing separation of grounding conductors from other cables.
 3. Holds up to four (4) conductors in sizes up to 750 kcmil.
 4. Maintains minimum 2-inch separation between bonding conductors and other types of cabling per TIA/EIA-607-B.
 5. Paint piercing teeth provide electrical continuity between cable pathway sections.
 6. Provide with bonding jumper kits to bond sections of basket tray or ladder rack.
 7. Front and back mounting screw options for installation and visual inspection.
 8. Basis of Design: Panduit GACB series.
- H. Armored Cable Grounding Kit:

1. Provides a secure bond to the armor sheath on indoor and indoor/outdoor cables.
2. Work-gear design to evenly distribute force across the armor.
3. Manufactured from steel and aluminum material compatible with common armor.
4. Black insulating cover/protector.
5. Basis of Design: Panduit ACG series.

I. Bonding Accessories:

1. Anti-oxidation paste for copper-to-copper and copper-to-steel connections.
 - a. Basis of Design: Panduit CMP-300-1.
2. Thread Forming Bonding Screws:
 - a. Color coded Green.
 - b. Penetrates painted surfaces to provide electrical connection.
 - c. Shall have "Phillips" head.
 - d. Basis of Design: Panduit RGTBS series.
3. Bonding Cage Nut:
 - a. Color coded Green.
 - b. Creates electrical bond between the mounting rails and equipment.
 - c. Basis of Design: Panduit CNB series.
4. Paint Piercing Grounding Washer Kit:
 - a. Color coded Green.
 - b. Penetrates painted surfaces to provide electrical connection.
 - c. Supplied with antioxidant compound.
 - d. Basis of Design: Panduit RGW series.
5. Bonding Stud Kit:
 - a. Color coded Green.
 - b. Incorporates paint piercing serrations to create a bond point between the rack and painted patch panels, mounted equipment, servers, busbars and jumpers.
 - c. Basis of Design: Panduit TRBS series for threaded rail fasteners and Panduit CGNBSK for cage nut rail fasteners.

2.4 BONDING CONDUCTORS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work, include, but are not limited to, the following:
1. American Insulated Wire Corp.
 2. Brintec Corporation.
 3. Cablec.
 4. Carol Cable Co., Inc.
 5. General Cable.
 6. Senator Wire and Cable Co.
 7. Southwire Company.
- B. Bonding and grounding conductors shall be copper. Conductors may be insulated.
1. When conductors are insulated, they shall be Listed for the application and environmental conditions.
 2. The telecommunications bonding conductor (TBC), each telecommunications bonding backbone (TBB), and each backbone bonding conductor (BBC) shall be green or marked with a distinctive green color.

- C. Conductors shall be sized using engineered calculations. Reference Table 1 (Part 3 of this Section).
 - 1. The TBB conductor shall be sized at 2 kcmil per linear foot of conductor length up to a maximum size of 750 kcmil. The minimum TBB conductor size shall be a No. 6 AWG.
 - 2. The bonding conductor for telecommunications (TBC) shall be, as a minimum, the same size as the largest TBB.
 - 3. The backbone bonding conductor (BBC) shall be, as a minimum, the same size as the largest TBB.
- D. Grounding conductors shall not decrease in size as the grounding path moves closer to earth.

PART 3 - EXECUTION

3.1 GENERAL

- A. Ground electrical systems and equipment as required by code, utility, local ordinances, and requirements herein, including referenced Standards.
- B. Work shall be installed in accordance with the Contract Documents, manufacturer's recommended installation practices, applicable codes and referenced Standards.
- C. System installation and connections shall be visually verifiable.
- D. Contractor shall bring to the Owner's attention any existing system elements not compliant with modern grounding and bonding requirements for possible remediation.

3.2 INSTALLATION

- A. General:
 - 1. Provide PBB/SBB, required conductors and terminations for each communications room or space for grounding and bonding. Provide required connections, terminations and products for a complete communications grounding and bonding system.
 - a. Isolate grounding busbars from the structure support by a 2-inch minimum separation using manufacturer's recommended insulating stand-offs and hardware.
 - 2. Minimize practical lengths and number of bends of bonding conductors to the PBB/SBB.
 - 3. Bonding conductors shall be continuous and routed in the shortest possible straight-line path, avoiding changes in elevations and sharp bends.
 - 4. Utilize H-Tap compression fittings with clear insulating covers to tap cables.
 - 5. Make connections in such a manner as to minimize possibility of galvanic action or electrolysis. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact will be galvanically compatible.
 - 6. Coat and seal connections involving dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

7. Use electroplated or hot-tin-coated materials to assure high conductivity and make contact points closer in order of galvanic series.
8. Make connections with clean bare metal at points of contact.
 - a. Utilize bonding screws and paint piercing grounding washer kits to attach painted surfaces.
9. Clean and apply an anti-oxidant to grounding busbars before fastening conductors.
10. Utilize exothermic welded connections for connections to structural steel and for underground connections except those at test wells. Install at connections to ground rods. Comply with manufacturer's written recommendations. Welds that are puffed up or that show convex surfaces indicating improper cleaning are not acceptable.
11. Tighten bonding and grounding connectors and terminals in accordance with the manufacturer's published tightening methods and practices. Where manufacturer's requirements are not indicated, tighten connections to comply with UL 486A and UL 486.
12. Utilize hydraulic compression tools to provide the correct circumferential pressure for compression-type connectors. Use tools and dies recommended by the manufacturer of the connectors. Provide embossing die code or other standard method to make a visible indication that a connector has been adequately compressed on the ground conductor.
13. Where insulated ground conductors are connected to ground rods, insulate the area of the connection and seal against moisture penetration of the insulation and cable.

B. Primary Bonding Busbar (PBB):

1. Locate the PBB in the telecommunications entrance facility (EF), and install on a plywood backboard (wall Lining).
2. Placement of the PBB shall provide for the shortest and straightest practical routing of the for telecommunications bonding conductor (TBC) and the primary protector grounding conductor.
3. The PBB shall be as close as practical to the electrical power panel (panel board) and shall be installed to maintain clearances required by applicable electrical codes.
4. When a panel board is located in the same room or space as the PBB, bond the alternating current equipment ground (ACEG) (when equipped) or the panel board enclosure to the PBB.
 - a. When a panel board for telecommunications equipment is not installed in the EF, the PBB shall be located near the backbone cabling and associated terminations.
 - b. Connections (bonds) between the communications grounding and bonding system and associated electrical panels shall be completed by a qualified electrician in accordance with guidelines in TIA/EIA-607-C and applicable electrical codes.
5. Coordinate with Division 26 for connection of the primary protector grounding conductor to the PBB. The TBC shall bond the PBB to the service equipment (power) ground.
6. TBC and TBB connections and conductors for bonding telecommunications equipment and pathways to the PBB shall utilize exothermic welding, Listed compression two-hole lugs, or two-hole exothermic lugs.
7. The PBB shall serve telecommunications equipment that is located within the same room or space.

8. When outside plant cables in the EF or equipment room (ER) incorporate a cable shield isolation gap, the cable shield on the building side of the gap shall be bonded to the PBB.
9. Minimum size of the PBB is as specified. If required, increase the size of the PBB to accommodate the number of necessary bonded connections.

C. Secondary Bonding Busbar (SBB):

1. Install SBB (s) on a plywood backboard (wall lining).
2. SBB shall be as close as practical to the electrical power panel (panel board) and shall be installed to maintain clearances required by applicable electrical codes.
3. When a panel board is located in the same room or space as the SBB, bond the alternating current equipment ground (ACEG) (when equipped) or the panel board enclosure to the SBB.
 - a. When a panel board for telecommunications equipment is not installed in the same room or space as the SBB, the SBB shall be located near the backbone cabling and associated terminations.
 - b. Connections (bonds) between the communications grounding and bonding system and associated electrical panels shall be completed by a qualified electrician in accordance with guidelines in TIA/EIA-607-C and applicable electrical codes.
 - c. When a panel board for telecommunications equipment is not installed in the same room or space as the SBB, the SBB shall be bonded to the panel board that feeds the space.
4. When a bonding backbone conductor (BBC) is required, it shall be bonded to the SBB.
5. TBBs shall be bonded to the SBB with a conductor the same size as the SBB.
6. BBC and TBB connections and conductors for bonding telecommunications equipment and pathways to the SBB shall utilize exothermic welding, Listed compression two-hole lugs, or two-hole exothermic lugs.
7. The SBB shall serve telecommunications equipment that is located within the same room or space.
8. Minimum size of the SBB is as specified. If required, increase the size of the SBB to accommodate the number of necessary bonded connections.

D. Conductors:

1. Bonding conductors shall be continuous and routed in a direct path to the point of termination. Conductors shall be copper and sized not less than a No. 6 AWG.
2. Bonding and grounding conductors for telecommunications shall not be placed in ferrous metallic conduit. If it is necessary to route through ferrous metallic conduit due to building constraints, the conductors shall be bonded to each end of the conduit using appropriately sized HTAP and conduit grounding clamps or grounding bushings at both ends of the conduit, as described in TIA/EIA-607-C.
3. The TBC and the BBC shall be, as a minimum, the same size as the largest TBB.
4. TBBs shall be sized for the length of the circuit between the connected SBB and PBB.
5. Conductors shall be sized, as a minimum, in accordance with the following chart. Individual conductors shall be upsized as indicated in the TIA/EIA-607-C Standard.
 - a. Table 1 – TBB conductor size versus length:

TBB/GE linear length feet (m)	TBB/GE size (AWG)
----------------------------------	----------------------

Less than 13 (4)	6
14 – 20 (4 – 6)	4
21 – 26 (6 – 8)	3
27 – 33 (8 – 10)	2
34 – 41 (10 – 13)	1
42 – 52 (13 – 16)	1/0
53 – 66 (16 – 20)	2/0
67 – 84 (20 – 26)	3/0
85 – 105 (26 – 32)	4/0
106 – 125 (32 – 38)	250 kcmil
126 – 150 (38 – 46)	300 kcmil
151 – 175 (46 – 53)	350 kcmil
176 – 250 (53 – 76)	500 kcmil
76 – 91 (251 – 300)	600 kcmil
Greater than 301 (91)	750 kcmil

6. Telecommunications bonding backbone (TBB):
 - a. TBBs shall be connected to the PBB and follow the backbone pathways.
 - b. TBBs shall be connected to the PBB and follow the backbone pathways.
 - c. Protect the TBBs from physical and mechanical damage.
 - d. TBBs shall be installed without splices.
 - 1) If splices are required due to distance and material limitations, required splices shall be accessible and located within telecommunications spaces. Splices shall be kept to a minimum.
 - 2) Segments of TBBs shall be joined by means of an exothermic weld, Listed irreversible compression-type connectors, or equivalent.
 - 3) Joints shall be supported and protected from damage.
7. Backbone Bonding Conductor (BBC):
 - a. Whenever two or more TBBs are used within a multistory building, bond the TBBs together with a backbone bonding conductor (BBC) at the top floor and every third floor in between (minimum) to the lowest floor level.
8. Telecommunications equipment bonding conductor (TEBC):
 - a. The TEBC connects the PBB/SBB to equipment racks, cabinets and other enclosures.
 - b. Cabinets, racks and other enclosures shall not be bonded serially. Each shall have a dedicated bonding conductor.
 - c. TEBC shall be continuous copper conductor sized not less than a No. 6 AWG or as the largest size equipment grounding conductor in the AC branch power circuit(s) serving the racks/cabinets. See Table 1, and size conductors accordingly.
 - d. Cable shields do not satisfy the requirements for a TEBC.
 - e. Connections to the TEBC shall be made with Listed irreversible compression connectors and with rack bonding conductors routed toward the PBB/SBB.

- f. TEBCs may be routed within cable trays, on the outside of ladder rack, tray supported at no greater than 3-foot intervals, or along equipment platforms.
 - g. TEBCs shall be separated a minimum of 2 inches from conductors of other cable groups (e.g., power, telecommunications cables).
 - 1) Exception: An exception may occur when conductors are grouped together to enter or exit a cabinet or enclosure. This grouping is acceptable, provided the conductors are separated on either side of the opening.
 - h. TEBCs shall be separated from ferrous material by a distance of at least 2 inches where achievable or shall be effectively bonded to the ferrous material.
 - i. TEBCs shall be connected to the cabinets/equipment racks. Each rack/cabinet shall have a suitable connection point to which the bonding conductor shall be terminated.
- E. Pathways, equipment, communications cabling and building steel:
- 1. Bond exposed cables in a telecommunications facility to ground as close as practical to the point of entrance, including bonding to ground the cable shields and metallic sheath members according to manufacturer's installation instructions.
 - 2. Where the building backbone telecommunications cabling incorporates a shield or metallic member, bond the shield or metallic member to the PBB or SBB where the cables are terminated or where pairs exit the cable sheath.
 - 3. Bond telecommunications conduits to the PBB/SBB.
 - a. Exception: short metallic pathways (e.g., wall and floor sleeves, J-hooks) are not required to be bonded.
 - 4. Bond cable runway/ladder sections together and to the PBB/SBB.
 - 5. Where building steel is accessible and in the same room as the PBB/SBB, bond the PBB/SBB to building steel. Test to verify ground conductivity to earth.
 - 6. Where the building steel is external to the room, but readily accessible, bond the building steel to the PBB/SBB. Test to verify ground conductivity to earth.
 - 7. Bond metallic enclosures, including telecommunications cabinets and racks, to the PBB/SBB.
 - a. Cabinets, racks and other enclosures shall not be bonded serially. Each shall have their own dedicated bonding conductor to the PBB or SBB.
 - 8. Bond equipment containing metallic parts in cabinets and racks to the telecommunications grounding system in accordance with the manufacturer instructions.
- F. Bonding of Equipment Racks and Cabinets:
- 1. The welded construction of a welded cabinet or equipment rack may serve as the method of bonding the structural members of the cabinet/rack together.
 - 2. Bolted cabinets/equipment racks shall incorporate bonding hardware (e.g., bolts, washers, nuts and screws) specifically designed to accomplish integral bonding of the cabinet and rack assembly, frame and support, and tested to meet applicable NRTL requirements.
 - a. If the hardware (e.g. bolts, washers, nuts and screws) are not specifically designed for grounding purposes, the paint shall be removed from bonding contact areas.
 - 3. Detachable metallic parts of equipment cabinets (e.g., frame, door, side panel, top panel) shall be connected to ground.

- a. When grounding/bonding jumpers are provided, the jumper shall be minimum No. 12 AWG stranded, high strand count, insulated copper conductor with green or green with yellow stripe jacket. The jumper shall have an easily visible quick connect to facilitate detaching/attaching the door or panel.
- 4. Larger equipment (e.g., chassis switches) with integral grounding terminals or pads shall be bonded to the rack-mounted busbar with equipment grounding kits.
- G. When secondary protection is provided, connect the secondary protector grounding conductor to the nearest PBB or SBB using the shortest grounding conductor practical.
- H. Comply with manufacturers' grounding and bonding requirements when installing equipment.

3.3 FIELD QUALITY CONTROL

- A. Visually verify continuity of the communications grounding and bonding system throughout the installation, including, but not limited to the continuity of the communications bonding system from equipment, through racking systems, to overhead or underfloor backbone to the wall-mounted busbar between and within each communications room.
- B. Visually verify the use of appropriate grounding and bonding accessories in the racking systems, including, but not limited to grounding washers, thread-forming grounding screws and ESD ports and wrist straps.
- C. Visually verify size and installation of the telecommunications bonding backbone, including properly sized and installed grounding equalizer conductors between backbones contained in separate risers.
- D. Verify that where conductors pass through conduit, the conduit is bonded to the grounding conductor and as required by TIA/EIA-607-C.
- E. Verify conductors and connections for proper tightness and installation, including verification that proper dies were used on compression taps and fittings.
- F. Opens or gaps in the grounding and bonding system shall be documented and remedied.

3.4 TESTING

- A. Comply with testing identified in TIA/EIA-607-C.
- B. Utilize a two-point ground/continuity testing to determine if there is an acceptable maximum level of resistance between any point in the telecommunications bonding and grounding system and the building's electrical grounding electrode system.
- C. Test is performed using an earth ground resistance tester configured for a continuity test (i.e., two-point test or a "dead earth" test).

- D. Prior to testing, perform a visual inspection to verify that the bonding and grounding system is installed according to applicable codes and the guidelines of the TIA-607-C.
 - 1. Due to the possibilities of ground faults traveling through the telecommunications bonding and grounding system, perform a voltage test prior to conducting the two-point continuity test and verify with the test equipment manufacturer's printed instructions. Consult with other contractors to ensure other work does not interfere with the test.
- E. Test shall be performed in the following areas:
 - 1. PBB/SBB to the electrical ground in communications rooms.
 - 2. PBB/SBB to the building steel.
 - 3. PBB to SBB.
 - 4. Building steel to the electrical ground.
- F. In order for valid test results, test shall be performed prior to communications equipment installation; otherwise, parallel paths may invalidate test results.
- G. The recommended maximum value for resistance between any point in the telecommunications bonding and grounding system and the building's electrical grounding electrode system shall be 100 milliohms.
 - 1. In the case of long TBB and BBC conductor runs, the resistance of the conductor must be factored into the total resistance. For example, 1 km of a No. 3/0 conductor has a resistance of 0.2028 ohms (0.06180 ohms per 1000 feet).
- H. Based on test results, the Owner reserves the right to request testing on 100-percent of the exothermic and compression bonds within the system.
- I. Bonded connections failing testing shall be remedied and retested by the installing contractor at the contractor's expense.

3.5 LABELING

- A. Comply with TIA/EIA-607-C for labeling requirements.
- B. Comply with TIA/EIA-606-B, or most current version, Administrative Standard for Telecommunications Infrastructure.
- C. Comply with Section 270553 "Identification for Communications".
- D. Label each component of the Grounding and Bonding System.
- E. Label for bonding and grounding conductors shall be nonmetallic and include the following information:

IF THIS CONNECTOR OR CABLE IS
LOOSE OR MUST BE REMOVED,
PLEASE CALL THE BUILDING
TELECOMMUNICATIONS MANAGER.

- F. Uniquely label PBB and SBB. Clearly record and key this information on the as-built drawings.

SECTION 27 05 28 - PATHWAYS FOR COMMUNICATIONS

PART 1 - GENERAL

1.1 SUBMITTALS

- A. Product Data:
 - 1. Raceway.
 - 2. Innerduct.
 - 3. Spillways/waterfalls.
 - 4. Floor boxes.
 - 5. Device boxes.
 - 6. Cable spillways.
 - 7. Discrete cable supports.

- B. Shop Drawings:
 - 1. Coordinated floor plan drawings depicting the size(s), locations, and dimensions of the following:
 - a. Primary pathways.
 - b. Conduit sleeves (e.g., thru-the-wall, thru-the-floor, and thru-the-bulkhead).
 - c. Roof penetrations.
 - d. Conduits: Trade-size 2 inches and larger.
 - e. Raceway: Featuring a cross-sectional area of ≥ 4 square inches.
 - f. Vertical and horizontal working clearances around tray and ladder rack.
 - 2. Conduit Interconnect Diagrams: for each totally-enclosed pathway system.

- C. Closeout Submittals:
 - 1. Accurate up-to-date as-built versions of shop drawings.

1.2 REFERENCES

- A. Definitions:
 - 1. Hybrid Pathway System: A pathway system built from a varied mixture of boxes, raceway, cable tray and discrete cable supports. Fundamentally a pathway system that is not a totally-closed pathway system. A hybrid pathway system supports cables in the horizontal at increments not exceeding 60 inches.
 - 2. Pathway: A collection of products that when used together achieve a complete means for the conveyance of cable(s) from one location to another. A pathway system protects and supports cables to various degrees depending upon the application and products used. The pathway system most frequently terminates into an enclosure, boxes or other apparatus where cables are terminated and associated devices are mounted.
 - 3. Primary Pathway: A cabling pathway typically located in a corridor, public area, or dedicated vertical cable chase and used to enclose and/or support large quantities of compatible-signal cables from one or more systems to the general vicinity of where cables are terminated. Cables carried by a primary pathway transfer to secondary pathways.

4. Raceway: An enclosed pathway component used for the routing of cables. The raceway envelops the cables that pass through it to protect them from physical damage, and at times from heat, humidity, corrosion and water intrusion. A raceway may feature a continuous outer shell, or in select cases (such as surface raceway) may feature a removable outer shell that facilitates installation and removal of cables. Raceway frequently terminates directly into boxes or enclosures used for the purpose of mounting devices and termination of the cables.
5. Secondary Pathways: Pathways typically branching from a primary pathway and routing to a space(s) where a cable is terminated. A secondary pathway typically accommodates sixteen (16) cables or less. A secondary pathway carries cables from a single system that together can be run in tight parallel proximity to one another without any negative impact on adjacent cables or cause distortion or induce consequential interference on the signals they carry.
6. Totally Enclosed Pathway System: A pathway system that is built from a mixture of boxes and raceway that when assembled are closed on all sides. Fundamentally it is a pathway system where the cables within the system are not visible and not accessible except when a component of the system, or a device mounted to it is removed. A totally enclosed pathway system supports cables run horizontally and continuously.

1.3 SPECIAL REQUIREMENTS

- A. Contract Division of Work and issuance of separate contracts notwithstanding, the entity(s) performing work of this Section shall have the responsibility to provide complete, working and code compliant pathway systems for the systems specified in this Division and for the additional systems so specified in the Contract Documents. Such systems shall be constructed in compliance with the Contract Documents.
- B. Provide complete, working and code compliant pathway systems for Division 27 and Division 28 Systems (where applicable), and as otherwise identified in the Contract Documents. Note that the Drawings may not fully detail the required complete pathway system and components.
- C. Should Work of this Section be performed by a party that is different from the party responsible for providing components (e.g., cabling) that utilize the pathway systems, the pathway provider shall:
 1. Review specifications of this Division and Division 28 Systems (where applicable) and the related Drawings to gain a complete understanding of the specific systems that will utilize the pathways.

1.4 SYSTEM DESCRIPTION

- A. General:
 1. Each communications pathway system shall consist of products to support, protect, enclose, manage and secure the cables that are part of the communication system they serve.
 2. Pathway systems shall be supplied and installed to meet the unique requirements of individual communications systems.

3. Separate pathway systems shall be provided for individual communication systems. Individual communication systems shall have unique and dedicated conveyances. Cables from individual communication systems shall be run in separate conveyances (e.g., data system cables shall be run in separate conveyances from sound system cables).
 4. Separate pathway conveyances shall be provided for cables that carry incompatible signal types (e.g., analog microphone level and speaker level cables shall be run in separate conveyances).
 5. Pathway systems shall include penetrations through walls, floors, ceilings, roofs, bulkheads and other physical barriers that are necessary to route cable between adjacent spaces.
 6. Pathway penetrations shall be prepped, installed, sealed and fire stopped in a code-compliant manner.
 7. Pathways through expansion joints shall include expansion and deflection joint fittings with bonding straps.
 8. Pathways shall be assembled from components that are listed by a recognized safety testing laboratory.
 9. The cable fill capacity of each pathway segment shall meet or exceed the capacity necessary to accommodate cables initially installed. Additional capacity shall be provided as identified in the Contract Documents. The sizes and quantities of conveyances shown on the Drawings shall be interpreted as minimums. Larger sizes, or additional quantities, shall be provided as required or further identified herein.
 10. Pathway systems shall be provided with sufficient support to carry the weight of the system, plus a full capacity of cables, with a safety factor of greater than or equal to 5. In addition, each individual above-the-floor vertical hanging support shall feature an installed static weight support capacity of not less than 200 lbs. (e.g., hanging all-thread, multi-anchor mounting flange and support cable).
 11. Pathway systems shall include matching cover plates over junction and pull boxes.
- B. Pathway Systems for Horizontal Copper, Coaxial and Fiber Cabling:
1. Hybrid pathway system.
 2. Minimum permissible conduit size: 1-inch.
- C. Pathway Systems for Building Intercommunication Systems (e.g., Central Sound/Intercom):
1. Hybrid pathway system.
 2. Minimum permissible conduit size: 1-inch.
- D. Pathway Systems for Voice Paging, Background Music, Foreground Music Systems:
1. Hybrid pathway system.
 2. Minimum permissible conduit size: 3/4-inch.
- E. Pathway Systems for Speech Privacy / Sound Masking Systems:
1. Hybrid pathway system.
 2. Minimum permissible conduit size: 3/4-inch.
- F. Pathway Systems for Audio and Video Systems:
1. Totally enclosed raceway system.
 2. Minimum permissible conduit size: 3/4-inch.

- G. Pathway Systems for Sound Reinforcement Systems:
1. Totally enclosed raceway system.
 2. Minimum permissible conduit size: 3/4-inch.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 RACEWAY

- A. Conduit:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Hubbell-Raco (Raco).
 - b. Allied Tube & Conduit / Atkore (Allied).
 - c. Republic Conduit (Republic).
 - d. CalConduit (CalConduit).
 2. Rigid Steel Conduit (RMC):
 - a. NEC Type RMC recognized.
 - b. Threaded rigid steel conduit shall be manufactured from mild steel, zinc galvanized both inside and outside including threads.
 - c. Constructed in accordance with ANSI C80.1, Underwriters Laboratories Safety Standard UL6.
 3. Intermediate Metallic Conduit (IMC):
 - a. NEC Type IMC recognized.
 - b. Threaded intermediate metallic conduit shall be manufactured from mild steel, zinc galvanized both inside and outside including threads.
 - c. Constructed in accordance with ANSI C80.6, Underwriters Laboratories Safety Standard UL6.
 4. Electric Metallic Tubing (EMT):
 - a. NEC Type EMT recognized.
 - b. Electric metallic tubing shall be manufactured from mild steel, zinc galvanized both inside and outside.
 - c. Constructed in accordance with ANSI C80.2, Underwriters Laboratories Safety Standard UL6.
 5. Flexible metallic conduit (FMC):
 - a. NEC Type FMC recognized.
 - b. Spirally wound double sized zinc galvanized steel.
 - c. Unjacketed.
 - d. Integral ground conductor.
 - e. Color: Natural zinc.
 6. Liquid-Tight Flexible Metal Conduit (LFMC):
 - a. NEC Type LFMC recognized.

- b. Spirally wound double sized zinc galvanized steel.
 - c. Overall liquid-tight outer jacket.
 - d. Integral ground conductor.
 - e. Color: Gray.
 - 7. Polyvinylchloride (PVC-A, PVC-B):
 - a. Constructed of Type C300 virgin polyvinylchloride.
 - b. Schedule 40 or Schedule 80 rated to 90°C.
 - c. Constructed in accordance with NEMA TC2 and Federal Specifications W-C-1094A.
 - 8. Conduit LB
 - a. Built in bend radius to protect cabling
 - b. Madison Electric Products Smart LB
- B. Communication Pole:
- 1. Manufacturers: Subject to compliance with requirements, provide the Basis of Design product listed, or Designer approved comparable product from one of the following manufacturers:
 - a. Panduit.
 - b. Wiremold.
 - c. Hubbell.
 - 2. Characteristics:
 - a. Designed for multi-service applications.
 - b. Metal construction.
 - c. Baked enamel or powder coat finish.
 - d. Factory pre-terminated AC outlets.
 - e. Dual internal cable compartments providing isolation for NEC Class 1 power and NEC Class 2 communications cables.
 - f. Designed for mounting Decora-style electrical and communication receptacles using NEMA-standard gang size plates.
 - g. Provided with manufacturer accessory mounting hardware, entrance end fitting, and ceiling trim plate.
 - h. Provide with manufacturer recommended accessories to allow Telecommunications Outlets to be installed, including cable entrance fittings, expansion fittings, etc.
 - 3. Reference Division 26 for specific information.

2.3 DISCRETE CABLE SUPPORTS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into work include:
- 1. Erico CableCat™ Series.
 - 2. Panduit J-Pro™ Series.
 - 3. Cooper/B-Line BCH Series.
- B. Product Requirements:
- 1. UL 2043 Listed and NEC compliant for use in plenum air returns.
 - 2. J-Hook style design.
 - 3. No sharp edges that could come in contact with supported cables during or after installation.
 - 4. Linear bearing surface for cable:

- a. For use with backbone cables: Greater than or equal to 1-3/4 inches.
- b. For use in primary pathways: Greater than or equal to 1-3/4 inches.
- c. For use in secondary pathway: Greater than or equal to 1-3/8 inches.
- d. For use with individual cables less than 0.400 inch diameter: Greater than or equal to 7/8 inch.

2.4 FITTINGS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 1. Hubbell-Raco (Raco).
 2. Allied Tube & Conduit / Atkore (Allied).
 3. Republic Conduit (Republic).
 4. CalConduit (CalConduit).
 5. Cooper Crouse Hinds.
- B. Rigid Steel or Intermediate Metallic Conduit:
 1. Threaded to NEMA standards for conduit.
 2. Integral non-conductive plastic throat liner to minimize/eliminate risk of cable abrasion during installation.
 3. Zinc galvanized steel.
 4. Conductive.
- C. Electric Metallic Tubing:
 1. Compression type.
 2. Integral non-conductive plastic throat liner to minimize/eliminate risk of cable abrasion during installation.
 3. Attachment: 100-percent concentric compression.
 4. Zinc galvanized steel.
 5. Conductive.
- D. Flexible Metallic Conduit:
 1. Fittings shall be manufactured by the same manufacturer as the raceway(s) it connects.
 2. Integral non-conductive plastic throat liners to minimize/eliminate risk of cable abrasion during installation.
- E. Polyvinylchloride (PVC-A, PVC-B):
 1. Fittings shall be manufactured by the same manufacturer as the raceway(s) it connects.
 2. Seal connections using PVC cement.
- F. Conduit Sealing Bushings:
 1. Factory-fabricated watertight conduit sealing bushing assemblies.
 2. Suitable for sealing around conduit or tubing passing through concrete floors and walls.
 3. Constructed of steel sleeve, malleable iron body, neoprene sealing grommets or rings, metal pressure rings, pressure clamps, and cap screws.

- G. Insulating Bushings:
1. Designed to protect cables from damage caused by sharp edges on the exposed end(s) of conduit and associated fittings, fully insulating the exposed end.
 2. Rated for use in the environment where the product is installed.
 3. Sized to match the conduit or conduit fitting to which it is applied.
 4. Soft radius non-conductive front edge to prevent damage to cables passing through the bushing.
 5. Sized to hold firmly to the conduit or fitting to which it attaches with sufficient strength that the bushing cannot and will not come free during the installation of cable.
 6. Non-conductive version:
 - a. Threaded version: Provide threaded version for use on the threaded end of conduits or fittings.
 - b. Press-on version: Provide press-on version for use on non-threaded end of conduits and conduit fittings.
 - c. Internal diameter of one end equal to or slightly less than the internal diameter of the conduit or fitting to which it attaches. The opposite end sized to match the conduit or fitting to which it is applied.
 - d. Designed for installation before any cable is installed.
 7. Conductive version:
 - a. Conductive metal frame.
 - b. Integral grounding lug.
 - c. Separate non-conductive insulator to protect cable.
 - d. Designed for installation before any cable is installed.
- H. Expansion/Deflection Fittings:
1. Shall provide 4" axial expansion/contraction
 2. Shall allow 3/4" parallel misalignment
 3. Shall allow up to 30 degree angular misalignment in any direction
 4. Basis of Design shall be Cooper Crouse Hinds:
 - a. 2" Expansion/Deflection joint fitting XJGD64 (Galv. Rigid Conduit)
 - b. Tinned copper Braid Bonding Jumper 24" BJ64
 - c. 2.5" Expansion/Deflection joint fitting XJGD74 (Galv. Rigid Conduit)
 - d. Tinned copper Braid Bonding Jumper 24" BJ74
 - e. 3" Expansion/Deflection joint fitting XJGD84 (Galv. Rigid Conduit)
 - f. Tinned copper Braid Bonding Jumper 24" BJ84
 - g. 4" Expansion/Deflection joint fitting XJGD104 (Galv. Rigid Conduit)
 - h. Tinned copper Braid Bonding Jumper 36" BJ108

2.5 PENETRATIONS

- A. All penetrations through walls, floors, and ceilings shall be sleeved.
1. Reference Firestopping for Communications specification for fire rated sleeve assemblies.
 2. All sleeves shall be metallic and shall have bushings at both ends.

2.6 BOXES

- A. Standard Wall and Ceiling Device Boxes:

1. General:
 - a. Stamped steel, code-compliant gauge, zinc galvanized.
 - b. Available in various depths from 2-1/2 to 3-1/2 inches deep, minimum.
 - c. Corrosion protection suitable for the atmosphere in which they are installed.
 - d. Non-modular sheet-steel construction.
 - e. Conduit knockouts of the size, quantity and locations required.
 - f. Threaded device-mounting screw holes.
 - g. Rated for installation in the space where the box is installed.
 - h. Equip boxes with code compliant accessory Class-1 and Class-2 service partitions when boxes are used in multi-service applications.
 2. Boxes in Masonry or Tile Walls:
 - a. "Masonry" style box construction.
 - b. Available in standard gang sizes from 1 to 10.
 - c. Available in various depths from 2-1/2 inches to 3-1/2 inches.
 - d. Conduit knockouts to suit the application.
 3. Boxes used within interior framed walls (e.g., gypsum board walls):
 - a. 1 to 2 Gang Sizes, 2-1/2 inches box depth:
 - 1) 4 inches square or 4-11/16 inches square box, 2-1/8 inches deep.
 - 2) 3/4" deep device ring (single or double as required).
 - b. 3 to 10 Gang Sizes:
 - 1) Multi-gang style box construction (not gangable), 2-1/2" depth.
 - 2) 3/4" deep device ring.
 - 3) Conduit knockouts to suit the application.
- B. Exterior Surface Mount Outlet Style Boxes:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 2. Adalet / Scott Fetzer Company (Adalet).
 3. Appleton Electric (Appleton).
 4. Characteristics:
 - a. Hinged cover, sized to accommodate the devices being mounted to the box.
 - b. Cast aluminum construction.
 - c. Available in standard gang sizes from 1 to 3.
 - d. Threaded conduit hubs.
- C. Junction Boxes and Pull Boxes:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Hubbell-Raco (Raco).
 - b. Allied Tube & Conduit / Atkore (Allied).
 - c. Republic Conduit (Republic).
 - d. CalConduit (CalConduit).
 - e. Hoffman.
 2. Characteristics:
 - a. Screw-cover type enclosure.
 - b. Covers fabricated of the same material and with the same finish as the box itself.
 - c. Boxes installed flush in wall shall be provided with oversize cover plates painted to match the surrounding building surface.

- d. Boxes shall be NEMA rated for the atmospheric condition in which the box is installed.
 - e. Boxes in exterior or moist locations shall meet NEMA 3R (at minimum).
- D. Specialty Wall/Ceiling Boxes:
- 1. Manufacturers: Subject to compliance with requirements, provide the Basis of Design product listed, or Designer approved comparable product from one of the following manufacturers:
 - a. FSR, Inc.
 - b. Legrand/Wiremold.
 - c. Hubbell Inc.
 - d. Chief.
 - 2. Type WB:
 - a. Recessed activation type wall box designed to allow connectorized cables to be plugged into internally mounted connectorized device plates while the cable connector is hidden behind a cover plate.
 - b. Material: 14-gauge zinc coated steel box.
 - c. Nominal rough opening size required for the back box: 14.25 inches by 7.1 inches.
 - d. Designed for multi-service.
 - e. Three separate 1-gang knock-outs for box attachment.
 - f. Accommodates NEMA standard-size gang plate for AC power.
 - g. Accommodates both pre-manufactured and custom manufactured plates for mounting low-voltage connectors.
 - h. Designed in part to serve the connection needs of wall mounted video flat panel applications.
 - i. UL-listed AC power compartment.
 - j. Standard Covers:
 - 1) Nominal size: 14.75 inches by 7.5 inches.
 - 2) Stamped steel construction.
 - 3) Cable passage slot in cover to allow cables to exit while hiding connectors beyond.
 - 4) Finish: baked on enamel.
 - 5) Color: To be selected from White, Black and custom paintable in the field.
 - k. Provide box with Architect/Designer choice of standard cover.
 - l. Basis of Design: FSR PWB-250.
- E. Floor Boxes:
- 1. Manufacturers: Subject to compliance with requirements, provide the Basis of Design product listed, or Designer approved comparable product from one of the following manufacturers:
 - a. FSR, Inc.
 - b. Legrand/Wiremold.
 - c. Hubbell Inc.
 - 2. See Division 26 for specific types

2.7 ACCESSORIES

A. Pull Strings:

1. Construction: nylon.
 2. Designed and rated by the manufacturer for use as a pull-rope.
- B. Fiber Optic Innerduct:
1. Manufacturers: Subject to compliance with requirements, provide the Basis of Design product listed, or Designer approved comparable product from:
 - a. Arnco.
 - b. Endot.
 - c. Opti-Com.
 - d. Pyramid.
 2. NEMA TC 5, UL listed, corrugated, specifically designed for optical fiber cable pathways.
 - a. Color: Orange.
 - b. 1-inch minimum inside diameter.
 - c. 600 pounds minimum pulling strength.
 - d. Factory installed pull rope.
 - e. UL Listed and NEC approved for the environment in which it is installed.
 - f. Basis of Design:
 - 1) Riser Rated Environments: Carlon DF4X1C-****.
 - 2) Plenum Rated Environments: Carlon CF4X1C-****.
- C. Cable Waterfalls (Spillways) – for Conduit:
1. Manufacturers: Subject to compliance with requirements, available manufactures offering products that may be incorporated into Work include, but are not limited to, the following:
 - a. Bejed, Inc.
 - b. LincTek, Inc.
 - c. Cooper/B-Line.
 - d. Chatsworth.
 - e. Cable Management Corp.
 - f. Panduit
 2. Product Requirements:
 - a. Available in 2 inches and 4 inches diameter for direct attachment to conduit stubs and sleeves.
 - b. Integral clamp for securing to EMT conduit.
 - c. Maintains proper bending radii for cabling entering the conduit served.
 - d. Self-fastening tie down system.
 - e. UL Listed and NEC approved for the environment in which it is installed.
- D. Supports:
1. General:
 - a. Supports, support hardware, and fasteners shall be manufacturer protected with zinc coating or with treatment of equivalent corrosion resistance using approved alternative treatment, finish, or inherent material characteristic.
 - b. Products used outdoors shall be hot-dip galvanized.
 2. Material Types:
 - a. Raceway Supports:
 - 1) Clevis hangers, riser clamps, conduit straps, threaded C-clamps with retainers, ceiling trapeze hangers, wall brackets, and spring steel clamps.
 - b. Fasteners:

- 1) Types, materials, and construction features as follows:
 - a) Expansion anchors: Carbon steel wedge or sleeve type.
 - b) Toggle bolts: All-steel springhead type.
 - c) Powder-driven threaded studs anchors: Heat-treated steel, designed specifically for the intended service.
 - d) Solid concrete anchors: Drop-in zinc plated steel tubular expansion shield with solid, cone-shaped expander plug.
- c. Cable supports for vertical conduit:
 - 1) Factory-fabricated assembly consisting of threaded body and insulating wedging plug for non-armored electrical cables in riser conduits.
 - 2) Provide with plugs with the number and size of conductor gripping holes as required to suit each individual application.
 - 3) Body construction: Malleable-iron casting with hot-dip galvanized finish.
- d. Threaded Rod Stock (All-Thread Rod):
 - 1) Available in 1/4-inch, 3/8-inch, 1/2-inch, and 5/8-inch sizes.
 - 2) Utilize 1/2 " for ladder/tray installations under 24" and 5/8" for 24" or larger.
 - a) Rod lengths over 6' will require a "Rod Stiffener" installation for 1/2" and 5/8" rods.
- e. Slotted Metal Angle and U-channel Systems:
 - 1) 16-gauge steel U-shaped channel;
 - 2) Available in a variety of sizes including: 1-5/8 inches square, 1-1/4 inches square and 13/16 inch square.
 - 3) Available with pre-punched and un-punched versions.
 - 4) Available with holes on top or sides of channel.
 - 5) Available with a wide-variety of fittings for field construction of structural support assemblies.
- E. Bushing, Knockout Closures and Locknuts:
 1. Provide corrosion-resistant box knockout closures, conduit locknuts and malleable iron conduit bushings, offset connectors, of types and sizes, to suit respective installation requirements and applications.
- F. Pipe Curb Assemblies:
 1. Manufacturers: Subject to compliance with requirements, available manufactures offering products that may be incorporated into the Work include, but are not limited to:
 - a. The Pate Company, PCC-series.
 2. Product Requirements:
 - a. Designed to seal around pipes penetrating through conventional or metal roofs.
 - b. Prevents the ingress of water into the building under all weather conditions.
 - c. Models available to accommodate all standard sizes or pipe from 1/2 inch to 10 inches O.D.
 - d. Stainless steel pipe fasteners.
 - e. Provide with manufacturer recommended accessories and options necessary to seal and prevent water infiltration.

PART 3 - EXECUTION**3.1 COORDINATION**

- A. Review and coordinate the size requirements of pathways with the suppliers and installers of cabling and devices. Pathway segments shall accommodate the quantity and type of cables that will be installed. Upsize pathway segments from any default and minimum size(s) identified so as to accommodate the cables that will be installed, including any future expansion capacities, as identified in the Contract Documents.
- B. Review the specific routes and composite length of planned pathway routes with parties responsible for supplying or installing cables as distance limitations will apply differently for different cables and applications.
- C. Coordinate the location and routing of pathways with work of this Division, the work of other trades, the work of the Owner, and existing site conditions (where applicable) to ensure adequate headroom, post installation access to and working clearances around the pathways. Review and verify HVAC, Fire Suppression, Electrical Power, Lighting and other Drawings for design coordination. Provide routes accordingly.
- D. Proactively participate with other trades in the creation of coordination drawings that depict primary and major secondary pathways. Emphasis shall be placed on ensuring that pathways are accessible for initial cable installation and readily accessible for reuse in accommodating future cable moves, additions and changes.
- E. Coordinate the colors and types of surface raceway with the color of surface raceway provided as work of both Division 26 and Division 28. Colors of raceways shall match, except where expressly reviewed and approved by the Architect/Designer.
- F. Ensure that pathways, as installed, are adequately sized for the cables to be installed and any future expansion capacities as identified in the Contract Documents.

3.2 GENERAL

- A. Provide specified pull wires in all cabling pathways.
- B. Ground and bond all systems in accordance with the NEC and ANSI/TIA/EIA 607.
- C. All installation material and practices shall fully comply with NFPA 70 "National Electrical Code" and ANSI/TIA/EIA 569A Commercial Building Standard for Telecommunications Pathways and Spaces.
- D. Coordinate work with the building structural systems and electrical installation.
- E. All work shall fully comply with these Specifications and related Drawings and all manufacturers' recommended installation practices.

3.3 PATHWAY SIZING

- A. Raceways shall be sized so that they are the larger of the following:
 - 1. Minimum size indicated within the Contract Documents.
 - 2. In accordance with the National Electric Code.
 - 3. As recommended by the product manufacturer.
- B. Discrete cable supports shall be sized so that they are the larger of the following:
 - 1. Minimum size indicated within the Contract Documents.
 - 2. In accordance with the National Electric Code.
 - 3. As recommended by the product manufacturer.

3.4 RACEWAY USAGE

- A. Rigid Steel (GRC) Conduit:
 - 1. Above grade, outside the building envelope, in exposed areas.
 - 2. Above grade, inside the building envelope, within high moisture areas.
 - 3. As a transitional component of a below grade conduit path where the conduit needs to pass through a poured-in-place concrete slab.
 - 4. As a sleeve through poured-in-place concrete slabs.
 - 5. Where specifically indicated on the Drawings.
- B. Intermediate Metallic Tubing (IMC) Conduit:
 - 1. Where specifically indicated on the Drawings.
- C. Electric Metallic Tubing (EMT) Conduit:
 - 1. Within the building envelope concealed within walls and ceilings.
 - 2. Above grade, inside the building envelope, where no other type of raceway is identified to be used.
 - 3. Where specifically indicated on the Drawings.
- D. Flexible Metal Conduit (FMC):
 - 1. Inside the building envelope as a component of a secondary pathway system where flexibility is necessary for constructability to meet specified objectives and where length of the segment does not exceed 6 feet.
 - 2. Inside the building envelope as the transitional segment of a raceway system and interconnection to permanently-cabled systems-furniture is necessary and where the length of the FMC segment does not exceed 12 feet.
 - 3. Where specifically indicated on the Drawings.
- E. Liquid-Tight Flexible Metal Conduit (LFMC):
 - 1. Above grade, outside the building envelope, between junction (or pull) boxes and connected devices (e.g., cameras) and where cables to/from the devices would otherwise be visually exposed or exposed to the elements.
 - 2. Above grade, outside the building envelope, between junction (or pull) boxes and connected devices requiring regular movement where cables to/from the device would otherwise be visually exposed or exposed to the elements.
 - 3. Above grade, inside the building envelope, between junction (or pull) boxes and connected devices (e.g., cameras) and where cables to/from the connected

- devices would otherwise be exposed to water or sustained periods of high moisture.
4. Above grade, outside the building envelope, between junction (or pull) boxes and connected devices requiring regular movement where cables to/from the device would otherwise be exposed to water or sustained periods of high moisture.
 5. Where specifically indicated on the Drawings.
- F. Polyvinylchloride (PVC) Conduit:
1. Below grade, where conductive conduit is not otherwise required.
 2. Where specifically indicated on the Drawings.
- G. Electrical Nonmetallic Tubing:
1. Where specifically indicated on the Drawings.
- H. Non-metallic:
1. Non-metallic raceway shall be used only where specifically indicated to be used in the Contract Documents.
 2. Non-metallic raceway shall only be used where specifically approved for use by the Designer.
- I. Conduit Sleeves:
1. In accessible but concealed ceiling cavities, wherever a cable needs to pass through a wall, floor, ceiling, bulkhead (or similar building obstruction) to get from one space to another.
 2. In unfinished areas, high to the ceiling, where a cable not installed in raceway, needs to pass through a wall, floor, ceiling, bulkhead (or similar building obstruction) to get from one space to another.
 3. Wherever one or more conduits must pass through a poured-in-place formed concrete structure.
- J. Wireway:
1. Where specifically indicated on the Drawings.
- K. Communications Poles:
1. Where specifically indicated on the Drawings.
- 3.5 DISCRETE CABLE SUPPORT USAGE
- A. Discrete cable supports shall be used to support cable that is not installed within raceway, cable tray or ladder rack.
 - B. Discrete cable supports shall be supported from the building structure, in a manner that is code compliant.
 - C. Discrete cable supports shall be anchored using accessories and hardware that is manufactured or recommended by the support manufacturer.
 - D. Discrete cable supports shall be spaced at horizontal increments not exceeding 60 inches on center. Additional supports shall be installed to limit cable sag to less than 9 vertical inches.

3.6 BOX USAGE

A. Boxes:

1. Boxes shall be used at device and equipment locations. Raceway shall terminate into an approved box, except where indicated.
2. Standard wall and ceiling boxes shall be used in walls and ceilings except where specialty boxes are indicated.
3. Boxes designed expressly for use within floors shall be used within floors. The type of box used shall be appropriate for the floor construction.
4. The size and type of boxes used shall accommodate the quantity and type of cable, raceway and devices the box must accommodate.
5. Junction boxes and pull boxes shall be sized to comply with the NEC, but not less than the sizes indicated in the Contract Documents.
6. Custom size and special order boxes shall be provided where custom sizes and special order boxes are required to meet the project requirements.

3.7 INSTALLATION

A. General:

1. Install in accordance with local codes. Adhere to clearance and fire protection regulations.
2. Install above-grade pathways parallel to and perpendicular to building elements.
3. Install pathways plumb and level except where changes in elevation are specifically necessary for constructability.
4. Document the exact routing of concealed pathways on as-built drawings.

B. Bonding and Grounding:

1. Conductive components of the pathway systems shall be bonded to ground in accordance with the NFPA and the NEC.
2. Additional grounding and bonding shall be provided as set forth in the Contract Documents.

C. Rustproof Fasteners and Hardware:

1. Install pathway components and associated mounted devices with stainless steel nuts, bolts, screws and washers when installed on the exterior of the building, when installed within unconditioned building spaces, and when the pathway serves exterior devices or devices in areas prone to sustained humidity levels in excess of 60-percent.

D. Conduit:

1. Install conduit in a concealed manner except where approved by the Designer in advance.
2. Install conduit terminations into boxes and enclosures using fittings featuring locknuts and insulating throat liners.
3. Install insulating bushings on the exposed ends of conduit stubs and sleeves.
4. Install insulating bushings on the exposed threaded portion of conduits and conduit fittings that terminate conduit to a box or equipment enclosure.
5. Support conduits by using pipe straps or trapeze hangers. Space supports not more than 8 feet on center. Secure supports by means of toggle bolts, inserts or expansion bolts.

6. Space wall brackets supporting conduits not more than 4 feet 6 inches on center. Secure supports by means of toggle bolts, inserts or expansion bolts.
7. Support raceway components directly from structural building systems, not from ceiling suspensions systems. Provide supplemental supports for junction or pull boxes.
8. Conceal conduit raceways under floors, in walls, above ceilings and in furred spaces within finished building areas.
9. Support single conduits 1-1/2 inches and larger by means of rod and cast ring hangers. Support multiple runs in similar manner or use a common trapeze hanger system.
10. Provide two-hole sheet metal pipe straps for surface mounted conduit supports on walls up to a height of 8 feet above the finished floor.
11. Pinch type hangers similar to minerallac shall only be used at heights greater than 8 feet.
12. Protect conduits during construction with temporary plugs or caps. Securely cap conduits until pull string, or cable is installed.
13. Do not install conduit horizontally in concrete slabs on grade.
14. Provide expansion/deflection fittings where raceway crosses the building expansion joints.
 - a. Utilize manufacturer recommendations for installation
 - b. Provide external bonding jumpers to bond metallic conduits across joint.
15. Conduit Routing:
 - a. If specific routing information appears on the Drawings, route and maintain conduits as shown. Should interference or a conflict arise, consult the Designer before proceeding with the Work.
 - b. If specific routing information does not appear on the Drawings, Determine the best route for the conduit in accordance with code, accessibility and other project guidelines.
16. Conduit bends:
 - a. Bends shall be made so that the conduit will not be flattened or kinked and so that the internal diameter of the conduit is not reduced.
 - b. The radius of the curve of the inner edge of any bend shall not be less than indicated by the National Electrical Code and TIA/EIA-569 Commercial Building Standard for Telecommunications Pathways and Spaces.
 - c. All conduit bends or fabricated elbows shall have a bend radius equal or greater than 4 times the trade size.
 - d. When it is necessary to make field bends, use tools manufactured for conduit bending.
 - 1) Heating of metallic conduit to facilitate bending is not permitted.
 - e. Constructing an outside entrance to a building from buried conduit to penetrate above the ceiling line will allow an exception for a 4 inches LB fitting at one end to allow placement of the conduit flat to the building outside wall.
17. Do not cut, burn, or drill any structural member to pass through or mount any pathway product without first obtaining approval in writing from the building architect and structural engineer.
18. Install above-ceiling conduits a minimum of 7 inches above ceiling tiles to permit ceiling tile removal.
19. Install conduits at least 6 inches away from insulated pipes, steam lines or any other hot pipes which they pass. Where the lines are not insulated, the clearances

shall be increased until the temperature of the conduit, with no live conductors enclosed, does not rise above the ambient temperature of the installation area.

20. Install flashing and counter flashing or pitch pockets for waterproofing of raceways, outlets and fittings that must penetrate the roof.
21. Install oversized sleeves in forms for new concrete walls, floor slabs, and partitions to allow for the passage of raceways.
22. Waterproof sleeved raceways shall be provided below grade and in areas prone to high moisture and condensation.
23. Outside Plant Conduits
 - a. All conduits shall drain into open bottom hand holes.
 - b. Minimum depth is 24-30"
 - c. Conduits may slope from middle of run

E. Pull Boxes:

1. Install each pull box indicated on the Drawings.
 - a. As additionally required by Code.
2. Install additional pull boxes outside the building envelope:
 - a. Every 500 running feet of below-grade raceway.
 - b. Every 180 degrees of raceway bend.
 - c. Every 100 feet of above-grade raceway. (less than 2")
 - d. Every 200 feet of above-grade raceway (2" and larger)
 - e. As additionally required by Code.
3. Install pull boxes in areas that will be accessible after installation. Accessible areas include spaces above removable tile ceilings and behind access doors that are installed expressly for this purpose. Do not install pull-boxes in locations that will not be accessible after construction is complete and is not accessible after permanently installed furniture or fixtures are installed.
4. Size boxes in accordance with the NEC. Use larger boxes where so specified.
5. Support boxes rigidly.
6. Land conduits on the boxes such that conduits enter and exit across from each other on opposite sides of the box so as to facilitate straight line pulling of cable through the box.
7. Do not use pull boxes in lieu of conduit bends, except as necessary by design or to meet constructability constraints.
8. When directional transition of the cables is necessary through a box, land conduits on the box so that they permit the largest possible bending radius for those cables that will pass through the box.

F. Pull Stings:

1. Install a usable pull string in every pathway prior to the installation of cables. The string shall be installed after pathway installation and prior to such time as the cable installer desires to install cable within the pathway. The string shall be used as an aid to the installation of cables.
2. Install a replacement pull string in each pathway as part of the cable installation process to facilitate installation of additional cable(s). Tie the pull-string off and tag for "Future Use."

G. Innerduct:

1. Install innerduct within and along pathways that will be used to accommodate fiber optic cables.

- a. Plenum rated innerduct shall be used in pathways that are not 100-percent conduit.
 - b. Exception: Innerduct is not required in those pathways that will contain exclusively armored-type fiber optic cables.
- H. Spillways:
1. Install cable spillways where cable(s) will exit a conduit sleeve, cable tray, or wireway and where they would otherwise be unsupported for more than 6 inches.
- I. Telecommunication Poles:
1. Mount straight and anchor to building structure above the ceiling line.
 2. Provide mounting hardware, entrance end fitting, and ceiling trim plate.
 3. Utilize cutouts or add-on compartments for jack frames.
 4. Isolated pathway from electrical circuits with separate internal raceway.
- J. Discrete Cable Supports:
1. Install supports in areas that will be readily accessible after installation (e.g., above accessible suspended ceilings; up within the building structure in unfinished areas).
 2. Do not install supports in any location that is not readily accessible and cannot be reached by the hand of an individual standing flat footed on the ground, a ladder or scaffolding. Do not install in areas where an individual has to strain to reach or where a pole will be required to access.
 3. Install separate discrete cable support pathways for cables from each system. Where the allowed capacity of an individual support will be exceeded, install multiple parallel pathways.
 4. Install separate discrete cable support pathways for cables from the same system that carry signals that could negatively interfere with one another. Array supports vertically using an appropriate spacing not less than 6 inches for every 6 dB of nominal voltage differential between the cables.
 5. Attach supports directly to vertical building surfaces, or from overhead structural members using threaded rod and other approved attachment methods. Support of cables by use of suspended ceiling wires shall not be permitted.
 6. Install supports plumb and square.
 7. Install horizontal runs of cables supports level. Change elevation only where necessary for coordination with other trades and pathways of other systems.
 8. Mount the bottom of supports approximately 12 inches above the top of suspended ceilings.
 9. Install cable supports at intervals not exceeding 5 cable feet.
 10. Install supports so that they will not interfere with the removal or installation of ceiling tiles.
 11. Provide support in close proximity of device conduit pathway termination for service loop.
- K. Device Boxes:
1. New-work and old-work device boxes shall be installed flush with or slightly recessed below the finished surface. Do not recess boxes more than is permitted by code, nor more than .078 inches (2mm). Old-work boxes require advanced craftsmanship and construction techniques to achieve specification compliance for communications Work.

2. The installed elevation of boxes shall generally be as indicated on the drawings. Elevations shall be adjusted in the field to ensure a clean appearance resulting from coordination of the new box elevations to match the existing box elevations. Where the specified box elevations and existing condition box elevations differ by more than 4 inches, seek the direction of the Designer prior to installation.
 3. Device boxes and associated cover plates shall not span different types of wall finishes either vertically or horizontally. Horizontal and vertical position of boxes shall be adjusted at time of installation to ensure that this condition does not exist after finish is completed.
 4. Boxes in masonry shall be installed so that the specified over plates will cover the mortar joints and cut openings completely.
 5. Device boxes shall be installed so that they are securely and rigidly attached to structure. Gypsum board and similar non-structural board shall not be used for box support.
 6. Devices boxes shall not rely on raceway as a means of support. Boxes shall be fully supported by surrounding building structure.
 - a. Provide sufficient support for ceiling device boxes to support weight of installed products.
 - b. Provide tile support bridge for device box in accessible ceiling.
 7. Device boxes shall be installed plumb and level to within the following limits:
 - a. Maximum one-tenth (1/10) of one degree from plumb and from level, and;
 - b. Maximum difference from level of .078 inch (2mm) at one end of the box relative to the other end of the box, and;
 - c. Maximum difference from plumb of .078 inch (2mm) at the top of the box relative to the bottom of the box.
 8. Boxes shall be shimmed as necessary to insure level and plumb installation.
 9. Install gaskets on boxes installed outside and in wet or damp locations (e.g., tunnels, crawlspaces, pits).
 10. Device boxes shall be protected from plaster, drywall mud, mortar, and other construction debris.
 11. Floor boxes shall be installed flush and true with the finished floor, or otherwise in accordance with the manufacturer's instructions.
 12. Boxes shall be cleaned of debris after installation.
 13. Boxes shall be cleaned of debris thoroughly prior to installation of cover plates;
 14. Install blank cover plates on each unused device box.
 15. Knock out requirements exceeding manufacturers standard sizes shall be accommodated with punch of correct size.
- L. Sleeves and Penetrations:
1. Sleeves through poured-in-place concrete surfaces shall be set in place prior to the concrete pour and protected from concrete ingress.
 2. Sleeves through floors shall be installed to prevent the passage of water between the sleeve and the floor.
 3. Install cable-protecting insulating bushings on the each end of each sleeve.
 4. Extend through-the-wall sleeves a minimum of 2 inches beyond the wall surface. Extend the sleeve a greater distance where necessary to permit proper installation of cable-protecting bushings and any associated cable waterfalls.
 5. Extend through-the-floor sleeves to a consistent elevation of 4 inches to 6 inches above finished floors, except where otherwise noted on the Drawings.
 6. Fill the voids between sleeve and building surface with approved fire stop material sufficient to maintain the fire-rating of the building surface.

7. Firestop or plug all penetrations, conduits and sleeves to prevent the movement of air between spaces.
- M. Conduit Stubs:
1. Install cable-protecting insulating bushings on each conduit stub.
- N. Supports:
1. Fabricated Support Devices:
 - a. Conform to the manufacturer's recommendations for selection and installation of supports.
 - b. Install individual and multiple (trapeze) raceway hangers and riser clamps as necessary to support raceways. Provide U-bolts, clamps, attachments, and other hardware necessary for hanger assembly and for securing hanger rods and conduits.
 - c. Support parallel runs of horizontal raceways together on trapeze-type hangers.
 - d. Support individual horizontal raceways by separate pipe hangers. Spring steel fasteners shall be used in lieu of hangers for 1-1/2 inches and smaller raceways above suspended ceilings only.
 - e. For hanger rods with spring steel fasteners, use 1/4 inch diameter or larger threaded steel. Use spring steel fasteners that are specifically designed for supporting single conduits or tubing.
 - f. Support exposed and concealed raceway within 1 foot of box and access fittings. In horizontal runs, support at the box and access fittings shall be omitted where box or access fittings are independently supported and raceway terminals are not made with chase nipples or threadless box connectors.
 - g. In vertical runs, arrange supports so the load produced by the weight of the raceway and the enclosed conductors is carried entirely by the conduit supports with no weight load on the ends of the raceway.
 2. Miscellaneous supports:
 - a. Support miscellaneous electrical components as required to produce the same structural safety factors as specified for raceway supports. Install metal channel racks for mounting cabinets, pull boxes, junction boxes, and other devices.
 - b. Support sheet metal boxes directly from the building structure or by bar hangers. Where bar hangers are used, attach the bar to raceways on opposite sides of the box and support the raceway with an approved type of fastener not more than 24 inches from the box.
 3. Fastening:
 - a. Fasten pathway products and its supporting hardware securely to the building structure in accordance with the following:
 - 1) Fasten by means of wood screws or screw-type nails on wood, toggle bolts on hollow masonry units, concrete inserts or expansion bolts on concrete or solid masonry, machine screws, welded threaded studs, or spring-tension clamps on steel. Threaded studs driven by a powder charge and provided with lock washers and nuts shall be used instead of expansion bolts and machine or wood screws. Do not weld conduit, pipe straps, or items other than threaded studs to steel structures. In partitions of light steel construction, use sheet metal screws.

- 2) When installing fasteners in concrete or CMU structures, do not cut reinforcing bars.
 - 3) Ensure that the load applied to any fasteners does not exceed 25-percent of the proof test load. Use vibration-and shock-resistant fasteners for attachments to concrete slabs.
 - b. Raceway supports: Hanger spacing shall be as required for adequate support of the raceway, but in no case shall there be less than one hanger per 5 feet of raceway length.
- O. Pathway Evacuation:
1. Prior to the installation of cable:
 - a. Clean and vacuum boxes, raceway, cable tray, and discrete cable supports.
 - b. Remove solids or other hindrances that could impede its full utilization or that could damage cable during or after installation.
 - c. Remove liquids. Blow out until raceway is dry, sufficiently that the installed cables will not be subjected to contact with them.
 2. Where existing raceways are reused, remove liquid from the raceway.
- P. Water Proofing:
1. Protect raceways from moisture infiltration in areas where moisture penetration is probable (e.g., outdoors, natatoriums, wash bays).
 2. Provide watertight fittings where one or more cables exit the pathway in areas where moisture penetration is probable.
 3. Seal below-grade conduit joints to prevent moisture infiltration.
 4. Seal joints of conduits in high-moisture areas to prevent moisture infiltration.
 5. Pressure or vacuum test below-grade conduits before and after concealing the conduits to ensure resistance to moisture ingress.
- Q. Repair and Patching:
1. Holes and other penetrations into building surfaces or structure that are created to facilitate pathway installation but that are not ultimately used shall be filled, repaired, and restored to their original strength, appearance and integrity.
 2. Damage to building or property that occurs during the course of pathway installation shall be repaired and restored to its original condition prior to damage.
- R. Cover Plates
1. Provide cover plates over the openings of junction boxes, pull boxes and cast boxes.

END OF SECTION 27 05 28

SECTION 27 05 36 - CABLE TRAYS FOR COMMUNICATIONS

1.1 SUBMITTALS

- A. Product Data:
 - 1. Cable tray
 - a. Fittings
 - b. Accessories
 - c. Spillways/waterfalls.
- B. Shop Drawings:
 - 1. Coordinated floor plan drawings depicting the size(s), locations, and dimensions of the following:
 - a. Primary pathways.
 - b. Cable tray elevations.
 - c. Vertical and horizontal working clearances around tray.
- C. Closeout Submittals:
 - 1. Accurate up-to-date as-built versions of shop drawings.

1.2 SPECIAL REQUIREMENTS

- A. Contract Division of Work and issuance of separate contracts notwithstanding, the entity(s) performing work of this Section shall have the responsibility to provide complete, working and code compliant pathway systems for the systems specified in this Division and for the additional systems so specified in the Contract Documents. Such systems shall be constructed in compliance with the Contract Documents.
 - 1. Provide complete, working and code compliant pathway systems for Division 27 and 28 (where applicable) Systems, and as otherwise identified in the Contract Documents. Note that the Drawings may not fully detail the required complete pathway system and components.
- B. Should Work of this Section be performed by a party that is different from the party responsible for providing components (e.g., cabling) that utilize the pathway systems, the pathway provider shall:
 - 1. Coordinate with the parties providing cable and other products that will utilize the pathways to ascertain a complete understanding of the pathway needs of each system, including cable separation requirements.

1.3 SYSTEM DESCRIPTION

- A. General:
 - 1. Each communications pathway system shall consist of products to support, protect, enclose, manage and secure the cables that are part of the communication system they serve.
 - 2. Pathway systems shall be supplied and installed to meet the unique requirements of individual communications systems.

3. Separate pathway systems shall be provided for individual communication systems. Individual communication systems shall have unique and dedicated conveyances. Cables from individual communication systems shall be run in separate conveyances (e.g., data system cables shall be run in separate conveyances from sound system cables).
4. Separate pathway conveyances shall be provided for cables that carry incompatible signal types (e.g., analog microphone level and speaker level cables shall be run in separate conveyances).
5. Pathway systems shall include penetrations through walls, floors, ceilings, roofs, bulkheads and other physical barriers that are necessary to route cable between adjacent spaces.
 - a. Pathway penetrations shall be prepped, installed, sealed and fire stopped in a code-compliant manner.
6. Pathways shall be assembled from components that are listed by a recognized safety testing laboratory.
7. The cable fill capacity of each pathway segment shall meet or exceed the capacity necessary to accommodate cables initially installed. Additional capacity shall be provided as identified in the Contract Documents. The sizes and quantities of conveyances shown on the Drawings shall be interpreted as minimums. Larger sizes, or additional quantities, shall be provided as required or further identified herein.
8. Pathway systems shall be provided with sufficient support to carry the weight of the system, plus a full capacity of cables, with a safety factor of greater than or equal to 5. In addition, each individual above-the-floor vertical hanging support shall feature an installed static weight support capacity of not less than 200 lbs. (e.g., hanging all-thread, multi-anchor mounting flange and support cable).

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 CABLE TRAY

- A. Type CB – Ceiling Hung: Basket Type
 1. Manufacturers: Subject to compliance with requirements, provide one (1) of the following:
 - a. WBT Performance Cabletray
 - b. Cooper/B-Line FLEXTRAY™ Series.
 - c. Legrand/Cablofil – Wiremesh CF Series.
 2. Product Requirements:
 - a. Center hung ceiling-mount design using tray manufacturer's ceiling mount accessories.
 - b. Basket-style, fully ventilated tray design.
 - c. UL or ETL listed.

- d. Depth: Available in various usable depths ranging from 2 to 6 inches.
 - e. Width: Available in various usable widths from 4 to 32 inches.
 - f. Tiers: Available in single and double tier configurations. Double tier version assembled from multiple single-tier models and tray manufacturer accessories.
 - g. Cable protecting sleeves around tray supports emanating from within the tray.
 - h. Standard Segment Length: Greater than or equal to 10 feet (3 meters).
 - i. Designed to enable the establishment of full-width and half-width double-tier stacks of tray where additional capacity is needed and where discrete parallel pathways are required for cables from different systems.
 - j. Provide tiered trapeze mounting.
- B. Type WA – Wall: Basket Type
- 1. Manufacturers: Subject to compliance with requirements, provide one (1) of the following:
 - a. WBT Performance Cabletray
 - b. Cooper/B-Line FLEXTRAY™ Series.
 - c. Legrand/Cablofil – Wiremesh CF Series.
 - 2. Product Requirements:
 - a. Designed for wall mounting using tray manufacturer’s wall mounting accessories.
 - b. Basket-style, fully ventilated tray design.
 - c. UL or ETL listed.
 - d. Depth: Available in various usable depths ranging from 2 to 6 inches.
 - e. Width: Available in various usable widths from 2 to 6 inches.
 - f. Standard Segment Length: Greater than or equal to 10 feet (3 meters).
 - g. Tiers: Available in single and double tier configurations. Double tier version assembled from multiple single-tier models and tray manufacturer accessories.

PART 3 - EXECUTION

3.1 COORDINATION

- A. Review and coordinate the size requirements of pathways with the suppliers and installers of cabling and devices. Pathway segments shall accommodate the quantity and type of cables that will be installed. Upsize pathway segments from any default and minimum size(s) identified so as to accommodate the cables that will be installed, including any future expansion capacities, as identified in the Contract Documents.
- B. Review the specific routes and composite length of planned pathway routes with parties responsible for supplying or installing cables as distance limitations will apply differently for different cables and applications.
- C. Coordinate the location and routing of pathways with work of this Division, the work of other trades, the work of the Owner, and existing site conditions (where applicable) to ensure adequate headroom, post installation access to and working clearances around

the pathways. Review and verify HVAC, Fire Suppression, Electrical Power, Lighting and other Drawings for design coordination. Provide routes accordingly.

- D. Proactively participate with other trades in the creation of coordination drawings that depict primary and major secondary pathways. Emphasis shall be placed on ensuring that pathways are accessible for initial cable installation and readily accessible for reuse in accommodating future cable moves, additions and changes.
- E. Coordinate the colors and types of surface raceway with the color of surface raceway provided as work of both Division 26 and Division 28. Colors of raceways shall match, except where expressly reviewed and approved by the Architect/Designer.
- F. Ensure that pathways, as installed, are adequately sized for the cables to be installed and any future expansion capacities as identified in the Contract Documents.

3.2 GENERAL

- A. Ground and bond all systems in accordance with the NEC and ANSI/TIA/EIA 607.
- B. All installation material and practices shall fully comply with NFPA 70 "National Electrical Code" and ANSI/TIA/EIA 569A Commercial Building Standard for Telecommunications Pathways and Spaces.
- C. Coordinate work with the building structural systems and electrical installation.
- D. All work shall fully comply with these Specifications and related Drawings and all manufacturers' recommended installation practices.

3.3 PATHWAY SIZING

- A. Raceways shall be sized so that they are the larger of the following:
 - 1. Minimum size indicated within the Contract Documents.
 - 2. In accordance with the National Electric Code.
 - 3. As recommended by the product manufacturer.
- B. Cable Trays shall be sized so that they are the larger of the following:
 - 1. Minimum size indicated within the Contract Documents.
 - 2. In accordance with the National Electric Code.
 - 3. As recommended by the cable tray manufacturer.
 - 4. Sized so that it will not be loaded beyond 40-percent of the rated capacity, regardless of a code or manufacturer rated capacities greater than this.

3.4 CABLE TRAY USAGE

- A. Cable tray shall be used on the Project, as defined below:
 - 1. Where a hybrid pathway system is identified to be provided, above accessible ceilings within corridors, where the tray serves as a primary pathway for the system served.

2. Where a hybrid pathway systems is identified to be provided, above accessible ceilings where the tray serves as a secondary pathway and sixteen (16) or more cables need to traverse a horizontal cable distance of 50 feet or more from a primary pathway to reach their final destination.
 3. Where a hybrid pathway system is identified to be provided, within unfinished spaces without suspended ceilings, where the tray can be installed above an elevation of 8 feet 6 inches, and where the exposed installation of tray is approved by the Designer in advance.
 4. Where specifically indicated on the Drawings.
- B. Cable tray shall not be used where conduit or another form of raceway is expressly required.

3.5 INSTALLATION

- A. General:
1. Install in accordance with local codes. Adhere to clearance and fire protection regulations.
 2. Install above-grade pathways parallel to and perpendicular to building elements.
 3. Install pathways plumb and level except where changes in elevation are specifically necessary for constructability.
 4. Document the exact routing of concealed pathways on as-built drawings.
- B. Bonding and Grounding:
1. Conductive components of the pathway systems shall be bonded to ground in accordance with the NFPA and the NEC.
 2. Additional grounding and bonding shall be provided as set forth in the Contract Documents.
- C. Rustproof Fasteners and Hardware:
1. Install pathway components and associated mounted devices with stainless steel nuts, bolts, screws and washers when installed on the exterior of the building, when installed within unconditioned building spaces, and when the pathway serves exterior devices or devices in areas prone to sustained humidity levels in excess of 60-percent.
- D. Cable Tray:
1. Install tray so that segments of the tray system remain fully re-usable.
 2. Install tray only in locations where the tray is accessible and the cable conveyance area of the tray is accessible.
 3. Where tray is installed above lay-in ceilings, ensure there is ready access to the cable storage area through the ceiling grid.
 4. Install tray in accordance with the manufacturer's installation recommendations, using the fittings and accessories manufactured by and expressly recommended by the manufacturer.
 5. Utilize pre-manufactured fittings where changes in direction and elevation occur.
 6. Install tray so that mounting height(s) will be sufficient to clear light fixtures, piping, and equipment and so that it is readily accessible.
 7. Ensure that components of the tray system are free of sharp edges, burrs, or projections that could damage cable.

8. Install protective caps on the exposed ends of cable tray rungs.
9. Install waterfall fittings at each location where cable(s) exit the tray downwards.
10. Do not install cable tray high to the structure or above equipment, pipes, or ductwork where the tray may become inaccessible after installation or project completion.
11. Discontinuity of Cable Tray:
 - a. Where cable tray cannot be installed contiguous, because the pathway must pass through an otherwise inaccessible building space, install conduit sleeves of equivalent usable cross-sectional area through the inaccessible building space. The minimum number of sleeves shall not be less than one (1) 4-inch conduit for every 3 inches of cable tray width.
 - b. Where cable tray cannot be installed contiguous, because of obstacles that simply cannot be coordinated out of the way, furnish and install conduit sleeves or a discrete cable support system to traverse the obstacles. This intermediate pathway segment shall contain the same or greater usable cross-sectional area as the cable tray.
12. Working Clearances for Cable Tray:
 - a. 7 inches above the ceiling line of accessible ceilings to the bottom of the single or multi-tier cable tray to allow for removal and reinstallation of ceiling tiles.
 - b. Vertical clearance between tray and objects above:
 - 1) 6 inches vertical clearance above the top of trays less than or equal to 12 inches wide.
 - 2) 12 inches vertical clearance above the top of trays 12 inches to 24 inches wide.
 - c. Vertical clearance between tray and objects below:
 - 1) With the exception of suspended ceiling grid there shall be no objects located below the cable tray that could impede access to the cable tray.
 - 2) Vertical clearance is required above cable tray.
 - d. Horizontal clearance minimums between tray and objects installed beside the tray:
 - 1) 12 inches of clearance left and right of tray that is less than or equal to 12 inches wide.
 - 2) 18 inches of clearance left and right of trays 12 inches to 18 inches wide.
 - 3) 24 inches of clearance left and right of trays greater than 18 inches wide.
 - 4) Wall mounted tray requires clearance on one side of the tray.
 - 5) Suspended tray requires clearance on both sides of the tray.
13. Supports for Cable Tray:
 - a. Support cable trays from building structure.
 - b. Install supports for suspended cable trays at increments not more than 60 inches on center and additionally at each splice, tee, elbow, bend, intersection, and transition.
 - c. Suspended tray shall be installed with lateral bracing to prevent side-to-side movement of the tray.
 - d. Support rod sizing:
 - 1) Tray 12 inches or less in width shall utilize 1/2-inch all-thread-rod, minimum.

- 2) Tray greater than 12 inches in width shall utilize 5/8-inch all-thread-rod, minimum.
 - e. Support rod lengths over 6 feet shall be equipped with a rod stiffener.
 - f. Under-floor cable tray systems shall be installed using such means so that no lateral loads are applied to the risers of the raised floor system. Where cantilever type tray or tray mounting adapters are used, provide accessory supports designed to ensure that tray loads are carried vertically to the floor.
14. Multi-Tier Cable Tray:
- a. Multiple-tier cable tray shall be provided in lieu of single tier cable tray where space constraints and working clearance requirements limit the use of wider single tier cable tray solution.
- E. Repair and Patching:
1. Holes and other penetrations into building surfaces or structure that are created to facilitate pathway installation but that are not ultimately used shall be filled, repaired, and restored to their original strength, appearance and integrity.
 2. Damage to building or property that occurs during the course of pathway installation shall be repaired and restored to its original condition prior to damage.

END OF SECTION 27 05 36

SECTION 27 05 43 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - 2. Product Datasheets.
- B. Shop Drawings:
 - 1. Site Plans, coordinated: depicting the planned pathways and routing of pathways.
 - 2. Floor Plans, coordinated: depicting the planned pathways and routing of pathways.
 - 3. Traffic Control Plan:
 - a. Proposed work schedule and traffic control details.
- C. Closeout Submittal:
 - 1. Product Datasheets.
 - 2. As-Built Drawings:
 - a. Site Plans.
 - b. Floor Plans.

8. The most current published version of the “Outside Plant Design Reference Manual” published by the Building Industry Consulting Services International (BICSI).
9. Comply with applicable codes, including the most current version of the National Electrical Safety Code (NESC).

1.3 SYSTEM DESCRIPTION

- A. The underground ducts and raceways system shall be a system of conduits, boxes, hand holes and other raceways and accessories between communications rooms, entrance points and facilities of building(s), structures on a campus, towers, poles, maintenance holes, hand holes, and telecommunications pedestals or cabinets as part of a complete pathways system infrastructure. The underground ducts and raceways infrastructure shall meet the requirements of the authority having jurisdiction (AHJ) and applicable codes.
- B. Locate, identify, and avoid all existing utilities utilizing the marking service required by State Law and information from the Owner where new facilities or excavation is required.
 1. Provide all necessary traffic control (vehicular and pedestrian), hazard protection, construction site barriers/warning tape, trench wall supports, and any other safety provisions customary to provide a safe working environment where new work is required.
- C. Pathway System includes the following items and all necessary related activities necessary to provide a fully functional system.
 1. System components shall be located and/or provided as indicated on the Drawings.
 2. Provide all indicated entrances into specified Buildings and as detailed on the Drawings.
 - a. Provide necessary penetrations through the facility walls and restore the wall to the same condition as prior to cutting.
 - b. Provide all required Conduits and Boxes to construct the entrance pathway as indicated on the Drawings.
 - 1) Conduit utilized on an exterior wall above grade shall be Galvanized Rigid Conduit (GRC).
 - a) This shall include sleeves extending into the facility.
 - b) The GRC conduit shall continue to the first below grade Hand Hole.
 - 2) Transition boxes used on an exterior wall above grade shall be NEMA 3R rated.
 - 3) Conduit utilized in the interior of a building to extend to an Entrance Facility or termination/transition space shall be GRC.
 - 4) Conduit utilized to stub up into a termination/transition space from or below the slab of the building shall be GRC.
 - c. Provide all necessary hardware to secure and/or protect the entrance pathway.
 3. Provide underground conduit pathway system as shown on the Drawings.

- a. Provide all necessary Hand Holes including the minimum requirements shown on the Drawings.
 - 1) Provide gravel base in bottom of open bottom hand holes.
 - 2) Provide 6" a re-bar reinforced concrete apron, at least 12" deep, around each hand hole installed in a sidewalk, paved area, roadway (paved or unpaved).
 - 3) Provide enclosure covers with a minimum Tier 15 rating.
 - a) All covers shall indicate a label of "Communications" and Owner Name and telephone number (coordinate with Owner).
 - b) Field verify lid/cover construction requirements or provide all Tier 22 covers.
 - c) Bolt the lid to the enclosure.
 - b. Provide all conduits between Hand Holes/ Maintenance Holes/ Entrances and any other points as shown on the Drawings.
 - 1) Quantities and trade sizes shall be as indicated on the Drawings.
 - a) Unless otherwise noted, underground conduits shall be 4" schedule 40 PVC or HDPE.
 - b) (Note: Directional drilling installations shall utilize SDR 11)
 - c) Provide steel casings or concrete encasement around all conduits installed under public roadways to extend at least 5 feet beyond the paved surface on each side of the roadway or 2' beyond the right-of-way of a public roadway, whichever is farther.
 - d) Exception: Private drives located on Owner's property shall not require casings where conduits are installed at a minimum depth of 6' (six feet) below the drive or encased in concrete to eliminate "Live Load" impact.
4. Accessories
- a. Provide inner-duct system (textile unless specifically noted).
 - 1) Each primary pathway utilizing a single 4" conduit shall have three 3 cell duct units (9 cells).
 - 2) Each primary pathway utilizing more than one 4" conduit shall have the textile innerduct in one conduit; the remaining conduits shall receive only a pull rope.
 - b. Provide a #6 locate conductor inside the Primary Pathway conduit along each underground pathway segment; leave 5' coiled at each end.
 - 1) Alternate constructions such as locatable textile inner-duct are acceptable.
 - c. Provide a 1/4" nylon pull rope in each conduit segment with 5' minimum slack at each end; coil slack and anchor to enclosure side.
 - d. Provide warning tape above all pathway runs.
 - 1) Provide a 4" wide "Buried Cable Below" warning tape at a 3-6" depth along the underground pathway where the pathway is not covered by pavement, concrete, etc.
 - 2) "Slice" into ground below the surface over each pathway (One per pathway not one per duct).
 - e. Provide plugs in duct(s) entering a building.
 - 1) Install plugs in all conduits entering a building below grade or below the level of the next/last hand hole.

- 2) Install plugs in all unused conduits opening into a ceiling cavity from a transition box. (Plug all conduits/sleeves with cables installed with a removable barrier.)

D. Communications

1. All work schedules on site shall be communicated to the Owner and Site Manager at least 2 days in advance unless otherwise noted.
2. At all times during work hours the lead technician shall:
 - a. Carry a cellular telephone equipped with voice mail and local telephone number.
 - b. Provide the access numbers for the device to the Owner, Site Manager, and Consultant.

E. Restoration:

1. Completely restore all areas to how they existed before construction.
2. Provide erosion control, including bailed hay and sediment control fencing, as specified in the referenced standards.
3. Where trenching has been performed, restoration shall include additional trench fill after settlement of original fill has completely subsided and reseeding as necessary for complete restoration. Provide area safety as specified throughout restoration.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 PATHWAYS AND SPACES

A. Hand Holes:

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Strongwell (Quazite).
 - b. Oldcastle Precast.
 - c. Pencil.
2. General: Underground enclosures and associated components shall be provided by a single manufacturer, including coupling, lids/covers, adapters, fittings, brackets, hangers and other accessories recommended by the manufacturer and/or necessary for a complete and functional system, as indicated.
3. Underground Enclosures and Covers:
 - a. Manufactured of high strength polymer concrete material consisting of an aggregate mix bound together with a polymer resin.
 - b. Materials shall be non-conductive, non-corrosive, and unaffected by moisture, freezing, subsoil chemicals and UV light.

- c. Hardware shall be corrosion resistant stainless steel.
- d. Equip enclosures with adequate provisions for knockouts, cable racking and pulling irons for proper duct and cable installation per code, standards, and practice.
- e. Minimum design load: 22,500 lbs. over 10-inch by 20-inch plate.
- f. Minimum test load: 33,750 lbs. over 10-inch by 20-inch plate.
- g. Size:
 - 1) Sufficient to allow figure-eight coiling of cable slack without violating the bend radius restrictions of the cable.
 - 2) Sufficient to accommodate splice closures.
- h. Basis of Design: Strongwell (Quazite) PG2436BA30 (24-inch by 36-inch by 30-inch deep box) and PG3636BA30 (36-inch by 36-inch by 30-inch deep box).
- i. Lids/Covers:
 - 1) Covers shall be labeled "Communications" and Owner Name and telephone number (coordinate with Owner).
 - 2) Field verify lid/cover construction requirements or provide the highest grade cover (i.e., Grade 3) available.
 - 3) Support crossbars shall be provided from the manufacturer to meet load characteristics.
 - 4) Test loads for ANSI/SCTE 77-2007

APPLICATION	LOADING REQUIREMENTS			
Light Duty Pedestrian Traffic Only	Vertical	Test Load	13.3kN	3000 pounds
TIER 5 Sidewalk applications with a safety factor for occasional non-deliberate vehicular traffic	Vertical	Design Load	22.2 kN	5000 pounds
		Test Load	33.3 kN	7500 pounds
	Lateral	Design Load	28.7 kPa	600 pounds/sq.ft.
		Test Load	43.1 kPa	900 pounds/sq.ft.
TIER 8 Sidewalk applications with a safety factor for non-deliberate vehicular traffic	Vertical	Design Load	35.6 kN	8000 pounds
		Test Load	53.4 kN	12000 pounds
	Lateral	Design Load	28.7 kPa	600 pounds/sq.ft.
		Test Load	43.1 kPa	900 pounds/sq.ft.
TIER 15 Driveway, parking lot, and off-roadway applications subject to occasional non-deliberate heavy vehicular traffic	Vertical	Design Load	66.7 kN	15000 pounds
		Test Load	100.1 kN	22500 pounds
	Lateral	Design Load	38.3 kPa	800 pounds/sq.ft.
		Test Load	57.5 kPa	1200 pounds/sq.ft.
TIER 22 Driveway, parking lot, and off-roadway applications subject to occasional non-deliberate heavy vehicular traffic	Vertical	Design Load	100.1 kN	22500 pounds
		Test Load	150.1 kN	33750 pounds
	Lateral	Design Load	38.3 kPa	800 pounds/sq.ft.
		Test Load	57.5 kPa	1200 pounds/sq.ft.
AASHTO H-20 Deliberate vehicular traffic applications.	Certified precast concrete, cast iron, or AASHTO-recognized materials.			

Table 1 – Test Loads

- 5) Three grades of lids/covers are acceptable dependent on the location of placement.
 - a) Grade 2, Tier 15, Light Traffic and Mowers: Covers shall have a minimum design load of 15,000 lbs. and a minimum test load of 22,500 lbs. Basis of Design shall be Strongwell (Quazite) PG2436HA12.
 - b) Grade 3, Tier 22, Traffic Areas and Parking Lots: Covers shall have a minimum design load of 22,500 lbs. and a minimum test

load of 33,750 lbs. Basis of Design shall be Strongwell (Quazite) PG2436HH12.

- c) Covers located in Roadways shall have a AASHTO H-20 rating.

B. Conduit:

1. Rigid steel conduit:
 - a. Threaded rigid steel conduit shall be manufactured from mild steel, zinc galvanized both inside and outside including threads. It shall be constructed in accordance with ANSI C80.1, Federal Specification WW-C-581; UL listed.
2. Non-metallic raceways,
 - a. Polyvinylchloride (PVC):
 - 1) PVC conduit shall be virgin C300 type, Schedule 40 or 80 (90° C) constructed in accordance with NEMA TC2 and Federal Specifications W-C-1094A.
 - b. Schedule 40 HDPE duct is acceptable for buried ducts but is not permitted indoors or for use with standard conduit fittings.
 - 1) Conduit shall be a nonmetallic flexible raceway manufactured from High Density Polyethylene (HDPE) for use in underground applications. It shall be a smooth-walled interior and exterior configuration with wall construction of SDR 13.5. (Note: Directional drilling installations shall utilize SDR 11) Each conduit shall have a one-half inch pre-lubricated, woven, 1130lb. minimum polyester tape made from low friction, high abrasion resistant yarns placed within the conduit and secured at each end. Tape shall be printed with sequential footage markings for accurate measurements. Each conduit shall be black with (3) unique colored stripes, to be specified in the part number to replace the "XX" or as specified on the drawings. (i.e. 3D=3 buff stripes, 3E=3 gray stripes, 3F=3 green strips, 3G=3 lilac stripes)
 - a) Standard of quality shall be Carlon 4" smooth-walled HDPE conduit, part #A16C9N7AXXC

C. Pull rope:

1. Jacketed, unidirectional aramid fiber, custom woven flat pull rope.
2. Required within each conduit, innerduct or cell.
3. Manufactured using a process that encapsulates the aramid fiber and bonds an exterior waterproof tape to the aramid fibers.

D. Cable lubricant:

1. Use a non-hardening, non-toxic, non-corrosive, non-sensitizing, lubricating compound during installation of cabling to reduce friction. Do not use liquid detergent.

E. Underground Warning Tape (UWT)

- a. Material: Linear low density polyethylene.
- b. Width: 6 inches (150 mm).
- c. Thickness: 100 microns manufactured to ENATS 12-23 specification.
- d. Lead free pigments with virgin grade film.
- e. Soil tolerance: pH 2.5 to pH 11.0 inclusive.
- f. Dual lines of continuous text.
 - 1) Line 1 Text: "Caution" repeated infinitum

- 2) Line 2 Text: Custom labeled to identify what is below (e.g., "Telephone Conduit Below" or "Cable TV Cable Below").
- g. Tape Color: Use tape with major color in accordance with the American Public Works Association Uniform Utility Color Code.

- F. Duct Plugs:
1. Removable.
 2. Forms a watertight seal.

2.3 SOURCE QUALITY CONTROL

- A. System components shall be tested and listed by one of more United States NRTL.

PART 3 - EXECUTION

3.1 GENERAL

- A. Secure applicable permits for work specified in this Section.
- B. Refer to the Drawings for types and quantities of pathways and backbone cabling requirements. Review and coordinate pathways prior to installation.
1. Coordinate to identify quantities and sizes of backbone cables that the pathway system is required to support.
 2. Coordinate to resolve deviations, defects or other problems with pathways prior to installation. Allow adequate time for corrections so as to avoid delays to the Project completion date.
 3. Provide additional or supplemental TIA/EIA-569-C, or most current version, compliant pathways and cable support where required. Provide additional sleeves through walls/floors/ceilings, as necessary to route cables within buildings.
 4. Locate, identify, and avoid existing utilities utilizing the marking service required by State Law and information from the Owner where new facilities or excavation is required.
 5. Coordinate installation of pathway products with work of other trades and other Divisions.
 - a. Provide necessary traffic control (vehicular and pedestrian), hazard protection, construction site barriers, signage, supports, fencing, and any other customary provisions.
 6. Coordinate with the Owner and utility company(s) prior to beginning the Work.
 - a. Locate, identify, and avoid existing utilities (public and private), including but not limited to electric, water, sewer, gas, and telecommunications.
 - b. Repair damage occurring to existing underground utilities as a result of the Project.
- C. Installation practices followed shall use the latest available machinery, equipment, and tools. Installation techniques used on the Project shall result in the ease of maintenance and ready access to components.
- D. Right of Way

1. Right-of-way will be secured by the Owner. Provide work specified within the requirements of the right-of-way agreement.

3.2 EXISTING UTILITIES

- A. Comply with the “call before you dig” damage prevention program (Utility Marking Service) prior to excavation.
- B. Locate, identify, and avoid existing utilities (public and private), including but not limited to electric, water, sewer, gas, and telecommunications.
- C. Identify underground utilities by marking on the ground with color coded paint in accordance with the most current version of the American Public Works Association Uniform Utility Color Code.
 1. Electric – red
 2. Gas/oil – yellow
 3. Communications/CATV – orange
 4. Water – blue
 5. Sewer – green
 6. Limits of exposed excavation – white
 7. Temporary survey marking – pink
- D. Where the actual location is uncertain, identify obstacles located along the proposed construction area by means of test holes.
- E. Create test holes either directly above or to the side of the assumed location of any obstacle. After obstacle is located, take exact measurements and create a profile drawing identifying the obstacle’s exact location.
- F. Repair damage occurring to existing underground utilities as a result of this Project.

3.3 INSTALLATION

- A. Provide conduit pathway system(s) as indicated on the Drawings.
 1. Provide hand holes, including the minimum requirements shown on the Drawings.
 - a. Hand holes shall meet applicable code requirements, including the most current version of the National Electrical Safety Code (NESC).
 - b. Provide pea gravel base to a minimum depth of 6 inches in the bottom of open-bottom hand holes.
 - c. Provide rebar reinforced concrete apron, at least 12 inches deep, around each hand hole installed in a sidewalk, paved area and roadway (paved or unpaved).
 - 1) The Concrete apron shall be compliant with the Contract Documents, including applicable and/or referenced Standards.
 - 2) A fiber expansion joint shall be placed between the apron and the box and between the apron and the surfacing material outside.
 - d. Field verify lid/cover construction requirements.
 - 1) Provide a suitable rated cover as specified.
 - 2) Covers located in Roadways shall have a AASHTO H-20 rating.

- e. Covers shall be labeled as indicated.
- f. Bolt the cover to the enclosure.
- 2. Provide conduit pathways between Hand Holes and any other points shown on the Drawings.
 - a. Quantities and trade sizes of pathways shall be as indicated on the Drawings.
 - 1) Unless otherwise noted, underground conduits shall be 4-inch, Schedule 40 PVC.
 - 2) Conduits shall be installed at a nominal depth of 30 inches (\pm 6 inches) below grade and as indicated in the Contract Documents.
 - 3) Where minimum depth is unattainable, cover duct system with concrete.
 - b. Provide galvanized steel casings around conduits installed under public roadways, including paved street or highways, railroads, river or stream crossing to extend at least 5 feet beyond each side, or 2 feet beyond the right-of-way of a public roadway, whichever is farther.
 - 1) Exception: Private drives located on Owner's property shall not require casings where conduits are installed at a minimum depth of 6 feet below the drive or encased in concrete to eliminate Live Load impact. Ducts under roadways shall be directionally bored.
 - 2) After installation of underground duct system, fill casing with fine sand (blown in under pressure) and seal both ends with a 3-inch concrete wall.
 - c. No single continuous conduit run shall exceed 300 feet between pull points.
 - 1) Provide additional maintenance holes, hand holes, or vaults as required to comply with this requirement.
 - d. No more than a total of 180 degrees of bends shall be in any conduit segment between two maintenance holes, hand holes, or vaults. Avoid back-to-back 90-degree bends.
 - 1) Provide additional maintenance holes, hand holes, or vaults as required to comply with this requirement.
 - e. Where bends are required, manufactured bends shall be used whenever possible. Bends made manually shall not reduce the internal diameter of the conduit. Bends shall be sweeps with a minimum radius of six times the internal diameter for conduits up to 2 inch and ten times the internal diameter for conduits larger than 2 inch.
 - f. Multi-cell duct systems shall be installed to manufacturer's instructions, including 65-foot bend radius on turns.
 - g. Minimum bend radii shall be observed (for concrete encasement, compacted fill, or directionally bored). Inside radii of bends and sweeps shall not be less than 40 inches.
 - h. Changes in conduit depth shall be accomplished with smooth sweeps of no less than a 10-foot bend radius, or the change shall be considered a 45-degree bend.
 - i. Install underground duct system with a drain slope to allow drainage and to prevent the accumulation of water. Provide a drain slope of 0.125 inches per foot extending away from all building structures and between underground enclosures extending from mid-span towards each enclosure.
 - j. Hand-trench within 5 feet of each side and across existing underground services.

- 1) All trenches deeper than 5' shall have side walls shored, sheeted, braced or otherwise supported per OSHA requirements unless the side walls are cut to a slope of 12" horizontal for each 24" vertically.
- k. Clearances: Provide and maintain the following clearances from the system at times:
 - 1) 12 inches of well-tamped earth or 3 inches of concrete between system and any electric power of other conduit.
 - 2) 6 inches when crossing and 12 inches when parallel of well-tamped earth between system and any pipes (e.g., gas, water, oil).
 - 3) 50 inches below the top rail of any railroad crossing.
 - 4) 36 inches below the top rail of any street railway crossing.
- l. Seal conduit ends during construction to prevent intrusion of foreign debris. Provide duct plugs on duct ends at underground enclosures and building penetrations to prevent water and gas infiltration.
- m. Conduit ends shall be smooth and free from burrs and sharp edges.
- n. After complete installation of the system, and before the installation of any cabling, pull completely through each innerduct a spherical template having a diameter not less than 75-percent of the inside diameter of the innerduct to ensure absence of obstruction(s).
- o. Textile innerduct system shall be provided for Outdoor underground conduit system(s).
 - 1) Each textile innerduct unit shall consist of 3 cells (minimum), unless noted otherwise.
 - 2) Each cell shall accommodate cables up to 1-inch O.D.
 - 3) Construction shall allow maximum pull lengths of up to 4,000 feet (optimum 1,500 feet).
 - 4) The system shall include pull ropes in cells.
 - 5) Cell Quantities:
 - a) Each primary pathway utilizing a 4-inch conduit shall have three (3) 3-inch, 3 cell duct units (9 cells) (minimum).
 - b) Each primary pathway utilizing more than one 4-inch conduit shall have three 3 cell duct units (9 cells) in one conduit; the remaining conduits shall receive only a pull rope, unless noted otherwise.
 - 6) Anchor the ends of each innerduct in each hand-hole or box.
3. Entrance Facilities and Entrance Points
 - a. Cable entrance points for each building shall be as indicated on the Drawings.
 - b. Provide penetrations through the facility walls, and restore the wall to the same condition as prior to cutting. Wall and penetrations shall be water-tight and weather-tight.
 - c. Provide conduits and boxes as required to construct the entrance pathway as indicated on the Drawings.
 - 1) Conduit utilized on an exterior wall above grade shall be Galvanized Rigid Conduit (GRC), including sleeves extending into the building. The GRC conduit shall continue to the first below grade Hand Hole.
 - 2) Conduits shall slope upward at least 1% to the facility from the last pull box/vault.
 - 3) Conduit utilized to stub up from or below the slab of the building shall be Schedule 40 PVC.

- d. Provide transition point(s) between cable entrance points and the termination point of the cable(s), as required by Code and/or the Drawings.
 - 1) Transition points shall be secured in a 24-inch by 24-inch by 6-inch (minimum) screw-secured covered box. Provide provisions for padlocks.
 - 2) Provide telecommunications backboards at each interior entrance point where a transition box is required.
- e. Provide hardware to secure and protect the entrance pathway.
- f. Entrance Facilities allowing cable entrance to a ducted ceiling space may use open cable supports to support the cable (minimum 5-foot spacing between supports) to a termination point within 50 feet. Prior to installation, verify and comply with the AHJ and Code requirements.
 - 1) Exception: Indoor/Outdoor plenum rated loose tube fiber optic cable(s).
 - 2) If the termination point is in excess of 50 feet, a closed metallic conduit shall be continuous from the Entrance Point to the termination point, or an adequately sized splice point must be provided in a serviceable area to splice properly rated indoor cable(s) to the unlisted OSP cable(s).
- g. Entrance Points allowing cable entrance to a plenum (air return) ceiling space shall use closed metallic conduits to support the cable to a termination or splice point.
 - 1) Exception: Indoor/Outdoor plenum rated loose tube fiber optic cable.
 - 2) If it is impractical to provide a closed metallic conduit continuous from the Entrance Point to the termination point, an adequate splice point shall be installed in a serviceable area to splice properly rated indoor cable(s) to the unlisted OSP cable(s).
- h. Entrance Point(s) stubbing up into a Communications Room (e.g., Equipment Room (ER), Telecommunications Room (TR), and Entrance Facility (EF)) shall extend 4 to 6 inches above the finished floor, shall be approximately 3 inches from the nearest wall, and shall be bushed. Cap for protection during construction.
- i. Provide sleeves for building penetrations. Patch and firestop around the sleeve and provide the appropriate bushings on each end. Split bushings are not acceptable or permissible. Firestop the interior of the sleeve after cabling is installed.

B. Accessories:

- 1. Provide a No. 6 locate conductor inside a duct along each pathway; leave 10 feet coiled at each end.
 - a. Place outside the innerduct system in the primary pathway.
- 2. Provide a 1/4-inch nylon pull rope in each conduit segment with 5-foot minimum slack at each end; coil slack and anchor to enclosure side. Provide pull rope in all innerducts.
- 3. Provide warning tape above pathway runs.
 - a. Slice into ground below the surface over each pathway, and provide a 4-inch wide "Buried Cable Below" warning tape at a 6-inch depth along the underground pathway where the pathway is not covered by pavement or concrete. Provide one per pathway (not one per duct).
- 4. Provide plugs in duct(s) entering a building.

- a. Install plugs in conduits entering a building below grade or below the level of the next/last hand hole.
 - b. Install plugs in unused conduits opening into a ceiling cavity from a transition box. Plug conduits/sleeves with cables installed with a removable barrier.
- C. Documentation: Update site plan to indicate actual field conditions. Document labeling used and record on the site plan.

3.4 GROUNDING AND BONDING

- A. Ground electrical systems and equipment as required by code, utility, local ordinances, AHJ and requirements herein, including referenced Standards.

3.5 IDENTIFICATION

- A. Identify system components and cabling in compliance with TIA/EIA-606-B, or most current version.
- B. Label each cable, space, pathway, enclosure and termination.
- C. Below Grade Pathways:
 - 1. Below-Grade Conduit Markers:
 - a. Install underground warning tape 6 inches (152 mm) below grade directly above conduit ducts.
 - b. Install underground warning tape on top of the surface over which concrete is poured (e.g., driveways, sidewalks, slabs) and directly above ducts or buried conduits.
 - c. Select a tape featuring a warning message that most accurately describes the pathway usage below.

3.6 RESTORATION

- A. Restore affected areas to how they existed before construction.
 - 1. Where trenching has been performed, restoration shall include additional trench fill after settlement of original fill has completely subsided and reseeding as necessary for complete restoration.
 - 2. Where existing surface is removed, repair by backfilling with material equal in composition and density to the surrounding areas and replace removed surface such as asphalt pavement and concrete riprap with like material to equivalent condition.
- B. Provide erosion control, including bailed hay and sediment control fencing, as identified in the referenced Standards.

END OF SECTION 27 05 43

SECTION 27 05 50 - FIRESTOPPING FOR COMMUNICATIONS**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - 2. Product Datasheets.
 - 3. Material Safety Data Sheets (MSDS).
- B. Closeout Submittal:
 - 1. Product Datasheets.
 - 2. Material Safety Data Sheets (MSDS).
 - 3. Schedule of opening locations and sizes, penetrating items, and required listed design numbers to seal openings to maintain fire resistance ratings.
 - 4. Product certificates signed by firestop system manufacturer certifying material compliance with applicable code and specified performance characteristics.

1.2 REFERENCES

- A. Definitions:
 - 1. Firestop: A fire-rated material, device, or assembly of parts installed in a penetration of a fire-rated barrier.
 - 2. Firestop system: A specific construction consisting of the material(s) (firestop penetration seals) that fill the opening in the wall or floor assembly and any items that penetrate the wall or floor, such as cables, cable tray, conduit, ducts, pipes, and any termination devices, such as electrical outlet boxes, along with their means of support.
 - 3. Firestopping: The process of installing listed, fire-rated materials into penetrations in fire-rated barriers to reestablish the fire-resistance rating of the barrier.
 - 4. Intumescent firestop: A firestopping material that expands under the influence of heat.
- B. Reference Standards:
 - 1. ASTM E 84, "Surface Burning Characteristics of Building Materials."
 - 2. ASTM E 119, "Fire Tests of Building Construction and Materials."
 - 3. ASTM E 814, "Fire Tests of Penetration Firestop Systems."
 - 4. ANSI/UL 263, "Fire Tests of Building Construction and Materials."
 - 5. ANSI/UL 723, "Surface Burning Characteristics of Building Materials."

1.3 QUALITY ASSURANCE

- A. Where the local jurisdiction requires additional training, licensing, permits and certifications to perform firestopping, the entity and individuals performing the work shall comply with such requirements.

1.4 SYSTEM DESCRIPTION

- A. All penetrations through floors, ceilings, and walls shall be sleeved. All sleeves through floors and walls shall be firestopped.
 1. The firestopping system shall resist and limit the spread of fire, heat, smoke and gasses through otherwise unprotected openings in rated assemblies, including walls, partitions, floors, ceilings/roof and similar locations, restoring the integrity of the fire rated construction to its original fire rating, in accordance with applicable codes, standards, and as directed by the AHJ.
 2. All sleeves into spaces containing pressurized fire suppression systems shall be self-sealing sleeve assemblies.
- B. Firestopping shall be manufacturer installed in a re-usable sleeve assembly or may be removable/ re-usable material(s) inserted within and around a sleeve assembly to provide the required protection.
 1. Sleeves shall be mechanically fastened.
 2. Provide re-usable (re-enterable) firestopping system(s) and materials in backbone and horizontal cabling pathways to accommodate cabling changes.
- C. Firestopping requirements and locations are not specifically indicated on the Drawings. Review the architectural and other related Drawings to determine fire- and smoke-rated walls and floors, including minimum rating requirements. Provide firestopping Work associated with Division 27 and Division 28 (where applicable) per the requirements of the Contract Documents.
 1. At a minimum, firestopping shall equal or exceed the rating of the wall or floor and with a minimum UL classification for 1-hour fire and cold side temperature ratings.
 2. Firestopping systems shall be listed for the specific combination of fire-rated construction, type of penetrating item, annular space requirements, and fire rating, including the following criteria:
 - a. F-Rating: Where applicable, provide products that meet the intent of the F-rating classification for passage of flame per ANSI/UL 1479 or ASTM E814 for through penetrations. Rating shall be equal to or greater than the fire-resistance rating of the assembly in which the firestopping will be installed.
 - b. T-Rating: Where applicable, provide products that meet the intent of the T-rating classification for the transfer of temperature per ANSI/UL 1479 or ASTM E814 for through penetrations. In habitable areas where penetrating items are exposed to potential contact with materials on fire side(s) of rated assembly, T-rating must equal F-rating

- c. L-Rating: Provide products that meet the intent of the L-rating classification for the movement of smoke per ANSI/UL 1479 or ASTM E814 for through penetrations.
 - d. W-Rating: Where applicable, provide products that meet the intent of the W-rating classification for passage of water per ANSI/UL 1479 or ASTM E814 for through penetrations. Shall meet UL Water Leakage Test, W-Rating – Class 1 requirements for systems tested and listed in accordance with ANSI/UL 1479 or ASTM E814.
 - e. Wall Penetrations: Through penetration systems shall be symmetrical, with the same rating from both sides of the wall.
3. Firestopping shall be installed within the interior cavity of conduit sleeves, raceway, cable tray and other cable conveyances where the interior volume of the conveyance is open and exposed in one space while the opposite end of the conveyance is open and exposed within another.
 4. Firestopping shall be installed where preparations for, or installation of equipment (e.g., cabling, devices) cause the fire or smoke rating of a building component or assembly to be reduced as a result of some action taken.
 5. Fire-resistive joint sealants: Provide joint sealants with fire-resistance ratings as determined per ASTM E 119, but not less than that equaling or exceeding the fire-resistance rating of the construction in which the joint occurs.
 6. Firestopping products shall be compatible with each other, with the substrates forming openings, and with the items, if any, penetrating the firestopping, under the conditions represented by the Project, based on testing and field performance demonstrated by the firestopping products/system manufacturer.
 7. Firestopping system and products exposed to view, traffic, moisture, and physical contact shall not deteriorate when exposed to these conditions.
 8. Firestopping systems for floor penetrations with annular spaces exceeding 4 inches (100 mm) or more in width and exposed to possible loading and traffic shall be capable of supporting the floor loads involved by installing floor plates or by other means.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 MANUFACTURERS

- A. To maintain control and integrity of the firestopping applications, utilize a single manufacturer. Specific UL or approved listing agencies systems applicable to each type of firestop condition shall be supplied by a single manufacturer.
- B. Subject to compliance with requirements, provide products by one of the following:
 1. Specified Technologies, Inc. (STI).
 2. 3M Fire Protection Products (3M).

3. Hilti Corporation (Hilti).
4. Unique Fire Stop Products.
5. Nelson Firestop Products.
6. Unifrax Corporation.

2.3 MATERIALS

- A. Firestopping products shall be tested and Listed for specific fire resistance rated construction conditions and shall conform to construction assembly type, penetrating item type, annular space requirements, and fire rating involved for each separate instance.
- B. Component Types – Utilize as required to meet Project requirements
 1. Intumescent sealants: Single component intumescent latex formulations containing no water soluble intumescent ingredients.
 - a. Basis of Design shall be Specified Technologies Inc. (STI) SpecSeal Series SSS Intumescent Sealant and SpecSeal Series LCI Intumescent Sealant.
 2. Endothermic sealants: Single component latex formulations that upon cure do not re-emulsify during exposure to moisture.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series LC Endothermic Sealant.
 3. Firestop devices: Factory-assembled steel collars lined with intumescent material sized to fit specific outside diameter of penetrating item.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSC Firestop Collars and SpecSeal LCC Firestop Collars.
 4. Wall opening protective materials: Intumescent, non-curing pads or inserts for protection of device boxes to reduce horizontal separation to less than 24 inches (610 mm).
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSP Firestop Putty Pads or SpecSeal Series EP PowerShield Insert Pads.
 5. Firestop putty: Intumescent, non-hardening, water resistant putties containing no solvents, inorganic fibers or silicone compounds.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSP Putty.
 6. Intumescent wrap strips: Single component intumescent elastomeric strips faced on both sides.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSW Wrap Strip.
 7. Firestop pillows: Re-enterable, non-curing, mineral fiber core encapsulated with an intumescent coating on all six sides contained in a flame retardant poly bag.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSB Pillows.
 8. Mortar: Portland cement based dry-mix product formulated for mixing with water at Project site to form a non-shrinking, water-resistant, homogenous mortar:
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSM Firestop Mortar.
 9. Silicone sealants: Moisture curing, single component, silicone elastomeric sealant for horizontal surfaces (pourable or non-sag) or vertical surface (non-sag).

- a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal SIL300 Silicone Firestop Sealant or SpecSeal SIL300 SL Self-Leveling Silicone Firestop Sealant.
 - 10. Composite sheet: Intumescent material sandwiched between a galvanized steel sheet and steel wire mesh protected with aluminum foil:
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal CS Composite Sheet.
 - 11. Firestop plugs: Re-enterable, foam rubber plug impregnated with intumescent material for use in blank openings and cable sleeves.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series FP Firestop Plug.
 - 12. Intumescent collar devices: Steel collar system with intumescent inserts.
 - a. Basis of Design: Specified Technologies Inc. (STI) SpecSeal Series SSC and LCC.
 - 13. Horizontal wall penetrations in Gypsum Board
 - a. Fire-rated cable grommet: Molded two-piece grommet made from plenum grade polymer with a foam inner core for sealing individual or small, multi-cable bundle penetrations.
 - 1) Basis of Design: Specified Technologies Inc. (STI) Ready Firestop Grommet.
 - 14. Ceiling and ceiling tile penetrations
 - a. Fire-rated cable grommet: Molded two-piece grommet made from plenum grade polymer with a foam inner core for sealing individual or small, multi-cable bundle penetrations.
 - 1) Basis of Design: Specified Technologies Inc. (STI) Ready Firestop Grommet.
- C. Firestop sleeve assembly kit:
 - 1. Sized to accommodate cable quantities indicated in the Contract Documents plus 20 -percent additional capacity for growth.
 - 2. Includes steel escutcheon plates and intumescent firestop gaskets sized to fit the specific outside diameter of the sleeve and sandwich the barrier to lock the sleeve in place.
 - 3. Includes sufficient thickness of intumescent firestop putty to seal the ends of the sleeve to restrict the passage of fire, smoke and superheated gases.
 - 4. Basis of Design shall be Specified Technologies Inc. (STI) SpecSeal READY SLEEVE and SpecSeal READY SPLIT SLEEVE (for existing cable penetrations).]
 - 5. Fire rated cable pathways: Gangable device modules comprised of steel raceway with intumescent foam pads allowing 0 to 100 percent cable fill and requiring no additional action in the form of plugs, twisting closure, putty, pillow, or sealant to achieve fire and leakage rating. Shall include cable radius control modules that snap onto the ends of devices.
 - a. Basis of Design: Specified Technologies Inc. (STI) EZ-PATH Fire Rated Pathway with EZRCM44S for Series 44+ radius control modules (RCM). Radius Control Modules are to be used for wall penetrations only.
- D. Accessories:
 - 1. Provide components for each firestopping system required to install fill materials and to comply with the system performance requirements. Use only components specified by the firestopping manufacturer and approved by the qualified testing and inspecting agency for the designated fire-resistance-rated systems.

Firestopping materials shall be asbestos-free and shall not contain flammable solvents. Accessories include but are not limited to the following:

- a. Permanent forming, damming, backing materials, including the following:
 - 1) Semi-refractory fiber (mineral wool) insulation.
 - 2) Ceramic fiber.
 - 3) Sealants used in combination with other forming/damming materials to prevent leakage of fill materials in liquid state.
 - 4) Fire-rated form-board.
 - 5) Joint fillers for joint sealants.
- b. Temporary forming materials.
- c. Substrate primers.
- d. Collars.
- e. Steel sleeves.
- f. Warning labels.

2.4 COMBUSTIBLES IN PLENUM SPACES

- A. Passive combustibles installed within plenum spaces that are not UL listed for installation within plenum spaces shall be encased within high-temperature plenum insulation, the purpose of which is to prevent flame propagation and smoke development in the plenum areas. Passive combustibles include such items as non-plenum cables, pipe, low-voltage connector housings.
 1. Plenum insulation shall be UL listed for the application.
 2. Basis of Design: UniFrax FyreWrap 0.5.

PART 3 - EXECUTION

3.1 GENERAL

- A. Consult and comply with the AHJ concerning local firestopping requirements.
 1. Where no NRTL tested firestop application exists, manufacturer's engineering judgment derived from similar listed system designs or other tests shall be submitted to the AHJ for review and approval prior to installation.
 2. It is the sole responsibility of the firestopping provider to install tested and approved systems that comply with applicable codes, standards and/or agencies and authorities having jurisdiction.
- B. Comply with TIA-569-B, Annex A, "Firestopping."
- C. Comply with the most current published edition of the "Telecommunications Distribution Methods Manual (TDMM)" published by the Building Industry Consulting Services International (BICSI), including the "Firestopping" article.
- D. Through-penetration firestop systems and construction gap fire resistive systems shall be supplied and installed with approved methods using materials that have been tested and classified to produce a listed and approved assembly.

- E. Provide products that upon curing do not re-emulsify, dissolve, leach, break down or otherwise deteriorate over time from exposure to atmospheric moisture, sweating pipes, ponding water or other forms of moisture characteristic during or after construction.
- F. Openings within floors and walls designed to accommodate cabling shall be provided with re-enterable products that do not cure or dry.
- G. Damaged or expired materials shall be removed from the site and shall not be used in the Work.
- H. Do not use materials that contain flammable solvents.
- I. Sleeves shall be mechanically fastened to the wall, floor, ceiling or roof assembly.

3.2 DELIVERY, STORAGE AND HANDLING

- A. Deliver firestopping products to the Project site in original, unopened containers or packages with intact and legible manufacturer labels identifying product and manufacturer, date of manufacture, lot number, shelf life, if applicable, qualified testing and inspecting agency's classification marking applicable to Project, curing time, and mixing instructions for multi-component materials.
 - 1. Coordinate the delivery date of firestopping materials with the scheduled date of installation to minimize the amount of storage time required at the Project site.
 - 2. Store with a copy of the manufacturer MSDS sheet. Submit a copy of each sheet to the Owner's project manager upon delivery to the site.
- B. Store and handle firestopping materials to prevent deterioration or damage due to moisture, temperature changes, contaminants or other causes. Handle, store and protect products and materials according to the manufacturer's printed recommendations and guidelines.
- C. Do not deliver or install product(s) in conditions that jeopardize the performance of the product.

3.3 INSTALLATION

- A. Install firestopping products in compliance with manufacturer's printed instructions, recommendations and technical information.
- B. Coordinate construction of openings and penetrating items to ensure that through-penetration firestop systems are installed according to manufacturer's requirements. Coordinate sizing of sleeves, openings, core drilled holes or cut openings to accommodate through-penetration firestop systems.
- C. Environmental conditions:
 - 1. Install firestopping products when ambient or substrate temperatures are within the requirements recommended by the firestopping manufacturer. Do not install firestopping when ambient or substrate temperatures are outside the limits

- permitted by the manufacturer or when substrates are wet due to rain, frost, condensation or other causes.
2. Maintain temperatures and environmental conditions within limits recommended or required by manufacturer's printed instructions or technical information for any required periods of time before, during and after installation of materials.
- D. Ventilation: Provide ventilation as required by firestopping manufacturer, including mechanical ventilation if required.
- E. Examine substrates and conditions for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of firestopping. Do not proceed with installation until unsatisfactory conditions have been corrected.
- F. Surfaces shall be free of dirt, grease, oil, scale, laitance, rust, release agents, water repellants and any other substances that may inhibit optimum adhesion.
- G. Clean openings and joints immediately before installation of firestopping to comply with firestopping manufacturer's printed guidelines and recommendations and the following requirements:
1. Remove foreign materials from surfaces of opening and joint substrates and from penetrating items that could interfere with adhesion of firestopping.
 2. Clean opening and joint substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with firestopping. Remove loose particles remaining from cleaning operation.
 3. Remove laitance and form-release agents from concrete.
- H. Provide masking and temporary covering to protect adjacent surfaces and prevent contact with the following:
1. Adjoining surfaces that will remain exposed upon completion of the Work.
 2. Surfaces that would otherwise be permanently stained or damaged by such contact or cleaning methods used to remove smears from firestopping materials.
 3. Remove masking and temporary covering as soon as possible to do so without disturbing firestopping seal with substrates.
- I. Install fire stop materials, including forming, packing, and other accessory materials, to fill openings around services penetrating floors, walls, ceilings and roofs, to provide fire-resistance ratings indicated for the assembly in which the penetration occurs. Comply with installation requirements established by the manufacturer and testing and inspecting agency.
- J. Install forming/damming materials and other accessories of types required to support fill materials during application and in the position needed to produce the cross-sectional shapes and depths required to achieve fire ratings of designated firestop systems. After installing fill materials, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.
- K. Install fill materials for through-penetration firestop systems by proven techniques to produce the following results:
1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items.

2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
- L. Seal between sleeves and pipes and other through-penetration pathway devices with firestop material. Material shall meet applicable fire ratings required.
- M. Firestop systems shall not hamper the performance of fire dampers in ductwork or other safety systems.
- N. Tool non-sag sealants immediately after sealant application and before skinning or curing begins. Form smooth, uniform beads of configuration required to produce fire-resistance rating, as well as to eliminate air pockets, and to ensure contact and adhesion of sealants with sides of joint. Remove excess sealant from surfaces adjacent to the joint. Do not use tooling agents that discolor sealants or adjacent surfaces or that are not approved by the sealant manufacturer.
- O. Firestopping for discrete cable pathways (J-hooks):
 1. Discrete cable pathways shall terminate at each barrier and resume on the opposite side such that cables pass independently through fire-rated pathway devices.
- P. Firestopping for cable trays:
 1. Cable trays shall terminate at each barrier and resume on the opposite side such that cables pass independently through fire-rated pathway devices. Cable tray shall be rigidly supported independent from fire-rated pathway devices on each side of barrier.
 - a. Openings for cable trays shall be sealed using re-enterable firestopping pillows.

3.4 FIELD QUALITY CONTROL

- A. Components used in firestop systems shall be the same as the products used in fire qualification tests, must be prepared and installed using established quality control procedures, and verified periodically by an independent quality auditor at the manufacturer's facility. The final field installation shall be reviewed and validated by the AHJ.
- B. Do not enclose firestopping with other construction until examinations are completed. Area of Work shall be accessible until inspections are completed by the AHJ.
- C. Where deficiencies are found, repair or replace firestopping at no additional expense to the Owner so that Work complies with requirements.

3.5 CLEANING

- A. Clean all surfaces adjacent to sealed openings to be free of excess firestopping materials and soiling as work progresses.

- B. Remove excess fill materials and sealants adjacent to openings and joints as Work progresses. Use methods and cleaning materials approved by manufacturers of firestopping products and products in which openings and joints occur. Return surfaces to the original condition.
- C. During and after the curing period, protect firestopping from contact with contaminating substances and from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion.
 - 1. If damage or deterioration occurs, remove damaged or deteriorated firestopping immediately, and install new materials to produce firestopping complying with specified requirements.

3.6 IDENTIFICATION

- A. Label firestopping locations. Install a label on each side of the wall indicating the following information:
 - 1. Firestop manufacturer.
 - 2. Name of product and UL system number/designation.
 - 3. Name of installation contractor.
 - 4. Date of installation.
 - 5. Rating of the wall/system.

END OF SECTION 27 05 50

SECTION 27 05 53 - IDENTIFICATION FOR COMMUNICATIONS

PART 1 - GENERAL

1.1 SUBMITTALS

- A. Product datasheets.
- B. Labeling schemas.
- C. [Shop Drawings
 - 1. Communications Plan Key Drawings:
 - a. Two complete set of full-size drawings representing the Key Plan Drawings that will be posted within the Communications Rooms.]

1.2 SUMMARY

- A. Section Includes:
 - 1. Labeling of cabling and termination devices.
 - 2. Labeling of equipment.
 - 3. Labeling of Communications Rooms.
- B. Requirements of this Section apply to all Work of this Division and Work Division 28 (where applicable).

1.3 REFERENCE STANDARDS

- A. Definitions:
 - 1. Component Identifier / Component ID: See Device ID
 - 2. Device.ID: The unique identifier given to a specific instance of a product, module and assembly. Identifiers are unique within the context of the system and product in which it is used.

1.4 SYSTEM DESCRIPTION

- A. The identification system shall be a coordinated system of permanently affixed labels of specified types that are used to uniquely identify each instance of a product and the space in which it is located. The following items shall be identified:
 - 1. Cables.
 - a. All cables shall have cable ID on the jacket at each end 4-6 inches from termination.
 - 2. Telecommunications cabling cross-connect Blocks, including 66-blocks and 110-blocks.
 - 3. Patch Panels.
 - 4. Faceplates.
 - 5. Individual connection jacks, receptacles and terminals.

- 6. Remote Equipment enclosures/cabinets not within telecommunications rooms.
 - 7. Equipment racks and cabinets within telecommunications rooms.
 - 8. Telecommunications Backboards.
 - 9. Rooms containing communications or security products.
 - 10. Device boxes, junction boxes, pull boxes, floor boxes, wall boxes, ceiling boxes and other forms of boxes used for passage, splicing, or termination of cables.
 - 11. Equipment power cord plugs.
- B. The labeling schema used for horizontal and backbone structured cabling systems shall be TIA/EIA-606-A, or most current version, compliant.
- C. Label Type Schedule

LABEL TYPE SCHEDULE		
APPLICATION	TYPE	NOTES
EQUIPMENT RACK - FRONT	DB	
EQUIPMENT RACK - REAR	DB	
PATCH PANELS – BACKBONE CABLES	CB	
PATCH PANELS – HORIZONTAL CABLES	CB	
FACEPLATES – HORIZONTAL	CB	CLEAR BACK
FACEPLATES - CUSTOM	DE	ENGRAVED; SCREENED
FACEPLATES – MULTISERVICE	CB	CLEAR BACK; ENGRAVED
OUTLETS – HORIZONTAL	CB	
OUTLETS – CUSTOM FACEPLATE	DB	
CABLES - HORIZONTAL	CA	
CABLES - BACKBONE	CA	
AV CABLES	CA	
COMMUNICATIONS BACKBOARDS	DC	
CONNECTING BLOCKS	PI	WITH PLASTIC COVER
FIBER OPTIC PANEL	PI	
ABBREVIATED DEFINITIONS CA=SELF LAMINATING WRAP-AROUND), CB=SELF LAMINATING DA = LAMACOID, DB=TAPE TYPE, DC=IMPRINTED/ETCHED; DE=ENGRAVED PI=PRINTED INTEGRAL LABEL; RA=LAMACOID SEE SECTION 270553 FOR SPECIFICATIONS OF VARIOUS LABEL TYPES		

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Brady
 - 2. Brother
 - 3. Casio
 - 4. Hubbell
 - 5. Panduit
 - 6. Hellerman/Tyton
 - 7. Thomas and Betts

2.3 PERFORMANCE

- A. Labels shall be designed to remain permanently affixed under typical environmental conditions for the life of the product identified.
- B. Nomenclature shall be permanent and non-fading under typical environmental conditions.
- C. Adhesive labels shall remain attached to the affixed product in continuous conditions of 90% relative humidity and temperatures of 100-degrees Fahrenheit (38-degrees Celsius).

2.4 CABLE INFRASTRUCTURE LABELS

- A. Type CA:
 - 1. Self-laminating type.
 - 2. Adhesive backed.
 - 3. Opaque solid-color background area, color for nomenclature: White.
 - 4. Clear self-laminating wrap-around cover for protection of nomenclature.
 - 5. Available in a variety of heights and widths to suit the cable being labeled.
 - 6. Printing area of the label available in a wide variety of sizes to accommodate the specific nomenclature to be applied.
 - 7. Overall label width: Minimum 1 inch (25 mm); Maximum 2 inches (50 mm).
 - 8. Opaque printing area length: Minimum 1/2 inch (12 mm); Maximum 1-1/4 times the cable circumference.
 - 9. Self-laminating wrap length: 1-1/2 to 2-1/2 times the cable circumference.

10. Bold computer-generated and commercial printer applied high-contrast project and system specific nomenclature.
- B. Type CB – Tape Type:
1. Self-laminating type.
 2. Adhesive backed.
 3. Opaque solid-color background area, color for nomenclature: White.
 4. Available in a variety of heights and widths to suit the termination being labeled.
 5. Printing area of the label available in a wide variety of sizes to accommodate the specific nomenclature to be applied.
 6. Overall label width: Minimum 1 inch (25 mm); Maximum 2 inches (50 mm).
 7. Opaque printing area length: Minimum 1/2 inch (12 mm); Maximum 1-1/4 times the cable circumference.
 8. Bold computer-generated and commercial printer applied high-contrast project and system specific nomenclature.
- C. Type PI – Tape Type:
1. Integral card type.
 2. Opaque solid-color background area, color for nomenclature: White.
 3. Heights and widths to suit the termination being labeled.
 4. Printing area of the label to accommodate the specific nomenclature to be applied.
 5. Bold computer-generated and commercial printer applied high-contrast project and system specific nomenclature.
 6. Provide with clear plastic covers to protect label.

2.5 DEVICE LABELS

- A. Type DB – Tape Type:
1. Tape-type construction.
 2. Material: Polyester.
 3. Working temperature range: -40 to 248 degrees Fahrenheit (-40 to 120 degrees Celsius)
 4. Opaque solid-color background over which nomenclature is applied.
 5. Self-adhesive backing for adhesion to labeled item.
 6. Designed for thermal-transfer based machine imprinting of nomenclature.
 7. Available in a wide-variety of manufacturer sizes.
 8. Available with a wide-variety of background colors.
 9. Available with a variety of different nomenclature colors.

2.6 CABLE LABEL HEATSHRINK

- A. Should any condition arise in which cable labels are used that are neither self-laminating nor permanent, then properly sized clear heat-shrink shall be applied over the label to make it permanent.

PART 3 - EXECUTION**3.1 INSTALLATION****A. General:**

1. Label each instance of each product.
2. Label each connector of each product.
3. Install labels so that they are legible after installation.
4. Install labels so they are parallel to the dominant visual lines of the product identified.
5. Install labels of the appropriate size for the application.
6. Maintain consistency in label sizes that are used for labeling similar applications.
7. Install secondary labels on the rear of products that are mounted within racks, within equipment enclosures/cabinets, within furniture or casework, and in any application where the rear of the product is accessed for termination, installation, service, operation or adjustment.
8. Coordinate "final" room numbers or identifiers with the Owner prior to performing work; all labeling shall perform to operational room identifiers. If actual room numbers differ from architectural room numbers both shall be included on the as-built floorplans.
9. Campus environments with multiple buildings shall add a building identifier to the labeling in each building.

B. Cables:

1. General:
 - a. Uniquely identify each cable so that no two cables serving a single system utilize the same identifier.
 - b. Cables that terminate within different architectural spaces shall include both the source and destination space identifiers on the label in addition to a unique cable identifier
 - c. Install a primary label near the end of cable.
 - d. Install a secondary label (with identical nomenclature as the primary label) near the ends of the cable at such point that the label is viewable and readable when the cable is in its final dressed position.
 - e. Utilize specified labeling schemas. Substitute schema may be considered if submitted to, reviewed and returned by the Designer without exceptions.
2. Horizontal Cables:
 - a. Label in accordance with TIA/EIA-606-A, or most current version.
 - b. Horizontal labeling schema:
 - 1) "Communication Room Identifier"–"Outlet Room Number"–"Rack, Patch Panel and Patch Panel Port Number."
3. Backbone Cables:
 - a. Label in accordance with TIA/EIA-606-A, or most current version.
 - b. In addition to labels at each end, apply a label at each junction/pull point to identify the cable.
 - c. Cabling labeling schema:
 - 1) Service designation and number: CB = Copper Backbone, FB = Fiber Backbone, VB = Video Backbone (e.g., CB.01, FB.01, FB.02, VB.01)
 - 2) Interconnected Communication Room designations (e.g., ER01–TR04)

- 3) Composite Examples:
 - a) Example: CB.01–ER01–TR02.
 - b) Example: CB.01–ER01–TR03.
 - d.
 4. Patch Cables:
 - a. Label with the same unique identifier at each end.
 5. Multi-Cable Assemblies and Tethers:
 - a. Label the overall assembly, sleeve, or jacket (as applicable) at both ends.
 - b. Label each individual cable member at both ends.
 - c. If the cable assembly features connectors on the end of any cable member, affix labels also on the connector. Use user-friendly nomenclature that identifies the use of the connector and the port to which it mates.
 - d. See illustrations at the end of this Section.
- C. Faceplates and Outlets:
1. Faceplates – General:
 - a. Label each faceplate with a Device.ID label.
 - 1) Exception: Faceplates used exclusively for Horizontal cables do not need to feature a Device.ID label.
 - 2) Exception: Blank faceplates are not required to have a Device.ID label, except where noted.
 - b. Use labels with a clear background or a background color that matches the plate. On custom fabricated faceplates, label shall be integral to the plate by means of engraving or screening or other approved means.
 - c. See illustrations at the end of this Section.
 2. Faceplates – with Horizontal Cables:
 - a. Label modular outlet frame(s) with a label identifying origination and destination rooms of the horizontal cable(s) present at the faceplate. When non-modular faceplates are used, affix the label to the plate.
 3. Outlets/Connectors – General:
 - a. Label each outlet.
 4. Outlets/Connectors – Horizontal Cables:
 - a. Identify the specific patch panel and port to which the opposite end of the cable is connected.
 5. Use .35” tape with 9 pt Arial font.
- D. Cross-Connect Blocks:
1. 110-Style:
 - a. Label the front of the block directly above or below (as indicated by the manufacturer) each position in the block.
 - b. Label connections in numerical order and corresponding to the faceplate outlet schema (horizontal cabling) or the opposite end labeling schema (backbone cabling), dependent upon use.
 - c. Label the upper left corner of each block designating the service of that particular block.
 2. 66-Style:
 - a. Label the front of the block directly above or below (as indicated by the manufacturer) each position in the block.
 - b. Label connections in numerical order and corresponding to the faceplate outlet schema (horizontal cabling) or the opposite end labeling schema (backbone cabling), dependent upon use.

- c. Label the upper left corner of each block designating the service of that particular block.
- E. Patch Panel:
- 1. Chassis – General:
 - a. Label each panel chassis with a Device.ID.
 - b. Affix chassis labels aligned with the left or right edge of the product. Locate consistently across chassis in the rack and throughout the project.
 - 2. Chassis – for Horizontal Cabling:
 - a. In lieu of or in addition to the Device.ID uniquely label the chassis for each panel within each Communication Room in accordance with the following schema:
 - 1) “Letter” or “Letter Letter” where letters A-Z or dual letter assemblies AA-ZZ are valid.
 - 3. Individual Connectors – for Horizontal Cabling:
 - a. Label each connector on each panel in order from Left to Right and Top to Bottom 1 to “X,” where “X” is the number of connector spaces on the panel.
 - b. In addition, the connector label nomenclature shall clearly identify the room number in which the opposite end of the cable is terminated.
 - 4. Individual Connectors – Others:
 - a. Label each connector.
 - b. Use color-coded nomenclature acceptable to the Designer.
- F. Patch Bays (e.g., Audio, Video):
- 1. Label each patch bay with a Device.ID.
 - 2. Label each connector on the patch bay.
 - 3. Use color-coded nomenclature acceptable to the Designer.
 - 4. Where the patch bay features an integral labeling strip, label the connectors using the strip following the techniques recommended by the manufacturer.
 - 5. Where the Drawings depict additional means of labeling, provide additional labels with designer reviewed nomenclature.
- G. Equipment Racks:
- 1. Label each equipment rack with a unique identifier.
 - 2. Accurately record the nomenclature on the project as-built documentation.
 - 3. Affix a primary label to the front of the rack.
 - 4. Affix a secondary label to the rear of the rack.
 - 5. Locate labels on the upper-most part of the rack, typically the frame, in an area that is clearly visible if doors are installed and closed.
 - 6. Label each equipment rack to match the designation indicated on the floor plans
 - 7. Labels shall be black text on white background.
- H. Equipment Cabinets/Enclosures (e.g., NEMA Enclosures):
- 1. Label each equipment cabinet/enclosure with a unique identifier.
 - 2. Accurately record the nomenclature on the project as-built documentation.
 - 3. Affix a primary label on the dominant front-most outer surface.
 - 4. Affix a secondary label on the dominant interior surface if the product is equipped with a removable cover or door.
 - 5. Use Lamacoid label for the primary label.
 - 6. Use Tape-type labels for the secondary label.

3.2 LABEL PROTECTION

- A. Cable Labels: If at any time during the course of the project a condition arises for which cable labels are used that are neither self-laminating nor permanent, then such labels shall be protected with properly sized clear heat-shrink to protect the label and to make it permanent.

3.3 RECORD DRAWINGS

- A. Accurately record the labels used for identifying items within the project as-built documentation.

END OF SECTION 27 05 53

SECTION 27 08 10 - VERIFICATION TESTING OF STRUCTURED CABLING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM):
 - a. Make, Model, Serial Number.
 - b. Description of the test instrument.
 - c. Tests for which the instrument will be used.
 - 2. Product Datasheets: For each test instrument to be used.
 - 3. Product Calibration Certificate for each test instrument: Certificate shall document the date of calibration and the name of the calibration organization.

- B. Closeout Submittal:
 - 1. UTP Cable Test Result Documentation:
 - a. Make, model, serial number and date of last calibration of each piece of test equipment used.
 - b. Summary Test Reports: Paper copy of the summary test results shall be provided that lists the links that have been tested with the summary information as set forth in Part 3.
 - c. Detailed Test Reports: Detailed test results data to be provided in the electronic database for each tested link must contain the information as set forth in Part 3.
 - 1) The database for the completed job as stored and delivered on CD-ROM or DVD including the software tools required to view, inspect, and print any selection of test reports.
 - 2. Fiber Optic Test Result Documentation:
 - a. Make, model, serial number and date of last calibration of each piece of test equipment used.
 - b. Summary Test Reports: Paper copy of the summary test results shall be provided that lists the links that have been tested with the test summary information as set forth in Part 3.
 - 1) Fiber tests from the same cable between the same 2 points shall not vary over .25db from each other.
 - c. Detailed Test Reports: Detailed test results data to be provided in the electronic database for each tested fiber link must contain the information as set forth in Part 3.
 - 1) The database for the completed job as stored and delivered on CD-ROM or DVD including the software tools required to view, inspect, and print any selection of test reports.
 - 3. Coaxial Cabling Test Result Documentation:
 - a. Make, model, serial number and date of last calibration of each piece of test equipment used.
 - b. Summary Test Reports: Paper copy of the summary test results shall be provided that list links that have been tested with the summary information as set forth in Part 3.

- c. Detailed Test Reports: Detailed test results data to be provided in the electronic database for each tested link must contain the information as set forth in Part 3.
 - 1) The database for the completed job as stored and delivered on CD-ROM or DVD including the software tools required to view, inspect, and print any selection of test reports.

1.2 REFERENCES

A. Definitions:

1. IDC: Insulation displacement connector.
2. Margin: Designates the difference between the measured value and the corresponding test limit value. For passing links, 'worst case margin' identifies the smallest margin over the entire frequency range; the point at which the measured performance is "closest" to the test limit.
3. NVP: Nominal Velocity of Propagation expresses the speed of the electrical signals along the cabling link in relation to the speed of light in a vacuum. Insulation characteristics and twist rate of the wire pair influence NVP in minor ways. Typically, an 'average' value for NVP is published for four wire-pairs in a cable.
4. OLTS: Optical loss test set.
5. OTDR: Optical time domain reflectometer.

B. Reference Standards:

1. ANSI/TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises.
2. ANSI/TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard.
3. ANSI/TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard.
4. ANSI/TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
5. ANSI Z136.2, ANS For Safe Use Of Optical Fiber Communication Systems Utilizing Laser Diode And LED Sources.
6. ANSI/EIA/TIA-455-50B, Light Launch Conditions For Long-Length Graded-Index Optical Fiber Spectral Attenuation Measurements.
7. ANSI/TIA/EIA-455-59A, Measurement of Fiber Point Discontinuities Using an OTDR.
8. ANSI/TIA/EIA-455-60A, Measurement of Fiber or Cable Length Using an OTDR.
9. ANSI/TIA/EIA-455-61A, Measurement of Fiber or Cable Attenuation Using an OTDR.
10. ANSI/TIA/EIA-526-7, Optical Power Loss Measurements of Installed Singlemode Fiber Cable Plant.
11. ANSI/TIA/EIA-526-14-A, Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant.
12. TIA/EIA TSB-140, Additional Guidelines for Field-Testing Length, Loss and Polarity of Optical Fiber Cabling Systems.
13. The most current published edition of the "TELECOMMUNICATIONS DISTRIBUTION METHODS MANUAL" published by the Building Industry Consulting Services International (BICSI).

1.3 COORDINATION

- A. The Owner or the Owner's representative shall be invited to witness and review field testing and procedures. The representative shall be notified of the start date of the testing phase a minimum of five (5) business days before testing commences.

1.4 QUALITY ASSURANCE

- A. Testing shall be supervised by an individual certified by BICSI as an RCDD.
- B. Individuals performing tests shall have attended and have successfully completed an appropriate training program and have obtained a certificate as proof thereof. Appropriate training programs include but are not limited to installation certification programs furnished by BICSI or the ACP (Association of Cabling Professionals).
- C. Test equipment shall perform in accordance with the manufacturer's published specifications and shall have been calibrated by either the manufacturer or a recognized independent test equipment calibration organization within the 365 day period prior to its use.

1.5 SYSTEM DESCRIPTION

- A. Outlets, cables, patch panels and associated components shall be fully assembled and labeled prior to field-testing. Any testing performed on incomplete systems shall be redone on completion of the work.
- B. Perform testing on each cabling link (connector to connector), including copper twisted pair, fiber optic (multi-mode and single-mode) and coaxial cabling.
 - 1. Fiber optic Intra-Building Links shall be tested as Tier 1.
 - 2. Fiber optic Inter-Building Links shall be tested as Tier 2.
 - 3. All fiber optic links including more than one segment shall be tested as Tier 2 whether involving fusion splicing or mechanical connection.
- C. Testing shall not include any active devices or passive devices within the link other than cable, connectors, and splices.
 - 1. Link attenuation does not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.
- D. In addition to the tests identified in this document, contractor shall notify the Owner or Owner's representative of any additional tests that are deemed necessary to guarantee a fully functional system. These tests shall be implemented with additional measurement results recorded at no additional costs.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT REQUIREMENTS

- A. Subject to compliance with requirements, available test equipment manufacturers that may be used for testing include, but are not limited to the following:
1. Fluke Corporation.
 2. Ideal
 3. Softing
 4. Viavi
- B. UTP Cable Test Equipment:
1. Category 5e, 6 and 6A (Augmented Category 6) Compliance: Coordinate with the Drawings and related Sections for project requirements.
 - a. The test equipment (tester) shall comply with the accuracy requirements for field testers as defined in ANSI/TIA-1152. The tester, including the appropriate interface adapter, must meet the specified accuracy requirements. The accuracy requirements for the permanent link test configuration (baseline accuracy plus adapter contribution) are specified in Table 2 of ANSI/TIA-1152.
 - 1) Level IIe – Category 5e (100MHz)
 - 2) Level III – Category 6 (250 MHz)
 - 3) Level IV – Category 6A (500MHz)
 - b. The test plug shall fall within the values specified in ANSI/TIA-568-C Annex C for NEXT, FEXT and Return Loss.
 - c. The tester shall be within the calibration period recommended by the vendor in order to achieve the vendor-specified measurement accuracy.
 - d. The tester interface adapters must be of high quality and the cable shall not show any twisting or kinking resulting from coiling and storing of the tester interface adapters. In order to deliver optimum accuracy, preference is given to a permanent link interface adapter for the tester that can be calibrated to extend the reference plane of the Return Loss measurement to the permanent link interface. The contractor shall provide proof that the interface has been calibrated within the period recommended by the vendor. To ensure that normal handling on the job does not cause measurable Return Loss change, the adapter cord cable shall not be of twisted-pair construction.
 - e. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests (detailed in Section 4.2.2 of ANSI/TIA-1152). Any Fail or Fail* result yields a Fail for the link-under-test. In order to achieve an overall Pass condition, the results for each individual test parameter must Pass or Pass*.
 - f. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter. The test result of a parameter shall be marked with an asterisk (*) when the result is closer to the test limit than the accuracy of the field tester. The field tester manufacturer must provide documentation as an aid to interpret results marked with asterisks.
 2. Measurement Capabilities
 - a. Wire Map
 - b. Length

- c. Propagation Delay
- d. Delay Skew
- e. DC Loop Resistance
- f. DC Resistance Unbalance within a pair
- g. DC Resistance Unbalance between pairs
- h. Insertion Loss
- i. NEXT (Near-End Crosstalk)
- j. PS NEXT (Power Sum Near-End Crosstalk)
- k. ACR-N (Attenuation to Crosstalk Ratio Near-End)
- l. PS ACR-N (Power Sum Attenuation to Crosstalk Ratio Near-End)
- m. ACR-F (Attenuation to Crosstalk Ratio Far-End)
- n. PS ACR-F (Power Sum Attenuation to Crosstalk Ratio Far-End)
- o. Return Loss
- p. TCL (Transverse Conversion Loss)
- q. ELTCTL (Equal Level Transverse Conversion Transfer Loss)
- r. Time Domain Reflectometer
- s. Time Domain Xtalk Analyzer
- t. PS ANEXT (Power Sum Alien Near-End Crosstalk)
- u. Average PS ANEXT (Average Power Sum Alien Near-End Crosstalk)
- v. PS AACR-F (Power Sum Alien Attenuation to Crosstalk Ratio Far-End)
- w. Average PS AACR-F (Average Power Sum Alien Attenuation to Crosstalk Ratio Far-End)

C. Fiber Optic Cable Test Equipment:

1. The test equipment shall be within the calibration period recommended by the manufacturer.
2. Fiber optic test jumpers and adapters shall be of high quality and shall not show excessive wear.
3. Optical Loss Test Set (OLTS):
 - a. An OLTS is comprised of two components: an optical light source and an optical power meter. After making a reference measurement, the source and meter are located at opposite ends of the fiber under test. A source and meter may be contained within the same package to enable bi-directional testing without swapping end test equipment.
 - b. Multimode optical fiber light source:
 - 1) Dual LED light sources with central wavelengths of 850nm (± 30 nm) and 1300nm (± 20 nm).
 - 2) Output power of -20dB minimum.
 - 3) The light source shall meet the launch requirements of ANSI/EIA/TIA-455-50B, Method A. This launch condition can be achieved either within the field test equipment or by use of an external mandrel wrap (as described in clause E.7 of ANSI/TIA-568-C.0) with a Category 1 light source.
 - c. Singlemode optical fiber light source:
 - 1) Dual laser light sources with central wavelengths of 1310nm (± 20 nm) and 1550nm (± 20 nm).
 - 2) Output power of -10dB minimum.
 - d. Power Meter:
 - 1) 850 nm, 1300/1310 nm, and 1550 nm wavelength test capability.
 - 2) Power measurement uncertainty of ± 0.25 dB.

- 3) Store reference power measurement.
 - 4) Save at least 100 results in internal memory.
 - 5) PC interface (serial or USB).
 - 4. Optical Time Domain Reflectometer (OTDR):
 - a. Internal non-volatile memory and removable memory device with at least 16MB capacity for results storage.
 - b. Serial and USB ports to transfer data to a PC.
 - c. Multimode OTDR:
 - 1) Wavelengths of 850nm (± 20 nm) and 1300nm (± 20 nm).
 - 2) Event deadzones of 3.7 m maximum at 850 nm and 1300 nm.
 - 3) Attenuation deadzones of 10m maximum at 850nm and 13m maximum at 1300nm.
 - 4) Distance range at least 2,000m.
 - 5) Dynamic range at least 10dB at 850nm and 1300nm.
 - d. Singlemode OTDR:
 - 1) Wavelengths of 1310 nm (± 20 nm) and 1550 nm (± 20 nm).
 - 2) Event dead zones of 3.5 m maximum at 1310 nm and 1550 nm.
 - 3) Attenuation dead zones of 10 m maximum at 1310 nm and 12 m maximum at 1550 nm.
 - 4) Distance range not less than 10,000 m.
 - 5) Dynamic range at least 10 dB at 1310 nm and 1550 nm
 - 5. Fiber Microscope:
 - a. Magnification of 200X or 400X for endface inspection
 - b. Optional requirements:
 - 1) Video camera systems are preferred.
 - 2) Camera probe tips that permit inspection through adapters are preferred.
 - 3) It is preferable to use test equipment capable of saving and reporting the end face image.
 - 6. Integrated OLTS, OTDR and fiber microscope:
 - a. Test equipment that combines into one instrument an OLTS, an OTDR and a fiber microscope may be used.
- D. Coaxial Cable Test Equipment:
- 1. Capacitance Meter:
 - a. Range: 1 nanofarad to 9,999 microfarads.
 - b. Accuracy: $\pm 1.5\%$ or better.
 - 2. DCR Ohms Meter:
 - a. Range: .01 ohms to 40 megaohms.
 - b. Resolution: $\geq .1$ ohm.
 - c. Accuracy: $\pm .4\%$ or better.
 - 3. Cable Loss Meter:
 - a. RF Signal Generation:
 - 1) Range: 1-2000 megahertz.
 - 2) Resolution: 1 megahertz or better.
 - 3) Output level capability: 1dBmV to ≥ 20 dBmV.
 - b. Spectrum Analysis:
 - 1) Range: 1-2000 megahertz.
 - 2) Resolution: 1 megahertz or better.
 - c. Loss Measurement Resolution:
 - 1) .1dBmV or better.

- d. Data Storage & Recall:
 - 1) Capable of storing test results from ≥ 100 individual cables.
 - 2) Serial and USB ports to transfer data to a PC.
4. Copper Time-Domain Reflectometer (TDR):
 - a. Adjustable Pulse Width Settings.
 - b. Programmable nominal velocity of propagation (NVOP) to match cable under test.
 - c. NVOP Range: .30 to .99, in .01 increments
 - d. Measurement Accuracy: 1% or better.
 - e. Measurement Range: $\geq 30,000$ -feet @ 64% NVOP.

PART 3 - EXECUTION

3.1 UTP CABLE TESTING

A. General:

1. Field test UTP cabling upon completion of the installation.
2. Every cabling link in the installation shall be tested in accordance with the field test specifications defined in ANSI/TIA-568-C.2 "Commercial Balanced Twisted-Pair Telecommunications Cabling and Components Standard."
3. The installed twisted-pair horizontal links shall be tested from the MDF/IDF (ER/TR) in the telecommunications room to the telecommunication wall outlet in the work area against the "Permanent Link" performance specification.
4. One hundred percent of the installed cabling links must be tested and must pass the requirements of the standards mentioned above and as further detailed in Part 3. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for links shall be provided in the test results documentation (below).
5. Field-test instruments shall have the latest software and firmware installed.
6. Link test results from the Test Equipment shall be recorded in the test instrument upon completion of each test for subsequent uploading to a PC in which the administrative documentation (reports) may be generated.
7. Testing shall be performed on each cabling segment (panel to panel, panel to connector or connector to connector).
8. Testing of the cabling shall be performed using high-quality test cords of the same Category and manufacturer as the cabling under test.

B. Performance Test Parameters – Category 5e, Category 6 and Category 6A (Augmented Category 6):

1. The field test specifications are defined in ANSI/TIA-568-C.2 "Commercial Balanced Twisted-Pair Telecommunications Cabling and Components Standard."
2. The test of each link shall contain the following parameters as detailed below.
 - a. Category 5e: In order to pass the test, measurements at each frequency in the range from 1 MHz through 100 MHz must meet or exceed the limit value determined in the above-mentioned standard.
 - b. Category 6: In order to pass the test, measurements at each frequency in the range from 1 MHz through 250 MHz must meet or exceed the limit value determined in the above-mentioned standard.

- c. Category 6A (Augmented Category 6): In order to pass the test, measurements at each frequency in the range from 1 MHz through 500 MHz must meet or exceed the limit value determined in the above-mentioned standard.
3. Wire Map:
 - a. The wire map test is intended to verify pin-to-pin termination at each end and check for installation connectivity errors. For each of the 8 conductors in the cabling, the wire map indicates:
 - 1) Continuity to the remote end
 - 2) Shorts between any two or more conductors
 - 3) Reversed pairs
 - 4) Split pairs
 - 5) Transposed pairs
 - 6) Distance to open on shield
 - 7) Any other miss-wiring
 - b. The correct connectivity of telecommunications outlets/connectors is defined in ANSI/TIA-568-C.2. Two color schemes are permitted. The user shall define which scheme is to be used. The field tester shall document which color scheme was used.
4. Length:
 - a. The length of each balanced twisted pair shall be recorded.
 - b. Since physical length is determined from electrical length, the physical length of the link calculated using the pair with the shortest electrical delay shall be reported and used for making the pass or fail determination.
 - c. The pass or fail criteria is based on the maximum length allowed for the Permanent Link as specified in ANSI/TIA-568-C.2 plus the nominal velocity of propagation (NVP) uncertainty of 10%. For a Permanent Link, the length measurement can be 325 ft. (99 m) before a fail is reported.
5. Propagation Delay:
 - a. Is the time it takes for a signal to reach the end of the link.
 - b. The measurement shall be made at 10 MHz per ANSI/TIA-1152.
 - c. The propagation delay of each balanced twisted pair shall be recorded.
 - d. Is not to exceed 498 ns per ANSI/TIA-568-C.
 - e. This measurement is to be performed for each of the four wire pairs.
 - f. Minimum test results documentation (summary results): Identify the wire pair with the worst-case propagation delay. The report shall include the propagation delay value measured as well as the test limit value.
6. Delay Skew
 - a. Is the difference in propagation delay @ 10 MHz between the shortest delay and the delays of the other wire pairs.
 - b. The delay skew of each balanced twisted pair shall be recorded.
 - c. Is not to exceed 44 ns per ANSI/TIA-568-C.2.
 - d. This parameter shows the difference in propagation delay between the four wire pairs. The pair with the shortest propagation delay is the reference pair with a delay skew value of zero.
 - e. Minimum test results documentation (summary results): Identify the wire pair with the worst-case propagation delay (the longest propagation delay). The report shall include the delay skew value measured as well as the test limit value.
7. DC Resistance

- a. Often reported as Resistance, is the loop resistance of both conductors in the pair.
 - b. Cat 5e and Cat 6
 - 1) Is not specified in ANSI/TIA-1152, but shall be recorded for all four pairs.
 - c. Cat 6A
 - 1) The DC Resistance shall be reported for all four pairs.
 - 2) Is not to exceed 21 Ω for all four pairs per ANSI/TIA-568-C.2.
8. DC Resistance Unbalance within a pair
- a. Often reported as Resistance Unbalance, is the difference in resistance of the two wires within the pair.
 - b. Cat 5e and Cat 6
 - 1) Is not specified in ANSI/TIA-1152 for a Permanent Link, but shall be recorded for all four pairs.
 - c. Cat 6A
 - 1) The DC Resistance Unbalance within a pair shall be reported for all four pairs.
 - 2) Is not to exceed 200 mΩ or 3%, whichever is the greatest per ANSI/TIA-568-C.2.
9. DC Resistance Unbalance between pairs (Cat 6A)
- a. Is the difference in DC parallel resistance of the conductors of a pair compared to the DC parallel resistance of another pair, given in the formula below:
- $$Resistance_Unbalance_{Between_pairs} = \left(\frac{|R_{P1} - R_{P2}|}{R_{P1} + R_{P2}} \right) 100\%$$
- Where:
- R_{P1} is the DC parallel resistance of the conductors of a pair.
 - R_{P2} is the DC parallel resistance of the conductors of another pair.
- b. The DC Resistance Unbalance shall be reported for the following pairs
 - 1) 1,2-3,6
 - 2) 1,2-4,5
 - 3) 1,2-7,8
 - 4) 3,6-4,5
 - 5) 3,6-7,8
 - 6) 4,5-7,8
 - c. Is not to exceed 200 mΩ or 7.5%, whichever is the greatest.
10. Insertion Loss (Attenuation):
- a. Insertion Loss is a measure of signal loss in the permanent link or channel. The term “Attenuation” has been used to designate “Insertion Loss.” Insertion Loss shall be tested from 1 MHz through the frequency range identified above for the category-rating requirements, in maximum step size of 1 MHz. Measure insertion loss at the same frequency intervals as NEXT Loss in order to provide a more accurate calculation of the Attenuation-to-Crosstalk ratio (ACR) parameter.
 - b. Minimum test results documentation (summary results): Identify the worst wire pair (1 of 4 possible). The test results for the worst wire pair must show the highest attenuation value measured (worst case), the frequency at which this worst case value occurs, and the test limit value at this frequency.
11. NEXT Loss:
- a. Pair-to-pair near-end crosstalk loss (abbreviated as NEXT Loss) shall be tested for each wire pair combination from each end of the link (a total of 12

pair combinations). This parameter is to be measured from 1 through the frequency range identified above for the category-rating requirements. NEXT Loss measures the crosstalk disturbance on a wire pair at the end from which the disturbance signal is transmitted (near-end) on the disturbing pair. The maximum step size for NEXT Loss measurements shall not exceed the maximum step size defined in the Standard as shown in Table 1.

- b. Minimum test results documentation (summary results): Identify the wire pair combination that exhibits the worst case NEXT margin and the wire pair combination that exhibits the worst value of NEXT (worst case). NEXT is to be measured from each end of the link-under-test. These wire pair combinations must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
- c. Table 1 – Maximum frequency step size as defined in ANSI/TIA-1152

Frequency Range (MHz)	Maximum Step size (MHz)
1 – 31.25	0.15
31.26 – 100	0.25
100 – 250	0.50
250 – 500	1.00

- d.
- 12. PS NEXT Loss:
 - a. Power Sum NEXT Loss shall be evaluated and reported for each wire pair from both ends of the link under-test (a total of eight results). PS NEXT Loss captures the combined near-end crosstalk effect (statistical) on a wire pair when other pairs actively transmit signals. Like NEXT this test parameter must be evaluated from 1 through the frequency range identified above for the category-rating requirements, and the step size may not exceed the maximum step size defined in the Standard as shown in Table 1.
 - b. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for PS NEXT. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
- 13. ACR-N Loss, pair-to-pair:
 - a. Attenuation Crosstalk Ratio Near-end is calculated from the pair-to-pair NEXT Loss. It shall be measured for each wire-pair combination from both ends of the link under-test. NEXT Loss measures the crosstalk disturbance on a wire pair at the close end (near-end) from which the transmitter emits the disturbing signal on the disturbing pair. NEXT is measured to compute ACR-N Loss that must be evaluated and reported in the test results. ACR-N measures the relative strength of the near-end crosstalk disturbance relative to the attenuated signal that arrives at the end of the link. This test yields 24 wire pair combinations. ACR-N is to be measured from 1 through the frequency range identified above for the category-rating requirements, and the maximum step size for NEXT Loss measurements shall not exceed the maximum step size defined in the Standard as shown in Table 1.
 - b. Minimum test results documentation (summary results): Identify the wire pair combination that exhibits the worst-case margin and the wire pair

combination that exhibits the worst value for ACR-N. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.

14. PS ACR-N Loss:
 - a. Power Sum Attenuation Crosstalk Ratio Near-end is a calculated parameter that combines the effect of the NEXT disturbance from three wire pairs on the fourth one. This test yields eight wire-pair combinations. Each wire-pair is evaluated from 1 through the frequency range identified above for the category-rating requirements, in frequency increments that do not exceed the maximum step size defined in the Standard as shown in Table 1.
 - b. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst pair combinations must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
15. ACR-F Loss, pair-to-pair:
 - a. Attenuation Crosstalk Ratio Far-end is calculated from the pair-to-pair FEXT Loss. It shall be measured for each wire-pair combination from both ends of the link under-test. FEXT Loss measures the crosstalk disturbance on a wire pair at the opposite end (far-end) from which the transmitter emits the disturbing signal on the disturbing pair. FEXT is measured to compute ACR-F Loss that must be evaluated and reported in the test results. ACR-F measures the relative strength of the far-end crosstalk disturbance relative to the attenuated signal that arrives at the end of the link. This test yields 24 wire pair combinations. ACR-F is to be measured from 1 through the frequency range identified above for the category-rating requirements, and the maximum step size for FEXT Loss measurements shall not exceed the maximum step size defined in the Standard as shown in Table 1.
 - b. Minimum test results documentation (summary results): Identify the wire pair combination that exhibits the worst-case margin and the wire pair combination that exhibits the worst value for ACR-F. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
16. PS ACR-F Loss:
 - a. Power Sum Attenuation Crosstalk Ratio Far-end is a calculated parameter that combines the effect of the FEXT disturbance from three wire pairs on the fourth one. This test yields eight wire-pair combinations. Each wire-pair is evaluated from 1 through the frequency range identified above for the category-rating requirements, in frequency increments that do not exceed the maximum step size defined in the Standard as shown in Table 1.
 - b. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst pair combinations must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
17. Return Loss:
 - a. Return Loss (RL) measures the total energy reflected on each wire pair. Return Loss is to be measured from both ends of the link-under-test for each wire pair. This parameter is also to be measured from 1 through the frequency range identified above for the category-rating requirements, in

- frequency increments that do not exceed the maximum step size defined in the Standard as shown in Table 1.
- b. Minimum test results documentation (summary results): Identify the wire pair that exhibits the worst-case margin and the wire pair that exhibits the worst value for Return Loss. These wire pairs must be identified for the tests performed from each end. Each reported case should include the frequency at which it occurs as well as the test limit value at this frequency.
18. TCL (Transverse Conversion Loss)
- a. Is the ratio (in dB) between a differential mode signal inject at the near-end and the common-mode signal measured at the near-end on the same wire pair.
 - b. This parameter is also to be measured from 1 through the frequency range identified above for the category-rating requirements, in frequency increments that do not exceed the maximum step size defined in the Standard as shown in Table 1.
 - c. Both worst case and worst margins shall be reported in both directions for all four pairs.
 - d. Cat 5e and Cat 6
 - 1) Is not specified in ANSI/TIA-1152, but shall be recorded for all four pairs.
 - e. Cat 6A
 - 1) Is not to exceed the Category 6A limits found ANSI/TIA-568-C.2.
19. ELTCTL (Equal Level Transverse Conversion Transfer Loss)
- a. Is the ratio (in dB) between a differential mode signal inject at the near-end and the common-mode signal measured at the far end on the same wire pair minus the Insertion Loss of that pair.
 - b. This parameter is also to be measured from 1 through the frequency range identified above for the category-rating requirements, in frequency increments that do not exceed the maximum step size defined in the Standard as shown in Table 1.
 - c. Both worst case and worst margins shall be reported in both directions for all four pairs.
 - d. Cat 5e and Cat 6
 - 1) Is not specified in ANSI/TIA-1152, but shall be recorded for all four pairs.
 - e. Cat 6A
 - 1) Is not to exceed the Category 6A limits found ANSI/TIA-568-C.2.
- C. UTP Cable Test Result Documentation:
- 1. The test results/measurements shall be transferred into a database utility that allows for the maintenance, inspection and archiving of these test records. A guarantee must be made that the measurement results are transferred unaltered, i.e., "as saved in the tester" at the end of each test and that these results cannot be modified at a later time.
 - 2. The database for the completed job shall be stored and delivered on CD-ROM or DVD including the software tools required to view, inspect, and print any selection of test reports.
 - 3. A paper copy of the summary test results shall be provided that lists the links that have been tested with the following summary information:
 - a. The identification of the link in accordance with the naming convention defined in the overall system documentation.

- b. The overall Pass/Fail evaluation of the link-under-test including the NEXT Headroom (overall worst case) number.
- c. The date and time the test results were saved in the memory of the tester.
4. General Information to be provided in the electronic data base with the test results information for each link:
 - a. The identification of the customer site as specified by the end-user.
 - b. The identification of the link in accordance with the naming convention defined in the overall system documentation.
 - c. The overall Pass/Fail evaluation of the link-under-test.
 - d. The name of the standard selected to execute the stored test results.
 - e. The cable type and the value of NVP used for length calculations.
 - f. The date and time the test results were saved in the memory of the tester.
 - g. The brand name, model and serial number of the tester.
 - h. The identification of the tester interface.
 - i. The revision of the tester software and the revision of the test standards database in the tester.
 - j. The test results information must contain information on each of the required test parameters that are listed and detailed above.
5. In-Link (In-Channel) Test Results Data. The detailed test results data to be provided in the electronic database must contain the following information:
 - a. For each of the frequency-dependent test parameters, the value measured at every frequency during the test is stored. The database program must be able to process the stored results to display and print a color graph of the measured parameters. Software must also provide a summary numeric format in which some critical information is provided numerically as defined by the summary results (minimum numeric test results documentation) as outlined above for each of the test parameters.
 - 1) Length: Identify the wire-pair with the shortest electrical length, the value of the length rounded to the nearest 0.1 m and the test limit value.
 - 2) Propagation delay: Identify the pair with the shortest propagation delay, the value measured in nanoseconds (ns) and the test limit value.
 - 3) Delay Skew: Identify the pair with the largest value for delay skew, the value calculated in nanoseconds (ns) and the test limit value.
 - 4) Insertion Loss (Attenuation): Minimum test results documentation as identified above for the worst pair.
 - 5) Return Loss: Minimum test results documentation as identified above for the worst pair as measured from each end of the link.
 - 6) NEXT, ACR-F: Minimum test results documentation as identified above for the worst pair combination as measured from each end of the link.
 - 7) PS NEXT and PS ACR-F: Minimum test results documentation as identified above for the worst pair as measured from each end of the link.

3.2 OPTICAL FIBER CABLE TESTING

A. General

1. Testing Tiers requirements are as described below, unless indicated otherwise or otherwise required by the Owner.

2. Every fiber optic cabling link in the installation shall be tested in accordance with the field test specifications defined in ANSI/TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises.
3. One hundred percent of the installed cabling links must be tested and must pass the requirements as specified within this document. Any failing link must be diagnosed and corrected. The corrective action shall be followed with a new test to prove that the corrected link meets the performance requirements. The final and passing result of the tests for links shall be provided in the test results documentation (below).
4. The Pass or Fail condition for the link-under-test is determined by the results of the required individual tests.
5. A Pass or Fail result for each parameter is determined by comparing the measured values with the specified test limits for that parameter.
 - a. Loss shall not exceed calculated link loss.
6. Tests shall be documented, including OLTS dual wavelength attenuation measurements for multimode and singlemode links and channels and OTDR traces and event tables for multimode and singlemode links and channels.
7. Tests performed on optical fiber cabling that use a laser or LED in a test set shall be carried out with safety precautions in accordance with ANSI Z136.2.
8. Field-test instruments shall have the latest software and firmware installed.
9. Link and channel test results from the OLTS and OTDR shall be recorded in the test instrument upon completion of each test for subsequent uploading to a PC in which the administrative documentation (reports) may be generated.
10. Fiber end faces shall be inspected at 200X or 400X magnification. 200X magnification is suitable for inspecting multimode and singlemode fibers. 400X magnification may be used for detailed examination of singlemode fibers. Scratched, pitted or dirty connectors shall be diagnosed and corrected.
 - a. End face images shall be recorded in the memory of the test instrument for subsequent uploading to a PC and reporting.
11. Testing shall be performed on each cabling segment (connector to connector).
12. Testing shall be performed on each cabling channel (equipment to equipment) that is planned for use per the owner's instructions.
13. Testing of the cabling shall be performed using high-quality test cords of the same fiber type as the cabling under test. The test cords for OLTS testing shall be between 1 m and 5 m in length. The test cords for OTDR testing shall be approximately 100 m for the launch cable and at least 25 m for the receive cable.

B. Performance Test Parameters:

1. Three tiers of certification are available that vary in thoroughness of infrastructure analysis.
 - a. Tier 1: optical loss testing
 - b. Tier 2: optical loss and OTDR testing
 - c. Tier 3: optical loss and OTDR testing and magnified endface inspection
2. Optical loss testing (Tiers 1, 2 and 3):
 - a. Backbone link:
 - 1) Multimode backbone links shall be tested at 850 nm and 1300 nm in accordance with ANSI/EIA/TIA-526-14A, Method B, One Reference Jumper or the equivalent method.
 - 2) Singlemode backbone links shall be tested at 1310 nm and 1550 nm in accordance with ANSI/TIA/EIA-526-7, Method A.1, One Reference Jumper or the equivalent method.

- 3) Link attenuation does not include any active devices or passive devices other than cable, connectors, and splices, i.e. link attenuation does not include such devices as optical bypass switches, couplers, repeaters, or optical amplifiers.
 - 4) Use the One Reference Jumper Method specified by ANSI/TIA/EIA-526-14A, Method B and ANSI/TIA/EIA-526-7, Method A.1 or the equivalent method. Follow the procedures established by these standards or application notes to accurately conduct performance testing.
 - 5) Fiber tests from the same cable between the same 2 points shall not vary over .25db from each other.
3. OTDR Testing (Tiers 2 and 3):
 - a. Fiber links shall be tested at the appropriate operating wavelengths for anomalies and to ensure uniformity of cable attenuation and connector insertion loss..
 - 1) Multimode: 850nm and 1300nm
 - 2) Singlemode: 1310nm and 1550nm
 - b. Each fiber link and channel shall be tested in both directions.
 - c. A launch cable shall be installed between the OTDR and the first link connection.
 - d. A receive cable shall be installed after the last link connection.
 4. Magnified Endface Inspection (Tier 3):
 - a. Fibers shall be inspected at 200X or 400X magnification. 200X magnification is suitable for inspecting multimode and singlemode fibers. 400X magnification may be used for detailed examination of singlemode fibers.
 - b. Scratched, pitted or dirty connectors shall be diagnosed and corrected.
 - c. The end face images shall be saved and included in the test documentation package.
 5. Length Measurement:
 - a. The length of each fiber shall be recorded.
 - b. It is preferable that the optical length be measured using an OLTS or OTDR.
 6. Polarity Testing:
 - a. Paired duplex fibers in multi-fiber cables shall be tested to verify polarity in accordance with Clause E.5.3 of ANSI/TIA-568-C.0. The polarity of the paired duplex fibers shall be verified using an OLTS.
- C. Fiber Optic Cable Test Result Documentation:
1. The OLTS and OTDR test result information for each link shall be recorded in the memory of the field tester upon completion of the test.
 2. The test result records saved by the tester shall be transferred into a database utility that allows for the maintenance, inspection and archiving of these test records. A guarantee shall be made that these results are transferred to the PC unaltered (i.e., as saved in the tester at the end of each test). The popular 'csv' format (comma separated value format) does not provide adequate protection and shall not be acceptable unless specified by the end user.
 3. The database for the completed job shall be stored and delivered on CD-ROM. This CD-ROM shall include the software tools required to view, inspect, and print any selection of test reports.
 4. Circuit IDs reported by the test instrument shall match the specified label ID.
 5. Summary Test Reports: A copy of the test results shall be provided listing links that have been tested, including the following summary information.

- a. The identification of the link in accordance with the naming convention defined in the overall system documentation.
 - b. The overall Pass/Fail evaluation of the link-under-test
 - c. The date and time the test results were saved in the memory of the tester.
6. General Information to be provided in the electronic data base containing the test result information for each link:
- a. The identification of the customer site as identified by the end-user.
 - b. The operator responsible for testing.
 - c. The overall Pass/Fail evaluation of the link-under-test.
 - d. The name of the standard selected to execute the stored test results.
 - e. The value of the NVP of the cable installed (used for length calculations).
 - f. The date and time the test results were saved in the memory of the tester.
 - g. The brand name, model and serial number of the tester.
 - h. The tester software version and the revision of the test standards database in the tester.
7. Detailed Test Reports: Detailed test results data to be provided in the electronic database for each tested optical fiber must contain the following information.
- a. The identification of the link/fiber in accordance with the naming convention defined in the overall system documentation.
 - b. Tier 1:
 - 1) The insertion loss (attenuation) measured at each wavelength, the test limit calculated for the corresponding wavelength and the margin (difference between the measured attenuation and the test limit value).
 - 2) The link length shall be reported for each optical fiber for which the test limit was calculated based on the formulas above.
 - c. Tier 2:
 - 1) Tier 1 test results.
 - 2) The overall OTDR loss (attenuation) and length.
 - 3) The OTDR event loss at each wavelength and event location.
 - 4) The OTDR trace at each wavelength.
 - d. Tier 3:
 - 1) Tier 1 and 2 test results.
 - 2) A picture of the magnified connector endface.
 - 3) The pass status based upon visual inspection.

3.3 COAXIAL CABLE TESTING

- A. Test every cable individually. The following tests shall be conducted and the results recorded and submitted:
1. Visual Inspections:
 - a. Conduct a visual inspection of the center conductor at each end of each cable. Verify that the center conductor does not have any visible nicks.
 2. Mechanical retention of connectors:
 - a. Verify F-Connectors each can withstand at least 35 pounds of direct pulling force for 2-seconds.
 - b. Verify hardline connectors shall be verified to withstand at least 100 pounds of direct pulling force for 2-seconds.
 - c. Verify that other connector types used withstand 90% of their manufacturer rated retention strength for 2-seconds.
 3. Cable measurements:

- a. Length of cable. Determine length through the use of physical cable markings and through the use of a TDR calibrated for the cable under test.
 - b. DC Loop Resistance: Short the center conductor and shield at the station outlet end of the cable using a premade thread on 0-ohm shunt. Measure and record the loop resistance of the cable at the opposite end of the cable.
 - c. DC Resistance to Ground. Measure and record the DCR between each cable conductor (center and shield) and the nearest telecommunications grounding bus bar. This measurement shall occur after the telecommunications grounding system has been tested.
 - d. Attenuation by Frequency: Sweep the cable from 1 MHz to 1 GHz and record the attenuation results. Quantify the results in table-form in at least the following frequencies: 1, 5, 10, 50 megahertz, and 100 to 2000 megahertz in 50 megahertz increments.
 - e. Cable capacitance. With no load connected at one end of the cable connect a capacitance meter to the opposite end. Measure and record the total center- conductor- to-shield capacitance.
- B. Conduct, coordinate and supply cable test data to parties supplying or installing products that will connect to and use the coaxial cabling. Timing is critical as these parties may need to perform calculations based on test values prior to procurement and installation of certain products.

3.4 ACCEPTANCE OF TEST RESULTS

- A. A representative of the end-user may at their discretion select a random sample of five percent of the installed links. The representative (or his authorized delegate) shall test these randomly selected links, and the results shall be stored in accordance with this Section. The results obtained shall be compared to the data provided by the installation contractor. If more than two percent of the sample results differ in terms of the pass/fail determination, the installation contractor under supervision of the end-user representative shall repeat 100-percent testing at no cost to the Owner.
- B. Installed cabling links and channels shall be field-tested and pass the test requirements and analysis as described in this Section. Any link or channel that fails these requirements shall be diagnosed and corrected. Any corrective action shall be documented and followed with a new test to prove that the corrected link or channel meets performance requirements. The final and passing result of the tests for links and channels shall be provided in the test results documentation in accordance with this Section.
- C. Acceptance of the test results shall be given in writing after the project is fully completed and tested in accordance with Contract Documents and to the satisfaction of the Owner.

END OF SECTION 27 08 10

SECTION 27 11 10 - WALL LININGS FOR COMMUNICATION ROOMS**PART 1 - GENERAL****1.1 DEFINITIONS**

- A. Communications Backboard: Finished plywood surface (wall lining) installed over a finished wall and used for the purpose of wall attachment/mounting of a wide-variety of communications and electronic security products.

1.2 SYSTEM DESCRIPTION

- A. Wall lining shall be installed around the entire perimeter of each communication room, except where otherwise detailed on the Drawings.
 - 1. Wall lining materials shall be installed behind wall-mounted Communications, Audio Visual and Security products, except as otherwise approved in advance by the Designer.
 - 2. Wall linings shall provide a solid reusable and fire-retardant surface for mounting of active and passive electronic products.
 - 3. Linings shall be attached to and supported by a wall structure in such manner as to be capable of fully supporting the load of products attached to it.
 - 4. Linings shall be applied over the standard painted drywall, brick and/or block wall materials as may be present within the space.
 - 5. Linings shall be installed in addition to and shall not take the place of standard wall-finish materials.

PART 2 - PRODUCTS**2.1 MANUFACTURERS**

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated in the Work include, but are not limited to:
 - 1. Georgia-Pacific.
 - 2. Weyerhaeuser.
 - 3. Sherwin-Williams.
 - 4. PPG Industries, Inc.
 - 5. Benjamin Moore.
 - 6. Hy-Tech Thermal Solutions.
 - 7. Hilti Corporation.
 - 8. Red Head.

2.2 WALL LININGS

- A. Plywood:
 - 1. ¾" AC-grade plywood.

2. 4-foot wide x 8-foot tall x 3/4-inch thick.

2.3 FINISHES:

- A. Paint:
 1. Color: White.
 2. Self-priming design.
 3. 30-Year manufacturer warranty.
 4. ASTM E-84/UL 723 Class A-B fire-retardant.

2.4 HARDWARE:

- A. Anchoring Hardware:
 1. Material: Steel.
 2. Finish: Rust preventative permanent outer coating.
 3. Lag-type hex-head bolts for attachment to wood framed walls.
 4. Lag-type hex-head bolts with expandable metal anchors for attachment to CMU construction.
 5. Machine-thread hex-head bolts and expandable machine threaded concrete anchors for attachment to concrete walls.
 6. Molly bolt or similar type all-metal machine threaded permanent anchor assembly for anchoring to metal stud framing.
 7. Steel washers and lock washers between bolt head and wall lining.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Wall Linings:
 1. Install plywood directly over and against the finished wall surfaces, without use of standoffs, and without leaving a gap between the plywood and wall.
 2. Line the entire interior surface of each communication room, starting each wall with a full-size sheet at the left edge of each wall and progressing to the right, unless otherwise detailed on the drawings.
 3. Utilize full standard-size sheets. Where the sheets need to be cut down to fit within the available mounting space, cut a single sheet down to fit the opening. Do not use multiple partial-size sheets where a full-size sheet, or where a single sheet cut down from a full-size sheet shall suffice.
 4. Mount sheet with the highest grade side (e.g., A-side) outward facing into the space.
 5. Attach sheets securely to the walls using horizontally arrayed columns of (at least) three bolts (top, middle, and bottom). Spacing of bolt columns shall be such as to secure the backboard directly to wall studs or other structural wall members. Each full-size sheet shall be supported by not less than two (2) columns of bolts. Horizontal spacing between bolts used for a single sheet shall not exceed 24 inches. The minimum number of bolts per sheet shall not be less than one (1) bolt for every 5.33sq/ft of plywood surface area, but not less than four (4) bolts.

6. Set mounting hardware flush and smooth with the finished surface of the plywood.
 7. Install plywood plumb and level.
 8. Install the bottom of edge of the plywood beginning at 1/2 inch above the baseboard or 6 inches above the finished floor (whichever is lower).
 9. Where plywood must mount over devices such as AC switches, outlets, fire-alarm devices and the like, the backboard shall be cut to permit the entire device to be revealed plus an additional margin of 1/4 inch on each side of the device. Openings shall be plumb and level.
- B. Painting:
1. Paint the front and rear surfaces of the wall linings using fire-retardant paint.
 2. Paint the edges of lining, including edges of the lining that abut other segments of the lining or another surface.
 3. Paint the edges of the lining that result from cutouts around obstacles.
 4. Paint the hardware used to secure the lining to the wall. Use the same color used to paint the lining.
 5. Apply minimum of two coats of fire-retardant paint. Apply additional coats as recommended by the paint manufacturer to achieve specified fire-retardant rating.

END OF SECTION 27 11 10

SECTION 27 11 16 - CABINETS, RACKS, FRAMES AND ENCLOSURES**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Product Datasheets.
 - 2. Bill of Materials (BOM):
 - a. At the top of each BOM list, identify the following:
 - 1) Rack Device.ID.
 - 2) Name and number of the space where the rack is located.
 - 3) Name of the systems the rack supports.
 - 4) Rack type.
 - b. Enumerate the quantity, brand, model and description of the rack and each option and accessory being furnished with the rack (e.g., sides, casters and fans).
- B. Shop Drawings:
 - a. Enlarged plans of the spaces housing equipment racks.
 - 1) Plans shall call out the Type and Device ID of the rack.
- C. Closeout Submittals:
 - 1. Product data.
 - 2. As-built drawings:
 - a. Enlarged plan depicting the as-installed locations of the racks.

1.2 REFERENCES

- A. Definitions:
 - 1. Where the term “equipment rack” or “rack” is used, in either the singular or plural form, it refers generically to products that are designed for and normally used to house and/or mount 19-inch, 23-inch and 25-inch EIA standard rack mounted equipment. Racks come in multiple forms, sizes, finishes and styles including commonly called cabinets.
 - 2. Where asterisks (*) are used in part numbers, they represent alphanumeric variables. These variables typically represent that portion of a model or product number that must be established when ordering product based upon the size, color, accessories and other information specified.

1.3 COORDINATION

- A. Review and coordinate the sizes, quantity, and location of racks/cabinets/enclosures to ensure they will adequately support the work of this Division and Division 28 Systems (where applicable).

1. Coordinate requirements of all systems to provide a coordinated and usable installation.

1.4 SYSTEM DESCRIPTION

- A. Furnish and install all Equipment Racks (see "Definitions"), accessories and products identified in this section, and as shown on the Drawings, and as additionally required to support the installation of systems and equipment specified in other related sections.
 1. Mount securely as specified and shown.
- B. Provide all rack hardware and accessories as specified.
 1. Provide in quantities as shown on the Drawings and as specified.
- C. Provide Rack Bus Bar (RBB) on each Rack.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.
- B. Accessories furnished for equipment racks shall be as manufactured from the same manufacturer as the rack served, except where otherwise indicated.
- C. Black shall be the default color for racks. Provide alternate colors where specified.
- D. Racks that are located adjacent to one another shall be matching size, color, fit and finish except where otherwise indicated.
- E. Rack sizes. Unless another size of rack is identified in a schedule or indicated on the Drawings, provide the largest RU rack size option available of the Type specified, if another RU size is not defined as the default size.
- F. Additional rack accessories:
 1. Refer to the Drawings for additional requirements for rack assemblies.
 2. Provide additional manufacturer recommended accessories for installation of products specified.
- G. Rack Side Panels:
 1. Where equipment racks utilize accessory side panels, and where such racks are detailed on the Drawings to be ganged together, only one set of side panels is required per model group that is installed adjacent.
 - a. Where more than one depth of enclosed cabinet is utilized in a row, side panels shall be provided between the different depths.

2.2 SUBSTITUTION LIMITATIONS

- A. Approved qualifying manufacturer status notwithstanding, substitute equipment racks may not differ in exterior physical dimensions as compared to the specified equipment racks by more than $\pm 3/4$ inch in any dimension, without pre-bid model-specific review and approval. Substitute racks with dimensions that differ greater than this shall not be considered after award of the Contract.

2.3 EQUIPMENT RACKS

A. Cabinet Types, Floor:

1. Manufacturers: Subject to compliance with the requirements, provide the basis of design product or a comparable product by one of the following manufacturers:
 - a. Middle Atlantic Products.
 - b. Chatsworth Products.
 - c. APC.
2. Type C2:
 - a. Free-standing vertical multi-bay, gangable design.
 - b. Construction: Steel, fully welded. 14-gauge top and bottom, 16-gauge vertical structure.
 - c. Finish: Durable powder coat.
 - d. UL Listed.
 - e. Depth: 36.00 inches.
 - f. Width: 22.00 inches, without side panels.
 - g. Width: 23.31 inches, with side panels.
 - h. Height: 76.13 inches to 83.13 inches, RU dependent.
 - i. Rack mounting width: 19-inch EIA horizontal rack rail spacing.
 - j. Moveable front and rear rack rails, EIA vertical mounting-hole spacing.
 - k. Drilled and tapped #10-32 rack mounting rails.
 - l. Removable side panels (SPN-**-36).
 - m. Removable top kit for fan (MW-10FT).
 - n. Front door: Plexiglas, vented, removable, and locking (PVFD-**).
 - o. Rear door: Steel, solid, removable, and locking.
 - p. Provide Top fan (FAN-10) with thermostatic control
 - q. Leveling feet.
 - r. Basis of Design:
 - 1) 44 RU (77 inch VMS): Middle Atlantic model MRK-4436, plus accessories.
3. Type C4: Cable Management Enclosure.
 - a. Free-standing vertical multi-bay, gangable design.
 - b. Construction: Steel, fully welded.
 - c. Finish: Durable powder coat.
 - d. UL Listed.
 - e. Depth: 36.00 inches.
 - f. Width: 30.00 inches, without side panels.
 - g. Width: 31.50 inches, with side panels.
 - h. Height: 83.49 inches.
 - i. Rack mounting width: 19-inch EIA horizontal rack rail spacing.
 - j. Moveable front and rear rack rails, EIA vertical mounting-hole spacing.
 - k. Cage-nut style rack rails, with full complement of cage nuts.

- l. Removable locking side panels (SPN-**-36).
 - m. Removable top panel for 10-inch fan.
 - n. Front door: Plexiglas, vented, removable, and locking (DPVFD-**).
 - o. Rear door: Steel, solid, removable, and locking.
 - p. Provide Top fan (FAN-10) with thermostatic control.
 - q. Leveling feet.
 - r. Dual (both sides) full length integral vertical cable management ducts located between rack rails and sides, featuring 16 square inches of usable area.
 - s. Basis of Design:
 - 1) 44 RU (77 inch VMS): Middle Atlantic model DRK19-44-36, plus accessories.
4. Type C15 Server Cabinet:
- a. Free-standing vertical multi-bay, gangable design.
 - b. Basis of Design:
 - 1) APC AR3300 plus accessories. SEE SECTION 27 11 17 FOR DETAILS
5. Type C16 Networking Cabinet:
- a. Free-standing vertical multi-compartment, gangable design.
 - b. Basis of Design:
 - 1) APC AR3340 plus accessories. SEE SECTION 27 11 17 FOR DETAILS
6. Type C17 CoLo Cabinet:
- a. Free-standing vertical multi-compartment, gangable design.
 - b. Construction: Steel, 12-gauge construction, 16-gauge doors.
 - c. Finish: Pretreated steel coated with RAL 9005 black textured, low-gloss polyester powder paint.
 - d. Depth: 35.34 inches.
 - e. Width: 23.94 inches
 - f. Height: 78.39 inches.
 - g. Single 42 RU or two independent compartments with 20 RU in each
 - h. Levelers included
 - i. Rack mounting width: 19-inch EIA horizontal rack rail spacing.
 - j. 19-in. adjustable square hole, L-shaped rack angles front and rear
 - k. Secure interior cable ducts with 2 compartment version.
 - l. Vented top panel. Provide with cooling fan.
 - m. Full Mesh front and rear doors.
 - n. 1 or 2 sets of front and rear doors with Mechanical 3 digit combination locks.
 - o. Provide barriers between cabinets to secure compartments; provide side panels at end of each row (or stand-alone cabinets).
 - p. Basis of Design:
 - 1) Hoffman Pentair PCLC2069B plus accessories.
- B. Open Frame Types:
- 1. Manufacturers: Subject to compliance with the requirements, provide the basis of design product or a comparable product by one of the following manufacturers:

- a. Middle Atlantic Products.
 - b. Ortronics/Legrand.
 - c. Panduit.
 - d. CPI Chatsworth Products
2. Type R9:
- a. Free standing, gangable, open frame, 4-post design.
 - b. Construction: Aluminum extrusion.
 - c. Finish: Epoxy-polyester hybrid powder coat.
 - d. Weight capacity: 1,000 lbs.
 - e. Depth: 41 inches – 29” between rails.
 - f. Width: 20.3 inches.
 - g. Height: 84 inches.
 - h. Usable Height 78.75”
 - i. Rack mounting width: 19-inch EIA horizontal rack rail spacing.
 - j. .375” Square punched rail, EIA-310-D hole pattern, including (100) cage nuts and screws.
 - k. Rack Mounting spaces marked and numbered.
 - l. Dual-sided (front and back) cable duct with pre-installed cable grommets and front door, required as indicated on the Drawings:
 - 1) 6-inch width: Chatsworth 30095-703
 - m. Basis of Design:
 - 1) 45RU (78.75 inch VMS): Chatsworth Products 15053-703, plus accessories.]
 - 2) Provide 100 cage nuts with 12-24 screws: Chatsworth 12639-001 (25pk)
- C. Wall Racks
1. Type W1:
- a. Welded steel construction for strength
 - b. 26” width provides extra space for cables and patching
 - c. Comes standard with adjustable wide-face rackrail
 - d. Locking swing open center section for front and rear access
 - e. Includes a locking/latching plexi front door for added security
 - f. Front door can be easily reversed for left or right hand swing
 - g. Engineered for passive thermal management; optional fan kit available
 - h. Bag of 50 mounting screws included
 - i. RU size: 26
 - j. Depth, usable: 24 inches.
 - k. Depth, overall: 26.67 inches.
 - l. Width: 26 inches.
 - m. Height: 45.5
 - n. Rack mounting width: 19-inch EIA horizontal rack rail spacing.
 - o. Fully adjustable rack rails.
 - p. Front rail rails: 11-gauge steel; drilled and tapped #12-24 mounting holes.
 - q. 12-inch x12-inch knockout in backpan for pull box access.
 - r. Front Door: Plexiglass.
 - s. Basis of Design: Middle Atlantic model CWR–26-26PD

2.4 RACK ACCESSORIES

- A. Manufacturers: Subject to compliance with the requirements, provide the basis of design product or a comparable product by one of the following manufacturers:
1. Middle Atlantic Products.
 2. Atlas Sound.
 3. Raxxess / Chief.
 4. Lowell Manufacturing.
 5. Hubbell.
 6. Hoffman.
 7. X-Mark.
 8. Chatsworth.
 9. Ortronics/Legrand.
 10. Panduit
- B. Vertically mounted metered PDU strips
1. 36 C13, 6 C19, 2 5-20
 2. 5.7kW 208v
 3. Standard of quality is AP8861, with L21-20P input plug
 4. Provide one cabinet or rack.
- C. Temperature Sensor
1. Standard of quality shall be APC AP9335T
 2. Provide one per cabinet
- D. Thermostatic Fan Control:
1. UL Listed.
 2. 120VAC Input voltage.
 3. Temperature probe with 48 to 60 inches of cable.
 4. Fan Receptacles: Four (4) separate AC fan receptacles.
 5. Regulates the speed of up to four rack ventilation fans based upon temperature range.
 6. Minimum of four (4) temperature/fan speed ranges:
 - a. Fan off: Less than 80 degrees Fahrenheit.
 - b. Fan low: 80 to 90 degrees Fahrenheit.
 - c. Fan medium: 90 to 100 degrees Fahrenheit.
 - d. Fan high: Greater than or equal to 100 degrees Fahrenheit.
 - 1) Quantity: One (1) per enclosed equipment rack or up to adjacent ganged racks; additional units where indicated.
 - e. Basis of Design Middle Atlantic FC-4-1CA
- E. Filler Panels:
1. General:
 - a. Panel mix: Provide mixture of vent and blank-type filler panels as required to ensure satisfactory air-flow and heat dissipation.
 - b. Sizes: Provide filler panels in sizes not exceeding two (2) RU, except where shown on the Drawings.
 - c. Quantity: Provide filler panels to occupy all unused mounting spaces of the front rack rail of racks.
 2. Vent-Type:
 - a. Construction: 16-gauge steel.

- b. Finish: Flat black powder coat.
 - c. Ventilation: Vertical vent slots.
 - d. Flanged upper and lower horizontal edges for rigidity.
 - e. Size: Available sizes from one (1) to two (2) RU.
 - f. Basis of Design: Middle Atlantic EVT-* Series.
3. Blank-Type:
- a. Construction: 16-gauge steel.
 - b. Finish: Flat black powder coat.
 - c. Ventilation: None, solid face.
 - d. Flanged upper and lower edges for rigidity.
 - e. Sizes: Available sizes from one (1) to six (6) RU.
 - f. Basis of Design: Middle Atlantic SB-* Series.
- F. Rack Mounting Screws:
- 1. Truss-type screw head.
 - 2. Black finish.
 - 3. Matching size and color nylon protective washer.
 - 4. For Racks with #10-32 threaded rack rails.
 - a. #10-32 thread.
 - b. Basis of Design: Middle-Atlantic model HP.
 - 1) Quantity: Three (3) Phillips-drive screw/per RU/per rack.
 - c. Basis of Design: Middle-Atlantic model HSK.
 - 1) Quantity: One (1) Square-post security drive/per RU/per rack.
 - 5. For Racks with #12-24 threaded rack rails.
 - a. Basis of Design: Middle Atlantic model HP-24.
 - b. Quantity: Four (4) Phillips-drive screw/per RU/per rack.
 - 6. For Racks with 6MM cage-nut rack rails.
 - a. Basis of Design: Middle-Atlantic model HP-6MM.
 - b. Quantity: Four (4) Phillips-drive screw/per RU/per rack.
- G. Rack Bonding Busbar Kits:
- 1. Optimized for installation on 19-inch racks or cabinets meeting EIA-310-D.
 - 2. Available pre-assembled with mounting screws.
 - 3. Electro-tin plated to inhibit corrosion.
 - 4. Provide quantities of busbars to handle a quantity of two-hole connectors equal to a minimum of one-half of the total rack units (RUs).
 - 5. Provide hole spacing to match Panduit LCC series two-hole lugs.
 - a. Basis of Design: Panduit RGRB19U (minimum) for threaded rail fasteners and Panduit RGRB19CN for cage nut rail fasteners.

2.5 CABLE MANAGEMENT

- A. Lacing Strips:
- 1. Vertically Mounted:
 - a. Available in various lengths to match the number of RUs of the rack served.
 - b. Perforated strip designed to accommodate types of wire ties, including hook-and-loop type.
 - c. Basis of Design: Middle Atlantic model LACE-**-OP, sized to match rack RU.
 - d. Quantity: Two (2) per rack, additional units where indicated.

- B. Wire Management Panels:
1. Manufacturers: Subject to compliance with the requirements, provide the basis of design product or a comparable product by one of the following manufacturers:
 - a. Middle Atlantic Products
 - b. Hubbell.
 - c. Leviton.
 - d. Ortronics/Legrand.
 - e. Panduit.
 2. Type A: Cable management panels shall be of this type unless specifically noted otherwise on the Drawings.
 - a. Rack mountable design.
 - b. Front and rear mounted horizontal metal slotted rings.
 - c. Basis of Design:
 - 1) 1 RU (1.75 inches): Middle Atlantic HCM-1DR
 - 2) 2 RU (3.50 inches): Middle Atlantic HCM-2DR
 3. Type B:
 - a. Rack mountable design.
 - b. Front mounted horizontal and vertical metal slotted rings.
 - c. Must be used with horizontal lacing bars.
 - d. Shall not be used with vertically mounted cable managers that may interfere with side rings.
 - e. Basis of Design:
 - 1) 1 RU (1.75 inches): Middle Atlantic HCM-1DV with vertical cable management rings (D-RING) on each side.
 - 2) 2 RU (3.50 inches): Middle Atlantic HCM-2DV with vertical cable management rings (D-RING) on each side.

PART 3 - EXECUTION

3.1 COORDINATION

- A. Coordinate with each party providing product that will be housed within the racks. Review rack configurations to ensure they complement the systems being provided.
- B. Coordinate the delivery and installation to meet the workflow and schedules of parties reliant upon the product for their portion of the Work.

3.2 INSTALLATION

- A. Equipment Racks:
 1. General:
 - a. Secure fixed-position, non-portable racks using removable threaded fasteners to prevent from moving or tipping.
 - b. Secure racks without casters to the floor allowing a 36-inch minimum clearance between the rearmost part of the rack and the nearest obstruction. See the Drawings for additional and more stringent requirements.
 - c. Install doors, side panels and other accessories specified.
 - d. Install bushings or grommets at cable entry and exit points to protect cables.

- e. Clean, prep and paint visible conduits using oil-based paint that matches the color of the rack.
 - f. Comply with rack manufacturers' printed instructions and guidelines for rack installation.
 - 2. Cabinet Types, Floor:
 - a. Secure racks to floor to prevent movement and tipping.
 - b. Level the rack. Provide shimming and leveling feet as necessary.
 - c. Install rows of like-size racks that are located adjacent to one another level with one another.
 - 3. Open Frame/Relay Types:
 - a. Securely bolt rack to the floor.
 - b. Install lateral supports to nearby walls to ensure lateral stability.
- B. Rack Accessories:
- 1. Grounding Bus Bar:
 - a. Install grounding bus bars in the rear of racks.
 - b. Coordinate location with equipment being housed within the rack and for full adjustability of the rack rails.
 - 2. Filler Panels:
 - a. Install filler panels within each equipment rack.
 - b. The size, location and ratio of blank-to-vent filler panels shall be as required to assure proper ventilation of equipment.
 - c. Mount the filler panels using approved mounting hardware, ensuring that unused spaces within the equipment rack are covered.
 - 3. Rack Lights:
 - a. Mount lights in the rear of equipment racks. Locate where it will most effectively benefit installation and service personnel.
 - b. Where non-magnetic racks are provided, provide additional hardware to enable attachment of light in a position to benefit installation and service personnel.
 - 4. Ventilation Products:
 - a. Furnish and install ventilation products as specified and indicated on the Drawings. Test operation of ventilation products and adjust as necessary.
 - 5. Cable Management Products:
 - a. Install horizontal and vertical cable lacing bars in locations to optimize support and grouping of cables within the equipment racks.
 - b. Mount bars using hardware recommended by the product manufacturer. Mount securely.

3.3 GROUNDING AND BONDING

- A. Install a grounding busbar in each equipment rack and bond to equipment rack.

3.4 IDENTIFICATION

- A. Label each rack.

END OF SECTION 27 11 16

SECTION 27 11 23 - CABLE MANAGEMENT AND LADDER RACK**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Material.
 - 2. Product Datasheets for any of the following:
 - a. Horizontal ladder rack.
 - b. Vertical ladder rack.
 - c. Fittings.
 - d. Stand-offs.
 - e. Spillways/waterfalls.
 - f. D-rings.
 - g. Finger duct.

- B. Shop Drawings:
 - 1. Communications Room plan(s) depicting the following:
 - a. Size and locations of ladder rack.
 - b. Size and locations of other cable management products.
 - c. Backboards.
 - d. Pathway and cable entry and exit points.
 - 2. Communications Room wall elevation drawings depicting the following:
 - a. Sizes and locations of ladder rack.
 - b. Sizes and locations of other cable management products.
 - c. Backboards.
 - d. Pathway and cable entry and exit points.

- C. Closeout Submittal:
 - 1. Product Data.
 - 2. As-Built Drawings:
 - a. Enlarged floor plans.
 - b. Wall elevations.

1.2 SYSTEM DESCRIPTION

- A. The cable management and ladder rack pathway system shall accommodate the support and orderly routing of cabling within communication rooms.
 - 1. Communications systems served include but are not limited to:
 - a. Voice/telephone systems.
 - b. Network/data/information systems.
 - c. RF broadband video distribution systems.
 - d. Intercom and central sound systems.
 - e. Paging and sound masking systems.
 - f. Audio and video systems.
 - g. Teleconferencing systems.

2. Security systems served include but are not limited to:
 - a. Video surveillance and CCTV.
 - b. Access control.
 - c. Intrusion detection.

- B. The system shall consist of horizontal ladder rack used for support of cables that need to traverse horizontally overhead within the room.
 1. Within the restraints of the room, a perimeter layout with over-rack section is desired.
 2. Fill capacity (as designated by the manufacturer) shall not be exceeded;
 3. Utilize properly sized supports with adequate strength to exceed the maximum recommended weight capacity.
 4. Provide all manufacturer recommended hardware and accessories including, but not limited to, splice extension clamps, stand-off brackets, horizontal tee splice kits, corner support kits, adjustable vertical bend kits, adjustable vertical splice kits, runway drop-out at equipment racks, runway end caps, etc.

- C. The system shall consist of vertical ladder rack for support and dressing of cables that must traverse vertically between cable entry/exit points near the floor and entry/exit points near the ceiling of the room or ladder rack.

- D. The system shall consist of products to organize, dress and support cables that traverse the walls.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 COMPONENTS

- A. Ladder Rack:
 1. Manufacturers: Subject to compliance with requirements, provide products from one of the following manufacturers:
 - a. Chatsworth.
 - b. Cooper/B-Line.
 - c. Middle Atlantic
 2. Horizontally mounted:
 - a. 1-1/2 inch by 3/8 inch ASTM A513 compliant tubular steel construction.
 - b. Color: Black.
 - c. UL Classified for suitability as an equipment grounding conductor.
 - 1) Must remove paint or use ground straps.
 - d. Available in various widths from 12 to 24 inches wide.
 - e. Available in factory lengths of 10 feet (nominal) and longer.
 - f. Rung spacing shall be 9 to 12 inches on center.

- g. Minimum linear cable bearing surface of 1-1/2 inches per linear foot of run.
 - h. Basis of Design: Chatsworth 10250-712.
 - 3. Vertically mounted:
 - a. 1-1/2 inch by 3/8 inch ASTM A513 compliant tubular steel construction.
 - b. White in color. (Matching white backboard).
 - c. Available in various widths from 12 to 24 inches wide.
 - d. Available in factory lengths of 10-feet (nominal) and longer.
 - e. Rung spacing shall be 9 to 12 inches on center.
 - f. Minimum linear cable bearing surface of 1-1/2 inches per linear foot of run.
 - g. Basis of Design: Chatsworth 10250-212.
 - 4. Spillways, Waterfalls, Cable Drop-outs:
 - a. Basis of Design: Chatsworth 12100-***.
- B. D-Rings:
 - 1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into work include, but are not limited to:
 - a. Panduit.
 - b. Middle Atlantic Products.
 - c. Hubbell Premise Wiring (Hubbell).
 - d. Great Lakes.
 - e. Erico/Caddy.
 - 2. D-Shaped wall-mount loop designed for cable management.
 - 3. Continuous loop for pull-through cable installation, or open slot alternate insertion of cables.
 - 4. Size: Available in a variety of pre-manufactured sizes.
 - 5. Mounting holes for secure attachment with screws.
 - 6. Material: Rigid nylon, zinc covered steel.

PART 3 - EXECUTION

3.1 COORDINATION

- A. Review and coordinate the final size requirements of cable management and ladder rack with the supplier and installer of the cabling. Each shall be sufficiently sized for the cables that are to be installed.
- B. Coordinate the locations and products being installed as work of this Section with each party supplying work within the same space. Coordinate to ensure adequate headroom, capacities, working clearances and accessibility of the installed products.

3.2 LADDER RACK UTILIZATION

- A. Horizontal Ladder Rack shall be provided as follows:
 - 1. Where specifically indicated on the Drawings.
 - 2. Within each ER, TR, IDF, and MDF, as follows:
 - a. 12 inch (minimum) horizontal ladder rack around the entire perimeter of the room.

- b. 12 inch (minimum) horizontal ladder rack directly above and parallel to floor mounted equipment racks below. This ladder rack shall intersect with and join to the perimeter ladder rack.
 - c. Target height for ladder rack is 96 inches above the finished floor (AFF), but not less than 12 inches below finished ceiling and not less than 86 inches above the finished floor. The installed height shall not interfere with doors, windows and other equipment within the room.
3. Utilize as an equipment grounding conductor for bonding within the room.
 - a. Must remove paint or use ground straps.
- B. Vertical Ladder Rack shall be provided as defined below:
1. Where specifically indicated on the Drawings.
 2. Within each ER, TR, IDF, and MDF, as follows:
 - a. 12 inch (minimum) vertical ladder rack on the wall at floor and ceiling cable penetrations. Ladder rack shall extend from the penetration to the perimeter ladder rack.
- C. Sizing:
1. Ladder rack sizes shall be the larger of the following:
 - a. Size indicated on the Drawings.
 - b. 12 inches wide.
 - c. As required by the National or Local electric code.
 - d. Ladder rack manufacturer recommendations.
 - e. Sufficient that cable fill does not exceed 40% of its rated capacity, regardless of manufacturer rated capacity greater than this.

3.3 INSTALLATION

- A. Ladder Rack:
1. General:
 - a. Install as a complete system in accordance with manufacturer's written installation instructions.
 - b. Install with sufficient support to carry the weight of the ladder rack system, fully loaded with cables, with a minimum safety factor of 5. In addition, each individual vertical support point above the floor shall be selected and installed to achieve a capacity to support not less than 200 lbs. of vertical load.
 - c. Furnish and install using manufacturer recommended hardware and accessories including, but not limited to: splice extension clamps; horizontal tee splice kits; corner support kits; adjustable vertical bend kits; adjustable vertical splice kits; runway support kits designed for ceiling support from all-thread rod; runway drop-out at equipment racks; and runway end caps.
 - d. Provide protective caps on the exposed ends of rungs and rails.
 - e. Paint accessories and fittings to maintain the aesthetic integrity of the installation using paint recommended and approved by the manufacturer.
 - f. Install the system free of sharp edges, burrs or projections that could harm cables or humans.
 - g. Install using such accessories, means and methods that ensure electrical continuity of the entire system.

- C. D-Rings:
1. Securely mount to communications room wall linings or other approved mounting surface.
 2. Space rings at intervals of 12 inches along the path of the cables served.
 3. Provide rings of sufficient size and quantity that no ring is utilized more than 40% of the rated capacity.
 4. Provide multiple sets of rings to form separate pathways for cables that require physical separation.
 5. Provide D-Rings for routing and management of cables on communication room walls, except where another type is identified for use on the Drawings.

3.4 GROUNDING AND BONDING

- A. Comply with Section 270526 "Grounding and Bonding for Communications."

END OF SECTION 27 11 23

SECTION 27 11 26 - RACK MOUNTED POWER PROTECTION AND POWER STRIPS**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials.
 - 2. Product Datasheets.
- B. Shop Drawings:
 - 1. Power Distribution Diagram(s):
 - a. Depict the power products and the AC power distribution configuration for each rack:
 - 1) Identify the Device.ID for each rack.
 - 2) Include a rack layout depicting the location of power products within the rack.
 - 3) Depict UPSs, PDUs, sequencers, receptacle strips, remote power modules, modular power strips and other distribution products.
 - 4) Identify the interconnectivity between sequencers and the products the sequencer controls.
 - 5) Identify the power up and power down sequence.
- C. Closeout Submittal:
 - 1. Product Data:
 - a. Bill of Materials.
 - b. Product Datasheets.
 - 2. As-Built Drawings:
 - a. Power Distribution Block Diagram(s).

1.2 SYSTEM DESCRIPTION

- A. General:
 - 1. Equipment racks, furniture, backboards and enclosures that house communications and security (where applicable) equipment shall be equipped with a functional local AC power distribution system for delivery of power from the building power system to the product(s) they house.
 - 2. Each distribution system shall be sufficient to support the powered products.
 - 3. Each distribution system shall feature sufficient connectivity to accommodate each powered product, plus an additional 20-percent spare receptacle count usable for future use. Each designated "spare" outlet shall be accessible and usable without the removal or movement of existing cables, plugs or other product.
 - 4. Selected distribution systems shall feature one or more locally installed uninterruptible power supplies for maintaining power to connected equipment in the event there is a loss of incoming building power.
 - a. UPS shall be provided with SNMP and web-based communications options to monitor and control the UPS from a network management station or any

- PC running Microsoft Internet Explorer. Coordinate with the Owner and provide network connectivity to the UPS.
5. Communications backboards, countertops/work-surfaces and other locations where insufficient building power receptacles are present shall be equipped with local power distribution equipment with sufficient outputs to serve the locally installed equipment.
- B. Provide UPS and power distribution equipment as shown on the detail drawings and as required to protect and power communications and security equipment.
1. Audio-Visual Systems
 2. Public Address and Intercom Systems
 3. Security Systems
 4. Equipment Racks for Undefined Use
 5. Telephone system

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 VERTICALLY MOUNTED RECEPTACLE STRIPS

- A. Manufacturers: Subject to compliance with requirements, provide products from one (1) of the following manufacturers:
1. APC
- B. Type VA:
1. 15 Amp capacity.
 2. 120VAC input.
 3. NEMA 5-15R receptacles (14 – 24 outlets).
 4. 45 to 72 inches lengths.
 5. 9-foot power cord with NEMA 5-15P plug.
 6. Manufacturer accessory mounting brackets.
 7. Basis of Design: Middle Atlantic Products PD-1415C-NS with PB-5A brackets.
- C. 120V Metered Vertically mounted metered PDU strips
1. 36 C13, 6 C19, 2 5-20
 2. 5.7kW 208v
 3. Standard of quality is AP8830, with L5-20P input plug
- D. 208V Metered Vertically mounted metered PDU strips
1. 24 NEMA 5-20R
 2. 1920VA
 3. Standard of quality is AP8861, with L21-20P input plug

- E. Temperature Sensor
 - 1. Standard of quality shall be APC AP9335T
- F. Accessories
 - 1. Provide manufacturer recommended accessories for mounting, termination and interconnectivity to achieve a complete and working installation.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Surge Suppression
 - 1. Where independent outboard surge suppression products are used, connect the surge-suppression products to incoming branch power first, then derive power for downstream power distribution products from the surge suppression device.
- B. Uninterruptible Power Supplies (UPS):
 - 1. Connect UPS units to un-switched AC building power.
 - 2. Rackmount power supply(s) and the accessory batteries that are designed for rack mounting.
- C. Vertical Receptacle Strips:
 - 1. In racks, mount vertical receptacle strips inside and in the rear of the rack in an accessible location that does not interfere with the mounting of the equipment served or with future mounting of equipment.
 - 2. When UPS products are present, derive power for the strips from the output receptacle(s) of the UPS.
 - 3. Mount receptacle strips securely.
 - 4. Mount strips using the accessories and hardware recommended by the manufacturer.

END OF SECTION 27 11 26

SECTION 27 13 13 - COPPER BACKBONE CABLING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - 2. Product Datasheets.

- B. Quality Assurance
 - 1. Cable and connectivity manufacturers' certification of quality and performance, including:
 - a. List of manufacturers and products approved for use by the cabling and connectivity manufacturers to meet the required extended warranty and warranty registration procedures.
 - b. Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.

- C. Shop Drawings:
 - 1. Backbone System Diagram.
 - 2. Labeling Schema.

- D. Closeout Submittals:
 - 1. Product Datasheets.
 - 2. As-Built Drawings:
 - a. Labeling Schema.
 - b. Backbone System Diagram.
 - 3. Field Quality Control / Test Results.
 - 4. Cable and connectivity manufacturers' certification of quality and performance.
 - a. Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.
 - b. Executed warranty documentation: Site specific, supplied from the manufacturer.
 - 5. Provide additional closeout documentation as required in Division 01 and Division 27 "General Requirements for Communications."

1.2 REFERENCES

- A. Definitions:
 - 1. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

- B. Reference Standards:

1. TIA/EIA-568-C, including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard Part 1: General Requirements; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunications Cabling and Components Standard; and TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
2. TIA/EIA-569-C, or most current version, Telecommunications Pathways and Spaces.
3. TIA/EIA-606-B, or most current version, Administration Standard for Commercial Telecommunications Infrastructure.
4. TIA/EIA-607-B, or most current version, Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications.
5. The most current published version of the "Telecommunications Distribution Methods Manual (TDMM)" published by the Building Industry Consulting Services International (BICSI).
6. The most current published version of the "Information Transport Systems Installation Methods Manual (ITSIMM)" published by the Building Industry Consulting Services International (BICSI).

1.3 COORDINATION

- A. Review and coordinate the sizes, quantity, routing and spacing of pathways to ensure they will adequately support the Work of this Section.
 1. Confirm that cables to be installed will not exceed maximum fill capacities of raceways and shall meet the minimum requirements of Local, State and Federal laws and requirements.
 2. Confirm that cables to be installed within the pathways will not exceed the maximum standards-based distance limitations.
- B. Coordinate layout and installation of communications cabling with Owner's telecommunications, WAN and LAN equipment and service suppliers.

1.4 QUALITY ASSURANCE

- A. Prior to bid, Contractor shall be listed and shall maintain participation as part of the cabling and connectivity manufacturers' certified contractor programs. Provide documentation as outlined in Submittals.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Store materials in conditions endorsed by the product manufacturer.
- B. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
- C. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.

1.6 WARRANTY

- A. Additional requirements: Cabling and connectivity products manufacturers, including patch cords, shall have in place an agreement recognizing each other for execution of the warranty as specified. Performance and applications warranties shall be channel rated, including patch cords.
- B. The cable manufacturer and the connectivity products manufacturer shall have a partnership agreement established in order to provide the required warranty.
- C. Required warranty: The TIA/EIA-568-C compliant cable system shall include a minimum 15 year extended product warranty and performance/applications assurance program.

1.7 SYSTEM DESCRIPTION

- A. The copper backbone cabling system shall be a system of interconnections between communications rooms, main terminal spaces and entrance facilities as part of a complete communications cabling system infrastructure.
 - 1. The cabling system consists of cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for backbone-to-backbone cross-connection.
 - 2. Refer to Backbone Diagram for types, quantities of cables.
 - 3. Refer to detail drawings for terminations standards and positioning of termination devices.
 - 4. Refer to floor plans for termination locations.
- B. Provide TIA/EIA-568-C compliant multi-pair twisted pair backbone cabling system.
- C. Provide total connectivity for complete and permanent installed communications links.
- D. Backbone cabling cross-connects shall be located within communications rooms, entrance facilities and other locations as designated.
- E. Unless pre-approved by the Designer, provide a single, uniform and complete connectivity solution for this Section:
 - 1. Cabling for this Section, and related structured cabling Sections (as identified above in Related Requirements), shall be provided by a single manufacturer.
 - 2. Connectivity for this Section, and related structured cabling Sections (as identified above in Related Requirements), shall be provided by a single manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 CABLING

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. CommScope, Inc. (CommScope).

- B. General:
 - 1. General Performance: Comply with transmission standards in TIA/EIA-568-C.2 when tested according to test procedures of this standard.
 - a. Twisted pair cable is required to have the appropriate Category classification as defined by TIA/EIA-568-C.2. Compliance with these electrical characteristics shall be third party verified by the manufacturer.
 - 2. System cables shall be code compliant and UL/NEC rated for the location, manner, and environmental conditions in which the cables are installed.
 - a. Within a building, cables that are not installed in a totally enclosed pathway system shall be UL plenum rated.
 - b. Cables used for below grade applications, and cables used in pathways that may reasonably end up with standing water within them, shall be manufacturer rated for continuous contact with water without performance degradation or compromise in warranty.
 - c. Cables used for direct burial, aerial, or other applications shall be manufacturer rated for the application.
 - 1) Also see "Inter-Building Cabling" Section for cable alternate construction.
 - d. Cables shall be Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444 and NFPA 70 for the following types:
 - 1) Communications, Plenum Rated: Type CMP, complying with NFPA 262.
 - 2) Communications, Riser Rated: Type CMR, complying with UL 1666.
 - 3. Cables on this Project may be color-coded. See drawings for color code.

- C. Twisted Pair Cable
 - 1. Description: 100-ohm, multi-pair UTP as indicated on the Drawings, formed into 25-pair binder groups covered with a thermoplastic jacket.
 - a. Comply with ICEA S-90-661 for mechanical properties.
 - b. Comply with TIA/EIA-568-C for performance specifications.
 - c. Comply with TIA/EIA-568-C, Category 3
 - 1) Cable shall have two individual insulated 24 AWG solid copper conductors formed into a twisted pair.
 - 2) Cable must be constructed of one or more 25-pair bundles of individually insulated Unshielded Twisted Pairs (UTP).
 - 3) Cables shall range from 25 pair to 300 pair in 25 pair increments.
 - d. Basis of Design Commscope 107766057

2.3 CABLE TERMINATION HARDWARE

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following :
 - 1. CommScope, Inc. (CommScope)

2. Hubbell Premise Wiring (Hubbell).
 3. Leviton Mfg. Company, Inc. (Leviton).
 4. Ortronics; a subsidiary of Legrand (Ortronics).
 5. Panduit Corp. (Panduit).
- B. General Requirements for Cable Connecting Hardware:
1. Comply with TIA/EIA-568-C, IDC type, with modules designed for punch-down. Cables shall be terminated with connecting hardware of same Category or higher.
 2. Provide one single manufacturer for twisted pair termination hardware used together in a permanent link and whenever a Category certification is required.
 3. Cable hardware (i.e., connectivity) shall be part of the manufacturer's enterprise solution.
 4. Cable hardware shall be component rated with third-party verification for the specified Category-rated component compliance.
- C. Wall Mounted
1. Connecting Blocks: 110-style IDC for Category 5e. Provide blocks for the number of cables terminated on the block. Integral with connector bodies, include plug and jacks where indicated.
 - a. 110-style Wiring Block:
 - 1) Comply with TIA/EIA-568-C, Category 5e.
 - 2) Industry normal footprint available in 50-pair, 100-pair and 300-pair blocks.
 - 3) Labeling areas on front and available label kits.
 - 4) 110-style IDC termination system requiring 110C-x connecting clips.
 - 5) Optional jumper troughs available and designed to mount with base footprint.
 - 6) Available without legs for mounting on rack/cabinet mounted panels or on tower systems.
 - 7) Basis of Design: Commscope 569440-1.
 - b. 110-style Connecting Clips (110C-4 and 110C-5):
 - 1) Comply with TIA/EIA-568-C, Category 5e.
 - 2) 110-style IDC termination system.
 - 3) 110C-4 Clips (4-pair) used for termination of 4-pair cables or a combination of 4-pair and multi-pair cables.
 - 4) 110C-5 Clips (5-pair) used for termination of multi-pair cables.
 - 5) Basis of Design: Commscope 558401-1(4 pair) 558402-1 (5 pair)
- D. Rack Mounted.
1. Patch Panel:
 - a. Modular panels housing multiple-numbered in-line configured IDC terminations for permanent termination of pair groups of installed cables.
 - 1) Number of RJ-45 interfaces per panel: As shown in the Details.
 - a) Details will specify the number of pairs to be terminated per interface.
 - b) Supply panel interface quantities to terminate 1 pair per port unless otherwise noted.
 - 2) Comply with TIA/EIA-568-C, Category 5e.
 - a) Flat patch panel.
 - b) UL listed.
 - c) Black steel with PCB connection between interfaces.

- d) Labeling areas on front and rear.
- e) Mountable in EIA standard 19-inch rack/cabinet rails.
- f) 24-ports in 1.75 inches of rack space (1 RU); 48-ports in 3.5 inches of rack space (2RU).
- g) RJ45 (8P8C) jack interface on front and 110-style IDC connections on rear.
- h) Tested and verified to meet TIA component, permanent link and channel requirements.
- i) Provide accessory strain relief bars on the rear with hook and loop ties.
- j) Basis of Design: Commscope Systimax 760205278 PM-PS-48

2.4 SOURCE QUALITY CONTROL

- A. System components shall be tested and listed by one or more United States NRTL.

PART 3 - EXECUTION

3.1 GENERAL

- A. Review and coordinate cabling pathways prior to pathway and cabling installation.
 - 1. Coordinate to resolve deviations, defects or other problems with pathways prior to installation. Allow adequate time for corrections so as to avoid delays to the Project completion date.
 - 2. Provide additional or supplemental TIA/EIA-569-C, or most current version, compliant pathways and cable support where required. Provide additional sleeves through walls/floors/ceilings, as necessary to route cables within buildings.
- B. Project Conditions
 - 1. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 - 2. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.
 - 3. Delivery, Storage and Handling
 - a. Store materials in conditions endorsed by the product manufacturer.
- C. Compliance
 - 1. Comply with NECA 1.
 - 2. Comply with TIA/EIA-568-C, including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard; and TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
 - 3. Monitor cable pull tensions, and comply with BICSI ITSIMM, Chapter "Pulling Cable."
 - 4. Comply with BICSI ITSIMM, Chapter "Cable Termination Practices."

5. Comply with requirements for raceways and boxes specified in Section 270528 "Pathways for Communications."
 - a. Comply with TIA/EIA-569-C, or most current version, for pull-box sizing and length of conduit and number of bends between pull points.
 - b. Do not exceed the required fill capacity of raceways.
6. Provide the appropriate cable rated for the environmental conditions in which the cable is to be installed.

3.2 ENTRANCE FACILITIES

- A. Coordinate backbone cabling with the protectors and demarcation point provided by the communications service providers.

3.3 INSTALLATION OF CABLES

- A. Prior to procurement and installation, confirm that cables to be installed within the pathways will not exceed the maximum standards-based distance limitations for Category-rated cabling.
- B. Install cables within approved pathways. Install cables that are not otherwise required to be installed within raceway in such manner as to conceal them from view. Conceal conductors and cables in accessible ceilings, walls and floors.
- C. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and discard cable if damaged during installation and replace it with new cable.
- D. Do not splice cable between terminations or junction points. Cable runs shall be continuous. Wiring shall be free from grounds, shorts, opens and reversals.
- E. Maintain complete protection of cabling. Cabling shall not be left hanging or coiled where it potentially obstructs the Work of other trades.
- F. Cable routing shall follow building structure lines (parallel and perpendicular).
- G. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
- H. Cold-Weather Installation: Bring cable to room temperature before de-reeling. Heat lamps shall not be used for heating.
- I. Open-Cable Installation:
 1. Install cabling with horizontal and vertical cable guides in communications spaces with terminating hardware and interconnection equipment.
 2. Suspend cable not in raceway, a minimum of 8 inches (200 mm) above ceilings by discrete cable supports not more than 60 inches (1524 mm) apart. Bridle rings are not permitted.
 3. Cable shall not be run through structural members or in contact with conduits, pipes, ducts or other similar or potentially damaging items.

- J. Provide conduit sleeves for penetrations.
1. Provide conduit sleeves for cables where cables pass through walls, floors and ceilings.
 2. Patch and firestop around sleeves.
 3. Firestop the interior of the sleeves after cable installation.
 4. Provide the appropriate bushings on each end. Split bushings shall not be used.
 5. Provide waterproof sealant for penetrations in humidity controlled areas.
- K. Installation of Cable Routed Exposed Under Raised Floors:
1. Install plenum-rated cable only.
 2. Install cabling after the flooring system has been installed in raised floor areas.
 3. Coil cable 6 feet (1800 mm) long not less than 12 inches (300 mm) in diameter below each feed point.
- L. Comply with requirements in Section 270502 "Basic Materials and Methods for Communications."
1. Bundle cables within racks, ladder racks, cable trays and in discrete cable supports. Utilize reusable cable bundling hardware. Utilize plenum-rated hardware in plenum spaces.
- M. Separation from EMI Sources:
1. Comply with BICSI TDMM and TIA/EIA-569-C, or most current version, recommendations for separating unshielded twisted pair (UTP) cable from potential EMI sources, including electrical power lines and equipment.
 2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: A minimum of 5 inches (127 mm).
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 12 inches (300 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 24 inches (610 mm).
 3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: A minimum of 2-1/2 inches (64 mm).
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 6 inches (150 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 12 inches (300 mm).
 4. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: No requirement.
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 3 inches (76 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 6 inches (150 mm).
 5. Separation between Communications Cables and Electrical Motors and Transformers: A minimum of 48 inches (1200 mm).

6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches (127 mm).
- N. Separate cabling by service and type (i.e., voice, data, control, coaxial, fiber) prior to terminating.
1. Terminate cabling on specified termination hardware in alpha-numerical order.
 2. Group connecting hardware for cables into separate logical fields.
 3. Neatly dress and securely attach cabling to the backboard and/or cabinet/rack.
 4. Provide adequate cable lengths to reach any location on the backboard or within the cabinet/rack.
 5. Bundle and support cables of this System separately from the cables of other systems.
 6. Maintain separation between cables carrying different signal types and different signal levels.
 - a. Where cables from different systems or cables with different signal types are expressly permitted by the Designer to share a common pathway, each of these cable groups shall be kept segregated to the maximum degree physically possible. Cables from different systems shall not be mixed or intertwined.
- O. Provide a minimum service loop of 5 feet at each end and 10 feet at each junction point, unless noted otherwise.
- P. Maintain (do not violate) the minimum bend radius specified by the manufacturer of the cable.
- Q. At final termination, excess cable and the service loop shall be supported and stored neatly in the cable tray or ladder rack within the communications rooms.
1. Proper strain relief shall be applied to cables after installation to lessen the risk of physical damage and to provide proper aesthetic value.
- R. Cabling within Enclosures:
1. Bundle, lace, and train cables within enclosures.
 2. Connect to terminal points with no excess and without exceeding manufacturers' limitations on bending radii.
 3. Provide and use lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.
- S. Cable Termination:
1. Terminate every conductor; no cable shall contain unterminated elements unless otherwise indicated. Make terminations only at indicated outlets, terminals, cross-connects and patch panels.
 2. Bridged taps and splitters shall not be installed as part of backbone cabling.
 3. Utilize standard positive identification color coding for multi-conductor cables.
 4. Provide 110-style IDC termination hardware unless otherwise indicated.
 - a. Do not untwist twisted pair cables more than 1/2 inch (12 mm) from the point of termination to maintain cable geometry.

3.4 IDENTIFICATION

- A. Label each end of the cable.
- B. Identify system components and cabling in compliance with TIA/EIA-606-B, or most current version.

3.5 FIELD QUALITY CONTROL

- A. Comply with Section 270810 "Verification Testing of Structured Cabling."
- B. Perform tests and inspections.
 - 1. Twisted pair cabling shall be factory tested according to TIA/EIA-568-C.
 - 2. Visually inspect twisted pair jacket materials for NRTL certification marking. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA/EIA-568-C.
 - 3. Visually confirm Category rated marking of cabling and termination hardware, including connecting blocks and patch panels.
 - 4. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords and labeling of components.
 - 5. Test twisted pair copper cabling for DC loop resistance, shorts, opens, intermittent faults and polarity between conductors.
 - a. Test instruments shall meet or exceed applicable requirements in TIA/EIA-568-C. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
 - 6. Final Verification Tests: Perform verification tests for twisted pair systems after the complete communications cabling and workstation outlet/connectors are installed.
 - 7. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report for the cables as well as a detailed report for each cable tested.
 - 8. Remove and replace cabling where test results indicate they do not comply with specified requirements. Retest cabling and provide documentation.
 - 9. End-to-end cabling shall be considered defective if it does not pass tests and inspections.
 - 10. Prepare and submit test and inspection reports.
- C. The Owner reserves the right to have a representative present during testing procedures. Verification testing of copper and fiber may be performed at or near Project completion by the Consultant for quality assurance.
- D. Upon verification testing, if the Consultant finds the test results do not match the Contractor's results, the Consultant or a third party may at the Owner's request retest the cabling and submit those results to the Owner and deduct the verification testing costs from the Contractor's Contract amount.

END OF SECTION 27 13 13

SECTION 27 13 23 - FIBER OPTIC BACKBONE CABLING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - 2. Product Datasheets.

- B. Quality Assurance
 - 1. Cable and connectivity manufacturers' certification of quality and performance, including:
 - a. List of manufacturers and products approved for use by the cabling and connectivity manufacturers to meet the required extended warranty registration procedures.
 - b. Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.

- C. Shop Drawings:
 - 1. Labeling Schema.
 - 2. Backbone System Diagram.

- D. Closeout Submittals:
 - 1. Product Datasheets.
 - 2. As-Built Drawings:
 - a. Labeling Schema.
 - b. Backbone System Diagram.
 - 3. Field Quality Control / Test Results.
 - 4. Cable and connectivity manufacturers' certification of quality and performance.
 - a. Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.
 - b. Executed warranty documentation: Site specific, supplied from the manufacturer.

1.2 REFERENCES

- A. Definitions:
 - 1. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

- B. Reference Standards:
 - 1. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651 and NFPA 70 for the following types:
 - a. Plenum Rated, Nonconductive: Type OFNP, complying with UL 910.

- b. Riser Rated, Nonconductive: Type OFNR or OFNP, complying with UL 1666.
 - c. Plenum Rated, Conductive: Type OFCP or OFNP, complying with UL 910.
 - d. Riser Rated, Conductive: Type OFCR or OFNR, OFCP or OFNP, complying with UL 1666.
2. TIA/EIA-568-C, including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard Part 1: General Requirements; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunications Cabling and Components Standard; and TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
 3. TIA/EIA-569-C, or most current version, Telecommunications Pathways and Spaces.
 4. TIA/EIA-606-B, or most current version, Administration Standard for Commercial Telecommunications Infrastructure.
 5. TIA/EIA-607-B, or most current version, Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications.
 6. The most current published version of the "Telecommunications Distribution Methods Manual (TDMM)" published by the Building Industry Consulting Services International (BICSI).
 7. The most current published version of the "Information Transport Systems Installation Methods Manual (ITSIMM)" published by the Building Industry Consulting Services International (BICSI).

1.3 COORDINATION

- A. Review and coordinate the sizes, quantity, routing and spacing of pathways to ensure they will adequately support the work of this Section.
 1. Confirm that cables to be installed shall not exceed maximum fill capacities of raceways and shall meet the minimum requirements of Local, State and Federal laws and requirements.
- B. Coordinate layout and installation of communications cabling with Owner's telecommunications, WAN and LAN equipment and service suppliers.

1.4 QUALITY ASSURANCE

- A. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate marking of applicable testing agency.
- B. Prior to bid, Contractor shall be listed and shall maintain participation as part of the cabling and connectivity manufacturers' certified contractor programs. Provide documentation as outlined in Submittals.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Store materials in conditions endorsed by the product manufacturer.

- B. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
- C. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.

1.6 WARRANTY

- A. Additional requirements: Cabling and connectivity products manufacturers, including patch cords, shall have in place an agreement recognizing each other for execution of the warranty as specified. Performance and applications warranties shall be channel rated, including patch cords.
- B. The cable manufacturer and the connectivity products manufacturer shall have a partnership agreement established in order to provide the required warranty.
- C. Required warranty: The TIA/EIA-568-C compliant cable system shall include a minimum 15 year extended product warranty and performance/applications assurance program.

1.7 SYSTEM DESCRIPTION

- A. The fiber optic backbone cabling system shall be a system of interconnections between communications rooms, main terminal spaces and entrance facilities as part of a complete communications cabling system infrastructure. The cabling system consists of cables, cross-connect enclosures, and terminations used for backbone-to-backbone cross-connection.
- B. Provide TIA/EIA-568-C compliant fiber optic backbone cabling system.
- C. Cabling
 1. Refer to the Drawings for types and quantities of backbone cables.
 2. Provide total connectivity for complete and permanent installed communications links.
 3. Backbone cabling cross-connects shall be located within communications rooms, entrance facilities and other locations as designated.
- D. Unless pre-approved by the Designer, provide a single, uniform and complete connectivity solution for this Section:
 1. Cabling and connectivity for this Section, and related structured cabling Sections (used to form a unified Structured Cabling System), shall be provided by a single manufacturer or a two manufacturer formal relationship.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 FIBER OPTIC CABLE

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following :
1. CommScope, Inc. (CommScope).

B. General:

1. General Performance: Comply with transmission standards in TIA/EIA-568-C when tested according to test procedures of this standard.
2. System cables shall be code compliant and UL/NEC rated for the location, manner, and environmental conditions in which the cables are installed.
 - a. Within a building, cables that are not installed in a totally enclosed pathway system shall be UL plenum rated.
 - b. Cables used for below grade applications, and cables used in pathways that may reasonably end up with standing water within them, shall be manufacturer rated for continuous contact with water without performance degradation or compromise in warranty.
 - c. Cables used for direct burial, aerial, or other applications shall be manufacturer rated for the application.
 - 1) Also see "Inter-Building Cabling" Section for cable alternate construction.
3. Fiber optic backbone cables on this Project shall utilize industry standard jacket color coding to identify fiber grade.

C. Cable Construction

1. Any fiber optic cable not of interlocking armored construction will be installed in a properly rated (plenum) inner-duct.
2. All fiber optic cable will be properly constructed for the environmental conditions and to meet all applicable codes.
3. Jacket:
 - a. Utilize industry standard color coding for multimode and singlemode fiber optic cable jacket colors.
 - b. Cable cordage jacket, fiber, unit and group color shall be according to TIA/EIA-568-C.
 - c. Imprinted with fiber count, fiber type and aggregate length at regular intervals not to exceed 40 inches (1000 mm).
4. The following basic construction types are recognized on this Project:
 - a. Tight buffer armored premise distribution cable
 - 1) Plenum (OFNP) rated construction unless otherwise specifically noted.
 - 2) Used in indoor pathways primarily as backbone cable.
 - 3) Fiber counts can range from 4 to 72 strands

- 4) Hybrid SM/MM strand mix is acceptable.
- 5) This cable construction will never be used in an outdoor or harsh environment.
- 6) OD shall range .49”-.59”
- 7) Basis of Design shall be Commscope P-###-DZ-8W-FSUYL (### = Strand Count.)

D. Optical Properties

E. Description: Multimode, 50/125-micrometer, OM4.

1. Comply with ICEA S-83-596 for mechanical properties.
2. Comply with EIA-455-41 and EIA-455-25 for crush resistance and impact resistance.
3. Comply with TIA/EIA-492AAAD for detailed specifications.
4. Comply with TIA/EIA-568-C for performance specifications.
5. Meet or exceed ISO/IEC 11801 OM4 Grade 6 optical characteristics:
 - a. Dual window of 850 nm and 1300 nm.
 - b. Minimum Overfill Launch Bandwidth: 1500 MHz/km at 850 nm; 500 MHz/km at 1300 nm.
 - c. Laser Launch Bandwidth: 4700 MHz/km.
 - d. Gigabit Ethernet (GbE) Distance (min.): 1000 m at 850 nm; 550 m at 1300 nm.
 - e. 10 Gigabit Ethernet (10 GbE) Distance (min.): 550 m at 850 nm.
 - f. Maximum attenuation: 3.0 dB/km at 850 nm; 1.0 dB/km at 1300 nm.

F. Description: Singlemode, OS2.

1. Comply with ICEA S-83-596 for mechanical properties.
2. Comply with EIA-455-41 and EIA-455-25 for crush resistance and impact resistance.
3. Comply with TIA/EIA-568-C for performance specifications.
4. Meet or exceed ISO/IEC 11801 Singlemode optical characteristics:
 - a. Dual window of 1310 nm and 1550 nm.
 - b. Guaranteed Gigabit Ethernet (GbE) Distance: 10,000 m at 1310 nm.
 - c. Guaranteed 10 Gigabit Ethernet (10 GbE) Distance: 5,000 m at 1310 nm; 30,000 m at 1550 nm.
 - d. Maximum attenuation: .7 dB/km at 1310 nm; .7 dB/km at 1550 nm.

2.3 FIBER OPTIC CABLE TERMINATIONS AND HARDWARE

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following :

1. CommScope, Inc. (CommScope).

B. General Requirements for Cable Connecting Hardware:

1. Cables shall be terminated with connecting hardware of same optical performance or higher.
2. Provide one single manufacturer for fiber optic cable termination hardware.
3. Cable hardware (i.e., connectivity) shall be part of the manufacturer's enterprise solution.

- C. Rack Mounted Fiber Optic Panel Enclosure: Modular enclosures housing multiple adapter plates, splice trays and MTP cassette modules:
1. TIA/EIA-568-C compliant.
 2. Steel: black powder coated finish.
 3. Front metal door or smoked polycarbonate door, removable.
 4. Rear metal cover/door, removable.
 5. Rear tray capacity for splice trays.
 6. Slack management spools included.
 7. Accepts standard fiber optic adapter plates and cassettes.
 8. EIA standard 19 inches rack rails.
 9. Available in 1RU (1.75 inches), 2RU (3.50 inches) or 4RU (7 inches) sizes.
 - a. 1RU: Capacity for up to (4) adapter plates; up to (3) splice trays.
 - b. 2RU: Capacity for up to (8) adapter plates; up to (6) splice trays.
 - c. 4RU: Capacity for up to (16) adapter plates; up to (12) splice trays.
 10. Basis of Design: Commscope HD-1U-SP (1 RU), HD-2U-SP (2 RU), HD-4U-SP (4 RU), size as indicated.
 - a. Include slide mounting kit for access, as required.
 - b. Include additional fiber management rings, as required.
 - c. Include Cable clamp kits.
- D. Wall Mounted Fiber Optic Panel Enclosure: Modular enclosures housing multiple adapter plates and splice trays:
1. TIA/EIA-568-C compliant.
 2. Steel: black powder coated finish.
 3. Wall mountable panel.
 4. Split metal door with lock on service side and lock on customer side.
 5. Slack management spools included.
 6. Accepts standard fiber optic adapter plates and splice trays, as required.
 7. Available capacities: four (4) adapter plates.
 8. Basis of Design: Commscope WBE-EMT-BK-4P-MOD size/quantities as required to terminate fiber quantities indicated on the Drawings.
- E. Fiber Optic Adapter Plates: Modular adapter plates for multiple fibers and connector types fitting within rack mounted and wall mounted fiber optic panel enclosures:
1. Multimode:
 - a. Individual couplers installed.
 - b. Mounts within fiber optic panel enclosures.
 - c. Six (6) duplex SC adapters accommodating twelve (12) fibers.
 - d. Provide adapter plate with couplers to match specified fiber performance.
 - 1) Provide phosphor bronze sleeves for multimode applications.
 - 2) Provide ceramic sleeves for 50/125-micrometer OM 4 and 4+ laser optimized applications.
 - 3) Utilize industry standard color coding.
 - e. Coordinate with fiber optic panel enclosure.
 - f. Provide adequate panels to terminate all fiber strands on rear of adapter plates.
 - g. Basis of Design Commscope G2-SP-12LCX-PT
 2. Singlemode:
 - a. Individual couplers installed.
 - b. Mounts within fiber optic panel enclosures.

- c. Six (6) duplex LC adapters with ceramic sleeves accommodating six (12) singlemode fibers.
 - d. Color code SM couplers blue; utilize industry standard color coding.
 - e. Coordinate with fiber optic panel enclosure.
 - f. Provide adequate panels to terminate all fiber strands on rear of adapter plates.
 - g. Basis of Design Commscope Systimax G2-SP-12LCG-PT
- F. Fusion Splice Tray: Splice trays mounting within fiber optic panel enclosures:
- 1. Each splice tray shall be of fusion type.
 - 2. Splices shall be enclosed in a splice tray mounted in a splice module housing or splice enclosure.
 - 3. Provide mounting hardware kits, holders and sleeves as required.
 - 4. Basis of Design Commscope RS-2AF-16SF (2 trays), RS-4AF-16SF (4 trays)
- G. Fiber Optic Break-Out (Fan-Out)/(Furcation) Kit:
- 1. Shall be used for fiber optic cable terminations.
 - 2. Shall include buffer tubing and heat shrink tubing for each strand to have 18 inches length from break-out.
 - 3. Basis of Design: Corning Cable Systems FAN-BT25-** (Indoor) or FAN-OD25-** (Outdoor).

2.4 SOURCE QUALITY CONTROL

- A. System components shall be tested and listed by one or more United States NRTL.

PART 3 - EXECUTION

3.1 GENERAL

- A. Review and coordinate cabling pathways prior to pathway and cabling installation.
 - 1. Coordinate to resolve deviations, defects or other problems with pathways prior to installation. Allow adequate time for corrections so as to avoid delays to the Project completion date.
 - 2. Provide additional or supplemental TIA/EIA-569-C, or most current version, compliant pathways and cable support where required. Provide additional sleeves through walls/floors/ceilings, as necessary to route cables within buildings.
- B. Project Conditions
 - 1. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 - 2. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.
 - 3. Delivery, Storage and Handling
 - a. Store materials in conditions endorsed by the product manufacturer.

- C. Compliance
 - 1. Comply with NECA 1.
 - 2. Comply with TIA/EIA-568-C., including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard; and TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
 - 3. Monitor cable pull tensions, and comply with BICSI ITSIMM, Chapter "Pulling Cable."
 - 4. Comply with BICSI ITSIMM, Chapter "Cable Termination Practices."
 - 5. Comply with requirements for raceways and boxes specified in Section 270528 "Pathways for Communications."
 - a. Comply with TIA/EIA-569-C, or most current version, for pull-box sizing and length of conduit and number of bends between pull points.
 - b. Do not exceed the required fill capacity of raceways.

3.2 ENTRANCE FACILITIES

- A. Coordinate backbone cabling with the protectors and demarcation point provided by the communications service providers.

3.3 INSTALLATION OF CABLES

- A. Install cables within approved pathways. Install cables that are not otherwise required to be installed within raceway in such manner as to conceal them from view. Conceal conductors and cables in accessible ceilings, walls and floors.
- B. Provide the appropriate cable rated for the environmental conditions in which the cable is to be installed.
- C. Fiber optic cable shall be installed in a protective barrier (innerduct) with the appropriate rating for the environmental conditions.
 - 1. Any fiber optic cable not of interlocking armored construction shall be installed in a properly rated (plenum) inner-duct.
 - 2. Exception: Fiber optic cabling with plenum rated interlocking armor jacket shall not require innerduct.
- D. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and discard cable if damaged during installation and replace it with new cable.
- E. Do not splice cable between terminations or junction points. Cable runs shall be continuous.
- F. Maintain complete protection of cabling. Cabling shall not be left hanging or coiled where it potentially obstructs the Work of other trades.
- G. Cable routing shall follow building structure lines (parallel and perpendicular).

- H. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
- I. Cold-Weather Installation: Bring cable to room temperature before de-reeling. Heat lamps shall not be used for heating.
- J. Open-Cable Installation:
 - 1. Install cabling with horizontal and vertical cable guides in communications spaces with terminating hardware and interconnection equipment.
 - 2. Suspend cable not in a raceway, a minimum of 8 inches (200 mm) above ceilings by discrete cable supports not more than 60 inches (1524 mm) apart. Bridle rings are not permitted.
 - 3. Cable shall not be run through structural members or in contact with conduits, pipes, ducts or other similar or potentially damaging items.
- K. Provide conduit sleeves for penetrations.
 - 1. Provide conduit sleeves for cables where cables pass through walls, floors and ceilings.
 - 2. Patch and firestop around sleeves.
 - 3. Firestop the interior of the sleeves after cable installation.
 - 4. Provide the appropriate bushings on each end. Split bushings shall not be used.
 - 5. Provide waterproof sealant for penetrations in humidity controlled areas.
- L. Comply with requirements in Section 270502 "Basic Materials and Methods for Communications."
 - 1. Bundle cables within racks, ladder racks, cable trays and in discrete cable supports. Utilize reusable cable bundling hardware. Utilize plenum-rated hardware in plenum spaces.
- M. Separate cabling by service and type (i.e., voice, data, control, coaxial, fiber) prior to terminating.
 - 1. Terminate cabling on specified termination hardware in alpha-numerical order.
 - 2. Neatly dress and securely attach cabling to the backboard and/or cabinet/rack.
 - 3. Provide adequate cable lengths to reach any location on the backboard or within the cabinet/rack.
 - 4. Bundle and support cables of this System separately from the cables of other systems.
 - 5. Where cables from different systems or cables with different signal types are expressly permitted by the Designer to share a common pathway, each of these cable groups shall be kept segregated to the maximum degree physically possible. Cables from different systems shall not be mixed or intertwined.
- N. Provide a minimum service loop of 5 feet at each end and 10 feet at each junction point, unless noted otherwise.
- O. Maintain (do not violate) the minimum bend radius specified by the manufacturer of the cable.
- P. At final termination, excess cable and the service loop shall be supported and stored neatly in the cable tray or ladder rack within the communications rooms.

1. Proper strain relief shall be applied to cables after installation to lessen the risk of physical damage and to provide proper aesthetic value.

Q. Cabling within Enclosures:

1. Bundle, lace, and train cables within enclosures.
2. Connect to terminal points with no excess and without exceeding manufacturers' limitations on bending radii.
3. Provide and use lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.

R. Cable Termination:

1. Terminate every conductor; no cable shall contain unterminated elements unless otherwise indicated. Make terminations only at indicated outlets, terminals, cross-connects and patch panels.
2. Fiber optic cabling shall be terminated using fusion-spliced, factory-polished pigtails.
3. Fiber optic cables shall utilize factory manufactured break-out kits to protect fiber strands within fiber optic enclosures.
 - a. Provide buffer tubing on fiber strands from the connector to the cable break-out (minimum 6 inches pigtails), and secure to the cable jacket for fiber optic cables that do not have a cladding.
4. Utilize standard positive identification color coding for multi-strand cables.

3.4 IDENTIFICATION

- A. Label each end of the cable.
- B. Identify system components and cabling in compliance with TIA/EIA-606-B, or most current version.

3.5 FIELD QUALITY CONTROL

- A. Perform tests and inspections.
 1. Visually inspect optical fiber cabling jacket materials for NRTL certification markings.
 2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords and labeling of components.
 3. Optical fiber cable tests:
 - a. Test instruments shall meet or exceed applicable requirements in TIA/EIA-568-C. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
- B. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report for the cables as well as a detailed report for each cable tested.
- C. Remove and replace cabling where test results indicate they do not comply with specified requirements. Retest cabling and provide documentation.

- D. End-to-end cabling shall be considered defective if it does not pass tests and inspections.
- E. Prepare and submit test and inspection reports.
- F. The Owner reserves the right to have a representative present during testing procedures. Verification testing of copper and fiber may be performed at or near Project completion by the Consultant for quality assurance.
- G. Upon verification testing, if the Consultant finds the test results do not match the Contractor's results, the Consultant or a third party may at the Owner's request retest the cabling and submit those results to the Owner and deduct the verification testing costs from the Contractor's Contract amount.

END OF SECTION 27 13 23

SECTION 27 15 13 - COPPER HORIZONTAL CABLING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Product Datasheets.
 - 2. Bill of Materials (BOM).
 - 3. Warranty documentation, including connectivity/cabling manufacturer product warranty data and certificates of complete connectivity solution provider status for the Contractor.

- B. Quality Assurance
 - a. Cable and connectivity manufacturers' certification of quality and performance, including:
 - 1) List of manufacturers and products approved for use by the cabling and connectivity manufacturers to meet the required extended warranty and warranty registration procedures.
 - 2) Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.
 - 3) The Telecommunications contractor must be an approved Commscope or other Certified Installer (CI) A copy of certification documents must be submitted with the quote in order for such quote to be valid. The Telecommunications contractor is responsible for workmanship and installation practices in accordance with Commscope or other pre-approved manufacturer's recommendations

- C. Shop Drawings:
 - a. Floor Plans
 - b. Labeling Schema.

- D. Closeout Submittals:
 - 1. Product Datasheets.
 - 2. As-Built Drawings:
 - a. Floorplans
 - b. Rack Elevations.
 - c. Wall Elevations.
 - d. Labeling Schema.
 - 3. Field Quality Control / Test Results.
 - 4. Cable and connectivity manufacturers' certification of quality and performance.
 - a. Warranty documentation, including cabling and connectivity manufacturers' current product warranty data and certificates of complete connectivity solution provider status for the Contractor.
 - b. Executed warranty documentation: Site specific, supplied from the manufacturer.

1.2 REFERENCES

A. Definitions:

1. Consolidation Point (CP): A location for interconnection between horizontal cables extending from Telecommunications Rooms and horizontal cables extending to the communications outlet/connector. Typically used to feed office furniture or similar re-configurable areas.
2. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.
3. MUTOA: Multiuser telecommunications outlet assembly, a grouping in one location of several telecommunications outlet/connectors. Similar function as CP except the horizontal cables are terminated with RJ45 interfaces at both ends and the cable extends to the workstation as a station attachment cable.
4. Outlet/Connectors: A connecting device in the work area on which horizontal cable or outlet cable terminates.
5. Twisted-Pair: Two individually insulated copper wires physically twisted together to form a balanced pair.
6. Twisted-Pair Cable: A multi-conductor cable comprising two or more copper conductors twisted in a manner designed to cancel electrical interference. Also called balanced twisted-pair cable.

B. Reference Standards:

1. TIA/EIA-568-C, including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard Part 1: General Requirements; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunications Cabling and Components Standard; and TIA/EIA-568-C.3, Optical Fiber Cabling Components Standard.
2. TIA/EIA-569-C, or most current version, Telecommunications Pathways and Spaces.
3. TIA/EIA-606-B, or most current version, Administration Standard for Commercial Telecommunications Infrastructure.
4. TIA/EIA-607-B, or most current version, Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications.
5. The most current published version of the "Telecommunications Distribution Methods Manual (TDMM)" published by the Building Industry Consulting Services International (BICSI).
6. The most current published version of the "Information Transport Systems Installation Methods Manual (ITSIMM)" published by the Building Industry Consulting Services International (BICSI).

1.3 COORDINATION

A. Review and coordinate the sizes, quantity, routing and spacing of pathways to ensure they will adequately support the work of this Section.

1. Confirm that cables to be installed will not exceed maximum fill capacities of raceways and shall meet the minimum requirements of Local, State and Federal laws and requirements.
2. Confirm that cables to be installed within the pathways will not exceed the maximum standards-based distance limitations (90 meters (295 feet)) for horizontal cabling.

- B. Coordinate communications outlet/connector locations with the location of power receptacles at each work area. Coordinate so that power receptacles are immediately adjacent and same height.
- C. Coordinate layout and installation of communications cabling with telecommunications and LAN equipment and service suppliers.

1.4 QUALITY ASSURANCE

- A. Prior to bid, Contractor shall be listed and shall maintain participation as part of the cabling and connectivity manufacturers' certified contractor programs. Provide documentation as outlined in Submittals.

1.5 DELIVERY, STORAGE AND HANDLING

- A. Store materials in conditions endorsed by the product manufacturer.
- B. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
- C. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.

1.6 WARRANTY

- A. Additional requirements: Cabling and connectivity products manufacturers, including patch cords, shall have in place an agreement recognizing each other for execution of the warranty as specified. Performance and applications warranties shall be channel rated, including patch cords.
- B. The cable manufacturer and the connectivity products manufacturer shall be the same manufacturer or shall have a partnership agreement established in order to provide the required warranty.
- C. Required warranty: The TIA/EIA-568-C Category 6 – 250 MHz and 6A - 500 MHz compliant cable system shall include a minimum 15 year extended product warranty and performance/applications assurance program to minimum of 5dB of crosstalk margin beyond the CAT 6 standard for NEXT, PSNEXT, ACR and PSACR.

1.7 SYSTEM DESCRIPTION

- A. Horizontal cabling and connecting hardware provide the means of transporting signals between the communications outlet/connector and the horizontal cross-connect located in the communications room or enclosure. The cabling and associated connecting hardware are called a "permanent link," a term that is used in the testing protocols.

- B. Provide TIA/EIA-568-C compliant 4-pair twisted pair horizontal cabling system.
1. Provide Category 6 compliant horizontal cabling system.
 2. Provide Category 6A (Augmented Category 6) compliant horizontal cabling system for Wireless Access Point (WAP) cabling.
- C. Cabling
1. Refer to the Drawings for types and quantities of horizontal cables.
 2. Provide total connectivity for complete and permanent installed communications links.
 3. The copper horizontal cabling system shall include provisions for voice/telephone, data/network, video surveillance, audio-visual, access control, building automation, control data and intrusion detection systems.
 - a. Cables may be color-coded by system. Reference the Drawings for requirements, and coordinate with the Owner for final verification.
 - 1) Cable and outlet color code
 - a) Wireless access point (AP) pulls are to be 1 category 6 grey in color.
 - b) Time clock pulls (if required) are to be done with category 6 cabling yellow in color.
 - c) Camera cables are to be done with category 6 cabling purple in color terminated on a separate patch panel in the telecommunications closet.
 - d) Work station voice cables are to be done with category 6 cabling blue in color
 - e) Work station Data cables are to be done with category 6 cabling Red in color for Primary outlet and White in color for the secondary outlet.
 - f) If colored conduit is required it should be White in color. • Outlet color should match cable color
 - g) All cable drops must have a minimum of 1 voice (category 6) and 2 data (category 6 or higher) unless specified differently by Network Services. The color of the cable and matching jacks should be as follows: 1 Red cat 6, 1 White Category 6, and 1 Blue category or 1 White and 1 Blue Category 6A cable.
 - b. Under slab conduits (i.e. floor boxes) shall require OSP rated cable. Splice to plenum rated cable in junction box at ceiling transition.
- D. Unless pre-approved by the Designer, provide a single, uniform and complete connectivity solution for this Section:
1. Cabling and connectivity for this Section, and related structured cabling Sections (used to form a unified Structured Cabling System), shall be provided by a single manufacturer or a two manufacturer formal relationship.

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.

2.2 CABLING

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. CommScope, Inc. (Systimax).

B. General:

1. General Performance: Comply with transmission standards in TIA/EIA-568-C when tested according to test procedures of this standard.
 - a. Twisted pair cable is required to have the appropriate Category classification as defined by TIA/EIA-568-C. Compliance with these electrical characteristics shall be third party verified by the manufacturer.
2. System cables shall be code compliant and UL/NEC rated for the location, manner, and environmental conditions in which the cables are installed.
 - a. Within a building, cables that are not installed in a totally enclosed pathway system shall be UL plenum rated.
 - b. Cables used for below grade applications, and cables used in pathways that may reasonably end up with standing water within them, shall be manufacturer rated for continuous contact with water without performance degradation or compromise in warranty.
 - 1) Cables in conduit to a floorbox in a slab on grade application shall transition to OSP rated 4 pair cables.
 - c. Cables used for direct burial, aerial, or other applications shall be manufacturer rated for the application.
 - 1) Also see "Inter-Building Cabling" Section for cable alternate construction.
3. Cables on this Project may be color-coded. See drawings for color code.

C. Twisted Pair Cable

1. Description: 100-ohm, Indoor four-pair with a thermoplastic jacket.
 - a. Comply with ICEA S-90-661 for mechanical properties.
 - b. Comply with TIA/EIA-568-C for performance specifications.
 - c. Comply with TIA/EIA-568-C, Category 6.
 - 1) Cable shall have two individual insulated 23 AWG solid copper conductors formed into a twisted pair.
 - 2) Cable shall be constructed of one 4-pair bundle of individually insulated Unshielded Twisted Pairs (UTP).
 - 3) Minimum of 5dB of crosstalk margin beyond the CAT 6 standard for NEXT, PSNEXT, ACR and PSACR.
 - 4) Basis of design shall be: Systimax 2071E xxx C6 4/23 U/UTP (xxx = color)

- d. Comply with TIA/EIA-568-C, Category 6A (Augmented Category 6).
 - 1) Cable shall have two individual insulated 23 AWG solid copper conductors formed into a twisted pair.
 - 2) Cable must be constructed of one 4-pair bundle of individually insulated Unshielded Twisted Pairs (UTP).
 - 3) [Nominal cable OD shall not exceed 0.300 inches.]
 - 4) Basis of design shall be: Systimax 2091B xxx C6A 2/23 U/UTP (xxx = color)
- 2. Description: 100-ohm, four-pair OSP Rated UTP cable.
 - a. Comply with ICEA S-90-661 for mechanical properties.
 - b. Comply with TIA/EIA-568-C for performance specifications.
 - c. Utilized for wet environments.
 - d. Comply with TIA/EIA-568-C, Category 6.
 - 1) Cable shall have two individual insulated 23 AWG solid copper conductors formed into a twisted pair.
 - 2) Cable shall be constructed of one 4-pair bundle of individually insulated Unshielded Twisted Pairs (UTP).
 - 3) Cable shall be flooded to prevent moisture migration in underground or wet environments.
 - 4) Cable shall be performance guaranteed to 250 MHz.
 - e. Basis of design shall be: Systimax 1-1967222-1

2.3 CABLE TERMINATION HARDWARE

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
 - 1. CommScope, Inc. (Systimax).
- B. General Requirements for Cable Connecting Hardware:
 - 1. Comply with TIA/EIA-568-C, IDC type, with modules designed for punch-down.
 - 2. Cables shall be terminated with connecting hardware of same category or higher.
 - 3. Provide one single manufacturer for twisted pair termination hardware used together in a permanent link and whenever a Category certification is required.
 - 4. Cable hardware (i.e., connectivity) shall be part of the manufacturer's enterprise solution.
 - 5. Cable hardware shall be component rated with third-party verification for the specified Category-rated component compliance.
- A. Patch Panels
 - 1. Configurable Patch Panel: Modular panels housing rear-mounted UTP connector jack modules which snap in and out for easy moves, adds, and changes.
 - a. Number of Positions and Connector Jacks per Field: One (1) for each four-pair UTP cable required.
 - b. Comply with TIA/EIA-568-C.
 - 1) Flat modular patch panel, flush mount.
 - 2) Black steel.
 - 3) UL listed.
 - 4) Molded rear snap-in positions for category-rated modules for UTP. Refer to the Drawings for color coding requirements.
 - 5) Labeling.

- 6) Mountable in EIA standard 19-inch rack/cabinet rails.
- 7) 24-ports in 1.75 inches of rack space (1RU); 48-ports in 3.5 inches of rack space (2RU).
- 8) Provide accessory strain relief bars on the rear with hook and loop ties.
- 9) Basis of Design: Commscope Systimax 760187195 360-E-MOD-2U-48.

B. Connector Jacks, Jack Assemblies

1. Connector Jacks:
 - a. 100-ohm, balanced, twisted pair connector; four-pair, eight-position modular color-coded receptacle units with integral IDC-type terminals, component rated.
 - 1) [Category 6 Modular Jack: Basis of Design shall be Systimax MGS400-### - ### = Color Code
 - 2) [Category 6A (Augmented Category 6) Modular Jack: Basis of Design shall be Systimax MGS600-### - ### = Color Code
 - b. Connector jacks and jack assemblies shall be color coded by system.
 - 1) Color(s): As scheduled in the Contract Documents.

C. Cable transition splice

1. Shall only be utilized where transition is required to an environment requiring OSP rated cable.
2. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - a. 3M.
3. Description: Cable transition splice shall comply with requirements for cable connecting hardware.
4. Electrical connections are made by metallic contact elements that displace the insulation creating a contact point between the conductor and contact element. This design provides a gas-tight connection.
5. Plastic sheath retention grip points known as “bat wings” and “cathedral windows” maintain retention on the conductor insulation. Load bearing is handled by the molded part as opposed to the metal contact element.
6. The metal, utilized for contact element fabrication, is resistant to various forms of localized corrosion, stress corrosion cracking and pitting. In addition, the contact elements will not produce significant galvanic corrosion in wet or humid conditions even if other metals are present.
7. Connectors may be used to splice conductors ranging in size between 22 to 26 AWG.
8. Utilize covers to avoid shorting hazard.
9. Utilize manufacturer pressing tool for termination.
10. Basis of design shall be:
 - a. 3M 710-BD1-5

2.4 SOURCE QUALITY CONTROL

- A. System components shall be tested and listed by one or more United States NRTL.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Review and coordinate cabling pathways prior to pathway and cabling installation.
 - 1. Coordinate to resolve deviations, defects or other problems with pathways prior to installation. Allow adequate time for corrections so as to avoid delays to the Project completion date.
 - 2. Provide additional or supplemental TIA/EIA-569-C compliant pathways and cable support where required. Provide additional sleeves through walls/floors/ceilings, as necessary to route cables within buildings.

- B. Project Conditions
 - 1. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
 - 2. Do not deliver or install product(s) in conditions that jeopardize the performance or manufacturer life expectancy and service life of the product.
 - 3. Delivery, Storage and Handling
 - a. Store materials in conditions endorsed by the product manufacturer.

- C. Compliance
 - 1. Comply with NECA 1.
 - 2. Comply with TIA/EIA-568-C, including TIA/EIA-568-C.0, Generic Telecommunications Cabling for Customer Premises; TIA/EIA-568-C.1, Commercial Building Telecommunications Cabling Standard; TIA/EIA-568-C.2, Balanced Twisted-Pair Telecommunication Cabling and Components Standard; and TIA/E7IA-568-C.3, Optical Fiber Cabling Components Standard.
 - 3. Monitor cable pull tensions, and comply with BICSI ITSIMM, Chapter "Pulling Cable."
 - 4. Comply with BICSI ITSIMM, Chapter "Cable Termination Practices."
 - 5. Comply with requirements for raceways and boxes specified in Section 270528 "Pathways for Communications."
 - a. Comply with TIA/EIA-569-C, or most current version, for pull-box sizing and length of conduit and number of bends between pull points.
 - b. Do not exceed the required fill capacity of raceways.
 - 6. Install faceplates and inserts furnished under Section 271543 "Faceplates and Connectors" and/or Section 271544 "Custom Faceplates, Panels and Connectors."
 - 7. Provide the appropriate cable rated for the environmental conditions in which the cable is to be installed.

3.2 INSTALLATION OF CABLES

- A. Prior to procurement and installation of the horizontal cabling system, coordinate and verify pathways provided and indicated on the Contract Documents.
 - 1. Coordinate and verify to ensure that horizontal cables will not exceed the maximum standards-based distance limitations (90 meters (295 feet)) for horizontal cabling.

- Any discrepancy shall be immediately brought to the attention of the Designer for direction.
2. The maximum allowable total channel distance is 328 feet (100m) between equipment in the communications room and station equipment, including cable service loops, patch cables and station attachment cables.
 3. If proactive steps are not taken prior to procurement or installation, the Contractor shall be responsible for costs associated with providing the horizontal cabling system within industry-standard distance limitation parameters, including, but not limited to, additional required cabling, pathways, rough-in, equipment, communications rooms or enclosures, power and cooling requirements.
- B. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the communications outlet/connector.
 - C. Bridged taps and splices shall not be installed as part of the horizontal cabling.
 - D. Install cables within approved pathways. Install cables that are not otherwise required to be installed within raceway in such manner as to conceal them from view. Conceal conductors and cables in accessible ceilings, walls and floors.
 - E. Do not install bruised, kinked, scored, deformed, or abraded cable. Remove and discard cable if damaged during installation and replace it with new cable.
 - F. Do not splice cable between terminations or junction points. Cable runs shall be continuous. Wiring shall be free from grounds, shorts, opens and reversals.
 - G. Maintain complete protection of cabling. Cabling shall not be left hanging or coiled where it potentially obstructs the Work of other trades.
 - H. Cable routing shall follow building structure lines (parallel and perpendicular).
 - I. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
 - J. Cold-Weather Installation: Bring cable to room temperature before de-reeling. Heat lamps shall not be used for heating.
 - K. Open-Cable Installation:
 1. Install cabling with horizontal and vertical cable guides in communications spaces with terminating hardware and interconnection equipment.
 2. Suspend cable not in a raceway, a minimum of 8 inches (200 mm) above ceilings by discrete cable supports not more than 60 inches (1524 mm) apart. Bridle rings are not permitted.
 3. Cable shall not be run through structural members or in contact with conduits, pipes, ducts or other similar or potentially damaging items.
 - L. Provide conduit sleeves for penetrations.
 1. Provide conduit sleeves for cables where cables pass through walls, floors and ceilings.
 2. Patch and firestop around sleeves.
 3. Firestop the interior of the sleeves after cable installation.

4. Provide the appropriate bushings on each end. Split bushings shall not be used.
 5. Provide waterproof sealant for penetrations in humidity controlled areas.
- M. Maintain (do not violate) the minimum bend radius specified by the manufacturer of the cable.
- N. At final termination, excess cable and the service loop shall be supported and stored neatly in the cable tray or ladder rack within the communications room and above the ceiling line at an accessible point at the station end.
- O. Proper strain relief shall be applied to cables after installation to lessen the risk of physical damage and to provide proper aesthetic value.
- P. Cabling within Enclosures:
1. Bundle, lace, and train cables within enclosures.
 2. Connect to terminal points with no excess and without exceeding manufacturers' limitations on bending radii.
 3. Provide and use lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.
- Q. Comply with requirements in Section 270501 "Basic Materials and Methods for Communications."
1. Bundle cables within racks, ladder racks, cable trays and in discrete cable supports. Utilize reusable cable bundling hardware. Utilize plenum-rated hardware in plenum spaces.
- R. Separation from EMI Sources:
1. Outlet requirements where power and communications must be co-located, a voltage barrier shall be provided.
 2. Comply with BICSI TDMM and TIA/EIA-569-C recommendations for separating unshielded twisted pair (UTP) cable from potential EMI sources, including electrical power lines and equipment.
 3. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: A minimum of 5 inches (127 mm).
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 12 inches (300 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 24 inches (610 mm).
 4. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: A minimum of 2-1/2 inches (64 mm).
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 6 inches (150 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 12 inches (300 mm).

5. Separation between communications cables in grounded metallic raceways and power lines and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
 - a. Electrical Equipment Rating Less Than 2kVA: No requirement.
 - b. Electrical Equipment Rating between 2 and 5kVA: A minimum of 3 inches (76 mm).
 - c. Electrical Equipment Rating More Than 5kVA: A minimum of 6 inches (150 mm).
 6. Separation between Communications Cables and Electrical Motors and Transformers: A minimum of 48 inches (1200 mm).
 7. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches (127 mm).
- S. Separate cabling by service and type (i.e., voice, data, control, coaxial, fiber) prior to terminating.
1. Color coding of cable and termination devices shall be coordinated and approved prior to procurement and installation.
 2. Terminate cabling on specified termination hardware in alpha-numerical order.
 3. Group connecting hardware for cables into separate logical fields.
 4. Neatly dress and securely attach cabling to the backboard and/or cabinet/rack.
 5. Provide adequate cable lengths to reach any location on the backboard or within the cabinet/rack.
 6. Bundle and support cables of this System separately from the cables of other systems.
 7. Maintain separation between cables carrying different signal types and different signal levels.
 - a. Where cables from different systems or cables with different signal types are expressly permitted by the Designer to share a common pathway, each of these cable groups shall be kept segregated to the maximum degree physically possible. Cables from different systems shall not be mixed or intertwined.
- T. Service loop:
1. Within communications rooms, provide a minimum service loop of 15 feet , and spool the service loop in the ladder rack.
 2. At the outlet/connector, provide a minimum service loop of 1 foot , and spool and store within a discrete cable support (J-hook) above the accessible ceiling at the outlet/connector location.
- U. Cable Termination:
1. Terminate every conductor; no cable shall contain unterminated elements unless otherwise indicated. Make terminations only at indicated outlets, terminals, cross-connects and patch panels.
 2. Utilize standard positive identification color coding for multi-conductor cables.
 3. Provide 110-style IDC termination hardware unless otherwise indicated.
 - a. Do not untwist twisted pair cables more than 1/2 inch (12 mm) from the point of termination to maintain cable geometry.
 4. Cables from the same room/space shall be terminated adjacent on termination hardware. Cables from outlets/connectors shall be terminated in alpha-numeric, sequential order, based on final room numbers.

- a. If the communications room serves more than one floor, in addition to the requirements identified above, sequentially group the cables, by floor, on separate patch panels.
5. Separate patch panels shall be utilized for termination of horizontal voice and data, wireless access points, camera and security systems cabling, as indicated on the Drawings.
 - a. Label patch panels to identify system use with unique identifiers, as indicated on the Drawings.

3.3 IDENTIFICATION

- A. Label cables and other components in compliance with Section 270553 "Identification for Communications" for labeling requirements.
- B. Label each end of the cable.
- C. Identify system components and cabling in compliance with TIA/EIA-606-B, or most current version.

3.4 FIELD QUALITY CONTROL

- A. Comply with Section 270810 "Verification Testing of Structured Cabling".
- B. Perform tests and inspections.
 1. Twisted pair cabling shall be factory tested according to TIA/EIA-568-C.
 2. Visually inspect twisted pair jacket materials for NRTL certification marking. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA/EIA-568-C.
 3. Visually confirm the required Category-rated marking of cables, outlets, cover plates, outlets/connectors, patch panels and other termination hardware.
 4. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords and labeling of components.
 5. Test twisted pair copper cabling for DC loop resistance, shorts, opens, intermittent faults and polarity between conductors.
 - a. Test instruments shall meet or exceed applicable requirements in TIA/EIA-568-C. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
 6. UTP Performance Tests:
 - a. Test for each outlet and MUTOA. Perform the following tests according to TIA/EIA-568-C and 270810 "Verification Testing of Structured Cabling."
 - b. Test cables through a Consolidation Point from workstation to patch panel.
 7. Final Verification Tests: Perform verification tests for twisted pair systems after the complete communications cabling and workstation outlet/connectors are installed.

8. Data for each measurement shall be documented. Data for submittals shall be printed in a summary report for the cables as well as a detailed report for each cable tested.
 9. Remove and replace cabling where test results indicate they do not comply with specified requirements. Retest cabling and provide documentation.
 10. End-to-end cabling shall be considered defective if it does not pass tests and inspections.
 11. Prepare and submit test and inspection reports.
- C. The Owner reserves the right to have a representative present during testing procedures. Verification testing of copper and fiber may be performed at or near Project completion by the Consultant for quality assurance.
- D. Upon verification testing, if the Consultant finds the test results do not match the Contractor's results, the Consultant or a third party may at the Owner's request retest the cabling and submit those results to the Owner and deduct the verification testing costs from the Contractor's Contract amount.

END OF SECTION 27 15 13

SECTION 27 15 43 - FACEPLATES AND MOUNTING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Product Data Sheet: For each type of product.
 - 2. Finish/Color Schedule: Identifying finish and color of each type of product for the Project, coordinated with finish and color of faceplates specified in other specification Sections related to the Project, including Division 26 Electrical and Division 28 Security.
- B. Closeout Submittals:
 - 1. Product Data Sheet: For each type of product actually supplied.
 - 2. Finish/Color Schedule: Identifying the finish and color of each type of product by location on the Project.

1.2 COORDINATION

- A. Unless otherwise noted, faceplate style and colors shall match electrical devices.
 - 1. Coordinate with Electrical Contractor and Owner's Representative for faceplate style and color prior to ordering.

1.3 SYSTEM DESCRIPTION

- A. Provide faceplates for mounting wiring devices as required in the documents.
 - 1. Provide blank cover plates for all unused Telecommunications and Security rough-in boxes.
 - a. Provide for mounting of termination devices in related Sections as well as blank cover plates over boxes without immediate requirements on boxes installed for Communications and Security devices.

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Products furnished of each Type shall be manufactured by a single manufacturer, bear the same brand name, be the same finish color and texture, and be from the same product model series, except where otherwise indicated.
- B. Source Limitations:
 - 1. Obtain faceplates from the same manufacturer as the modular connectors intended to be housed within the faceplate.

- a. Faceplates or wiring device mounting frames are designed to precisely fit and hold wiring devices such as jacks and bulkhead fittings.
 - 1) Faceplates shall be from the Manufacturer of the device it is intended to hold to ensure proper fit and color.
2. Obtain modular wiring device mounting frames from the same manufacturer as the modular connectors housed within the modular device mounting frame.
 - a. Multiple manufacturer sources may be used only when specialty/custom faceplates are required and both the standard and specialty plates are not available from a single manufacturer source.
 - b. The size, shape, finish and color of faceplates furnished as work of this Section shall exactly match the appearance of faceplates furnished as work of other specification Sections of the Contract Documents. A consistent and professional appearance shall result.

2.2 FACEPLATES

A. Faceplate with Modular Jack Frame

1. Duplex Style:
 - a. NEMA 106 compatible.
 - b. Available in various configurations that shall accommodate 1, 2 and 4 individual modular connectors. Provide 4-port modular frame unless indicated otherwise.
 - c. Available in a variety of manufacturer standard colors, including color(s) that exactly match the corresponding faceplate.
 - d. Provide with color-matched blank connector inserts that occupy unused openings of the frame.
 - e. Provide color(s) as scheduled in the Contract Documents.
 - f. Basis of design shall be Systimax M106FR4-### (### = color)
2. Cover plate
 - a. Designed for mounting over standard electrical gang-box size openings.
 - b. Available in manufacturer standard sizes ranging from 1 to 6 gangs, in 1-gang increments, to suit the size and configurations required by the Contract Documents.
 - c. Mounting holes for securing the faceplate to the device mounting box and/or the mounted device.
 - d. Manufacturer supplied metal mounting screws featuring screw heads matching the color of the faceplate. Screws shall be custom painted when matching standard color screws are not available.
 - e. Available with both Designer style (e.g., Decora®) and standard duplex style openings for accommodating mounted devices.
 - 1) Size, style, and color(s) as scheduled in the Contract Documents.
 - f. Basis of design shall be Duplex style Leviton SG 84003-40 DG 84016-40

B. Wall Phone Faceplate:

1. Designed for mounting over NEMA standard 1-gang electrical opening.
2. Stainless steel plate construction.
3. Dual mounting posts in standard positions to accommodate standard wall telephone with recess for modular jack/connector.
4. Compatible with 8P8C RJ45 modular jacks/connectors. Provide jack.
5. Basis of Design shall be Systimax 630B8

- C. Floor Box Faceplate:
 - 1. Compatible with floor box.
 - 2. Openings for Designer Style devices.
 - 3. Faceplate shall be Brass unless otherwise specifically note.
 - 4. Shall utilize jack mounting frame to securely mount jacks.
 - 5. Shall have closeable protective doors.
 - 6. Color coordinated with electrical faceplates and custom faceplates mounted within the same box.
 - 7. Provide with color-matched blank inserts to occupy all unused openings of the faceplate or mounting frame.
 - 8. Basis of Design shall be Systimax 1-1479504-3
 - 9. Coordinate with Division 26 Contractor.

- D. Surface Mount Housing
 - 1. Available in various configurations that shall accommodate a minimum of one (1) or two (2) individual modular connectors.
 - 2. Termination and housing shall be UL/NEC rated for the location, manner, and environmental conditions in which the cables are installed (plenum and non-plenum).
 - 3. Basis of design shall be Commscope M102SMB-A-xxx

- E. Furniture Outlet:
 - 1. Adapt standard faceplate and jack frame to mount in furniture.
 - 2. Utilize data outlet hangar bracket by the manufacturer to secure the outlet in the furniture.
 - a. Data Outlet Hangar Bracket INDPMT-W
 - 3. Coordinate with furniture supplier.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Examination and Coordination:
 - 1. If colors of product are not specifically identified in the Contract Documents, coordinate color selection with the Designer/Architect prior to procurement of product.
 - 2. Examine pathways before installation. Provide written report to the Architect identifying any issues with pathway rough-in that will prevent faceplates from being installed plumb, level and square to the major building lines, or flush with the building finished surface.
 - 3. Provide faceplates featuring the finish and color to match other faceplates installed in the surrounding visible areas, except where otherwise expressly scheduled, detailed or noted.

- B. Installation:
 - 1. Provide faceplates over pathway boxes, box eliminators and individual device openings of multi-opening boxes (e.g., floor boxes), including those designated for future use.

2. Provide blank faceplates over openings that do not otherwise feature a device required by the Contract Documents.
3. Install faceplates flush with the finished surface over which the plate mounts.
4. Secure faceplates using screws and other mounting hardware specifically recommended by the faceplate manufacturer and the manufacturer of the device served.
5. Install faceplates so the plate is plumb, level and square.
6. Provide and tighten mounting screws.

3.2 LABELING

- A. Label faceplates and connectors.

END OF SECTION 27 15 43

SECTION 27 41 00 - AUDIO AND VIDEO SYSTEMS**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials (BOM).
 - a. Separate list for each system.
 - 2. Product Datasheets.
- B. Shop Drawings:
 - 1. System diagrams.
 - 2. Rack elevations.
 - 3. Floor plans.
 - 4. [Wall elevations.]
 - 5.
- C. Closeout Submittals:
 - 1. As-built drawings.
 - 2. Programmable-product configuration file(s):
 - a. Source code version of files necessary for changes to be made by qualified personnel.

1.2 SUMMARY

- A. Section Includes:
 - 1. Supply, installation and integration of complete and working audio and video systems.
- B. Related Requirements:
 - 1. Related Sections:
 - a. Section 271116 "Cabinets, Racks, Frames and Enclosures" for racks and accessories.
 - b. Section 271126 - Rack Mounted Power Protection and Power Strips for power distribution products.
 - c. Section 274101 "Audio and Video Systems Cabling" for cable and connectors used to interconnect AV system equipment.
 - d. Section 274103 "Audio and Video Systems Software Development" for custom software development guidelines.

1.3 QUALITY ASSURANCE

- A. Comply with Section 270002 "Quality Assurance for Communications."

1.4 WARRANTY

- A. Comply with Section 270001 “General Requirements for Communications.”
- B. The warranty period for individual systems shall not start until the system is complete and working for its intended purpose
- C. Poor execution of Work can lead to warranty obligations that extend beyond the termination date of the manufacturer’s warranty.

1.5 SYSTEM DESCRIPTION(S)

- A. See technology drawings for system description(s).

PART 2 - PRODUCTS

2.1 GENERAL

- A. The Contract Documents, including specifications in conjunction with the drawings, shall be used together to conclude the project requirements.

2.2 SUBSTITUTIONS

- A. Brands and models listed on the drawings represent the Basis-of-Design and standard of quality for the identified components. The use of any product other than a Basis-of-Design product in this Section is considered a substitution. These products must include the feature set and operational characteristics to achieve the design intent.
- B. Comply with “Substitutions” in Section 270001 “General Requirements for Communications.”
- C. Contractors shall generate and submit acoustic modeling data for review and approval (by system) if the contractor desires to use loudspeaker models other than those designated as the Basis-of-Design. Acoustic modeling data for products from pre-approved manufactures may be submitted as part of the submittal review process. Acoustic data for products from manufactures not pre-approved shall be submitted for review and written approval prior to bid. Only those loudspeaker models that, in the opinion of the consultant, provide equal or superior “system” performance will be considered.

2.3 EQUIPMENT

- A. System equipment shall be derived from the system diagrams. Provide all products necessary for a complete and working system including those not expressly identified on the documents.

- B. Products depicted on the drawings which are not identified by brand and model are the responsibility of the Contractor to furnish and install. The decision whether a Contractor selected product is acceptable remains with the Designer.
- C. Supply manufacturer recommended accessories where necessary.

2.4 MISCELLANEOUS

- A. Audio combining and balancing components:
 - 1. Manufacturers: Subject to compliance with requirements, provide products manufactured by the following:
 - a. Extron
 - b. Jenson
 - c. Op-Amp Labs
 - d. RDL
 - e. Whirlwind
- B. Custom Rack shelves:
 - 1. Manufacturers: Subject to compliance with requirements, provide products manufactured by the following:
 - a. Middle Atlantic
 - b. Lowell Manufacturing
 - c. Raxxess
 - 2. Basis-of-Design: Middle Atlantic RSH series.

PART 3 - EXECUTION

3.1 INSTALLATION

- A. Safety:
 - 1. Install products in such manner as to protect life and property.
 - 2. Furnish and install safety accessories recommended by the manufacturer.
- B. Grounding:
 - 1. Implement signal and safety grounding and bonding to ensure the safety and performance of the system, its operators and the facility in which it is located.
- C. Impedance and Level Matching:
 - 1. Provide impedance matching devices at points in the system where such devices are technically necessary to achieve proper gain staging, product and system performance.
 - 2. Provide passive isolation to eliminate ground loops between equipment.
- D. Audio Combining and Balancing:
 - 1. Where audio signal distance exceeds 15', a balanced signal must be used.
- E. Speakers:

1. Calculate loudspeaker aiming with the objective of achieving the most uniform direct-sound coverage that is possible in the target areas.
 2. Install speakers (other than ceiling-type speakers) using steel cable, wire rope, chain or rigid but field adjustable mounts that enable aiming of the speakers into the target coverage areas.
 3. Speakers destined for installation in suspended ceilings shall be installed using an accessory tile bridge that spans tiles and supports the speaker from the metal ceiling grid system. For secondary support, an accessory safety cable shall be provided to support the speaker from the structure.
 4. Install speakers in a secure manner to sound building structures capable of safely sustaining the load applied to it..
 5. Install speakers using materials and mounting methods that ensure that neither the speaker nor the mounting system emits extraneous audible noise when the speakers operate within design limits.
 6. Paint exposed mounting brackets, supports and hardware to match surrounding finish.
- F. Equipment Racks, Cabinets, Enclosures and Furniture:
1. Provide vertical and horizontal wire management products to secure and manage cables.
 2. Provide horizontal wire support bars. Secure bars in such locations as to achieve a professional balance between cable support, equipment accessibility, service and appearance.
 3. Install service loops. Service loop length shall be determined as follows:
 - a. Long enough that the cable can be relocated to a variety of other compatible ports on the product, sufficient to enable the cable to be landed on a different port if it is incorrectly landed.
 - b. Long enough that it can be moved aside without becoming unplugged, being damaged or stressed while attempting to access another nearby connection.
 - c. Long enough that no stress is applied to the cable itself, a conductor, any other cable, or connectors on the equipment.
 - d. Short enough not to hinder serviceability of an adjacent product.
 4. Power Distribution:
 - a. Install power distribution products to serve system equipment.
 - b. Install not less than 20 percent usable spare outlets that are free, clear, and available for future use.
 5. Install filler panels for unoccupied spaces. Provide a mixture of vent and blank type panels that enable manufacturer requisite airflow over equipment for cooling.
 6. Bundle cables carrying different signal formats and levels separately into independent bundles. Separate bundles with an air space sufficient to prevent interference that adversely affects performance.
- G. Connection Plates/Panels:
1. Comply with Section 271544 "Custom Faceplates, Panels and Connectors."
 2. In addition to locations identified on the drawings, provide connection plates/panels:
 - a. At wall, floor and ceiling equipment locations that accommodate interconnection of portable or movable equipment.
 - b. At video display equipment locations.
 - c. At surface mount devices that are not installed with a direct pathway connection.

- d. At wall, floor, and ceiling boxes where the cable terminates in a piece of equipment that does not mount in/over the box.
 3. Provide custom manufactured plates/panels when pre-manufactured standard plates/panels are not explicitly specified.
- H. Mounting and Support:
1. Provide professionally engineered and professionally manufactured mounts and supports for non-portable products.
 2. Provide final engineering mounting products.
 3. Utilize the services of a registered Professional Engineer (PE) to certify custom mount designs and mounting methods of products whose weight does not fully rest on the floor.
 4. Follow the recommendations of the manufacturer for installation of pre-engineered non-custom mounting assemblies. Consult and follow the recommendations of a mechanical Professional Engineer (PE) in those cases where the manufacturer does not publish specific recommendations for product installation for a specific application.
 5. Except where code or the Contract Documents require a higher rating, a minimum safety factor of (5) shall apply to the structural integrity of product mounting methods.
 6. Submit shop drawings of custom mounting assemblies and atypical installation of pre-manufactured mounts prior to fabrication or installation. Designer's review and related comment(s) shall be limited to matters of function and appearance.
 7. Designer reserves the right to reject any mount and mounting methodology that is not submitted for review prior to installation or that is submitted for review but contains exposed elements that do not satisfy the architectural and aesthetic objectives of the Project.
- I. Video Displays:
1. Install displays in locations identified on the drawings, and mount at the height(s) designated.
 2. If a mounting height is not designated in the Contract Documents, coordinate mounting height with the Designer prior to installation.
 3. Install display using mounts that are rigidly supported and braced from building structure.
 4. Install display so that it is securely attached to the mount. Furnish and install security straps and/or other security products recommended by the mounting hardware and display manufacturers.
- J. Cameras:
1. Install cameras at the locations and heights identified on the drawings. Coordinate with the Designer if these are not identified.
 2. Neatly bundle, dress and conceal cables from view.
 3. Adjust camera settings to achieve optimal performance following the manufacturer's recommendations
 4. Setup and store site specific user-beneficial presets in cameras and related control equipment.
- K. Portable equipment and accessories:
1. Install batteries in products that require battery power, including remote controls.
 2. Install a label on each remote identifying the component.

- L. Lighting:
 - 1. Provide physical interface and cabling to the lighting system(s). Coordinate with the lighting system products provider and equipment manufacturers to obtain control protocols.

- M. Rack Mounts:
 - 1. Provide rack mounts for securing products within equipment racks. Standard rack shelves are not permitted, except where expressly depicted on the drawings and/or otherwise authorized by the Designer.
 - 2. Provide accessory rack mounts from the product manufacturer, where available.
 - 3. Provide custom rack mounts from an approved manufacturer when the product manufacturer does not offer an accessory rack mount.

3.2 IDENTIFICATION

- A. Comply with Section 270553 "Identification for Communications."
- B. Label each system product.

3.3 SOFTWARE DEVELOPMENT

- A. Comply with Section 274103 "Audio and Video Systems Software Development."

3.4 ADJUSTING

- A. General:
 - 1. Upon completion of physical installation, each system shall be adjusted. Adjustments shall be as necessary to make the system usable for its intended purpose and to the satisfaction of the owner's representative and designer.
 - 2. Adjustments shall be performed as recommended by each product manufacturer, recommended as a best practice by a referenced standard or a recognized related trade organization, and where additionally directed by the Designer.
 - 3. Products featuring analog controls shall be marked with self-adhesive dots or arrows to indicate their final settings.

- B. Adjustments:
 - 1. Audio Subsystems:
 - a. Gain staging:
 - 1) Adjust equipment to achieve optimum signal-to-noise ratio and lowest possible distortion. Optimum settings will generally be achieved when points in the signal chain reach maximum level / clipping / distortion at the same time.
 - 2) Adjust input trim gain and pads on mixers.
 - 3) Adjust the gain of both analog and digital products.
 - 4) Record settings for future reference.
 - b. Loudspeaker Aiming:
 - 1) Fine-tune the aiming of loudspeaker components to achieve coverage uniformity within the target coverage areas while simultaneously

- minimizing sound energy directed towards walls, ceilings, and other areas not intended as listening areas.
- 2) Fine tune physical positioning of components to achieve minimum phase interaction, prior to implementing the use of any form of electronic phase or delay adjustments.
- c. Frequency crossovers and filters:
- 1) Adjust crossovers for minimum interaction between components throughout the crossover frequency region.
 - 2) Set crossover frequencies and filters according to recommendations of the loudspeaker manufacturers.
 - 3) Adjust crossover delays for maximum coherency and minimal acoustic comb-filtering.
 - 4) Record settings for future reference.
- d. Equalize individual speakers:
- 1) Adjust loudspeaker filters. This process shall result in the flattening of the frequency response of individual speakers or adjustment to a specific frequency response contour.
 - 2) Equalize speakers using band-pass filters in conjunction with parametric equalization in lieu of fixed-Q graphic equalization.
 - 3) Use subtractive (cut) rather than additive (boost) techniques for achieving target frequency response contours.
 - 4) Derive settings for speakers from loudspeaker manufacturers or using independent TEF™ analysis performed by a trained audio engineer.
 - 5) Record the final settings for future reference. Lock down equipment settings to prevent accidental changes where such capability exists.
- e. Equalize the complete electro-acoustic system:
- 1) Adjust filters that serve the entire electro-acoustic system to achieve the target frequency contour. Where system equipment capability allows, use separate filter sets upstream from the individual loudspeaker filters.
 - 2) Adjust filters to achieve tonal balance between areas covered by different models of loudspeakers.
 - 3) Adjust filters to achieve a balance between gain before feedback performance and tonality.
 - 4) Contact the Designer for target equalization curves prior to performing system equalization.
 - 5) Record settings for future reference.
- f. Audio delays:
- 1) Adjust delays that serve loudspeakers that are physically separated.
 - 2) Adjust delays to achieve aural localization with maximum achievable HASS Integration.
 - 3) If the space served is a multi-function space and the area of focus changes to suit different event types, establish separate recallable delay and level configurations for each configuration.
 - 4) Record settings for future reference.
- g. Voltage and power limits:
- 1) Adjust settings that allow the system to reach but not exceed maximum sound pressure level maximums established by the Designer or Owner.
 - 2) Adjust settings that limit the voltage and power delivered to loudspeakers to within the safe operating range as published by each

- individual loudspeaker manufacturer. These settings are generally independent of settings used to limit sound pressure levels.
- 3) Lock down, cover, and protect these settings from unauthorized change.
 - 4) Record settings for future reference.
- h. Miscellaneous:
- 1) Adjust manual and automatic audio mixers. Review and adjust settings available on the product; adjust to achieve performance that is acceptable to the Designer.
 - 2) Enable phantom power on inputs that are intended to accommodate direct connection of condenser microphones and disable phantom power on those inputs that are not intended to accommodate direct connection of condenser microphones.
 - 3) Adjust automatic gain controllers (AGC).
 - 4) Adjust expanders.
 - 5) Adjust compressors.
 - 6) Adjust limiters.
 - 7) Adjust noise gates.
 - 8) Adjust ambient level sensing.
 - 9) Adjust signal-processing equipment.
 - 10) Record settings for future reference.
- i. Audio Video Synchronization:
- 1) Adjust signal delays to achieve synchronization between associated audio and video signals.
2. Video Subsystems:
- a. Display Equipment:
 - 1) Adjust video display equipment following the guidelines set forth by the display equipment manufacturer.
 - 2) Adjust image size and position.
 - 3) Adjust color temperature and color settings.
 - 4) Color match display images that appear side-by-side.
 - 5) Adjust image brightness and contrast.
 - 6) Adjust limit switches on mechanized screens.
 - 7) Store settings for manual and automatic recall to satisfy operational requirements.
 - 8) Record settings for future reference.
 - b. Signal processing:
 - 1) Configure and store multi-image view settings.
 - 2) Adjust and store image scaling settings.
 - 3) Record settings for future reference.
 - c. Convergence:
 - 1) Adjust video transmission products in accordance with each individual manufacturer's instructions so that individual colors are aligned at the output of links.
 - d. Timing:
 - 1) Adjust video timing in systems that include video conferencing, broadcast, video production and recording capability.
 - e. Camera:
 - 1) Adjust cameras following the procedures recommended by the camera manufacturer.

- 2) Adjust cameras so that they each produce the same quality and appearance of image.
 - 3) Adjust and store presets (pan, tilt, zoom and focus) for memory locations supported by the camera.
 - 4) Adjust and store separate presets in control system memory for each mode of system operation.
3. Control Subsystems:
 - a. Adjust the communication speed between controlled products. Use the fastest speed available that results in consistent reliable communications.
 4. Lighting Subsystems:
 - a. Participate in the adjustment of the lighting system(s) that serve the spaces containing systems provided as Work of this Section.
 - b. Assist the lighting system provider through proactive coordination and supply of guiding input on the following:
 - 1) Aiming and cropping of fixtures that impact usability of the system. This includes but is not limited to fixtures that serve the stage or other presenter areas and areas that rely on specific lighting for highest quality camera performance. Special attention shall be given towards achieving presenter areas that are well lit for both on- and off-camera uses while achieving maximum contrast on video display screens.
 - 2) Establishment of usable lighting scenes that complement the configurations of the space and modes of system operation.

3.5 TESTING

A. General:

1. Tests shall be performed on the system to the degree necessary to confirm that the system is fully usable to the Owner for its intended purpose to the satisfaction of the Designer.
2. Tests shall be performed to confirm that the products are performing according to manufacturers' specifications.

B. Speaker Line Impedance Verification:

1. Prior to landing speaker circuits onto amplifiers, measure and record the impedance of each individual speaker circuit. Confirm that the measured impedance coincides with the calculated impedance conditions and that they are within the safe operating range of the amplifier used.

C. Sound Level Uniformity:

1. Conduct sound pressure level measurements to confirm that coverage is uniform throughout the target listener areas.

3.6 REMEDIAL ACTIONS

- A. Replace defective products, re-terminate defective connections, perform re-adjustments and re-test offending elements of the system should any deficiencies be found during execution of the Work.

3.7 TRAINING

- A. Provide training for each unique system.
- B. Train Owner designated end-user staff.
 - 1. Include hands-on demonstrations covering typical uses of the system in day-to-day operation.
 - 2. Include hands-on demonstration on how to change the modes of the system.
 - 3. Include training covering how to set up and use the system for each type of event.
 - 4. Include training on how to perform actions/operations available on the system user interfaces intended for end-user staff.
- C. Training Owner designated maintenance staff.
 - 1. Include same training as support staff and facilitators.
 - 2. Include training on preventative and routine maintenance measures that are important to long-term reliability and operation of the system.
- D. Training shall include techniques for making level adjustments, using and placing microphones, and operating individual pieces of equipment.
- E. Training shall include hands-on demonstrations based upon Owner projected real-world system use scenarios.
- F. Enlist and provide the services of manufacturer personnel or qualified third party personnel to conduct training on major system components on which the Contractor is not proficient.
- G. Provide (40) hours of system specific training.
 - 1. Provide 30 percent of training prior to the first official use of the system.
 - 2. Provide 20 percent of the training after 15 days of system use.
 - 3. Provide 20 percent of the training after 30 days of system use.
 - 4. Provide 20 percent of the training after 90 days of system use.
 - 5. Provide 10 percent of the training after 180 days of system use.
- H. Training that occurs prior to final system completion does not count towards the required training allowance unless training approval is requested of and granted by the Designer in advance of the training taking place.
- I. A sign-in sheet shall be used to record the signatures of persons attending each training session. The sign-in sheet shall include the start and end times of the session and shall have attached to it a copy of the associated training handouts. Only well documented training sessions apply towards the required training.

3.8 PROTECTION

- A. Protect products from damage and from environmental conditions and contaminants that could adversely affect performance, reliability, manufacturers' warranty or longevity.

- B. If physical protection must be removed for continuation of Work, protection shall be removed only for the duration and extent necessary. Product shall be cleaned prior to reinstallation of protection.

3.9 CLEANING

- A. Clean each system product after installation, immediately prior to substantial completion, and at additional times during performance of Work as recommended by the product manufacturer.
- B. Clean the interior of system racks, enclosures and furniture.
- C. At the start of the warranty period, system equipment shall feature manufacturer factory-fresh appearance.

END OF SECTION 27 41 00

SECTION 27 41 01 - AUDIO AND VIDEO SYSTEMS CABLING**PART 1 - GENERAL****1.1 SUBMITTALS**

- A. Product Data:
 - 1. Bill of Materials
 - a. Separate list for each system.
 - b. List to identify the signal format the cable will be used to transport.

1.2 SUMMARY

- A. Section Includes:
 - 1. Cables for the interconnection of audio and video equipment, and related control system products.
 - 2. Standards-of-practice by which products are to be installed and tested.
- B. Related requirements:
 - 1. Section 271313 "Copper Backbone Cabling" for multi-pair (greater than four-pair) twisted pair cabling and termination hardware (e.g., connecting blocks), including channel rated performance and applications warranty.
 - 2. Section 271323 "Fiber Optic Backbone Cabling" for intra-building fiber optic backbone cabling and termination hardware, including channel rated performance and applications warranty.
 - 3. Section 271513 "Copper Horizontal Cabling" for intra-building, four-pair twisted pair cabling and patch panel termination hardware, including channel rated performance and applications warranty.
 - 4. Section 274100 "Audio and Video Systems."

1.3 DEFINITIONS

- A. DVI: Digital Video Interface.
- B. HDMI: High Definition Media Interface.
- C. HDSDI: High Definition Serial Digital Interface.
- D. HDBaseT: Ultra-high-definition video & audio, Ethernet, controls, USB and up to 100W of power over a single Cat6 or above cable, for up to 100 m/328 ft.

1.4 QUALITY ASSURANCE

- A. Comply with Section 27 00 02 "Quality Assurance for Communications."

PART 2 - PRODUCTS**2.1 GENERAL**

- A. Refer to the related drawings and specifications to determine the quantity, quality, and performance of products to be furnished. The cables provided as work of this section are fully dependent upon them.
- B. Consult with the manufacturers of the equipment to be interconnected to further determine the quantity, quality, and performance of cable required.
- C. Where the manufacturer of the product being interconnected requires cable featuring more stringent requirements than those identified in this Section, provide cable meeting the more stringent requirements.
- D. Brands and models listed represent the Basis-of-Design and standard of quality for the identified cables. The use of any product other than a Basis-of-Design product in this Section is considered a substitution. These products must include the operational characteristics equal to or greater than the Basis-of-Design.

2.2 FIXED INSTALLATION CABLES

- A. Manufacturers: Subject to compliance with requirements, provide products by the following manufacturers:
 - 1. Belden
 - 2. Canare Cable.
 - 3. Crestron.
 - 4. Extron
 - 5. Liberty Wire and Cable.
 - 6. West Penn Wire.
 - 7. Windy City Wire
- B. General Requirements:
 - 1. Fixed installation cables shall be UL Listed and NEC type acceptable for the location, application and manner of installation.
 - 2. Cables shall meet NEC 300 volt rating, higher where otherwise specified.
 - 3. Cable supplied to satisfy the requirements of a specified cable type shall be as manufactured from a single manufacture except as otherwise approved by the Designer (e.g. all RG-6 non-plenum analog video cable shall be from single manufacturer).
 - 4. Within a building, cables that are not installed in a totally enclosed pathway system shall be UL plenum rated.
 - 5. Cables used for below grade applications, in-grade floor boxes, and cables used in pathways that may reasonably end up with standing water within them, shall be manufacturer rated for continuous contact with water without performance degradation or compromise in warranty.
- C. Video:

1. HDMI:
 - a. HDMI version 2.0 or greater.
 - b. Resolution and Refresh Rate: $\geq 4096 \times 2160 @ 60 \text{ Hz}$.
 - c. Chroma Sampling: 4:4:4.
 - d. Bit Depth per Color: $\geq 8 \text{ bit}$.
 - e. Data Rate: 18.0 Gbps.
 - f. Basis-of-Design:
 - 1) Length less than or equal to 12 feet: Extron HDMI Ultra series.
 - 2) Length greater than 12 feet: Extron HDMI Pro series.

2. DisplayPort:
 - a. DisplayPort version 1.4 or greater.
 - b. Resolution and Refresh Rate: $\geq 4096 \times 2160 @ 60 \text{ Hz}$.
 - c. Chroma Sampling: 4:4:4.
 - d. Bit Depth per Color: $\geq 8 \text{ bit}$.
 - e. Data Rate: 21.6 Gbps.
 - f. Basis-of-Design: Extron DisplayPort Ultra series.

3. USB:
 - a. USB 3.0 Compliant
 - b. Data Rate: 4.8 Gbps
 - c. Basis-of-Design: Liberty E-USB3 series.]

- D. Twisted Pair Cable
 1. Furnish cable compliant with Section 271513 "Copper Horizontal Cabling"
 2. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - a. Manufacturers listed in 271513 "Copper Horizontal Cabling".
 - b. Crestron
 - c. Extron
 3. General:
 - a. General Performance: Comply with transmission standards in TIA/EIA-568-C when tested according to test procedures of this standard.
 - 1) Twisted pair cable is required to have the appropriate Category classification as defined by TIA/EIA-568-C. Compliance with these electrical characteristics shall be third party verified by the manufacturer.
 - b. Where applicable, provide the manufacturer recommended cable for the products being interconnected.
 - c. Basis-of-Design: Belden 2183P.]

- E. Audio, Speaker Level:
 1. General:
 - a. Where wire gauge is not specified on the drawings, calculate based on the following requirements:
 - 1) Line loss shall not exceed 2.00 dB.
 - 2) Equation used to calculate the data:
$$P_{loss} = 10 * \text{Log} (1 - ((2 * RL) / (2 * RL + (V_{line} \text{ squared} / Prated))))$$
$$RL = (R_{ref} / 1000) * D$$

Where:

D = length of wire used

Ploss = power loss in dB

Prated = power driven on line

RL = wire guage resistance

Vline = voltage on line

2. 10-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 10AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .302$ inches.
 - d. DCR @ 20 deg C: 1.07 Ohms/1000 feet.
 - e. Capacitance: ≤ 28 pF/ft.
 - f. Basis-of-Design: Belden 6T00UP.

3. 12-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 12AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .252$ inches.
 - d. DCR @ 20 deg C: ≤ 1.6 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.0 pF/ft.
 - f. Basis-of-Design: Belden 6000UE.

4. 14-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 14AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .210$ inches.
 - d. DCR @ 20 deg C: ≤ 2.53 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.0 pF/ft.
 - f. Basis-of-Design: Belden 6100UE.

5. 16-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 16AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .176$ inches.
 - d. DCR @ 20 deg C: ≤ 3.8 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.5 pF/ft.
 - f. Basis-of-Design: Belden 6200UE.

6. 18-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 18AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .154$ inches.
 - d. DCR @ 20 deg C: ≤ 6.5 Ohms/1000 feet.
 - e. Capacitance: ≤ 34 pF/ft.
 - f. Basis-of-Design: Belden 6300UE.]

F. Audio, Mic/Line Level:

1. 22 AWG, 1 Pair, Shielded:
 - a. Single shielded pair cable with overall jacket.
 - b. Conductors: 22AWG (x 2), copper, stranded.
 - c. Shield: 100% aluminum polyester tape, 22AWG tinned copper drain wire.

- d. Nominal diameter: $\leq .128$ inches.
 - e. DCR @ 20 deg C: 16.4 Ohms/1000 feet.
 - f. Capacitance: ≤ 55 pF/ft.
 - g. Basis-of-Design: Belden 6500FE.
- 2. 22 AWG, 1 Pair, Shielded + 22 AWG, 2 Conductor:
 - a. Single shielded pair cable and single non-shielded pair with overall jacket.
 - b. Conductors: 22AWG (x 2), copper, stranded.
 - c. Shield: 100% aluminum polyester tape, 24AWG tinned copper drain wire.
 - d. Nominal diameter: $\leq .180$ inches.
 - e. DCR @ 20 deg C: 16.4 Ohms/1000 feet.
 - f. Capacitance: ≤ 55 pF/ft.
 - g. Basis-of-Design: Belden 6502GE.
 - 3. 22 AWG, 2 Pair, Individually Shielded:
 - a. Two individually shielded pairs cable with overall jacket.
 - b. Conductors: 22AWG (x 4), tinned copper, stranded.
 - c. Shield: 100% aluminum polyester tape, plus single 24AWG tinned copper drain wire.
 - d. Nominal diameter: $\leq .158$ inches.
 - e. DCR @ 20 deg C: ≤ 14.7 Ohms/1000 feet.
 - f. Capacitance: ≤ 34 pF/ft.
 - g. Basis-of-Design: Belden 1325A.]
- G. Data/Network/Control:
- 1. RS-232 / RS-422 / RS-485:
 - a. Single shielded pair cable and single non-shielded pair with overall jacket.
 - b. Conductors: 22AWG (x 2), copper, stranded.
 - c. Shield: 100% aluminum polyester tape, 24AWG tinned copper drain wire.
 - d. Nominal diameter: $\leq .180$ inches.
 - e. DCR @ 20 deg C: 16.4 Ohms/1000 feet.
 - f. Capacitance: ≤ 55 pF/ft.
 - g. Basis-of-Design: Belden 6502GE.
 - 2. RS-485 plus power (Specialized Media Control Networks):
 - a. Cable configuration: Shielded twisted data pair, plus one unshielded pair.
 - b. For use with products requiring combination power and RS485 data interconnections using a single jacketed cable solution. Sample applicable networks include: Crestron Cresnet™, Biamp Remote Control Bus, Lutron GRAFIK Eye® control bus, and similar RS485 based remote control networks.
 - c. Data conductors: 22AWG, tinned stranded copper, paired.
 - d. Power conductors: 18AWG, tinned stranded copper, paired.
 - e. Shield: 100% aluminum polyester tape, 24AWG tinned copper drain wire.
 - f. Nominal diameter: $\leq .205$ inches.
 - g. DCR – data conductors: ≤ 16.3 ohms per 1000 feet.
 - h. DCR – power conductors: ≤ 6.9 ohms per 1000 feet.
 - i. Capacitance – data conductors: ≤ 14.0 pF/ft.
 - j. Basis-of-Design: Belden 1392P.]
- H. Power Cables, Low Voltage:

1. Where wire gauge is not specified on the drawings, calculate based on the following requirements:
 - a. Voltage drop shall not exceed 5% of the circuit voltage.
2. 10-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 10AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .302$ inches.
 - d. DCR @ 20 deg C: 1.07 Ohms/1000 feet.
 - e. Capacitance: ≤ 28 pF/ft.
 - f. Basis-of-Design: Belden 6T00UP.
3. 12-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 12AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .252$ inches.
 - d. DCR @ 20 deg C: ≤ 1.6 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.0 pF/ft.
 - f. Basis-of-Design: Belden 6000UE.
4. 14-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 14AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .210$ inches.
 - d. DCR @ 20 deg C: ≤ 2.53 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.0 pF/ft.
 - f. Basis-of-Design: Belden 6100UE.
5. 16-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 16AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .176$ inches.
 - d. DCR @ 20 deg C: ≤ 3.8 Ohms/1000 feet.
 - e. Capacitance: ≤ 36.5 pF/ft.
 - f. Basis-of-Design: Belden 6200UE.
6. 18-Gauge:
 - a. Single pair cable with overall jacket.
 - b. Conductors: 18AWG (x 2), bare copper, stranded.
 - c. Nominal diameter: $\leq .154$ inches.
 - d. DCR @ 20 deg C: ≤ 6.5 Ohms/1000 feet.
 - e. Capacitance: ≤ 34 pF/ft.
 - f. Basis-of-Design: Belden 6300UE.

2.3 FLEXIBLE / PORTABLE CABLES

A. General Requirements:

1. Flexible / portable cables shall be derived from the system diagrams. Provide all products necessary for a complete and working system including those not expressly identified on the documents.

2. Cables designed and recommended by the cable manufacturer for portable and/or flexible applications shall be furnished for such applications.
3. Individual conductors shall be stranded in lieu of solid. Shields shall be braided in lieu of foil only, or foil and drain wire construction.
4. Flexible / portable cables shall be provided wherever cables are exposed to flexing as a natural by-product of their use. This includes cables furnished expressly for “portable” applications as well as furnished for permanent installation but are routinely exposed to flexing as an inherent consequence of their normal use. This overriding flexible requirement does not apply to cables used in tethers that are subject to flexing less than once per year and the flexing occurs to allow access for servicing of equipment.
5. Products depicted on the drawings which are not identified by brand and model are the responsibility of the Contractor to furnish and install. The decision whether a Contractor selected product is acceptable remains with the Designer.
- 6.

- B. Manufacturers: Subject to compliance with requirements, provide products by the following manufacturers:
1. Canare Cable.
 2. Crestron.
 3. Extron.
 4. Liberty Wire and Cable.
 5. Mogami Cable.
 6. Pro Co Sound.

2.4 CONNECTORS

- A. Video Connectors:
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - a. Belden.
 - b. Liberty Wire and Cable.
 - c. West Penn Wire.
 - d. Windy City Wire
- B. Audio Connectors:
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - a. Canare Cable.
 - b. Liberty Wire and Cable.
 - c. Mogami Cable.
 - d. Neutrik.
 - e. Pro Co Sound.]
- C. Twisted pair Termination Devices:
1. Furnish cable compliant with Section 271513 “Copper Horizontal Cabling”
 2. Manufacturers: Subject to compliance with requirements, provide products by the following:
 - a. Manufacturers listed in 271513 “Copper Horizontal Cabling”.
 - b. Crestron

- c. Extron
- 3. General:
 - a. General Performance: Comply with transmission standards in TIA/EIA-568-C when tested according to test procedures of this standard.
 - 1) Twisted pair cable is required to have the appropriate Category classification as defined by TIA/EIA-568-C. Compliance with these electrical characteristics shall be third party verified by the manufacturer.
 - b. Provide the manufacturer recommended termination devices for the cable provided.

PART 3 - EXECUTION

3.1 CABLE UTILIZATION

- A. General:
 - 1. Where the Contract Documents identify only a general classification of product, the guidelines set forth in these specifications shall be used to determine the cable products to be provided.
 - 2. Where the Contract Documents, including the drawings and related specification do not identify a specific model or classification of product, the guidelines set forth within these specifications in conjunction with recommendations from the manufacturers of the interconnected equipment, and published industry standards and “best practices” shall be used to determine the appropriate product to be provided.
 - 3. Cable that is technically appropriate for the application shall be provided. Cables shall be classified by the manufacturer, in publicly available documents, for their intended use. For example, a cable used for RS232 signals shall be published as rated for RS232 applications. Furthermore, the model provided shall be technically sufficient for the length in which it is used.
 - 4. Provide cable models that are code compliant for the location, use, and method of installation. This includes, but is not limited to, providing plenum-rated cables wherever plenum cables are required by Code.
 - 5. Provide cable that is designed for portable use when the cable may be used in a portable application.
 - 6. Provide cable that is designed and manufactured to endure routine flexing when, by system design, the cable may be exposed to routine flexing.
 - 7. Provide cable models that are designed by the manufacturer for direct burial applications when the cable may come in contact with soil.
 - 8. Provide cable that allows required system performance to be achieved.

Speaker Cables:

- 9. Where the use of a specific cable is identified on the drawings, the identified cable shall be provided for the scope identified.
- 10. Where the use of a specific cable is not identified on the drawings, cables shall be chosen to achieve no more than 1dB of total power loss in the circuit.
- 11. The minimum gauge of speaker cable that may be used in any one-way “constant voltage” speaker circuit shall be 18AWG.

12. The minimum gauge of speaker cable that may be used in any one-way "low impedance" speaker circuit (2-16 ohms) shall be 16AWG.
13. Speaker cables used for bi-directional (i.e., two-way) intercommunications shall be shielded and twisted pair type cable.

B. Data, Serial, Parallel, and Control Cables:

1. Provide cables that are designed and rated by the manufacturer for the format of signal that the supplied cable will be used to transport.
2. The technical specifications of the cables shall be suitable for the length in which it is used, as well as capable of achieving error-free transmission of the signal at the fastest communication rate supported by the products ultimately being interconnected.

C. RF Communications:

1. Where RF frequencies are to be transported, provide cables that are designed by the cable manufacturer to transport the frequency range, the voltage and the current that is transported.
2. Provide cables that are sufficiently shielded to comply with FCC regulations, sufficient to prevent ingress and egress interference that adversely affects the system in which the cable is used, and sufficient to prevent egress interference that adversely affects other equipment and systems.

D. Low Voltage Power Cables:

1. Provided cables that are used for low-voltage power (≤ 70.7 RMS and ≤ 100 Peak) shall be of sufficient gauge to achieve each of the following:
 - a. $\leq 5\%$ maximum voltage drop between the power source and the load.
 - b. ≥ 18 AWG if the cable will transport > 500 ma or its length exceeds 20 feet.
 - c. ≥ 20 AWG if the cable will transport ≤ 500 ma and its length is than 20 feet.
 - d. Deliver voltage to the load that is not less than the minimum rated input voltage for the load.

E. Water blocked Cables:

1. Water blocked versions of cables shall be provided when:
 - a. The cable may be exposed to water.
 - b. The cable is installed outdoors.
 - c. The cable is installed below grade.
 - d. The cable is installed within conduit within a concrete slab that is above or below grade, and which there are one or more pull-boxes, junction boxes or other device boxes within the concrete slab along the path of the conduit.

3.2 INSTALLATION

A. Non-Plenum Cable in Plenum Areas:

1. Where non-plenum cable is supplied and code-compliant installation requires a plenum rating, provide a code-compliant pathway to enclose the cable.

B. Wiring Within Enclosures:

1. Provide adequate length of conductors. Bundle, lace, and train the conductors to terminal points and achieve clean service loops of appropriate length to the application.

2. Provide maximum possible physical isolation between cables of different operating levels to prevent crosstalk interference that degrades the performance or usability of the system.
 3. Replace, reroute, and redress cables that receive or cause negative interference of any form.
- C. Splices, Taps, and Terminations:
1. Install cables continuous and without splices, intermediate connections or terminations between products, except where expressly required by the Contract Documents.
 2. When required by the Contract Documents, splices, taps and terminations shall be made within an UL rated enclosure. In addition:
 - a. Cables shall be joined using standardized inline connectors of the type and rating compatible with, and approved by the Designer in advance for use with the cable and signal types being spliced.
 - b. Wire nuts are not permitted.
- D. Drain wire and shield preparation:
1. Non-insulated conductors (e.g., shields and drain wires) that are a part of a multi-conductor cable shall be individually insulated where the conductor exits the cable jacket. The conductor shall be covered with flexible high-temperature heat-shrinkable tubing of a size appropriate to the conductor.
 - a. Green color tubing shall be used except where it conflicts with another conductor's color within the same cable. Clear and white tubing (listed in order of preference) shall be used as necessary to maintain a non-conflicting conductor level color code.
 2. When a drain wire or shield conductor is insulated with tubing, as identified above, an additional piece of flexible high-temperature heat-shrinkable tubing shall also be installed over a portion of the cable jacket and the individual conductors where the individual conductors exit the cable jacket. This additional covering shall both insulate the remaining exposed portion of the shield/drain wire conductor and protect it to reduce the risk that this conductor can be bent easier than the manufacturer insulated conductors.
- E. Signal Cable Grounding and Bonding:
1. As a matter of practice, non-signal carrying and non-power passing shield and drain conductors shall be bonded to ground at one end only. The opposite end of the conductor shall be left floating. The shield shall be bonded at the signal sync (load, input) end of the cable. This practice shall be employed to reduce the risks of ground loops between the various interconnected audio components.
 2. Unterminated shields and drain wires shall not be cut off. Instead these conductors shall be insulated and prepped for termination and then folded back, protected and secured to the side of the cable jacket or stowed inside the connector shell (where space permits). These conductors shall remain intact and reserved for future and selective use when more challenging ground loop anomalies need to be remediated with the system.
 3. Alternate means of handling signal cable shield bonding may be considered when a well-documented grounding and bonding scheme has been submitted for review.
- F. Cable Separation:

1. Cables carrying different signal types shall be kept separate to prevent interference between cables.
2. Cables carrying similar signal types but at different nominal operating levels shall be kept separate to prevent interference between cables.
3. Cables from different systems shall be kept separate to better organize and identify systems as well as to prevent interference between systems.

G. Strain Relief:

1. Cables that are subject to changes in mechanical stress, and, especially those that are used in portable applications, shall be equipped with strain relief.
2. Cables that are probable to connect and disconnect more than once per year shall be equipped with strain relief at each end of the cable.
3. Conductors of cables shall not be exposed to any stress that could deteriorate either the mechanical or electrical integrity of the physical connection between the cable conductor and the connector to which it is attached.

H. Cable Management and Support:

1. Install cables in a neat and organized manner.
2. Route cables parallel to the product in which they are located.
3. Secure cables to wire management products using reusable hook-and-loop type fasteners.
4. Do not use nylon cable ties and other fasteners that pinch and stress cables.
5. Provide cable fasteners that are code compliant for the location and manner of installation.
6. Do not bend cables to a radius that is less than 8-times the cable diameter, nor less than the cable manufacturer's recommended minimum radius.

I. Flexible Cable Management and Support:

1. Provide expandable flexible sleeving:
 - a. Over bundles of two or more cables that have at least one end connected to movable / portable equipment.
2. Provide flexible strain relief:
 - a. Install strain relief products at each end of flexible cable assemblies so that no consequential strain is applied to a signal carrying component of the assembly nor to any connector or terminal to which the assembly interconnects. Size the strain relief to suite the assembly size. Provide an anchor for attachment of the strain relief and ensure that the anchor is attached to a sound structure that will not be damaged if strain is applied.

3.3 IDENTIFICATION

- A. Comply with Section 270553 "Identification for Communications."
- B. Provide identification of each end of cables. Nomenclature shall be clearly visible and accurately recorded on the as-built drawings.
- C. Use color-coded conductors, color-coded heat-shrink and color-coded permanent adhesive tape to designate individual conductors and cable unit. Record the color code on the as-built drawings.

3.4 TESTING

- A. Perform tests of cables after installation to confirm that each is performing effectively as an integral part of the system in which it is used. Test individual cable channels to confirm continued compliance with the Contract Documents and manufacturer's published specifications.

3.5 FIRESTOPPING

- A. Comply with Section 270550 "Firestopping for Communications."

END OF SECTION 27 41 01

SECTION 27 41 03 - AUDIO AND VIDEO SYSTEMS SOFTWARE DEVELOPMENT

PART 1 - GENERAL

1.1 SUBMITTALS

A. Control and DSP Programming:

1. Prior to the pre-construction meeting (described below), submit for review the initial DSP and control programs. Programs shall include the following at a minimum:
 - a. DSP
 - 1) Preliminary program structure including all expected blocks for the system.
 - 2) Speaker voicing based on manufacturer specifications.
 - 3) Appropriate Gain structure based on inputs as shown on plans.
 - 4) Control logic.
 - 5) Preliminary touch-panel layouts if DSP will be used for control.
 - b. Control System
 - 1) Preliminary program structure including all components for equipment that will be controlled by the system.
 - 2) Preliminary touch-panel layouts.

B. Quality Assurance:

1. Programmer qualifications (see Quality Assurance).

C. Closeout:

1. Electronic Documentation:
 - a. "Copyright, Ownership and Licensing Declaration" as described elsewhere in this Section, PDF version.
 - b. Storyboarding / flowcharting documentation, PDF version.
 - c. Software source code files.
 - d. Touch panel and other graphical user interface source code files.
 - e. Compiled graphics files.
 - f. Editable layered graphics files for Project specific custom graphics.
 - g. Current-version device drivers for controlled devices.
 - h. Controlled-device protocol documentation.

1.2 REVIEW MEETINGS

A. Pre-Construction Review

1. Prior to commencing on-site construction, the contractor shall attend a meeting at KLH Engineers to review the client expectations and system design considerations. The meeting shall not be scheduled without reviewed submittals including the reviewed program submittal described above. At a minimum, the

project manager and system programmer for the contractor shall be present. This meeting shall not exceed four (4) hours in length and will cover the following topics at a minimum:

- a. DSP structure and programming.
- b. Control panel design.
- c. Speaker aiming angles as designed and modeled by KLH.
- d. Staff qualifications.
- e. Testing and balancing materials and methods.

B. Post-Construction Review

1. Upon substantial completion of the system, the contractor shall meet on-site and demonstrate the operation of the system to KLH personnel for review. KLH will review the operation of the system based on the system drawings and the Pre-Construction meeting to ensure the system adheres to the design intent. The system should be fully tested and tuned prior to scheduling this review. This review shall not exceed four (4) hours in length.

1.3 PRICE AND PAYMENT PROCEDURES

A. Payment Procedures:

1. Requests for payment for Work will not be considered until Phases 1, 2 and 3 of the software development has been completed.
2. Progress payments for shall not be considered without electronic submission of Work progress. See also "Penalties for Non-Performance."

1.4 REFERENCES

- A. InfoComm International's publications: "Modern Approaches to Control Systems Design", <http://www.infocomm.org/>.

1.5 DEFINITIONS

- A. Controlled Device: A product with which the Software communicates. A controlled device is a physical or software-based product that receives commands/data from, or sends commands/messages/data to, the Software.
- B. IR: Infra-Red.
- C. GUI: Graphical User Interface.
- D. User Interface: Any physical or software-based product, custom or standard, that connects to and/or communicates with the control system and Software for the purpose of providing interactive interface between a system user and the Software.
- E. Software Developer: The entity responsible for performing Work of this Section.

1.6 QUALITY ASSURANCE

- A. Comply with Section 270002 “Quality Assurance for Communications.”
- B. Programmer Qualifications:
 - 1. Control Systems:
 - a. Manufacturer Certified Programmer. Certification shall be, at minimum, equivalent to Crestron Master Certified – Silver Level.
 - b. Resume of 20 programs or 5 years full-time computer programming experience.
 - 2. Shall be a full-time employee of the company providing the Division 27 41 00.00 work. Programing subcontractors are not permitted.

1.7 SOFTWARE LICENSING AND OWNERSHIP

- A. Supply a perpetual, irrevocable and royalty-free global license to use Software Work.
- B. Grant to the Owner the following number of licenses:
 - 1. One for each Audio and/or Video system identified in these Contract Documents.
- C. Source Code:
 - 1. Furnish fully editable source code for each processor, user interfaces and other control electronics.
 - 2. Layered electronic graphics files shall be furnished for user interface graphics.
- D. Rights to Modify Source Code:
 - 1. The Owner shall have the right to view and modify the source code and other files supplied. The Owner shall have the right to change the Software in any way it deems necessary, including but not limited to the right to evolve the Software to accommodate equipment changes, additions, deletions, or functional changes to the system.
- E. Payment of Licensing Fees:
 - 1. The Software Developer is responsible for properly licensing and making payment for any Software modules and graphics incorporated into Software Work, including license fees arising from the use of any part of software furnished by the Owner for the Software Developer’s benefit in creating Software Work.
- F. Copyright, Ownership and Licensing Declaration:
 - 1. In the event the Software Developer incorporates copyrighted work from any third-party entity into the Software Work, the Software Developer shall declare the lawful copyright holder and include valid contact information for the entity.
- G. Non-Disclosure:
 - 1. The name of the Owner may not be used in any advertisements, publications, lectures or any other public medium as it relates to the Software Developer’s role in creating this Software Work.
 - 2. The Software Developer may not reuse or demonstrate Software Work or any portion thereof that includes the name of the Owner, references to the Owner,

copyrighted material obtained from the Owner, or any other trade or service mark that could identify the Owner.

3. Should the Software Developer desire the right to publicly reference the Owner in any way, including demonstration of Software Work to others, the Software Developer shall obtain the express permission from the Owner, in writing.

1.8 WARRANTY

- A. Software furnished shall be warranted for a period of 365 days following final acceptance of the Software Work.
- B. During the warranty period, the resources necessary to resolve Software bugs shall be provided at no cost to the Owner. Software bugs that are catastrophic in nature shall be resolved within 3 business days following their report to the Software Developer by the Owner. Non-catastrophic bugs shall be resolved within 30 days.
- C. Software bugs are defined as:
 1. Any Software feature, operation, behavior, or mode that makes the system unstable or operationally unusable for the Owner's intended use of the system.
 2. The absence of any Software feature, operation, behavior, or mode determined necessary during the Software development phases that has not been implemented, not implemented completely, or not implemented reliably.
 3. Any Software feature that does not perform in the manner agreed to by the Owner's representative, or that otherwise performs in a manner that is counter-productive to the task to be performed by the Control System.
 4. The absence from the Software of any feature, operation, behavior, or mode expressly identified in the Contract Documents and not otherwise expressly removed from the Project scope in writing by the Designer.
 5. Incorrect labeling or misspelling of text on a programmable user interface.

1.9 MAINTENANCE

- A. Following final acceptance of the Software, the Software Developer shall return to the Project site at planned 30, 90 and 180-day intervals to make minor adjustments to the Software. The Software Developer shall contact the Owner at each interval to determine what, if any, Software adjustments are necessary. The Owner reserves the right to use these visits any time during the warranty period.

PART 2 - FUNCTIONALITY

2.1 GENERAL

- A. This Section is not a programming Manual. In general, this Section describes the capabilities and functionality expected of the Software product used to control related AV systems. The Software Developer shall be fluent in programming skills and well versed and experienced with the operational and programming needs of systems of the size, type, and complexity as those for which the Software is to be developed.

- B. This Section applies to multiple systems. Due to the presence of different equipment in each system, and the possible use of equipment with various capabilities, functionality described herein may not be completely possible with each system.
 - 1. Example: An AV system without remote controllable audio equipment shall not be required to have Software written with audio control capability unless express written direction to the contrary is identified.
- C. System functionality that is described in related Sections and Drawings that can only be achieved using custom Software are additive to the requirements of this Section. Review related Sections and Drawings.
- D. Due to the differences between products, including differences between products of like type, no attempt has been made to enumerate every remote-control function, operation and behavior that shall be accommodated by the Software.
- E. Functions described in the Contract Documents may not directly be available on the product being controlled. In such cases, functionality shall be achieved through development of suitable Software modules (e.g., intelligent macro) to achieve the desired effect. In select cases, the Designer or Owner may conclude the function is no longer required:
 - 1. Example: A motorized drapery or screen may not have an inherent "Preset" function. Therefore, a preset function may need to be emulated in the Software by timing the motor to run for a defined duration from a known position.
- F. Functionality and behaviors articulated in the Contract Documents are requirements of the Software Work until or unless otherwise modified and agreed to, in writing, with the Owner's Representative.

2.2 PERFORMANCE

- A. The Software performance shall be robust, predictable, reliable and stable.
- B. User interfaces shall accurately reflect the state of the system and controlled devices.
- C. Normal use of the system, including new-user encounters with the system, shall not result in a lock up of any portion of the system.
- D. System operation shall be restored to normal following a power failure to any controlled component or a control component. System and personnel-safe conditions shall be ensured by the Software following such conditions.
- E. The Software shall perform to the satisfaction of the Owner's representative.

2.3 SOFTWARE-AWARE PROGRAMMING

- A. The Software shall employ a coding methodology herein referred to as "Software-Aware programming."
 - 1. Software shall be aware of and locally buffer the status of the properties of a controlled device. This shall be true regardless of whether the settings of a

controlled device are changed by this Software via a device's local user interface, an external Software interface, a third-party software application, or by other means.

- a. Example 1: If a projector input is changed, the Software shall be aware of the current projector input change.
 - b. Example 2: If the program audio gain is changed using a third-party client application, the Software shall be aware of the current gain value.
 - c. Example 3: If a user presses play on a Blu-ray player, the Software shall be aware that the Blu-ray player is playing.
2. Software shall be aware of the current settings of controlled devices that are material to achieving accurate, responsive, and repeatable AV System performance under Software control.
 3. The Software shall leverage up-to-date information of the status of a device to achieve expedient and accurate logic decisions.
 4. Software user interface shall accurately represent the state of a device when the associated device status display is visible.
 5. Software decisions shall be made reliably, without having to routinely query a controlled device for a response immediately before taking the next logical step.
 6. Software Aware programming shall not rely on real-time on-demand polling for making routine logic decisions.
- B. In Software Aware programming, the Software shall not send commands to a controlled device to perform an action that the controlled device is already performing.
1. Example 1: If a video projector needs to be on Input 1 in order to display the most recent source selection, and if the projector is on Input 1 at the time the source selection is made, then the projector shall not be sent a command to change inputs, since it is already on the one it needs to be on. Conversely, if the projector had been changed to Input 2 (by the Software or other means), then the projector shall be switched to Input 1.
 - a. In this example, commanding the projector to switch to an input that is already active may cause video resynchronization which may result in a blank screen, flickering or other unnecessary and undesirable visual effects. It may also slow the responsiveness and performance of the system.
 2. Example 2: If a matrix already has Input 12 assigned to Output 14, the matrix shall not be sent a command to assign Input 12 to Output 14. Doing so may slow down the responsiveness and performance of the system.
- C. Software Aware programming requires a strategic mix of the following techniques:
1. Querying a controlled device to obtain critical device status properties.
 2. Querying controlled devices in the background, in a controlled manner, when the user is not actively making changes to the system.
 3. Monitoring and processing events and command acknowledgements of a controlled device software.
 4. Processing status messages received from controlled devices.
 5. Buffering device properties locally, within the control system hardware using arrays, objects, buffers, and modules.
 6. Highly modular, flexible and professional Software coding techniques.
- D. In Software Aware programming, a two-way touch panel shall accurately display settings of a selected device immediately when the device control page is activated. One second

(or longer) delays while the Software queries the device and then processes and reports the status to the user shall not be acceptable.

- E. Software Aware programming requires advanced programming skills and experience.
- F. Appropriately employed, Software Aware programming techniques shall result in Software performance that is robust, responsive, familiar, fast performing and does not result in Software induced, Software preventable aural or visual glitches.
- G. User interfaces that are part of a Software Aware programming solution shall be highly responsive to user stimulus to such an extent that users are not inclined to execute a command a second time because of a lack of user interface responsiveness.

2.4 USER INTERFACE FEEDBACK

A. General:

- 1. Implement controllable feedback on user interfaces (i.e., sound, lights and color change) as a means to achieve the following:
 - a. Supply an immediate acknowledgement to the user that the command has been received. Examples include the following:
 - 1) Changing the color of a button immediately in response to the user touching the button.
 - 2) Playing a sound in response to the user touching the button.
 - b. Supply immediate responses to the user to indicate the status of the command request. Examples include the following:
 - 1) Illuminating a power indicator "Green" when a device is powered up and ready for use.
 - 2) Illuminating a power indicator "Red" when a device is powered down and available to be power back on.
 - 3) Illuminating a power indicator "Flashing Red" when a device is in process of powering down.
 - 4) Illuminating a power indicator "Flashing Yellow" when an operation is in process.
 - 5) Displaying a progress bar while device is powering up and down and if this information is necessarily material to the user's next actions.
- 2. Where the user interface capability permits, supply separate means of achieving feedback to the user. Examples include the following:
 - a. Use a temporary button color change as an acknowledgement that the button has been pressed and was acknowledged by the system.
 - b. Use LED-like indicators to communicate device status.

B. Managed Feedback:

- 1. Feedback reporting shall be accurate and appropriate for the device(s) under control, including reporting of status changes that occur through direct interaction with a controlled device or other means.
 - a. Example 1: If the user makes a manual signal routing change via the control panel on a matrix, the Software shall monitor the matrix's events, or controlled background querying, to be aware of the change so it can be correctly reported to the user interface.

- b. Example 2: If the user hits play directly on a media player, the Software shall be aware of the change and correctly report that the media player is playing.
 - 2. When status information returned from a device to the Software is delivered slowly, (not fast enough to directly deliver an immediate response to the user) then a hybrid feedback solution shall be implemented. The hybrid solution shall result in immediate feedback to the user acknowledging their action, followed by command status feedback to advise the status of the request.
 - a. Example Situation: A lighting system takes 3 seconds to acknowledge a successful change from “Preset 1” to “Preset 3” following a user’s command to change.
 - 1) Example Solution:
 - a) Step 1: The “Preset 3” button immediately changes colors while it is being pressed as a means for the Software to acknowledge it has received the command. The button returns to normal color after the user’s finger is removed from the button.
 - b) Step 2: The Software initiates the request of the lighting system to change presets, and immediately begins to flash the “Preset 3” status indicator.
 - c) Step 3: The “Preset 3” status indicator illuminates solid on when the lighting system completes the transition to “Preset 3.”
 - b. Example Situation: A video projector takes 30 seconds to warm up, does not supply a warming-up status message, and does not acknowledge that it is On until after it is fully warmed up and ready for use:
 - 1) Example Solution 1:
 - a) Turn off the Power Off indicator and immediately begin flashing the projector Power On indicator.
 - b) Once the projector acknowledges that it is On, change the projector Power On indicator from flashing to constant.
 - 2) Example Solution 2:
 - a) Use a progress bar or similar control that communicates that the projector is warming up, incrementing the bar to emulate the warming process. Hide the progress bar, turn on the projector Power On indicator and turn off the projector Power Off indicator once the projector acknowledges it is On.
 - c. The manner in which hybrid solutions are deployed in the Software shall be as consistent as technically possible throughout the Software.

C. Infra-Red (IR) Controlled Devices:

- 1. Supply emulated status information for one-way controlled devices that do not otherwise supply status feedback. Review logic options with the Owner’s representative. In select cases, momentary feedback may be acceptable.

2.5 CONTROL METHODOLOGY

- A. To enhance overall Software performance, bi-directional communication control methods shall be used with controlled devices wherever possible in order to take advantage of device status information. Common bi-directional communication control methods include:

- 1. RS232.
- 2. RS485.

3. RS422.
 4. TCP/IP.
- B. Single direction communication control methods shall be used only where expressly specified or where it is the only method of control available on a specified product.
- C. Hybrid / Dual-Control communication methods shall be used when required functionality cannot be achieved through a single communication port. Such may be the case in a product that can achieve 98% of the desired functionality via its RS232 port, and the remaining functions are only available on an IR port. Hybrid methods shall be used as necessary to improve the stability and robustness of the Software application.

2.6 USE OF PRESETS OR MACROS

- A. The Software shall not use preset or macro functions of a controlled device if:
1. Use results in system performance that is slower than it would be if the applicable settings on the device were managed directly by the Software
 2. Use results in the loss of video or audio at any critical point in the system.
 3. Use results in any perceptible video or audio artifacts.
 4. Use results in negative effects on the system use or performance.
 5. Use results in any undesirable level or signal routing changes.
- B. Research the use of controlled-device presets or macros to obtain a thorough understanding of impact on the system performance. Use of presets and macros requires review and authorization of the Designer.

2.7 BEHAVIORS

- A. General:
1. The Software shall be written to include behaviors that would be considered familiar (i.e., intuitive) to the system users. Such familiarity may be derived from interaction with various other real-world interfaces such as personal computers, car radios, IPODs™, microwave ovens, home entertainment equipment or other products.
- B. User Interfaces:
1. User interface designs shall employ navigational schemes that limit the number of steps and interface layers that a user must navigate in order to perform a desired action. The more frequent a command must be executed in real-world use, the fewer actions the user shall be required to take in order to achieve the goal.
 2. One of the major objectives of Software user-interface design is to enable simple control of otherwise complex systems.
- C. Audio Breakaway and Audio-Lock:
1. Software shall incorporate functionality that permits the user to achieve the following:
 - a. Listen to audio from a multi-media (i.e., program) source without the necessity of having a video display powered on.
 - 1) Example: Listen to music or a lecture from audio-only media.

- b. Listen to audio from a multi-media (program) source, while viewing the video from a different source:
 - 1) Example: Listen to audio from a PC, while displaying video from a document camera.
 - 2. AV systems with two or more video displays (used for audience/participant viewing), Software shall include the ability to listen to the audio from either (but not both) of the visible multi-media sources.
 - 3. When changing the active multi-media source, audio switching shall function, by default, as an audio-follow-video switch, whereby a change in the video source, also results in a corresponding audio switch as well.
 - 4. In addition, an on-demand Audio-Lock feature shall be implemented to achieve the following:
 - a. Stop subsequent audio-follow-video switching.
 - b. Continued manual audio source assignment.
- D. Multi-Level Multi-Media Source Selection:
- 1. When user-interfaces featuring Graphical User Interface capability (i.e., touch panels) are used, and the user interface layout includes an approved two (or more) level approach to multi-media source selection, the Software shall include behavior that does not require the user to make a subsequent selection on the lowest level menu, unless the desired selection differs from the last selection.
 - a. Example: A level-one source select menu is implemented with the following choices: PC, Laptop, Doc Cam, Blu-ray, DVD, and Floor Pocket. The Floor Pocket has four (4) inputs. Touching the Floor Pocket source selection exposes a level-two source select menu that includes each of the four (4) floor pocket inputs. When the level-one Floor Pocket button is pressed, the level-two menu shall appear, the last used floor pocket input shall be active, and the signal associated with the last selected floor pocket input shall be routed to the associated display. The user shall not be required to make a level-two choice, unless it differs from the last selection. The act of pressing the Floor Pocket source select button therefore shall also have the effect of making active the last floor pocket input selection.
 - 2. At system initiation, default assignments shall be made for level-two source selection menus.
 - 3. This multi-level approach shall be employed similarly to other applicable controls. Deviation from this methodology shall occur only with written approval.
- E. Video Display Power Up:
- 1. Audience/Participant Video Display(s) shall, by default, power up under the following conditions:
 - a. The user assigns a video enabled multi-media source to the video display.
 - b. The user manually powers up the video display.
 - 2. Video displays shall not automatically power up when the System is powered up, unless this feature is deemed appropriate during the Software Development review with the Owner's representative.
- F. Video Swap:
- 1. A video swap feature shall be implemented in systems with two or more video displays serving the audience/participants. This feature is applicable when the AV system includes the inherent capability to route video signals to each display independently. The video swap function shall re-route/swap the video images

on the two displays. The swap shall be temporary. Subsequent video multi-media assignments made by the user shall route to and appear on the correct user-designated display.

2. When a video swap is performed, the system user interface(s) shall correctly reflect the assignment.

G. Audio Level Changes:

1. Audio level changes shall occur in real time. Audio level adjustments shall commence when a control is touched and shall cease immediately when the control is released. Audio changes shall not occur subsequent to the release of the control.
2. The rate of increase and decrease of audio settings shall be field adjusted to the satisfaction of the Owner's representative. Depending upon the product being controlled, this adjustment may require that the unit of change per cycle and/or the cycle/repetition rate (among others) be modified.
3. Bar graphs (and similar level reporting devices) shall accurately represent the relative gain of the device under control. This includes accurately displaying the gain settings anytime the bar graph is visible to the user, including immediately following a power up cycle, and following the recall of a preset or macro.
 - a. In the interest of performance, the Software Developer shall consider coding and control techniques that favor responsive control of a device by using a hybrid feedback solution while adjustments are being made. For example:
 - 1) If processing of gain status messages returned from a device causes delays in the speed at which commands to increase or decrease the level can occur, then locally emulating the level changes on the bar graph may be necessary. A subsequent release of the level control shall then be used to trigger an accurate refresh, or the bar-graph based upon the devices actual gain setting. The bar graph and actual device values shall match.
4. Use Software variables that are readily accessible to a technician and that do not require recompiling of Software.

H. Limited Range Controls:

1. User adjustments benefit from range limit settings. Where range limiting benefits the Owner, the Software Developer shall implement accordingly.
 - a. For example: The presenter microphone gain control may have a maximum gain that can be applied to it before acoustic feedback occurs. The same microphone may have minimum usable gain setting (e.g., one where the gain is not usable for a very loud-spoken presenter). The specific limits of the controls shall be determined in the field during system testing and demonstration with the Owner's representative.

I. Preset Status – Correct Reporting:

1. When a device is assigned a preset / scene by use of the Software, or by other means, the Software user interfaces shall correctly report the preset / scene currently active.
2. When either the Software user or an external user makes a manual change to a controlled device, and such change may mean that the device is no longer representing the preset / scene last selected, then the Software shall deactivate the user interface feedback that indicates the last scene selection.

- a. For Example: If a camera is instructed to go to Preset 1 and the camera complies, then the Preset 1 status indicator shall become active. If the user subsequently manually changes a camera position, the camera is no longer at Preset 1. Therefore, the act of manual repositioning shall result in the deactivation of the Preset 1 indicator.
- J. Disable Controls Not Applicable in Current Context:
1. The Software user interface shall expose only those controls that are applicable to the current context and operations. If a control has no purpose within the current context, the control shall either be hidden or systematically grayed out to indicate it is disabled, unusable and out of context.
 - a. Example 1: If an interface features three computer select buttons, and within the context of desired operation, one of the computers is in use by another room and it is (by design) not to be accessible locally, then the select button for the inaccessible computer shall be inoperable and either grayed out or hidden.
 - b. Example 2: A user interface includes source select buttons along the top of the screen. Operationally, if assigning a source requires a destination selection button to be visibly active, then if the destination button is neither active nor visible (because of another operation in process), the source select buttons shall also be disabled and grayed out or hidden.
 - c. This theme can be observed using various Microsoft Windows™ applications that gray-out selections that are not applicable in the current context.
 2. Disabling and/or hiding of controls shall be handled in a consistent manner throughout the Software.

2.8 DEFAULT SETTINGS

- A. Software shall ensure that controlled devices are in a known state when the system it controls is powered on, off, or placed into or taken out of standby.
1. Default values shall be set when the system is powered off so that in the event the controlled system is powered up using a means other than the control system interfaces, the system shall power up to a known state.
- B. Default settings shall include, but shall not be limited to:
1. Volume settings.
 2. Switcher / matrix settings.
 3. Mode settings.
 4. Video and audio processor settings.
 5. Screen positioning.
 6. Display status.
 7. Others as determined appropriate and necessary by the Software Developer and the Owner's Representative.
- C. Properly deployed default settings shall guarantee that proper settings are set in controlled devices when the system is powered on, regardless of what the settings were when the system was last used, and regardless of what setting changes may have been made locally to a controlled device by the user.

- D. Default settings shall be stored in a non-volatile memory location of the control system components.

2.9 CONTROLLED DEVICES

A. General:

- 1. Refer to related Sections and Drawings for identification of controlled devices. Controlled devices include:
 - a. Control system products appearing in the Drawings.
 - b. Products appearing on control system diagrams.
 - c. Products noted on control system diagrams as being connected to or otherwise communicating with the control system.
 - d. Products appearing in system diagrams and noted as being connected to the control system.
 - e. Products noted on related Drawings.
 - f. Products identified in related Sections.
- 2. Following are various controlled products that may be encountered, as well as common device-specific functions that shall be performed.

B. Multi-Media Sources:

- 1. Blu-ray, DVD, and similar devices:
 - a. Play, Stop, Pause.
 - b. Fast-Forward, Fast Reverse.
 - c. Step-Forward, Step Reverse.
 - d. Counter-Reset.
 - e. Power On/Off.
 - f. Channel Up/Down.
 - g. Discrete Channel and track selection.
 - h. Channel Display On/Off.
 - i. On-screen Display On/Off.
 - j. Closed Caption On/Off.
 - k. Menu Navigation Controls.
- 2. Document Cameras:
 - a. Zoom: In, Out.
 - b. Focus: In, Out.
 - c. Top Lights: On, Off.
 - d. Base Lights: On, Off.
 - e. Camera Up, Camera Down.
 - f. Power On, Power Off.
 - g. Presets Recall.
 - h. Preset Storage.

C. Recording Equipment:

- 1. Blu-ray, DVD, DVRs, NVRs
 - a. Play, Stop, Pause, Record.
 - b. Fast-Forward, Fast Reverse.
 - c. Step-Forward, Step Reverse.
 - d. Counter-Reset.
 - e. Counter/Track/Chapter Display.
 - f. Finalize/Close Disc.

- D. Video Display Equipment:
 - 1. Source selection based control.
 - 2. Manual signal routing.
 - 3. Power On/Off.
 - 4. Standby/warming-up/cooling-down messages.
 - 5. Lamp status/hours used/hours remaining.
 - 6. Video mute.
 - 7. Video freeze.
 - 8. Alignment controls.
 - 9. Menu navigation controls.

- E. Cameras:
 - 1. Pan, Tilt, Zoom.
 - 2. Storage and recall of presets, as required for the intended operation of the system:
 - a. Separate preset registers shall be implemented for each room layout.
 - b. Separate preset registers shall be implemented for each mode of camera automation as deemed necessary.

- F. Microphones:
 - 1. Software control of Status Lights/LEDs.
 - 2. Software monitoring of switch status, followed by execution of desired actions.

- G. Lighting Systems:
 - 1. Control of lighting levels of discrete lighting zones: Up, Down, Off.
 - 2. Recall of presets.
 - 3. Monitoring and display of current lighting preset(s).
 - 4. Store lighting presets.

- H. Drapes, Shades, Curtains, Screens:
 - 1. Up, Down, Open, Close, Stop.
 - 2. Recall presets.

- I. Routers and Matrices – Audio, Video, Data:
 - 1. Source/Destination based switching.
 - 2. Audio and Video breakaway switching.
 - 3. Manual switcher control.
 - 4. Input trim levels.
 - 5. Preview.

- J. Switchers – Audio, Video, Data:
 - 1. Source/Destination based switching.
 - 2. Audio and Video breakaway switching.
 - 3. Manual switcher control.
 - 4. Input trim levels.
 - 5. Seamless transition.
 - 6. Preview.

- K. Audio Products:
 - 1. Gain Up/Down.
 - 2. Mute.
 - 3. Routing.

4. Preset Recall.
5. Macro Recall.

2.10 CAMERA AUTOMATION

- A. Systems with cameras for video teleconferencing, broadcasts, recording and similar uses shall implement camera automation modes to manage which camera(s) and camera position(s) are active based upon various criteria. Common modes that shall be accommodated in the Software include the following:
 1. Push-To-Talk.
 2. Push-To-See.
 3. Automatic (gate based).
 4. Queued – First in, first out (i.e., manual “Next Question” selection).
 5. Manual Telemetry Control.
 6. Manual Preset Recall.
- B. The behavior of each mode shall be established during Software development.
- C. Camera automation shall regulate camera positioning and switching so that camera movement is not normally seen when the camera is live. This requires camera queuing and pre-positioning before the camera is made live.
- D. Visible movement from a camera shall only occur when a user manually positions a camera after it is live.
- E. Camera automation shall permit camera(s) to be taken out of service when a camera fails or is otherwise not available for use, and the remaining camera(s) shall pick up the work load of the camera(s) that are not available.
- F. The Software shall support multiple room configurations, where applicable, and shall manage separate camera selection and preset values for each configuration.

2.11 PREVIEW AND CONFIDENCE MONITORING

- A. Where the system under control is equipped with video preview and confidence monitoring equipment, the Software shall enable preview and confidence monitoring in a manner agreed to during Software development.
- B. When, where, what and how signals are triggered for monitoring shall be determined during Software development.

2.12 GLOBAL MONITORING AND CONTROL

- A. Control systems shall be programmed to communicate with, be controlled by, and supply status and statistical data to global management software, as applicable to the brand of control system hardware used on the Project. Sample applications include but are not limited to: AMX Media Manager and Crestron Room View.

2.13 HELP REQUEST

- A. User interfaces shall incorporate a “Call for Help” or similarly labeled button. This button shall be used to send an email, trigger the sending of a numeric or text page, or send a command/message to any other notification device connected to the system.
- B. The specific action taken shall be as agreed to during Software development.

2.14 HELP MESSAGES

- A. Graphical user interfaces shall incorporate the use of text-based help messages and operating instructions.
- B. Unless additional help messages are requested elsewhere in the specifications, at a minimum provide one unique pop-up style help message for each controlled device.
- C. Help messages shall be context sensitive. The message presented to the user shall be relevant to the current user interface view and mode at the time the button is activated.
- D. The manner in which the messages are activated and presented to the user shall be determined during Software development.

2.15 E-MAIL MESSAGING

- A. Software shall include provisions for sending automated email messages from the system.
- B. Up to **[20]** <Insert number> distinct email messages shall be programmable into each system.
- C. The system events that trigger messages shall be determined during Software development.

2.16 SHUTDOWN TIMERS

- A. General:
 - 1. Timers shall be implemented to shutdown select equipment or a complete system as described herein.
 - 2. Timer values shall be consistent values, stored in non-volatile memory.
 - 3. Time-of-day shutdown timers shall include a one-time-only bypass capability, whereby the user can instruct the system to bypass the next logical shutdown event so that shutdown will not occur at the next regularly scheduled time.
 - 4. Prior to automatic shutdown, the Software shall present a message on the various graphical user interfaces warning of a pending system shutdown. The message shall present options to the user, including options to shut down now, ignore the shutdown event altogether, or extend/delay shut down by a fixed amount of time. The amount of the advance warning and the amount of the time delay shall be determined during Software development. Initial values shall be five (5) minutes and one (1) hour.

5. Shutdown parameters shall be changeable by an advanced user or system administrator without the aid of a programmer. Updating these parameters shall be achieved through the use of one of the system's user interfaces, PC interface or database provided by the Software Developer.
6. If suitable replacement timers are incorporated into global monitoring and control application, local timers may not be necessary.

B. Visual Display Shutdown Timers:

1. Auto shutdown timers shall be programmed to place displays into standby or equivalent state, based upon various conditions. Common conditions include:
 - a. When a display has been assigned a Black or Blank source, a countdown timer shall commence that places the display into standby when the countdown timer reaches Zero.
 - b. When a predefined time of day is reached.
2. Display shutdown timer durations shall be global; however, each display shall feature a unique timer.

C. System Auto Shutdown:

1. Automatic system shutdown timers shall be programmed to power down the system under the following conditions:
 - a. When a user defined time of day has been reached.
 - b. After a user defined period of user interface inactivity.
2. Two separate time-of-day shutdown timers shall be programmed. One shall be used for weekends, and one shall be used for weekdays.
3. When a global management application is used, system auto shutdown timers may be relegated to the global management application instead of the local Software provided this is agreeable to the Owner's representative.

D. Special Circumstance Timers:

1. Where controlled devices other than those represented here are prone to excessive wear, operating or maintenance expense when left in a particular state, the Software Developer shall implement additional discrete timers adapted to the product. Software Developer shall consult with the Designer to determine which controlled devices may require special timers.

2.17 DATE, TIME, CLOCK AND TIMERS

A. Setting Date and Time:

1. The Software shall include the ability for the Owner to set the current date and time or feature an agreed upon alternate method for ensuring that the current date and time is accurate (e.g., network time server).
2. Special software or a programmer shall not be required to set these values.

B. User Interface Clock and Timer:

1. The Software shall incorporate clocks and timers on the user interfaces, visible at such locations as agreed to during Storyboarding, as described in Part 3 below.
2. Clocks shall be configured to permit 12-hour and 24-hour time. Consult with the Owner's representative.

3. Clocks shall be configurable to allow operation as timers. Each shall be programmed to achieve count-up and count-down operation. The user shall have the ability to switch between the various modes of operation.
4. Count-up and Count-down timers shall also be programmed to present some form of indication to the user that warns time is about to expire. The appearance of this indication (e.g. color change, dialog box, flag) shall be determined during Software development. Means shall also be included for a technician to change the warning period, means that does not require recompiling Software.

2.18 MODES OF OPERATION

- A. The Software shall include multiple modes of operation to suit the needs of the Owner. Common modes include the following:
 1. Normal Mode.
 2. Executive or Simple Mode.
 3. Advanced Mode.
 4. Administrative Mode.

PART 3 - EXECUTION

3.1 DEVELOPMENT PROCESS

- A. General:
 1. Software Development shall be the responsibility of the Software Developer.
 2. Development shall be a multi-phased interactive and iterative process lead by the Software Developer. Development shall involve input from, and interactive review with, the Owner's representative.
 3. Development shall begin not less than two weeks after award or notice of intent to award. Work shall be completed within such timeframe as to permit Work to be completed prior to the Owner's scheduled completion date(s).
 4. The Software Developer shall closely collaborate with parties providing related Work.
- B. Development Phases:
 1. Phase 1 – Needs Analysis:
 - a. This phase shall be used to refine the general expectations of the Software for each system that the Software controls, from a very high level perspective.
 - b. One or more meetings per system shall be expected.
 - c. The first meeting shall be scheduled within two weeks following Contract award, and the first meeting shall be held within three weeks following Contract award.
 - d. Information gathered during this phase, in the Contract Documents, and in subsequent development phases, shall be used to evolve expectations of the final Software Work.
 2. Phase 2 – Storyboarding / Flow-Charting:
 - a. The Software Storyboarding / Flow-Charting phase (henceforth called Storyboarding or Storyboards) shall be where the Software Developer

- creates physical documents to depict the navigational flow of the system (from a user interface/operation standpoint) and document the operation of the Software relative to the system(s) being controlled.
- b. This shall be an iterative phase whereby the Developer creates, presents, discusses and revises storyboards until there is a mutual agreement with the Owner.
 - c. At the conclusion of this phase, the resulting documents shall include information that:
 - 1) When reviewed by the Owner, the documents clearly communicate the operation and behavior of their system.
 - 2) When reviewed by a qualified programmer (including one with no prior knowledge of the system that the Software controls), communicates sufficiently to permit the writing of code that would meet the requirements of the Contract Documents and the intent of the Owner.
 - 3) When reviewed by the system installer, clearly communicates the intended operation and behavior of the system.
 - d. Storyboards shall be presented in hard-copy form on paper, either 24 inches by 36 inches or 30 inches by 42 inches in size.
 - e. Storyboards shall evolve to contain images of the permutations of each user interface. User interface images shall be drawn and interconnected in a flow chart fashion, and each element of the user interface shall be represented and described. Each button that performs a navigational action shall be interconnected to the view that results. Buttons performing an action shall also be described. The reader of the storyboard shall be able to follow it like a map, navigating through the operation of the system from start-up to shut-down and how to take advantage of features of the Software in-between.
 - f. The representations of user interfaces shall be presented as black on white line drawings, without graphic elements or color. Graphic elements and color on the storyboard representations at this phase routinely causes loss of functional focus and shall be avoided. Color may be used for annotations, interconnecting lines, and flow-chart logic and action text to enhance readability or flow interpretation.
 - g. Storyboards shall be used for graphical user interfaces (i.e., touch panels, client applications, web interfaces) as well as non-GUI type user interfaces (i.e., push-button panels).
 - h. The duration between review meetings covering a single user interface shall be kept as short as is practical, preferably not more than (2) to (3) days.
3. Phase 3 – User Interface Development:
- a. This phase shall result in the final appearance and operation of each user interface. This is an iterative process conducted between the Software Developer and the Owner’s representative.
 - 1) This phase shall involve reworking of the storyboards to accommodate modified Software flow, behaviors and conditions not evident or fully understood during prior phases.
 - b. This phase includes the following:
 - 1) Creation of real world user interfaces based upon the storyboarding documents.
 - 2) Development and implementation of graphics.
 - 3) Final sizing, shaping and positioning of buttons, indicators and text.
 - 4) Identification and assignment of color themes.

- 5) Creation/implementation of companion emulation Software that brings the user interface to life and enables evaluation of appearance, operational and navigational flow, behavior, and general responsiveness. Acceptable emulation Software allows the user interface to behave as though it were actively controlling the associated system.
 - a) Emulation Software includes: (a) Full navigational operation, (b) Button feedback, (c) Device status emulation, (d) System status emulation, (e) Working screen changes, page changes, pop-ups and messaging, and (f) Variable text change emulation.
- c. This phase is complete when the Software Developer has completed each prior development phase, and:
 - 1) Conducted working hands-on user interfaces demonstrations with the Owner's representative.
 - 2) Received conditional acceptance of the user interfaces from the Owner's representative.
 - 3) Final versions of this phase of Work, in electronic form, have been turned over to the Designer and the Owner's representative.
4. Phase 4 – Programming:
 - a. The Programming phase is the where the Software Developer shall write the Software to perform in accordance with the specifications and decisions made during prior Software development phases.
5. Phase 5 – Loading, Testing and Debugging:
 - a. The Loading, Testing and Debugging phase begins during, but near the end of the programming phase. During this phase, the Software shall be refined to make it fully usable by the Owner.
 - b. Software shall be loaded into the memory of applicable processors and components.
 - c. The Software shall be tested and debugged as an integral part of the complete systems being controlled. Adjustments shall be made to ensure that the Software meets the expectations of the Owner's representative.
 - d. If during this phase the Software Developer determines that the Software does not function as desired; the user interfaces do not operate in a familiar manner; the Software is unstable; or interactions with controlled equipment render the Software unstable, awkward to use, or unusable for the intended purpose, the Software Developer shall take remedial action. Should this be necessary, the Software Developer shall review the issue(s) with the Owner's representative and offer suggestions for remedial action. Acceptable remedial actions may include modifying user interfaces or adding, modifying or deleting Software features.

3.2 CHALLENGE RESOLUTION

- A. If for technical reasons it is not possible to achieve a specific functionality identified in the Contract Documents or included in the storyboards, consult with the Designer and the Owner's representative to review alternative options and assist in reaching a compromise solution.

3.3 OWNER'S MANUAL

- A. Software Developer shall provide custom printed and editable electronic documentation containing high quality graphical representations of user interfaces.
- B. Documentation shall include descriptive text that describes the use, flow, and operation of the system from a user perspective.
- C. Documentation shall be suitable for printing, photocopying and distribution by the Owner to users of the Software.
- D. Documentation shall include information covering advanced modes, hidden buttons, and other pertinent advanced features, as well as service information that a technical person, advanced user, and/or system administrator will need for the operation, management, maintenance and expansion of the system. Information regarding these advanced features shall be included on separate pages from the documentation so that they can easily be omitted from the information duplicated by the Owner and distributed to less advanced users of the Software.

END OF SECTION 27 41 03

SECTION 28 00 01 - COMMON WORK RESULTS FOR ELECTRONIC SAFETY AND SECURITY**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, Division 28 Specification Sections apply to all sections.
- B. NFPA 70
- C. Chicago Electrical code, Title 18 Chapter 27 of the Municipal code of Chicago
- D. Provide systems which meet or exceed the requirements of the following publications and organizations as applicable to the Work of this Section Underwriters Laboratories Inc. (UL):
 - 1. UL 365: Police Station Connected Burglar Alarm Units and Systems.
 - 2. UL 636: Holdup Alarm Units and Systems.
 - 3. UL 684: Local, Central Station, and Remote Station.
 - 4. UL 985: Household Fire-Warning System Units
 - 5. UL 1037: Antitheft Alarms and Devices
 - 6. UL 1610: Central-Station Burglar-Alarm Units.
 - 7. UL 1635: Installation and Classification of Residential Burglar Alarm Systems.
 - 8. Federal Communications Commission (FCC):
 - 9. Code of Federal Regulations Title 47: Part 15: Radio Frequency Devices.
- E. Code of Federal Regulations Title 47: Part 68: Connection of Terminal Equipment to the Telephone Network.
- F. Obtain the latest City of Chicago Design and Construction Standards document(s) from the Owner. Comply with all Owner-specific requirements in addition to requirements set forth in these specifications and accompanying drawings. Should there be a conflict, the Owner's standards shall take precedence, unless prevailing codes and regulations mandate otherwise.
- G. Related Drawings
 - a. All Electrical Drawings
 - b. All Technology (T-Series) Drawings
 - c. All Security and Fire Alarm Drawings

1.2 QUALITY ASSURANCE

- A. Qualifications: The Contractor's must be certified on the system being installed and if applicable with security systems be a licensed Alarm Contractor in the State of Illinois,

all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) .

1. Company with a minimum of five (5) years system design, engineering supervision, and installation experience in the security industry and has been authorized to install the products specified.
2. Comply with City of Chicago Electrical Code.
3. Code Compliance: UL or ULC Compliance and Labeling.

- B. Installer Qualifications: Engage an experienced installer for the installation and application of the products identified herein.
- C. Provide the services of locally licensed and authorized electrician(s) to perform that portion of the Work of this Division that is required by the applicable codes and/or the AHJ to be performed by licensed electrician(s).

1.3 GENERAL DIRECTION

A. EXAMINATION

1. Carefully review the Contract Drawings and Specifications.
2. Visit the site and verify that site conditions are in agreement with the design package.
3. Verify that all surfaces and areas are ready to receive work.
4. Verify field measurements as shown on drawings and as instructed by manufacturer.
5. Verify that required utilities are available, in proper location, and ready for use.

- B. Submittal of a bid indicates that the contractor has examined the drawings, specifications, and had an opportunity to visit the site to be able to provide a comprehensive complete bid.
- C. The intent of these specifications and the accompanying drawings is to provide complete and workable systems as shown, specified and required by applicable codes. Interpret these specifications in conjunction with the drawings and provide all work described. If work is shown on drawings and not mentioned in the specifications, or vice versa, it is to be included in the work the same as though clearly set forth by both. Should there be a conflict between the specifications and drawings, provide the greater quantity or better quality. Immediately notify owner's representative and design professional of such conflicts.
- D. The drawings that accompany these specifications are diagrammatic and although size and location of equipment is drawn to scale, wherever possible make use of submittal data and verify all dimensions on site. They do not show every conduit, offset or pull / junction box which may be required to install work in the space provided and avoid conflicts. Follow the drawings as closely as is practical and install additional pull / junction boxes and offsets where required by site conditions and codes at no additional cost. Install all new work in such manner as to conform to the structure, avoid obstructions, provide required service clearances and preserve headroom. Do not scale from drawings, measurements shall be taken in the field.

- E. Coordinate all new work with all other contractors and installers in addition to existing building obstructions and install accordingly. Refer to coordination drawings of other trades. Comply with requirements of architectural drawings including but not limited to mounting height and locations.
- F. Fully research peculiarities and limitations of space available for installation of work with materials being provided. Work around material lead times to not extend project schedule.
- G. Complete work, or part(s) thereof, at times as may be designated by the Owner's Representative, so that it can be used for temporary or permanent use. Do not construe such use of the system as an acceptance of it by Owner.
- H. During mobilization or construction, if an abnormal condition is uncovered either with existing conditions, equipment loads, submittal data, etc. bring these to the attention of the Design Professional for review.
- I. Owner's Representative or Design Professional may relocate fixtures, devices, equipment, etc. prior to installation within a 20-foot limit at no additional charge.
- J. Phasing - Where the scope of work dictates that the project shall be constructed in phases, all costs shall be incurred by this contractor for any temporary work required so that previous phases can be operational while construction is being done to adjacent spaces.

1.4 GENERAL STANDARDS

- A. Provide work in compliance with applicable provisions of the following standards. Provide listing and labeling for all electrical materials, marked for respective intended uses, from UL or other Nationally Recognized Testing Laboratory (NRTL) that is acceptable to applicable Authorities Having Jurisdiction (AHJs).
- B. Provide materials, installation methods, workmanship, testing, etc., in strict accordance with the latest edition of applicable standards and adopted codes, including (but not limited to) the following.
 - 1. International Building Code
 - 2. State Building Code and applicable amendments
 - 3. State Energy Code
 - 4. Utility company requirements and standards as applicable
 - 5. All provisions and requirements of NFPA (National Fire Protection Association)
 - 6. National Electrical Code (NEC), NFPA 70
 - 7. Life Safety Code, NFPA 101
 - 8. Local governmental and other prevailing codes and ordinances
 - 9. ADA/ADAAG requirements (American with Disabilities Act) including all applicable Standards for Accessible Design.
 - 10. UL (Underwriters Laboratories Inc.)
 - 11. ETL (Intertek Testing Services NA, Inc.)
 - 12. CSA (CSA Group Testing and Certification Inc.)
 - 13. FM (Factory Mutual Insurance Company)
 - 14. ASME (American Society of Mechanical Engineers)

15. NEMA (National Electrical Manufacturers Association).
16. NECA (National Electrical Contractors Association)
17. IP (International Protection Rating / Ingress Protection Rating)

1.5 PERMITS AND REGULATIONS

- A. Obtain and pay for permits, fees, certificates of inspection and approval, etc. required for this branch of the work. Furnish Owner with certificates of final inspection and approval prior to final acceptance of this branch of the work.
- B. Laws and regulations which bear upon or affect the various branches of this work shall be complied with by this contractor and are hereby made a part of this contract.

1.6 DEFINITIONS

- A. Furnish - Procure, supply and deliver to project site, ready for installation, install and warrant (unless indicated otherwise on documents). Include warranty expenses.
- B. Install - Assemble, wire and connect loose-shipped components on site. Place in position for service or use, including material, labor, accessories, services, and testing. Wire, connect, and render fully operational for intended use.
- C. Provide - Furnish and Install. Similar Terms: "include", "shall", "equip with", "consisting of"
- D. Equal or Equivalent - Determination of equivalency to be made by design professional for all products not listed as basis-of-design.
- E. Substantial Completion - Where frontend documentation does not define, products and systems must be fully installed as designed, tested, adjusted, labeled, and functionally demonstrated to owner.
- F. High Voltage: For the sake of this Division, greater than 70.7vac RMS; greater than 100vac P-P; greater than 49vdc.
- G. Low Voltage: For the sake of this Division, less than or equal to 70.7vac RMS; less than 100vac P-P; less than or equal to 49vdc.
- H. Structured Cabling: A standardized repetitive passive physical infrastructure of cables, conductors, terminations, hardware and supporting products that together are used to enable the conveyance of signals, information, and data between different locations. Such systems are commonly constructed in accordance with standards published by various standards organizations, including but not limited to the TIA, EIA, NICET and BICSI. In some cases, specialized derivatives of these standards are constructed to meet specialized system needs. Common usages of structured cabling systems include such things as computer or data networks (including wireless infrastructure), telephone systems, building automation systems, electronic safety and security systems, and building intercommunications systems. The structured cabling system does not include any active electronic equipment.

- I. Audio-Visual / Audio and Video Systems Work: That portion of the Project that involves the supply, installation, programming, or testing of products whose fundamental purpose is the reproduction, pickup, storage, transporting, processing, control of audio and/or video signals. Scope of this definition includes all incidentals that are regularly and fundamentally required to provide complete and working systems from the small and simple to the large and complex.

1.7 REQUESTS FOR INFORMATION

- A. See Section 01 25 13 – Request for Interpretations

1.8 ACRONYMS AND ABBREVIATIONS

A. General Industry Terms

1. ADA: Americans with Disabilities Act.
2. ANSI: American National Standards Institute.
3. AWG: American Wire Gauge.
4. BICSI: Building Industry Consulting Services International.
5. BOM: Bill of Materials.
6. Bps: Bits per second.
7. LEC: Local Exchange Carrier.
8. dB: Decibel.
9. Device ID: A system specific label assigned to a product to uniquely identify it within a given a system.
10. DSL: Digital Subscriber Line.
11. EF: Entrance Facility.
12. EIA: Electronics Industries Association.
13. EMI: Electromagnetic Interference.
14. ER: Equipment Room (a type of Communications Room).
15. Gb/s (Gbps): Gigabits per second.
16. GHz: Gigahertz.
17. IDF: Intermediate Distribution Frame (Replaced by TR).
18. IEEE: Institute of Electrical and Electronics Engineers.
19. ISO: International Organization for Standardization.
20. ISP: Internet Service Provider.
21. LAN: Local Area Network.
22. MAC: Media Access Control.
23. Mb/s (Mbps): Megabits per second.
24. MDF: Main Distribution Frame (Replaced by ER).
25. MHz: Megahertz.
26. MPLS: Multi Protocol Label Switching.
27. OFCI: Owner Furnished Contractor Installed.
28. OFE: Owner Furnished Equipment.
29. OFOI: Owner Furnished Owner Installed.
30. PoE: Power over Ethernet.
31. PSTN: Public Switched Telephone Network.
32. QoS: Quality of Service.
33. RAID: Random Array of Inexpensive Disks.
34. RAM: Random Access Memory.

- 35. RFC: Request for Comment.
- 36. RFI: Request for Information/ Radio Frequency Interference.
- 37. RFP: Request for Proposal.
- 38. RFQ: Request for Quotation.
- 39. SNMP: Simple Network Management Protocol.
- 40. SSD: Solid State Drive.
- 41. TB: Terabyte.
- 42. TCP: Transmission Control Protocol.
- 43. TCP/IP: Transmission Control Protocol/Internet Protocol.
- 44. TIA: Telecommunications Industries Association.
- 45. TR: Telecommunications Room (a type of Communications Room)
- 46. VoIP: Voice over Internet Protocol.

1.9 ADMINISTRATION

- A. See Section 01 31 00 Project Management and Coordination

1.10 WARRANTY

- A. System Components including all subsystems that comprise the systems as described within this specification shall be warranted for a period of one (1) year that shall begin after Owner acceptance.
- B. The Contractor shall guarantee all labor, workmanship, and materials for a period of three years from the date of final acceptance. Should a failure occur within the warranty period, the Contractor shall provide all labor and materials necessary to restore the system to the condition required for the final test and acceptance for this contract, at no cost to the Owner. During this period, the Contractor shall provide, free of charge, all software upgrades and patches.
- C. During the warranty period, additional card readers and components may be connected and their use entered in database. New devices will be connected in the same manner as shown on the drawings for this contract and the existence of the new connections shall not void this warranty.
- D. Provide a warranty/guarantee in written form as part of O&M manual stating that all work, materials, equipment and parts are warranted to be free of defect for a minimum period of one year from the date of Substantial Completion. Warranty period and requirements may be expanded in drawings or subsequent specification sections. Repair or replace (owner's option) any defects or failures at no cost to the owner within the warranty period. Issues arising within warranty period must be attended to in a timely manner and in no case exceed four (2) working days. State this in writing as part of O&M manual. Replace defective items to the satisfaction of the Owner's Representative and the Design Professional.

1.11 SUBMITTALS

- A. Product Data: For each type of product indicated.

- B. Shop/Coordination Drawings: Detail major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Indicate if sequence and coordination of installations are important to efficient flow of the Work.
1. Wiring diagrams showing device circuiting.
 2. System plan drawings showing device zones.
 3. Battery backup calculation.
 4. CCTV display pattern diagram.
 5. Proper labeling for panels and equipment
- C. Furnish a copy of an operation and maintenance manual consisting of PDFs, word documents etc. with a copy of the warranty, equipment specification, programming instructions, programming software disks, maintenance instructions and full sized copies of **as built drawings** including conduit routing, junction points, and devices in electronic format as well. In addition all system programming data shall be backed up and provided in electronic USB format to 2FM Alarm Section. Include names and phone numbers to contact for assistance, maintenance, and warranty service on the first page. Deliver to 2FM Alarm Section at time of demonstration and training required in Part 3.
1. License to Use: All software required for each component, and for the complete operation of the system as specified herein shall be delivered with either full Ownership transferred to the Owner or a non-time limited License to use on each machine it is installed on, including the right to make backup copies and the right to install the software on a new piece of hardware upon failure of the original. The licenses are to be provided on a CDROM or other storable form at the time of project acceptance.

1.12 INTELLECTUAL PROPERTY

- A. Patents:
1. Should patented articles, methods, materials apparatus, etc., be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the patent rights for any device on this Project.
- B. Copyrights:
1. Should copyrighted software be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the copyrights for any software on this Project.

PART 2 - PRODUCTS

2.1 GENERAL

- A. Materials, apparatus and equipment shall bear the Underwriter's Laboratory, Inc. label (or other nationally recognized testing laboratory label) where regularly supplied, and as additionally required by Code or the Contract Documents.

- B. Products furnished shall be new, full weight and of the best quality. Similar supplied materials shall be of the same type and from the same manufacturer.
- C. If a specified product is discontinued by the manufacturer and is no longer available for purchase, replacement product of equal or greater value, performance and function as the discontinued Basis of Design product shall be furnished. The replacement product shall be from the same manufacturer as the Basis of Design product unless written permission has been granted by the Designer. The Contractor is solely responsible for researching and submitting proposed replacement product. The final decision as to whether a Contractor proposed replacement is acceptable lies solely with the Designer.
- D. Substitute products shall only be considered if the Contractor has strictly adhered to the guidelines set forth under "Substitutions" as defined in this Section.

2.2 BASIS OF DESIGN

- A. Some of the Contract Documents are prepared on the basis of specific products that are designated as the "Basis of Design."
- B. The Basis of Design products for the Work of this Division are designated explicitly within the specifications, and in the case of some products, designated by brand and model on the Drawings.
 - 1. Where a product brand and model is expressly identified on the Drawings, this product represents the Basis of Design for that instance of the product in the associated system.
- C. The combination of Basis of Design products and the interconnection thereof collectively represent a work that includes the feature set and performance intended by the Designer and the Owner. The specifications may identify additional manufacturers whose equipment may be used in the system, provided the use of such products achieves the same capabilities and performance as that of the specified combination of the Basis of Design products.
 - 1. Due to the varied and integrated nature of modern communications products, there is no guarantee that any single product manufactured by any one of the listed additional manufacturers will be an exact equivalent to a single Basis of Design product in terms of functionality, capability or performance. Therefore, where the use of substitute product is considered, the product shall be verified by the substituting party to include the capabilities, features and performance as that of the Basis of Design product.
 - 2. Work of the Contract shall include covering the cost of additional products and labor necessary to achieve the same end results as would be achieved by using the specified combination of Basis of Design products, including additional costs for coordination, modifications to the building, pathway modifications, casework and furniture modifications, power modifications, licensing, or anything else that may cause additional expense to the Owner.
 - 3. In addition, costs incurred by the Owner's design team to accommodate such changes shall be the responsibility of the party making the substitution.

2.3 SUBSTITUTIONS

- A. A substitution is the use of any product other than that identified as the “Basis of Design,” the “Standard of Quality,” or an “Additional Approved Product.”
- B. Substitutions require pre-bid approval. Only substitutions authorized via addendum shall be considered.
- C. Substitutions are considered on a product-by-product and model specific basis.
- D. Substitution Submittal Requirements:
 - 1. Substitution requests must be received by the Designer sufficiently in advance of the scheduled bid date to allow time for review and issuance of an Addendum. If the timing of the request does not permit an Addendum, substitution shall not be considered or acceptable.
 - 2. Substitution requests shall consist of the following for each proposed substitution:
 - a. Substitution Request Letter
 - b. Product Datasheets/Brochures
- E. Costs that result from the use of substitute products and/or Additional Approved Manufacturer(s), including costs for additional equipment, coordination, accessories, modules, interface products, cables, software, and programming, as well as costs for any additional labor, materials, and products incurred by other trades or members of the project Design Team or Owner, are the sole responsibility of the Contractor making the substitution. This includes costs that may not be incurred or known until after Contract award or Work execution. Such costs shall be deducted from final sum payable to the Contractor.
- F. Post Contract award substitutions may be considered, but only if the proposed substitution includes substantial additional benefit to the Owner. Post award substitutions are considered solely at the discretion and convenience of the Designer. For a post Contract award substitution to be considered, one or more of the following shall apply:
 - 1. The Designer initiates the request for substitution.
 - 2. A basis of design product has become discontinued and is no longer available, and as a result, the use of a substitute product has become a necessity to meet the Owner’s objectives for the Project. See “Discontinued Products.”
 - 3. The request for substitution is accompanied by a proposal that identifies the benefits to the Owner, including a fair-market Contract price reduction.

2.4 DISCONTINUED PRODUCTS

- A. The availability of products shall be verified by the Contractor prior to submitting pricing for Work of the Contract.
- B. In the event that a specified product is discontinued at any time and becomes unavailable for use on the Project, provide a replacement product deemed acceptable to the Designer. Replacement product shall be of equal or greater value, performance and functionality.

1. Replacement product shall be from the basis of design manufacturer, from one of the additional product manufacturers identified for the product within the Section, or from another manufacturer deemed acceptable to the Designer.
- C. The cost for the supply and installation of suitable replacement product is the sole responsibility of the Contractor.
- D. Replacement products are considered substitutions and require Designer review and authorization. See "Substitutions."

PART 3 - EXECUTION

3.1 WORK AND WORKMANSHIP

- A. Provide labor, materials, equipment, and services necessary for complete installation of systems required to comply with the requirements of authorities having jurisdiction (AHJ), as indicated within the Contract Documents.
- B. Work shall be functional and complete in every detail, including items required to complete the system, regardless of whether each necessary item is fully enumerated in the Specifications or shown on the Drawings.
- C. Contractor and Subcontractors shall be knowledgeable of the details of Work to be performed by other trades and take necessary steps to integrate and coordinate Work of this Division with that of other Divisions and other trades.
- D. Wherever tables or schedules show quantities, they shall not be interpreted to represent the total contract quantity requirement, but instead a portion of the Contract requirement. The Contractor shall be responsible for the higher quantity communicated by the Drawings, within the Specifications and on the schedules/tables. Seek clarification from the Designer should a discrepancy be found.
- E. The Designer and Owner's Representative may, at their sole discretion, condemn or reject any Work, materials, or equipment not in accordance with the Contract Documents or the manufacturer's specifications or drawings reviewed by the Designer or Owner.
- F. Work or equipment that is rejected shall be removed and replaced to the satisfaction of the Owner and Designer at the Contractor's expense. Work or equipment that is rejected shall be so stated in writing by the Owner or Designer.
- G. Work shall fully comply with the Contract Documents and manufacturer's recommended installation guidelines.
- H. Work shall be performed with the best practices of the trade for performance, functionality, safety, endurance and aesthetics.
- I. Coordinate ordering and installation of equipment with long lead times or having a major impact on work by other trades so as not to delay the job or impact the schedule.

- J. Where mounting heights are not detailed or dimensioned, install systems, materials and equipment to provide the maximum headroom possible. Consult the Designer for direction.
- K. Supply scaffolding, rigging, hoisting and services necessary for erection and delivery of equipment and apparatus furnished into the premises. These items shall be removed from premises when no longer required.
- L. Work shall be installed level and plumb, parallel and perpendicular to prevailing building lines, except as expressly detailed otherwise or required for proper form, function or Designer-intended operation.
- M. Specialty tools shall be used for assembly, installation, termination, and removal of products as recommended by the product manufacturer.

3.2 TESTING

- A. General:
 - 1. Upon complete physical installation of products, align, balance, and adjust equipment to make it usable to the Owner for the intended purpose, and ensure compliance with the Contract Documents.
 - 2. Test each system and each component thereof, and correct deficiencies prior to scheduling acceptance testing.
 - 3. Replace malfunctioning or damaged products with new product, following immediately with retesting until satisfactory performance and specification compliant conditions are achieved.
- B. Operational Testing:
 - 1. Perform operational testing of supplied products individually and collectively to verify conformance with the Contract Documents, to ensure compliance with the product manufacturer's published specifications, and as additionally necessary for the system to meet the intended purpose.
- C. Performance Testing:
 - 1. Perform measurements and testing necessary to demonstrate performance compliance.

3.3 TRAINING

- A. Training shall be supplied for each Section of this Division and for each unique system provided.
- B. The Owner shall have the right to use the total allocated training for a period of 1 year following final completion of onsite work, solely at its discretion.
- C. Training shall be supplied as expressly identified within individual Sections. Where training requirements are not otherwise expressly identified, the Contractor shall furnish a minimum of two (2) hours per unique system, per Section. The Contractor

shall presume that at least two (2) discrete trips to the project site shall be required per unique system to conduct training.

- D. Training dates and times shall be coordinated with the Owner's designated training representative(s).
- E. Training shall cover the following:
 - 1. Normal system use and operation.
 - 2. Procedures and schedules involved in troubleshooting and performing routine preventative maintenance.
 - 3. Other facets as identified in individual Sections.
- F. Agenda and relevant training handouts shall be prepared and distributed to attendees at each training session.
- G. A sign-in sheet shall be created and used for each training session. The sheet shall identify the following, at a minimum:
 - 1. Specification Section reference and system(s) being trained.
 - 2. Date and starting time of the session.
 - 3. Signatures of attendees.
 - 4. Ending time of the session, along with a separate owner signature certifying the ending time.
 - 5. Training outline/agenda.
- H. Recording of Sessions:
 - 1. Recordings shall be supplied on DVD video format media playable in standard consumer grade reproduction appliance. Recordings do not need to be professionally edited but shall feature intelligible audio and a clear image of the subject trainer and any supplemental visual content material to the training.
 - 2. Recordings shall be turned over and signed for by an Owner's training representative at the end of each session. A copy of a signed delivery receipt shall be included as part of the closeout documentation.
 - 3. Contractor shall require each attendee to sign-in at the start of each training session. The sign-in form shall summarize the training conducted, specification section reference and system being trained on, as well as the starting time and duration of training. Following training, a representative of the Owner shall sign the form, acknowledging the same. Contractor shall retain the original copy of these forms and turn over a photocopy of the form to the Owner's representative as evidence of training. Training conducted without this official record of training shall not be considered as part of the Contractor's training obligation.
- I. For a training session to count towards the training obligation, each of the following shall be met:
 - 1. Training occurs after Training Submittal review.
 - 2. Training session outlines / agenda are distributed at the session.
 - 3. Quality Assurance requirements for the instructor have been met.
 - 4. Training occurs after the system / section is complete and working as intended by the Contract Documents, usually following Acceptance Testing. Training in advance of this requires Designer approval.
 - 5. Sign-in sheets are used, completed, and retained for the session.
 - 6. A master log of training conducted for the project is maintained.

28 00 01 - COMMON WORK RESULTS FOR
ELECTRONIC SAFETY AND SECURITY - 13

END OF SECTION 28 00 01

SECTION 27 00 02 - QUALITY ASSURANCE FOR ELECTRONIC SAFETY AND SECURITY**PART 1 - GENERAL****1.1 SUBMITTAL REQUIREMENTS**

- A. Quality Assurance:
 - 1. Quality Assurance: General Qualifications.

1.2 SUMMARY

- A. Section Includes:
 - 1. Quality Assurance requirements for Work of this Division.
- B. Related Requirements
 - 1. Related Sections
 - a. All Division 28 Sections.

1.3 QUALITY ASSURANCE

- A. General Qualifications:
 - 1. Business history of the last five (5) contiguous years performing work of similar type, value and scope as that required of the Contract Documents.
 - 2. Capable of demonstrating through valid references and other means that it has successfully completed no less than six (6) projects of similar type, monetary size, and scope of work within the last twenty-four (24) calendar months.
 - 3. A "Factory-authorized" reseller (e.g., distributor, dealer, integration partner, value-added reseller, channel partner) for the products furnished for each Section.
 - 4. House substantial business operations within a 300-mile radius of the project site.
 - 5. Employ full-time service staff based within a 50-mile radius of the project site.
 - 6. Financial Disclosure of the Contractor: Prior to contract award, upon request.
- B. Superintendent/Project Manager Qualifications:
 - 1. Furnish the services of an experienced superintendent/project manager who shall be constantly in charge of the Work, together with a qualified foreman and technical specialists to properly install, connect, adjust, start, operate and test the Work involved.
 - 2. Qualifications are subject to the review and acceptance by the Designer and Owner. Unless the Designer and Owner grant prior permission, the same superintendent/project manager shall be utilized throughout the duration of the Project and shall remain responsible for the complete scope of the Work.
- C. Subcontractor Qualifications:
 - 1. If the Contractor, as a singular entity, does not meet 100-percent of the quality assurance requirements for each specification section, the Contractor shall enlist the services of qualified subcontractors to perform the Work of those specific

section(s). This includes, but is not limited to, the supply of the products for the Section and the supply of the project engineering services, preparation of shop drawings and section submittals, technical installation labor, training, warranty, post-installation support and service.

2. The Contractor shall ensure that each subcontractor supplies the services of a project manager to represent its interests at the same project meetings in which the Contractor participates.
3. The Designer and Owner reserve the right to disqualify the use of any subcontractor that does not meet the quality assurance requirements set forth in these specifications. Should a subcontractor be disqualified, the Contractor shall supply the services of a different subcontractor that complies with the published quality assurance requirements. The Contractor is solely responsible for costs incurred as a result. It is therefore incumbent upon the Contractor to pre-qualify subcontractor choice(s) prior to submitting pricing for work.
4. To achieve quality assurance compliance, an equipment vendor that is not performing the technical installation labor associated with work of a Section shall not be considered a subcontractor.

D. Training Qualifications:

1. Personnel conducting training shall be knowledgeable of the product, system and technology on which they train. Personnel shall be factory trained, factory certified and/or otherwise recognized by the Designer as possessing sufficient experience and knowledge in the subject area.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 QUALITY ASSURANCE SUBMITTALS

- A. Provide documentation that demonstrates the qualification for each requirement articulated in this Section and in compliance with Section 01 33 0.

END OF SECTION 28 00 02

SECTION 28 00 03 - OWNER'S STANDARDS DOCUMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, Division 01 Specification Sections, Division 27, and Division 28 (if applicable) Specification Sections apply to this Section.

1.2 SUMMARY

- A. This Section includes the current version of the City of Chicago, **Electronics Systems Specifications Standard dated 2019 and Surveillance Systems dated 2019**. Comply with the requirements of this Section which shall be referred to as the "Owner's Standards Document."
- B. Related Requirements:
 - 1. The requirements of the Contract Documents and the Owner's Standards Document shall be additive. E.g., if the Contract Documents require cables to be labeled, and the Owner's standards do not indicate labeling, labeling shall be provided as specified in the Contract Documents.
 - 2. Where other Division 27 and Division 28 Specification Sections and this Section (i.e., the Owner's Standards Document) are in direct conflict, the Owner's Standards Document shall supersede the requirements of other Division 27 and Division 28 Section(s). E.g., if the Contract Documents require cables to be labeled, and the Owner's Standards Document expressly states do not label cables, the Documents are in direct conflict and the Owner's Standards Document shall supersede the Contract Documents.

1.3 OWNER'S STANDARDS DOCUMENT

CITY OF CHICAGO (2FM) - ELECTRONIC SYSTEMS SPECIFICATIONS

1.4 OVERVIEW

- A. Standardization of systems
 - 1. In an effort to maintain consistency and serviceability across the portfolio of facilities under its control 2FM requires specific system types and models so that system certified in house staff can successfully repair and maintain said systems.

1.5 RELATED DOCUMENTS TO 280001

- A. NFPA 70

- B. Chicago Electrical code, Title 18 Chapter 27 of the Municipal code of Chicago
- C. Provide systems which meet or exceed the requirements of the following publications and organizations as applicable to the Work of this Section Underwriters Laboratories Inc. (UL):
 - 1. UL 365: Police Station Connected Burglar Alarm Units and Systems.
 - 2. UL 636: Holdup Alarm Units and Systems.
 - 3. UL 684: Local, Central Station, and Remote Station.
 - 4. UL 985: Household Fire-Warning System Units
 - 5. UL 1037: Antitheft Alarms and Devices
 - 6. UL 1610: Central-Station Burglar-Alarm Units.
 - 7. UL 1635: Installation and Classification of Residential Burglar Alarm Systems.
 - 8. Federal Communications Commission (FCC):
 - 9. Code of Federal Regulations Title 47: Part 15: Radio Frequency Devices.
 - 10. Code of Federal Regulations Title 47: Part 68: Connection of Terminal Equipment to the Telephone Network.

1.6 SUMMARY TO 281301

- A. This Section includes the limited scope construction materials and methods for application with electrical installations as follows:
 - 1. ACMS, IDS, CCTV and facility's security related equipment.
 - 2. Remote door lock release as well as card reader equipped door access monitoring by ACMS.
 - 3. Miscellaneous materials for support of electrical materials and equipment.
 - 4. Connection to existing head end equipment for monitoring and alarm signals.
 - 5. Monitoring and signal connection to ACMS,IDS, CCTV systems.
 - 6. Provide door hardware for ACMS,IDS system.

1.7 PROJECT CONDITIONS TO 281301

- A. The Contractor shall configure the system as described and shown. The system shall include all connectors, adapters, and terminators necessary to interconnect all equipment. The Alarm Contractor's must be a licensed Alarm Contractor in the State of Illinois and City of Chicago, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) on their person and shall be furnished to 2FM Security before work is to begin. In the event of personnel changes the above requirements shall be updated and furnished to 2FM Security before that individual is to begin working.
- B. Data Entry TO 281301
 - 1. The Contractor shall enter all data needed to make the system operational. The Contractor shall identify and request from the Owner, any additional data needed to provide a complete and operational security system. The completed forms shall be delivered to the Owner for review and approval at least 10 days prior to the Contractor's scheduled needed date.

C. Conduits TO 280501 AND 281301

1. All IDS cabling shall be encased in conduit **Blue** in color minimum of ¾".
2. All CCTV cabling shall be encased in conduit **Purple** in color minimum of ¾".
3. All ACMS cabling shall be encased in conduit **Orange** in color minimum of ¾".
4. All fire systems shall be encased in conduit **Red** in color minimum of ¾".
5. If conditions do not allow for colored conduit to be installed, the contractor is responsible for labeling the conduit and to inform the Owner as how to proceed immediately.

D. WIRE AND CABLE TO 280501

1. Cabling utilized for the interconnection of field items specified herein shall comply with or exceed the recommendations of the component manufacturers.
2. Refer to Specification Division 16 for general wiring requirement.
3. Material and method utilized for the equipment described herein must meet the local building code and all the applicable codes.

E. GROUNDING TO 280501 AND 281301

1. All twisted pair shields shall be grounded at one point only. Cables that originate from equipment in systems/electrical rooms and terminate at field devices shall be grounded to the signal ground terminal in the system / electrical room. The field end shield shall be pulled back, trimmed, and taped in a good workmanlike manner.
2. Equipment, racks and associated devices shall be grounded per Division 26 specification.
3. Refer to Contract document drawings for additional information

1.8 QUALITY ASSURANCE TO 280001

A. Qualifications: The Contractor's must be certified on the system being installed and if applicable with security systems be a licensed Alarm Contractor in the State of Illinois, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) .

1. Company with a minimum of five (5) years system design, engineering supervision, and installation experience in the security industry and has been authorized to install the products specified.
2. Comply with City of Chicago Electrical Code.
3. Code Compliance: UL or ULC Compliance and Labeling.
4. Installer Qualifications: Engage an experienced installer for the installation and application of the products identified herein..

1.9 WARRANTY

A. TO 280001

- B. A. System Components including all subsystems that comprise the systems as described within this specification shall be warranted for a period of one (1) year that shall begin after Owner acceptance.
- C. B. The Contractor shall guarantee all labor, workmanship, and materials for a period of three years from the date of final acceptance. Should a failure occur within the warranty period, the Contractor shall provide all labor and materials necessary to restore the system to the condition required for the final test and acceptance for this contract, at no cost to the Owner. During this period, the Contractor shall provide, free of charge, all software upgrades and patches.
- D. C. During the warranty period, additional card readers and components may be connected and their use entered in database. New devices will be connected in the same manner as shown on the drawings for this contract and the existence of the new connections shall not void this warranty.

1.10 SUBMITTALS TO 280001

- A. Product Data: For each type of product indicated.
- B. Shop/Coordination Drawings: Detail major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Indicate if sequence and coordination of installations are important to efficient flow of the Work.
 - 1. Wiring diagrams showing device circuiting.
 - 2. System plan drawings showing device zones.
 - 3. Battery backup calculation.
 - 4. CCTV display pattern diagram.
 - 5. Proper labeling for panels and equipment
- C. Furnish a copy of an operation and maintenance manual consisting of PDFs, word documents etc. with a copy of the warranty, equipment specification, programming instructions, programming software disks, maintenance instructions and full sized copies of **as built drawings** including conduit routing, junction points, and devices in electronic format as well. In addition all system programming data shall be backed up and provided in electronic USB format to 2FM Alarm Section. Include names and phone numbers to contact for assistance, maintenance, and warranty service on the first page. Deliver to 2FM Alarm Section at time of demonstration and training required in Part 3.
- D. License to Use: All software required for each component, and for the complete operation of the system as specified herein shall be delivered with either full Ownership transferred to the Owner or a non-time limited License to use on each machine it is installed on, including the right to make backup copies and the right to install the software on a new piece of hardware upon failure of the original. The licenses are to be provided on a CDROM or other storable form at the time of project acceptance.

1.11 INTELLECTUAL PROPERTY TO 280001**A. Patents:**

1. Should patented articles, methods, materials apparatus, etc., be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the patent rights for any device on this Project.

B. Copyrights:

1. Should copyrighted software be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the copyrights for any software on this Project.

1.12 COORDINATION TO 280501

- A. Coordinate layout and installation of system equipment and system components with other construction that penetrates roofs, risers, masonry, ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.
- B. Install all system components and appurtenances in accordance with the Contract Documents and per manufacturer's instructions.
- C. Installation of conductors shall comply with the Contract Documents, manufacturer's recommendations, and the Chicago Electrical Code Article 900 using the 40% fill column from the appropriate table.

1.13 EXAMINATION TO 280001

- A. Carefully review the Contract Drawings and Specifications.
- B. Visit the site and verify that site conditions are in agreement with the design package.
- C. Verify that all surfaces and areas are ready to receive work.
- D. Verify field measurements as shown on drawings and as instructed by manufacturer.
- E. Verify that required utilities are available, in proper location, and ready for use.

1.14 INSTALLATION TO 280501

- A. Enclosure Penetrations: Penetrations of interior enclosures involving transitions of conduit from interior to exterior, and all penetrations on exterior enclosures shall be made with water tight hubs. The conduit riser shall terminate in a suitable junction/pull

box (see Div. 16). When required, the riser shall be sealed as recommended by the cable manufacturer and in such a manner that the cable is not damaged.

- B. Install the Intrusion Detection, Access Control, and Video Surveillance related equipment as specified by the manufacturer and as shown, provide mounting hardware sized appropriately to secure each device for conditions encountered at the site; connect signal lines and AC power to equipment interfaces.
- C. Install systems in accordance with manufacturer's recommendations. This includes, but is not limited to the following:
 - 1. Wiring within racks shall be routed horizontally and vertically in neatly tied bundles. Point-to-point wiring shall not be used.
 - 2. Cable bundles shall cross from one rack to the next at the top, center, or bottom only, leaving sufficient working room within the rack.
 - 3. Wiring for shall be tie-wrapped or Velcro-strapped so that all connectors in a bundle can be removed and re-installed without the possibility of cross connecting.
 - 4. Where wiring is routed through sheet metal or over frame members, the metal edges shall be covered with flexible grommeting or edge dressing designed for this purpose.
 - 5. Double-sided foam tape shall not be used to secure any terminal boxes, relay bases or circuit boards, etc. All device mounting shall be of a permanent nature.
 - 6. All excess length AC cords are to be tie-wrapped out of the way, and new plugs installed.
 - 7. All cabling shall be in conduit, present a professional appearance, and maintain the esthetics of the installation area. Refer to Division 26.
 - 8. Care shall be exercised at all times to protect Owner's property.
- D. Provide all panel wiring required, including temporary wiring. Install wiring in accordance with CEC and NFPA regulations (as applicable), local building codes and ordinances, and all Owner wiring standards. Contractor shall be responsible for obtaining and adhering to applicable regulations, codes, ordinances, and standards.
- E. Provide cable labeling per Division 26. Label all conductors at each end with legible, laser printed, self-laminating vinyl labels.

1.15 TESTING TO 280501

- A. The Contractor shall provide all personnel, equipment, instrumentation, and supplies necessary to perform all site testing. The Owner shall witness all performance verification. Written notification shall be provided to the Owner one week prior to proceeding with system testing. Original copies of all data produced during performance verification shall be turned over to the Owner at the conclusion of each phase of testing prior to Owner approval of the test.
- B. Cable Testing
 - 1. All cables and termination hardware shall be 100% tested for defects in the installation and the materials used in order to verify performance under installed

conditions. All conductors of each installed cable and system component shall be verified usable by the contractor.

2. Operational Test: After installation of cables and connectors, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance from each end of all pairs installed. Remove temporary connections when tests have been satisfactorily completed.
3. Copper Cable Procedures: Inspect for physical damage and test each conductor signal path for continuity and shorts. Use Class 2, bidirectional, Category 6 or above tester. Test for faulty connectors, splices, and terminations. Test according to TIA/EIA-TSB67, "Transmission Performance Specifications for Field Testing of Unshielded Twisted-Pair Cabling Systems." Link performance for UTP cables must meet minimum criteria of TIA/EIA-568-A.
4. Fiber-Optic Cable Procedures: Perform each visual and mechanical inspection and electrical test, including optional procedures, stated in NETA ATS, Section 7.25. Certify compliance with test parameters and manufacturer's written recommended test procedures. Test optical performance with optical power meter capable of generating light at all appropriate wavelengths.
5. All test results shall be well documented and the documentation given to the owner.

C. Contractor's Field Testing TO 281301

1. The Contractor shall calibrate and test all equipment, place the systems in service, and test the systems. The Contractor shall deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the Owner that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure.
2. If any conditions or other conditions exist that cause degradation or interfere with any security device, the Contractor shall inform the Owner.
3. The field testing shall as a minimum include:
 - a. Verification that the any signal or control cabling have been installed, tested, and approved as specified. All cabling to be identified and labeled to be included in test report.
 - b. When the system includes remote control/monitoring stations or remote switch panels, verification that the remote devices are functional, communicate with the center, and perform all functions as specified.
 - c. Verification that all systems devices are fully functional, and that applicable software has been programmed as needed for the site configuration.
 - d. Operation of all electrical and mechanical controls and verification that the control performs the designed function.
 - e. Verification that all cables are terminated properly. Verification that the any signal or control cabling have been installed, tested, and approved as specified.
 - f. When the system includes remote control/monitoring stations or remote switch panels, verification that the remote devices are functional, communicate with the center, and perform all functions as specified.
 - g. Verification that all security devices are fully functional, and that applicable software has been programmed as needed for the site configuration.
 - h. Verification that applicable software is functioning correctly. All software functions shall be exercised.

- i. Operation of all electrical and mechanical controls and verification that the control performs the designed function.
- j. Verification that all data sources and data outputs provide a full bandwidth signal at all data inputs.
- k. Verification that all cables are terminated properly.
 - 1) Deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the Designer that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure.

1.16 SYSTEM STARTUP TO 281301

- A. Do not apply power to any systems until the following items have been completed:
 - 1. Equipment items have been set up in accordance with manufacturer's instructions.
 - 2. A visual inspection has been conducted to ensure that defective equipment items have not been installed and that there are no loose connections.
 - 3. System wiring has been tested and verified as correctly connected as indicated.
 - 4. All system grounding and transient protection systems have been verified as properly installed and connected as indicated.
 - 5. Power supplies to be connected to the Systems have been verified as the correct voltage, phasing, and frequency as indicated.
 - 6. Verify network communications for the NVR, cameras, S2 controller, and network switch.
 - 7. Provide written and signed checklist indicating this was done.
 - 8. Satisfaction of the above requirements shall not relieve the Contractor of responsibility for incorrect installation, defective equipment items, or collateral damage as a result of Contractor work/equipment.

1.17 CLEANING AND ADJUSTING

- A. Clean installed items using methods and materials recommended by manufacturer.

1.18 DEMONSTRATION AND ACCEPTANCE 280501 AND 281301

- A. Create a written, step by step, plan to demonstrate the operation of all systems and submit it for approval two weeks prior to the demonstration date. The Owner will review and comment, or approve the plan at that time. Submit a suggested demonstration date and time along with the plan.
- B. On the accepted date, execute the demonstration plan in the presence of the Owner and their representatives. If the demonstration is successful, the systems will be considered accepted and a punch list will be generated. If the demonstration fails, the systems will be considered not accepted and another demonstration event shall be scheduled. This process will be repeated until the systems are accepted.

- C. Multiple Contractor User privilege levels will likely be established during the installation and testing periods of this Project. As a condition of system final acceptance, all Contractor User privileges shall be removed from the system, unless otherwise authorized in writing, by the Owner.

1.19 TRAINING TO 280501

- A. Training of the Owner's employees shall be provided by a factory trained instructor for each individual system. The training is to cover all systems; ACMS, IDS and video surveillance, including any particulars of the communications network operation.
- B. Training shall be conducted by experienced trainers for each of the systems. The trainers must be certified by the manufacturer of the system for which training is provided.
- C. Training shall take place at a location that is mutually agreed upon between all parties.
- D. Training shall provide information regarding the operation of the systems, diagnostics, data input, alarm handling, as well as any other aspects required to provide a knowledge base to manage the system(s).
- E. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain. Conduct training courses for designated personnel in the maintenance and operation of the systems as specified. The training shall be oriented to the specific system being installed under this contract.
- F. Training manuals shall be delivered for each trainee with two additional manuals delivered for archiving at the project site. The manuals shall include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson.
- G. The Contractor is responsible for furnishing all training materials and supplies in addition to those described above. Where the Contractor presents portions of the course through the use of audio-visual material, copies of the audio-visual materials shall be delivered to the Designer, either as a part of the printed training manuals or on the same media as that used during the training sessions.
- H. A training day is 8 hours of instruction, including two 15 minute breaks and excluding lunchtime, Monday through Friday, during times that will allow for all shifts at the facility to obtain training.
- I. Training shall have provided information regarding the operation of the systems, diagnostics, data input, alarm handling, as well as any other aspects required to provide a knowledge base to manage the Security systems.

1.20 ON-SITE ASSISTANCE 280501 AND 281301

- A. When requested by 2FM within one year of date of 2FM sign off/acceptance, provide on-site assistance in tuning and adjusting the system to suit actual occupied conditions

and to optimize performance. Provide up to 36 hours of time by a qualified technician, on site, for adjustments of the system without additional cost.

END OF SECTION**CITY OF CHICAGO (2FM)****SURVEILLANCE SYSTEMS****GENERAL**

1.21 OVERVIEW

- A. 2FM uses only Genetec CCTV systems and associated compatible hardware. All cabling shall be encased in conduit purple in color unless otherwise agreed upon.

1.22 RELATED DOCUMENTS IN 280001

- A. NFPA 70
- B. Chicago Electrical code, Title 18 Chapter 27 of the Municipal code of Chicago
- C. Provide systems which meet or exceed the requirements of the following publications and organizations as applicable to the Work of this Section Underwriters Laboratories Inc. (UL):
 - 1. UL 365: Police Station Connected Burglar Alarm Units and Systems.
 - 2. UL 636: Holdup Alarm Units and Systems.
 - 3. UL 684: Local, Central Station, and Remote Station.
 - 4. UL 1037: Antitheft Alarms and Devices
 - 5. UL 1610: Central-Station Burglar-Alarm Units.
 - 6. UL 1635: Installation and Classification of Residential Burglar Alarm Systems.
 - 7. Federal Communications Commission (FCC):
 - a. Code of Federal Regulations Title 47: Part 15: Radio Frequency Devices.
 - b. Code of Federal Regulations Title 47: Part 68: Connection of Terminal Equipment to the Telephone Network.

1.23 SUMMARY TO 281302

- A. This Section includes the limited scope construction materials and methods for application with electrical installations as follows:
 - 1. CCTV and facility's security related equipment.
 - 2. Miscellaneous materials for support of electrical materials and equipment.
 - 3. Connection to existing head end equipment for monitoring and alarm signals.

4. Monitoring and signal connection to CCTV systems.

1.24 PROJECT CONDITIONS TO 281302

- A. The Contractor shall configure the system as described and shown. The system shall include all connectors, adapters, and terminators necessary to interconnect all equipment. The Alarm Contractor's must be a licensed Alarm Contractor in the State of Illinois and City of Chicago, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) on their person and shall be furnished to 2FM Security before work is to begin. In the event of personnel changes the above requirements shall be updated and furnished to 2FM Security before that individual is to begin working.
- B. Data Entry
 1. The Contractor shall enter all data needed to make the system operational. The Contractor shall identify and request from the Owner, any additional data needed to provide a complete and operational security system. The completed forms shall be delivered to the Owner for review and approval at least 10 days prior to the Contractor's scheduled needed date.

1.25 GENERAL TO 281302

- A. All CCTV cabling shall be encased in conduit Purple in color minimum of $\frac{3}{4}$ ".

1.26 QUALITY ASSURANCE TO 280001

- A. Qualifications: The Alarm Contractor's must be a licensed Alarm Contractor in the State of Illinois, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) .
 1. Company with a minimum of five (5) years system design, engineering supervision, and installation experience in the security industry and has been authorized to install the products identified under PART 2 – PRODUCTS of this document.
- B. Comply with City of Chicago Electrical Code.
- C. Code Compliance: UL or ULC Compliance and Labeling.
- D. Installer Qualifications: Engage an experienced installer for the installation and application of the products identified herein. Installer must be licensed by the State of Illinois (PERC) and certified to install the required products.

1.27 WARRANTY TO 280001

- A. System Components including all subsystems that comprise the systems as described within this specification shall be warranted for a period of one (1) year that shall begin after Owner acceptance.

- B. The Contractor shall guarantee all labor, workmanship, and materials for a period of three years from the date of final acceptance. Should a failure occur within the warranty period, the Contractor shall provide all labor and materials necessary to restore the system to the condition required for the final test and acceptance for this contract, at no cost to the Owner. During this period, the Contractor shall provide, free of charge, all software upgrades and patches.
- C. During the warranty period, additional card readers and components may be connected and their use entered in database. New devices will be connected in the same manner as shown on the drawings for this contract and the existence of the new connections shall not void this warranty.

1.28 SUBMITTALS TO 280001

- A. Product Data: For each type of product indicated.
- B. Refer to Book 2a Section “Submittals” for administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other miscellaneous submittals.
- C. Shop/Coordination Drawings: Detail major elements, components, and systems of electrical equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Indicate if sequence and coordination of installations are important to efficient flow of the Work.
 - 1. Wiring diagrams showing device circuiting.
 - 2. System plan drawings showing device zones.
 - 3. Battery backup calculation.
 - 4. CCTV display pattern diagram.
 - 5. Proper labeling of panels and equipment
- D. Furnish a copy of an operation and maintenance manual consisting of PDFs, word documents etc. with a copy of the warranty, equipment specification, programming instructions, programming software disks, maintenance instructions and full sized copies of as built drawings including conduit routing, junction points, and devices in electronic format as well. In addition all system programming data shall be backed up and provided in electronic USB format to 2FM Alarm Section. Include names and phone numbers to contact for assistance, maintenance, and warranty service on the first page. Deliver to 2FM Alarm Section at time of demonstration and training required in Part 3.
- E. License to Use: All software required for each component, and for the complete operation of the system as specified herein shall be delivered with either full Ownership transferred to the Owner or a non-time limited License to use on each machine it is installed on, including the right to make backup copies and the right to install the software on a new piece of hardware upon failure of the original. The licenses are to be provided on a CDROM or other storable form at the time of project acceptance.

1.29 INTELLECTUAL PROPERTY TO 280001**A. Patents:**

1. Should patented articles, methods, materials apparatus, etc., be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the patent rights for any device on this Project.

B. Copyrights:

1. Should copyrighted software be used in this work, the Contractor shall acquire the right to use same. The Contractor shall hold the Owner and his agents harmless for any delay, action, suit, or cost growing out of the copyrights for any software on this Project.

1.30 COORDINATION TO 280501

- A. Coordinate layout and installation of system equipment and system components with other construction that penetrates roofs, risers, masonry, ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

PART 2 - PRODUCTS TO 281302**2.1 MANUFACTURERS****A. Approved Manufactures are as follows;**

1. Axis Communications
2. Genetec

B. Video Surveillance Components

1. Refer to section 2.5 IP Video Surveillance Components

- c. Genetec Security Center – Omnicast Enterprise

2.2 GENETEC SOFTWARE REQUIREMENTS**A. Seamless Unification with VMS**

- B. Through the USP, the ACS shall support integration with an IP Video Surveillance System or MVS. Integration with an IP video surveillance system shall permit the user to view live and recorded video.

- C. Users shall be able to associate one or more video cameras to the following entity types: doors, elevator, and hardware zone (input points) and more.
- D. The Monitoring UI shall present a true Unified Security Interface for access control and video surveillance. Advanced live video viewing and playback of archived video shall be available through the Monitoring UI.
- E. It shall be possible to view video associated with access control events when viewing a report.
- F. Outputs
 - 1. DOOR CONTACT SWITCH(ES)
 - a. The door position switch shall consist of a magnasphere type two part hermetically sealed assembly and will be designed for either metal or wood frame installations.

2.3 CCTV COMPONENTS TO 281302

- A. NVR SERVER
 - 1. Manufacturer: Genetec Omnicast Streamvault appliance line
 - 2. 2U rack mount type.
 - 3. 96 camera capability with minimum 16 IP camera licenses or a minimum of 20% of the total amount of cameras.
 - 4. Minimum 20TB HD capacity.
 - 5. Required license and programs to make system fully functional must be provided to owner.
 - 6. The NVR server hardware shall be capable of running Microsoft's latest Server OS.
- B. Lens Optics
 - 1. Provide high quality CCTV lenses sized according to the intended area of coverage as shown on the drawings and in accordance with the following minimum specifications:
 - a. Fixed cameras shall be provided with aspherical varifocal lens optics. Lenses provided for fixed cameras shall be aspherical varifocal length type and shall include provisions for automatic iris adjustment and standard "CS" or "C" mounting. Adapter rings shall be provided for all "C" mount lenses, aspherical varifocal lenses shall also be compatible with a CCD camera imager. Exact focal lengths of the lenses will be coordinated with the Owner based on the scene to be viewed.
 - b. The average video level sampled from the camera will determine automatic iris operation. Iris control signals and operating voltage shall be obtained from the camera and the lens will include a pre-wired plug assembly compatible with the cameras being provided.
 - c. Lenses for speed-dome cameras shall be provided as an integral part of the speed-dome camera configuration.
 - d. Lens optics shall be high quality precision ground glass. All optics shall be color corrected to provide accurate color scene reproduction.

2.4 IP VIDEO SURVEILLANCE COMPONENTS

- A. IP Cameras must be either a fixed type, 180°, 360° type camera depending on its location and use. PTZ and Fisheye type cameras are not acceptable.
 - 1. Acceptable manufacturers for security cameras:
 - a. Arecont Vision IP Cameras
 - b. AXIS IP Cameras
 - c. SONY IP Cameras
 - d. Vivotek IP Cameras
- B. Basic performance requirement:
 - 1. Color mode: 0.3 lux at F1.4, 30IRE
 - 2. Black/white mode: 0.005 lux at F1.4, 30IRE
 - 3. Motion JPEG
 - 4. MPEG-4 Part 2 (ISO/IEC 14496-2), Profiles: ASP and SP
 - 5. Mode: NTSC only
 - 6. Resolutions 4CIF, 2CIFExp, 2CIF, CIF, QCIF Max 704x480 (NTSC) min 160x120 (NTSC)
 - 7. Frame rate: MJPEG Up to 30/25 fps in all resolutions; MPEG-4: Up to 21/17 fps at 4CIF/2CIFExp; Up to 30/25 fps at 2CIF/CIF/QCIF
 - 8. Streaming: Simultaneous Motion JPEG and MPEG-4 Controllable frame rate and bandwidth; Constant and variable bit rate (MPEG-4)
 - 9. IP protocol using TCP and UDP protocol

2.5 APPROVED MANUFACTURER AND MODEL NUMBER FOR NETWORK SWITCHING COMPONENTS.

- A. Cisco WS-C2960S-24PS-L (POE ports)
 - 1. Generally supplied by Department of Innovation and Technology, arranged by Owner

2.6 CCTV CAMERA HOUSING

- A. The Contractor shall provide all cameras with permanent connections. Specifically, wiring shall not be open or loose. It is the contractors responsibility to provide rigid conduit for all installations to prevent wire tampering.
- B. Camera housings and their installation shall be coordinated with the owner as to maintain the esthetics of the installation sites.
- C. Camera platform shall be constructed of a non-conductive or insulated to eliminate grounding problems.
- D. Exterior camera housing shall be equipped with internal heating element.
- E. Camera housings shall also have the following characteristics:
 - 1. All cables shall be terminated, encapsulated in rigid conduit.

2. The housing shall be constructed with the intent to provide quick and easy servicing of the camera within it. Specifically, a slip in tray or cover with 180° opening.
3. The Contractor shall coordinate with the Owner the exact architectural style of the housing and finish, prior to ordering.
4. It the Contractors responsibility to perform all necessary calculations to verify that lens and camera combination can be accommodated by the housing being furnished.
5. Camera Housing shall have tamper resistant screws. The Contractor shall provide the Owner (2FM Alarm Section) with a tool to remove the tamper resistant screws allowing them to service the housing themselves.

2.7 CAMERA MOUNTS TO 281302

- A. Camera mounts shall be 100% compatible with the housing being provide and shall have the following characteristics:
 1. The Contractor shall field verify each camera location, prior to ordering.
 2. Mounts shall be constructed from steel or aluminum and shall prevent corrosion.
 - a. Mounts shall be 100% compatible with the housing.
 - b. Fixed cameras mounts and their installation shall be coordinated with the owner as to maintain the esthetics of the installation sites.

2.8 CAMERA POWER SUPPLY

- A. This section pertains to cameras that shall be powered from central location(s) and shall operate from a power source. Power supplies shall also have these characteristics.
 1. The Contractor shall furnish isolated power supplies, where required.
 2. Support eight (8) individually fused outputs. Fused outputs shall allow the Contractor to conduct maintenance on any given camera that is connected to the power supply without dropping power to the remaining seven (7) cameras.
 3. Power supply components shall be furnished in a lockable enclosure constructed for wall mounting.
 4. Each camera shall have an isolated fuse associated to only one given camera. Multiple cameras powered in series from a common fuse shall not be acceptable.
 5. The power supply shall additionally have two points of surge suppression. Typically, a main fuse and an inline fuse to protect cameras from up line surges.
 6. The unit shall maintain camera sync.
 7. Power supplies shall be equipped with a main power switch located inside the enclosure.
 8. Power supplies shall be UL 2044 listed.
 9. Power supplies shall be furnished to provide 120% of the current requirements for all associated locking devices.
 10. Power supplies shall be equipped with a minimum of a (8) eight-hour backup battery for continued camera operation after a power failure.
 11. Power supplies shall be equipped with the following features
 - a. Battery Backup:
 - 1) Built-in charger for sealed lead acid or gel type batteries.
 - 2) Automatic switch over to stand-by battery when AC fails.

- 3) Zero voltage drop when unit switches over to battery backup

2.9 VMS (VIDEO MANAGEMENT SYSTEM) SOFTWARE FEATURES SOME USED 281302

- A. The VMS shall be based on a true open architecture that shall allow the use of non-proprietary workstation and server hardware, non-proprietary network infrastructure and non-proprietary storage.
- B. The VMS shall offer a complete and scalable video surveillance solution that shall allow cameras to be added on a unit-by-unit basis.
- C. The VMS shall interface with analog-to-digital video encoders and IP cameras and with digital-to-analog video decoders, hereafter referred to as digital video servers (DVS). The VMS shall support DVS from various manufacturers.
- D. The VMS shall integrate DVS using the DVS native SDK or using the following industry standards to interface to the DVS:
 1. ONVIF
- E. All video streams supplied from analog cameras or IP cameras shall be digitally encoded in MPEG-4, MPEG-2, MJPEG, H.264, Wavelet, or JPEG2000 compression formats and recorded simultaneously in real time.
- F. All audio streams supplied from IP video servers shall be digitally encoded in g711 (u-law), g721, g723, or AAC compression formats and recorded simultaneously in real time.
- G. Each camera's bit rate, frame rate, and resolution shall be set independently from other cameras in the system, and altering these settings shall not affect the recording and display settings of other cameras.
- H. The VMS shall be able to use multiple CCTV keyboards to operate the entire set of cameras throughout the system, including brands of cameras from various manufacturers and including their PTZ functionalities (i.e.: Pelco keyboard controls Panasonic dome or vice-versa).
- I. The VMS shall be able to retrieve and set the current position of PTZ cameras using XYZ coordinates.
- J. The VMS shall support PTZ camera protocols from multiple manufacturers, including analog and IP protocols.
- K. The VMS shall arbitrate the user conflict on PTZ usage based on user levels per camera.

2.10 NVR HARDWARE FEATURES

1. The NVR server shall have recording resolutions of CIF, 2CIF, and D1 and shall be user selectable for each individual analog camera attached to the server.

Standard resolution and high resolution mega-pixel IP cameras shall also be selectable. MPEG-4 ASP or MJPEG video compression format shall be user selectable on any camera. Video recording shall be available at up to 30 images per second per input channel depending on IP camera type and server model selected.

2. The NVR server shall have video outputs for multi-monitor and spot monitors touring (switching) between analog camera video in either full, quad (2 x 2), 3 x 3, and 4 x 4 screen display modes.
 - a. The exacqVision Server shall be capable of recording line level audio, with synchronous video playback as well as playing live audio from any single audio channel selected.
3. Each server shall have the capability of automatically exporting a predetermined time frame of video to the internal server DVD/CD device upon an external trigger input connected to the server or by depressing a specific switch on the server. Such input shall export to the DVD/CD device a user defined amount of video and video camera source both pre and post event schedulable to the maximum capacity of the DVD/CD media selected.
4. Server hardware shall have an internal DVD/CD device that will allow the server to export video clips to the device in Standalone.Exe (*.exe), AVI Files (*.avi) and PS Files (*.ps) formats.
5. Each Server shall have a watchdog system that monitors the system and automatically reboots the system should it lock-up or fail to operate.
6. Each server shall be capable of integration with the City's SMS, Manitou, from Bold Technology.
 - a. Common System components

2.11 MONITOR AND KEYBOARD

- A. Provide a 22" color monitor, keyboard and mouse. A rack mounted tray/shelve to serve as an operator interface for the NVR.

2.12 UPS SYSTEM SEE OTHER SECTIONS

- A. Provide UPS systems to ensure continuity of electric power to the load without any interruption, upon failure of the normal power source. Emergency electric power to the load shall be maintained for 240 minutes, at a minimum.
 1. Enclosure:
 - a. Shall provide all the hardware necessary to mount in a standard 19-inch equipment rack.

2.13 INSTALLING AND UPDATING VMS CLIENT SOFTWARE. TO 281302

- A. Installing a new release of the VMS Client software shall be easily accessed by clicking on an icon in the Client software that will connect to a website and give an option to automatically download the new software. If the most recent version of the VMS software is already installed a message box will be displayed informing you have the most recent release.

- B. Provide required power outlets, interconnecting cables, hardware and equipment for a complete and operable system.
- C. Perform complete programming of the system, including matrix switch, and NVR(s) in coordination with the Owner, or designated representative. Programming shall include, but not be limited to, elimination of duplicate or redundant titling information, synchronization of system clocks, camera sequences, dome presets, salvos and tours. Programming of any system passwords or limiting of accessibility prior to commissioning and training is prohibited.
- D. Obtain IP addresses from 2FM Alarm Section for initial setup of all devices.

END OF SECTION 28 00 03

SECTION 28 01 00 - OPERATION AND MAINTENANCE OF COMMUNICATIONS**PART 1 - GENERAL****1.1 SUBMITTAL REQUIREMENTS**

- A. Closeout
 - 1. Operation and Maintenance Manual: For equipment and systems to include in operation and maintenance manuals.

- B. Shop Drawings
 - 1. As-Built Drawings: For recording installed conditions that deviate from design documents.

1.2 OPERATION AND MAINTENANCE MANUAL

- A. The contents of operating and maintenance manual shall include the following:
 - 1. Project Information Cover: Title of Project; Name and address of Owner, Design Professionals, Contractor of Record and Subcontractor; System name and specification references.
 - 2. Index: Contents of the manual.
 - 3. Warranty Statements: Furnish a warranty statement for each system, reiterating the terms of warranty identified within the Contract Documents, and identifying how the Owner is to obtain warranty service. Clearly identify which products are covered by Manufacturer warranties beyond the Contractor required minimum warranty period. The term of manufacturer warranty shall also be identified (e.g., 1-year parts and labor). Identify the date that the warranty for the system starts. This date shall be the date listed on the Certificate of Substantial Completion (if one was issued to the contractor specifically for the system) or the date listed on the Notice of Final Completion. Supply standard out-of-warranty service rates and service contact information.
 - 4. Bill of Materials: List of products supplied, and serial numbers of each product.
 - 5. Product Datasheets and Shop Drawings: Manufacturer datasheets and shop drawings for each product and system supplied.
 - 6. Manufacturer Owner / User Manuals: Manufacturer's Owner's or User's manual for each product, and Manufacturer's Installation instructions and other documentation supplied with the product.
 - 7. Extra Material Schedule:
 - a. Complete spare parts schedule for components of equipment furnished, which are not factory generic information, but accurate for the equipment provided.
 - b. Itemized list of each piece of communications, architectural and Owner equipment having communications connections with termination locations; also, list related expendable equipment required for each item as applicable.
 - 8. Maintenance Procedures: Maintenance procedures for routine preventative maintenance and troubleshooting; disassembly, repair, and reassembly; testing, aligning and adjusting instructions.

9. Function and Operating Descriptions: Description of function, normal operating characteristics and limitations, performance curves, engineering data and tests, and complete nomenclature and commercial numbers of replacement parts.
10. Operating Procedures: Manufacturer's printed operating procedures including start-up, break-in, normal operating instructions, regulation, control, stopping, shutdown, and emergency instructions.
11. Include Product Certificates, Source quality-control test reports and Field Quality-Control Reports
12. Test Reports and Checklists: Test reports, checklists, and other forms generated and completed for the Project.
13. Training Information: Copy of training outlines/agendas, training session handouts, training sign-in sheets, and signed delivery receipt for each training session recording; Separate USB drive, labeled, for audio/video-recorded instructions to Owner, for operations and maintenance for each system.
14. As-Built Drawings.
15. Software: Application and operating software documentation; Software licenses; Software service agreements; Manufacturer's operating specifications; design user's guide for software and hardware; Editable configuration files for system equipment; Software source code used in supplied products; Compiled versions of configuration files and source code; IP addresses of products configured to have static IP addresses; MAC addresses of products featuring network communication ports (wired and/or wireless); Network device names for products configured for DHCP; Software required for reviewing and editing supplied files.

1.3 AS-BUILT DRAWINGS

- A. Obtain two complete sets of communications prints and use them to provide progress record drawings which are separate, clean, prints reserved for the purpose of showing a complete picture of the work as actually installed (including routing of conduit and cables). These drawings also serve as work progress report sheets. Make notations, neat and legible thereon daily as work proceeds. Make these drawings available for inspection at all times and keep them at the job at a location designated by the Owner's Representative.
- B. Maintain the clean, undamaged set of prints of drawings as well as a set of submittal drawings and coordination drawings. Mark the sets to show the actual installation where the installation varies from the Documents as originally shown. Include locations of underground and concealed items if placed other than shown on the Documents. Where shop drawings are used, record a cross-reference at the corresponding location on the Drawings. Give particular attention to concealed elements that would be difficult to measure and record at a later date.
- C. Show changes in: size, type, capacity, etc., of material, device or piece of equipment, location of device or piece of equipment; location of outlet or source of building service systems; routing of piping, conduit, or other building services. Record location of concealed equipment, by indication of measured dimensions to each line from readily identifiable and accessible walls, column lines or corners of building. Indicate approved substitutions, modifications, and actual equipment and materials installed.

- D. Affix near the title block on each drawing the Contractor's Company Name(s), signature of Contractor's Representative(s) and current date.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 INSTRUCTION OF THE OWNER'S PERSONNEL

- A. Provide instruction in the proper operation and maintenance of equipment that requires routine servicing. Include the following:
1. Review of operation and maintenance manuals.
 2. Required tools.
 3. Extra Materials.
 4. Cleaning.
 5. Hazards.
 6. Warranties and maintenance agreements.
- B. Demonstrate equipment and systems operation including the following:
1. Start-up.
 2. Shut-down.
 3. Emergency conditions.
 4. Safety procedures.
 5. Setpoint and schedule adjustments.
 6. Economy and efficiency adjustments.

END OF SECTION 28 01 00

SECTION 28 05 01 - BASIC MATERIALS & METHODS FOR ELECTRONIC SAFETY A SECURITY**PART 1 - GENERAL****1.1 SUMMARY**

- A. Section Includes: Requirements applicable to work of this Division.
 - 1. Basic materials, methods and installation guidelines applicable to the installation of all communication systems.

1.2 QUALITY ASSURANCE

- A. Explosives
 - 1. Use of explosives at the project site shall not be permitted.
- B. Welding
 - 1. Welding at the project site, where necessary, shall be performed only by persons licensed to perform such work at the project site(s). Welding shall require a permit and the approval of the Owner's Representative. Request for permission to perform onsite welding shall be submitted in writing through designated project channels.

PART 2 - PRODUCTS**2.1 CABLE BUNDLING HARDWARE**

- A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. Hellermann Tyton.
 - 2. Millepede, Inc.
 - 3. Panduit.
 - 4. Velcro.
- B. General: Provide reusable, adjustable cable straps.
 - 1. Hook and Loop Fastener:
 - a. Shall be utilized within all cabinets and racks and below the ceiling of Telecommunications and Equipment rooms.
 - b. Provide plenum rated ties in plenum environments.
 - c. Minimum cable strap width shall be 3/4-inch.
 - d. Basis of Design: Velcro One-Wrap Qwik Ties.
- C. Nylon Plastic Cable Management Ties:
 - 1. Not to be used within cabinets or racks or below the ceiling line in Telecommunications or Equipment rooms.

2. Provide plenum rated tie in plenum environments.
3. Outdoor ties shall be Weather and ultraviolet resistant.
4. Sized as necessary for the quantity of cables.
5. Cable tie shall have no sharp edges when cut.
6. Basis of Design: Panduit PLT series.

PART 3 - EXECUTION

3.1 COORDINATION

- A. Coordinate layout and installation of system equipment and system components with other construction that penetrates roofs, risers, masonry, ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.
- B. Install all system components and appurtenances in accordance with the Contract Documents and per manufacturer's instructions.
- C. Installation of conductors shall comply with the Contract Documents, manufacturer's recommendations, and the Chicago Electrical Code Article 900 using the 40% fill column from the appropriate table.
- D. High Voltage Wiring
 1. Review all high voltage provisions for This Contractor's work with the Division 26 electrical contractor. Coordinate specific device termination, loading and circuiting requirements with the electrical contractor.
- E. Coordinate installation of new pathways with parties and the Work that will utilize the pathways, prior to installation.
- F. Review pre-existing pathways prior to installation of the Work, and report to the Designer any discrepancies between specified pre-existing pathway conditions and actual existing pathway conditions.
- G. Participate in coordination efforts through the preparation of shop drawings and details prior to fabrication or installation of any products. Coordinate actual clearance requirements of installed products.
- H. Begin coordination immediately upon award of contract. Coordinate the Work with other parties and adjust equipment locations accordingly. Participate in the preparation of coordination drawings.
- I. Devices and equipment shall be located symmetrical with architectural elements and shall be installed at the heights and locations shown on the Drawings. If a height or location is in question, seek immediate clarification from the Designer.
- J. Evaluate the Contract Documents and existing conditions to gain an understanding of the peculiarities and limitations of the spaces where the Work is to be performed. The final Work shall be accessible for servicing. Although the locations of equipment and

conduit may be shown on the Drawings in certain positions, the architectural details and conditions existing on the Project shall guide the Contractor, coordinating the Work with that of others. Provide necessary offsets to provide a neat workmanlike arrangement.

- K. The Drawings are generally diagrammatic and indicate the design intent, required sizes, points of termination and, in some cases, suggested routes of raceways. However, it is not intended that the Drawings indicate fully coordinated routing and placement or necessary offsets.
- L. Refer to each Drawing, including enlarged plans, elevations, sections, and details for additional information that may include dimensions and greater resolution and notes that serve to refine the intent and further assist and guide installation.
- M. Work in harmony with other parties performing work at the project site so as not to cause any delays in pouring concrete or erecting masonry walls. Consult each Contract Drawing, including those predominately used by other trades, before installing Work so as to ensure that performance of Work will not interfere with or be adversely affected by Work of others.
- N. Attend each regularly scheduled project meeting as well as any special meetings called to coordinate and/or resolve special issues that arise during the course of the Project.
- O. Conflicts in equipment and materials shall be corrected prior to installation. Should there be a conflict with drawings of other trades, work with the other trades to correct the conflict while coordinating the Project (prior to installation). If a conflict cannot be resolved, seek the direction of the Owner's representative. Refer to the drawings used by other trades for details, dimensions and locations of their work and route around their work so as not to conflict. Work installed that creates a conflict shall be removed and readjusted to the satisfaction of the Owner's representative at the Contractor's expense.

3.2 INSTALLATION

A. Conduits

1. All IDS cabling shall be encased in conduit **Blue** in color minimum of $\frac{3}{4}$ ".
2. All CCTV cabling shall be encased in conduit **Purple** in color minimum of $\frac{3}{4}$ ".
3. All ACMS cabling shall be encased in conduit **Orange** in color minimum of $\frac{3}{4}$ ".
4. All fire systems shall be encased in conduit **Red** in color minimum of $\frac{3}{4}$ ".
5. If conditions do not allow for colored conduit to be installed, the contractor is responsible for labeling the conduit and to inform the Owner as how to proceed immediately.

B. General:

1. Enclosure Penetrations: Penetrations of interior enclosures involving transitions of conduit from interior to exterior, and all penetrations on exterior enclosures shall be made with water tight hubs. The conduit riser shall terminate in a suitable junction/pull box (see Div. 26). When required, the riser shall be sealed as recommended by the cable manufacturer and in such a manner that the cable is not damaged.

2. Install the Intrusion Detection, Access Control, and Video Surveillance related equipment as specified by the manufacturer and as shown, provide mounting hardware sized appropriately to secure each device for conditions encountered at the site; connect signal lines and AC power to equipment interfaces.
3. Install systems in accordance with manufacturer's recommendations. This includes, but is not limited to the following:
 - a. Wiring within racks shall be routed horizontally and vertically in neatly tied bundles. Point-to-point wiring shall not be used.
 - b. Cable bundles shall cross from one rack to the next at the top, center, or bottom only, leaving sufficient working room within the rack.
 - c. Wiring for shall be tie-wrapped or Velcro-strapped so that all connectors in a bundle can be removed and re-installed without the possibility of cross connecting.
 - d. Where wiring is routed through sheet metal or over frame members, the metal edges shall be covered with flexible grommeting or edge dressing designed for this purpose.
 - e. Double-sided foam tape shall not be used to secure any terminal boxes, relay bases or circuit boards, etc. All device mounting shall be of a permanent nature.
 - f. All excess length AC cords are to be tie-wrapped out of the way, and new plugs installed.
 - g. All cabling shall be in conduit, present a professional appearance, and maintain the esthetics of the installation area. Refer to Division 26.
 - h. Care shall be exercised at all times to protect Owner's property.
4. Provide all panel wiring required, including temporary wiring. Install wiring in accordance with CEC and NFPA regulations (as applicable), local building codes and ordinances, and all Owner wiring standards. Contractor shall be responsible for obtaining and adhering to applicable regulations, codes, ordinances, and standards.
5. Provide cable labeling per Division 26. Label all conductors at each end with legible, laser printed, self-laminating vinyl labels.
6. Cabling installed within open ceilings shall be ran in conduit or fully concealed from view behind the building structure.
7. Work installed in finished areas shall be concealed.
8. Sequence, coordinate, and integrate installations of communications materials and equipment with the work of other trades for efficient flow of the Work.
9. Install systems, materials, and equipment to conform to reviewed submittal data, including coordination drawings.
10. Install systems, materials, and equipment level and plumb, parallel and perpendicular to other building systems and architectural/structural components (prevailing building lines), except as expressly detailed otherwise or required for proper form, function or Designer intended operation. Except where otherwise specified, detailed or directed by the Designer, install visible products level to within 1/8-inches per 100-feet.
11. Install equipment to facilitate servicing, maintenance, and repair or replacement of equipment components. Connect equipment for ease of disconnecting, with minimum of interference with other installations.
12. Install systems, materials, and equipment giving right-of-way priority to systems required to be installed at a specified slope.
13. Protect the structure, furnishings, finishes, and adjacent materials not indicated or scheduled to be removed.

14. Verify dimensions by field measurements. Take measurements and be responsible for exact size and locations of all openings required for the installation of work. Figured dimensions are reasonably accurate and should govern in setting out work. Where detailed method of installation is not indicated or where variations exist between described work and approved practice, direction of the owner's representative on job shall be followed.
15. If during construction it becomes apparent that certain minor changes in layout would result in a neater appearance or better arrangement, such alterations shall be made as part of the Contract. Designer's review shall be obtained before making such changes.
16. Workmanship throughout shall conform to the standards of best practice. Marks, dents or finish scratches shall not be permitted on any exposed materials, fixtures or fittings. Interiors of panels and equipment boxes shall be left clean.

C. Cabling

1. Cabling utilized for the interconnection of field items specified herein shall comply with or exceed the recommendations of the component manufacturers.
2. Refer to Specification Division 28 for general wiring requirement.
3. Material and method utilized for the equipment described herein must meet the local building code and all the applicable codes.
4. Use caution not to exceed the manufacturer allowed bending radius for cables and not to compromise the integrity of the cables during installation by pulling cable management devices too tightly, damaging cables. Raceway/cabling bending radii shall be minimum as directed by cable manufacturer. Use pulling compound or lubricant where necessary to ensure cable does not experience tension beyond manufacturer limits during installation. Compounds used shall be compatible with the cable and pathway products and shall not cause deterioration of either.
5. Where indicated, provide color-coded jackets to identify runs of different systems.
 - a. See related specifications and drawings for applicable color coding.
6. Neatly route cables parallel and perpendicular to building architectural lines.
 - a. Cables and cable assemblies shall be run as straight as possible and symmetrical (perpendicular to or parallel with) with architectural items and at a consistent elevation. Work installed diagonal to building members shall not be permitted.
7. Neatly comb out multiple cable bundled runs to remove tangling and crossing of cables within the bundles. Neatly dress all cable work and provide vertical and horizontal cable management (or other approved method) for properly dressing all work at racks, control panels, backboards etc. See detail(s) if applicable.
 - a. To avoid Alien Crosstalk, do not cinch UTP cables into tight bundles.
8. Cable shall be installed within approved pathways. Cables not installed within raceway, cable tray or ladder rack shall be supported by discrete cable supports. Support cables at box and faceplate.
9. All penetrations to walls and floors designed to shall include metal sleeves. All sleeves shall be mechanically secured in place and sealed between the sleeve and structure. Apply firestop to the interior of the sleeve.
10. Loosely bundle cables within racks, ladder racks, cable trays and in discrete cable supports. Utilize reusable cable bundling hardware. Utilize plenum-rated hardware in plenum spaces.
11. Plenum-rated cable ties shall be used wherever wire ties are permitted and wherever plenum rated cable is used.

12. Cable ties shall never be used in a manner that causes deformation of the cable jacket, damage to the cable, or has any adverse effect on the usability, specifications or longevity of the cable(s) on which it is applied.
13. Velcro type wire ties shall be used in non-plenum spaces; in equipment racks; in rack cabinets, and; in related equipment housing enclosures and backboards.

D. Cable Support

1. All cables shall be supported/anchored every 5 feet (or less) and within 12" of device boxes, outlets, racks/cabinets and cable tray.
2. Use J-Hook type cable supports for all cables run outside of conduit or cable tray. Bridle rings shall not be used for Communications Technology cables.
 - a. Use separate J-Hook cable support systems for cables belonging to different systems and for cables carrying different operating levels. See Cable Separation guidelines in this section.
3. Loosely secure cables at each J-Hook.
4. Cables shall not be directly or indirectly supported by a suspended ceiling or any other surface, support, material or structure not permissible for this use by all applicable codes and standards.
5. Cable pathway
 - a. Use and positioning
 - 1) Pathway shall be installed to form a reusable pathway system.
 - 2) Totally enclosed raceways (i.e. conduit, wireway, etc.) shall be utilized to span in-accessible or working spaces (i.e. offices, classrooms, etc.).
 - 3) Cable trays and discreet cable supports shall be utilized to support cables.
 - a) To form an open-top reusable pathway
 - b) Shall be used in accessible ceiling cavities and areas not accessible by the public (i.e. mechanical and service areas).
 - c) Shall follow corridors unless specifically noted otherwise.
 - d) Shall provide usable clearances above, below and beside for access space for the re-use of the pathway. Minimum 6" below and beside and 12" above.

E. Cable Separation:

1. Low-voltage cables shall be kept as far from electrical cables and equipment as possible. Avoid running low-voltage cables parallel to medium and high-voltage cables. When parallel runs cannot be avoided, keep low-voltage cables at least 24 inches away and cross cables at 90 degrees to minimize the risk of interference
2. Low-voltage cables shall not be permitted in the same conduit with high-voltage electrical cables.
3. Avoid running low-voltage cables any closer than 24 inches to any ballast type lighting fixture or other high RF energy producing device.
4. Cables for each system shall be installed separately and isolated from cables from other systems.
5. Cables carrying signals of different types and different nominal operating levels shall be kept separated to reduce the risk of undesirable interference and cross-talk between cables.
 - a. As a general rule, for each 25dBV difference in nominal operating level between cables, provide at least 6 inches of separation. Example 1: Cables with a 75dBV level difference between them shall be separated by 18 inches

- or greater. Example 2: Cables with a 13dBV difference between them shall be separated by 3 inches or greater.
- b. Contractor shall provide additional separation to prevent and to remedy any crosstalk that adversely affects the performance and usability of the system, or that exceeds specific crosstalk performance guidelines defined elsewhere in these specifications.
 - c. Provide greater separation than this guideline where the contractor believes and/or determines it is necessary to prevent or remedy interference between cables.
6. Keep length of parallel runs to a minimum. Cross cables of different nominal levels at 90 degrees.
 7. In common areas where cables from multiple systems are run in general proximity to one another, cables from each system shall be labeled to identify the system the cables serve.
 8. Additional pathway devices/systems shall be provided as required to comply with cable separation requirements, including, but not limited to, conduits, sleeves, discrete pathway devices and cable tray.
- F. Cable Splices:
1. Splices shall not be permitted in any cable except where expressly specified and/or approved by the Designer.
 2. In cases where splices are specified and/or otherwise reviewed and permitted, splices shall be made within UL listed junction or device boxes. Open air connections shall not be permitted.
- G. Cable Terminations:
1. Termination types shall correctly match cable and device termination. As an illustration, if “spade lug” type of termination is appropriate, then the spade lug cable entry size shall match the cable used. The spade lug shall also have the correct stud size to match the terminal to which it is connected. Terminations shall be completed with tools designed and sized for the specific application and connector.
 2. Where field installed cables connect to manufactured products via pig-tails or connectorized cable assemblies, terminations shall be made within the product enclosure or within a UL approved box. Exposed and open air splices shall not be permitted.
- H. Strain Relief:
1. Permanently installed cables shall be properly secured with an approved device. Strain relief shall be applied typically within 6 inches from the point of entry into a product enclosure, junction box, pull box, or device box. When properly applied, the strain relief device shall not damage the cable being secured and shall not permit movement of the cable in any way that may adversely affect the long-term integrity of nearby connections.
- I. Identification:
1. General:
 - a. Identification shall be in English, except as otherwise noted.
 - b. Where identification is applied to surfaces that require a finish, install identification after the surface finish is applied.

- c. Labeling products, color, sizes, nomenclature and location of the identification product are subject to the review of the Designer.
 2. Cables:
 - a. Each cable shall be uniquely labeled at each end.
 - b. Labels shall be permanent and feature computer generated type-written text.
 - c. Label text shall be bold-type and clearly readable by a person with average sight, and under the lighting conditions typical within the area of installation.
 - d. Labels shall be applied approximately 4-6 cable-inches from the point of termination.
 - 1) Adjust application to make legible during service/maintenance of system.
 - e. Systems cables installed for "Future Use" shall be clearly identified as such at both ends. Such cables shall be labeled to identify where the opposite end of the cable can be found.
 - 1) Not applicable for Structured Cabling for voice/data connectivity.
 - f. Each cable installed shall be recorded on the as-built drawings.
 3. Boxes:
 - a. Junction boxes and pull boxes shall be labeled on their interior and on their exterior covers with the identity of the system(s) the box serves along with the function of the box. Interior markings shall be made using permanent marker. Permanent marker may also be used on the cover of boxes installed in concealed areas (above accessible ceilings, for example). Exposed boxes shall be labeled with engraved plastic labels. Labels shall closely match the color of the box.
 - b. Device boxes, when first installed, shall be identified on its interior as to the system(s) served and the device(s) the box will contain.
 - 1) Where conduit feeding the device box is concealed, label the exterior of the conduit with permanent marker.
 4. Equipment Racks, Cabinets, Enclosures:
 - a. Equipment racks and enclosures shall be labeled.
 - b. The nomenclature, color, size, installed location, and type of labels are subject to the Designer's review.
 5. System Equipment:
 - a. Each individual instance of system equipment shall be labeled.
 - b. Front panel controls of equipment shall be labeled with nomenclature meaningful to the end user based on the intended use of the equipment in the system. Examples include, but are not limited to:
 - 1) Label router/matrix control panels with system specific input/output names.
 - 2) Label patch panels with meaningful input/output destination names.
 - 3) Label mixer input and output controls to identify the signal source and destination.
 - c. Professionally prepared, installed and readily visible "cheat sheets" may be acceptable under select circumstances with the approval of the Designer.
 - d. The nomenclature, color, size, installed location, and type of labels are subject to the Designer's review and approval.
- J. High Voltage Cabling (greater than 70.7 Volts):
1. Cabling that carries voltages higher than 70.7 Volts RMS AC or DC shall be installed and terminated by persons licensed to perform such work.

- K. Plates and Panels:
 - 1. Box covers and faceplates shall be installed flush against the surface over which it is mounted. There shall be no visible gap between the backside of a plate/panel and the wall, ceiling or floor; there shall be no visible gap between the backside of plate/panel and a surface mount box to which the plate/panel mounts). Advanced craftsmanship and construction techniques shall be employed where necessary to achieve this.
 - a. The same shall apply to other wall and ceiling mounted products.
 - 2. Plates and panels shall be installed with all screw holes filled and fastened securely.

- L. Device Boxes, Pull-Boxes, Junction Boxes:
 - 1. Boxes installed in walls and ceilings shall be installed so that the box does not stand proud (protrude out beyond) of the finished surface. Boxes shall be installed such that when the mounted devices and cover plates are installed, the backside of the cover plate rests flush with the finished surface of the wall or ceiling. Advanced craftsmanship and construction techniques shall be employed where necessary to achieve this.

3.3 GROUNDING

- A. All twisted pair shields shall be grounded at one point only. Cables that originate from equipment in systems/electrical rooms and terminate at field devices shall be grounded to the signal ground terminal in the system / electrical room. The field end shield shall be pulled back, trimmed, and taped in a good workmanlike manner.
- B. Equipment, racks and associated devices shall be grounded per Division 27 specification.
- C. Equipment shall be properly bonded to ground for the safety of personnel and property and as additionally necessary to satisfactory performance of the equipment.
- D. Comply with Section "Grounding and Bonding for Communications."

3.4 CUTTING, PATCHING AND SEALING

- A. General:
 - 1. Perform cutting as required for the execution of the Work. Unless directed otherwise in the field, provide related patching and painting to match surrounding methods, materials and colors. Any damage caused during the progress of Work shall be remediated. Perform cutting, fitting, and patching and materials as required to:
 - a. Uncover Work to provide for installation of ill-timed Work.
 - b. Remove and replace defective Work.
 - c. Remove and replace Work not conforming to requirements of the Contract Documents.
 - d. Remove samples of installed Work as specified for testing.
 - e. Install equipment and materials within existing structures.

2. Upon written instructions from the Owner's representative, uncover and restore Work to provide for observation of concealed Work by Owner's representative or by inspection by the Authority Having Jurisdiction.
 3. During cutting and patching operations, protect adjacent installations (e.g., structure, finishes, and furnishings). Where applicable, provide and maintain temporary partitions or dust barriers adequate to prevent the spread of dust and dirt to system components and components of other trades.
 4. Patch surfaces and building components using new materials matching existing materials and using experienced Installers. Refer to Division 01 for definition of experienced "Installer" or determine qualifications as directed in the field by the Owner's representative.
 5. Patching through fire rated walls and enclosures shall not diminish the rating of that wall or enclosure. Materials used for patching shall be installed to meet or exceed the smoke and fire rating of the respective surface being patched.
 6. Neatly cut and drill openings in walls and floors where openings are required for installation of the Work. Secure the approval of the Owner's Representative before cutting and drilling in existing facilities. Neatly patch any openings created.
 7. Cutting and patching shall be held to a minimum by arranging with other parties for sleeves and openings before construction is started.
 8. Provide factory-assembled watertight wall and floor seals, of types and sizes required, suitable for sealing around conduit, pipe, or tubing passing through concrete floors and walls. Construct seals with steel sleeves, malleable iron body, neoprene sealing grommets and rings, metal pressure rings, pressure clamps, and cap screws.
 9. Pipe sleeves shall be fabricated from Schedule 40 rigid, heavy wall, full weight galvanized steel pipe; remove burrs. Use sleeves which are two standard sizes larger than conduit passing through respective sleeve.
 10. Provide sleeve seals for piping that penetrates foundation walls below grade, or through exterior walls or roofs. Caulk between sleeve and pipe with non-toxic, UL-classified caulking material to ensure watertight seal. Elsewhere provide mechanical type seals, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between pipe and sleeve, connected with bolts and pressure plates which cause rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.
 11. Install standard Schedule 40 black steel pipe sleeves two sizes larger than pipes passing through floors, bearing walls, fire walls and masonry construction. Furnish and set forms required in masonry walls or foundation to accommodate pipes.
- B. Grout:
1. Provide non-shrink, nonmetallic grout, pre-mixed, factory-packaged, non-staining, non-corrosive, and non-gaseous grout, recommended for interior and exterior applications.
- C. General Joint Sealer Application:
1. Joint sealers, joint fillers, and other related materials compatible with each other and with joint substrates under conditions of service and application.
 2. Apply joint sealers under temperature and humidity conditions within the limits permitted by the joint sealer manufacturer. Do not apply joint sealers to wet substrates.
 3. Clean affected surfaces, joints, etc. immediately before applying joint sealers to comply with recommendations of joint sealer manufacturer.

4. Apply sealant primer to substrates as recommended by manufacturer. Protect adjacent areas from spillage and migration of sealant, using masking tape. Remove tape immediately after tooling without disturbing seal.
5. Comply with joint sealer manufacturers' printed application instructions applicable to products and applications indicated, except where more stringent requirements apply.
6. Immediately after sealant application and prior to time shinning or curing begins, tool sealants to form smooth, uniform beads; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.
7. Colors for exposed seals shall be as selected by the Owner's representative from manufacturer's standard colors.

3.5 FIRESTOPPING

- A. Penetrations created in support of any work of this Division shall be firestopped in accordance with locally applicable codes as acceptable to the Authority Having Jurisdiction.

3.6 TESTING

- A. The Contractor shall provide all personnel, equipment, instrumentation, and supplies necessary to perform all site testing. The Owner shall witness all performance verification. Written notification shall be provided to the Owner one week prior to proceeding with system testing. Original copies of all data produced during performance verification shall be turned over to the Owner at the conclusion of each phase of testing prior to Owner approval of the test.
- B. Cable Testing
 1. All cables and termination hardware shall be 100% tested for defects in the installation and the materials used in order to verify performance under installed conditions. All conductors of each installed cable and system component shall be verified usable by the contractor.
 2. Operational Test: After installation of cables and connectors, demonstrate product capability and compliance with requirements. Test each signal path for end-to-end performance from each end of all pairs installed. Remove temporary connections when tests have been satisfactorily completed.
 3. Copper Cable Procedures: Inspect for physical damage and test each conductor signal path for continuity and shorts. Use Class 2, bidirectional, Category 6 or above tester. Test for faulty connectors, splices, and terminations. Test according to TIA/EIA-TSB67, "Transmission Performance Specifications for Field Testing of Unshielded Twisted-Pair Cabling Systems." Link performance for UTP cables must meet minimum criteria of TIA/EIA-568-A.
 4. Fiber-Optic Cable Procedures: Perform each visual and mechanical inspection and electrical test, including optional procedures, stated in NETA ATS, Section 7.25. Certify compliance with test parameters and manufacturer's written recommended test procedures. Test optical performance with optical power meter capable of generating light at all appropriate wavelengths.

5. All test results shall be well documented and the documentation given to the owner.

3.7 DEMONSTRATION AND ACCEPTANCE

- A. Create a written, step by step, plan to demonstrate the operation of all systems and submit it for approval two weeks prior to the demonstration date. The Owner will review and comment, or approve the plan at that time. Submit a suggested demonstration date and time along with the plan.
- B. On the accepted date, execute the demonstration plan in the presence of the Owner and their representatives. If the demonstration is successful, the systems will be considered accepted and a punch list will be generated. If the demonstration fails, the systems will be considered not accepted and another demonstration event shall be scheduled. This process will be repeated until the systems are accepted.
- C. Multiple Contractor User privilege levels will likely be established during the installation and testing periods of this Project. As a condition of system final acceptance, all Contractor User privileges shall be removed from the system, unless otherwise authorized in writing, by the Owner.

3.8 TRAINING

- A. Training of the Owner's employees shall be provided by a factory trained instructor for each individual system. The training is to cover all systems; ACMS, IDS and video surveillance, including any particulars of the communications network operation.
- B. Training shall be conducted by experienced trainers for each of the systems. The trainers must be certified by the manufacturer of the system for which training is provided.
- C. Training shall take place at a location that is mutually agreed upon between all parties.
- D. Training shall provide information regarding the operation of the systems, diagnostics, data input, alarm handling, as well as any other aspects required to provide a knowledge base to manage the system(s).
- E. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain. Conduct training courses for designated personnel in the maintenance and operation of the systems as specified. The training shall be oriented to the specific system being installed under this contract.
- F. Training manuals shall be delivered for each trainee with two additional manuals delivered for archiving at the project site. The manuals shall include an agenda, defined objectives for each lesson, and a detailed description of the subject matter for each lesson.
- G. The Contractor is responsible for furnishing all training materials and supplies in addition to those described above. Where the Contractor presents portions of the course through the use of audio-visual material, copies of the audio-visual materials shall be delivered

to the Designer, either as a part of the printed training manuals or on the same media as that used during the training sessions.

- H. A training day is 8 hours of instruction, including two 15 minute breaks and excluding lunchtime, Monday through Friday, during times that will allow for all shifts at the facility to obtain training.
- I. Training shall have provided information regarding the operation of the systems, diagnostics, data input, alarm handling, as well as any other aspects required to provide a knowledge base to manage the Security systems.

3.9 ON-SITE ASSISTANCE

- A. When requested by 2FM within one year of date of 2FM sign off/acceptance, provide on-site assistance in tuning and adjusting the system to suit actual occupied conditions and to optimize performance. Provide up to 36 hours of time by a qualified technician, on site, for adjustments of the system without additional cost.

END OF SECTION 28 05 01

SECTION 28 13 01 - SECURITY ACCESS CONTROL SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the limited scope construction materials and methods for application with electrical installations as follows:
 - 1. ACMS, IDS, CCTV and facility's security related equipment.
 - 2. Remote door lock release as well as card reader equipped door access monitoring by ACMS.
 - 3. Miscellaneous materials for support of electrical materials and equipment.
 - 4. Connection to existing head end equipment for monitoring and alarm signals.
 - 5. Monitoring and signal connection to ACMS,IDS, CCTV systems.
 - 6. Provide door hardware for ACMS,IDS system.

- B. The Contractor shall configure the system as described and shown. The system shall include all connectors, adapters, and terminators necessary to interconnect all equipment. The Alarm Contractor's must be a licensed Alarm Contractor in the State of Illinois and City of Chicago, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) on their person and shall be furnished to 2FM Security before work is to begin. In the event of personnel changes the above requirements shall be updated and furnished to 2FM Security before that individual is to begin working.

- C. Data Entry
 - 1. The Contractor shall enter all data needed to make the system operational. The Contractor shall identify and request from the Owner, any additional data needed to provide a complete and operational security system. The completed forms shall be delivered to the Owner for review and approval at least 10 days prior to the Contractor's scheduled needed date.

- D. Related Sections
 - 1. All Division 27 and 28 Sections
 - 2. Technology Series Drawings

- E. Products supplied by others but installed under this Section
 - 1. Card Readers
 - 2. Door Controllers

1.2 SUBMITTALS

- A. Product Data Submittal
 - 1. Manufacturer datasheets for each system component
 - 2. Bill of Materials (BOM) List

- B. Shop Drawing Submittal

1. Plan Drawing(s)
 - a. Depicting the location of all devices and major equipment locations on the project site, coordinated with work of related sections.
2. System Diagram(s).
 - a. Depicting the interconnecting cabling between system equipment located at different locations at the project site.
3. Panel Board Elevations
 - a. Depicting system equipment drawn to scale, including cabling paths and support products and methods.
 - b. Location of products shall be shown coordinated with work of other Sections.
4. Equipment Rack Elevations
 - a. Scaled
 - b. Depicting the locations of all system products installed within the rack, coordinated with work of other sections, as applicable.

1.3 QUALITY ASSURANCE

- A. The contractor providing work of this section shall be engaged in the full-time business of providing integrated security systems of the type and scale of system specified herein.
- B. The contractor shall have been in the full-time business of providing like systems for the last contiguous (60) months. Contractor shall have completed not less the (6) systems of similar size, scope and complexity within the last 12 calendar months and shall be able to demonstrate proof of such upon request.
- C. Programming of the system shall be performed by the Owner.

1.4 SYSTEM DESCRIPTION

- A. General
 1. The system shall be constructed of products from one or more manufacturers that are designed by the manufacturer to integrate and interoperate with one another to the degree necessary to achieve compliance with these specifications.
 2. The system shall achieve integrated Access control functionality within a single unified software user interface solution.
 3. The system shall be capable of and enabled to communicate across a LAN and WAN for both fundamental and administrative functions.
 4. The system shall allow upgrades of both hardware and software seamlessly without the loss of database, system configuration, and historical data.
 5. The system shall feature integrated user interface maps that enable viewing of system status and control of devices (end points), e.g. doors.

PART 2 - PRODUCTS**2.1 MANUFACTURERS**

- A. This specification, the functionality, the products and the system capabilities that are represented herein are based upon capabilities achievable through integration of products from a variety of listed product manufacturers. It is however the responsibility of the Contractor to provide such combination that meets and exceeds all expressed and implied requirements of these project documents.

- B. Commercial Security Products from the following manufacturers will be considered acceptable
 - 1. Access Control System
 - a. Genetec Security Center – Synergis Enterprise
 - 2. ACS Server (hardware)
 - a. None Required
 - 3. Switches
 - a. By AIS
 - 4. Accessories
 - a. Altronix
 - b. Life Safety Power

- C. Latest Version
 - 1. Software supplied shall be the latest and most up-to-date official-release shipping version shipping at the time of acceptance.
 - 2. Hardware supplied shall be the latest and most up-to-date shipping version available at the time of installation, complete with the most current official-release firmware.

2.2 ACCESS CONTROL SYSTEM

- 1. The system shall include alarm monitoring, video imaging and credential badging.
 - 2. Authentication device control modules throughout the installation shall communicate with the system server using IP based communications.
 - 3. Events within the access control installation shall cause video alarm / recordings.
 - 4. The system shall feature a distributed software and hardware architecture.
 - 5. The architecture shall place key access decisions, event/action processing, and alarm monitoring functions within the controllers.
 - 6. Controllers shall operate independently of the host server for extended periods of time in the event communications with the host server is temporarily lost.
 - 7. Communications between the server/workstations, controllers, and other system hardware shall be via the Security Management System server software.
 - 8. Hardware shall include upgradable flash memory designed to enable firmware updates via network communications.
 - 9. The system shall feature supervised and non-supervised alarm point monitoring.
 - 10. Manual or automatic arming or disarming alarm points shall be achievable through the creation of schedules by time of day, day of the week, and date.
-
- B. Database partitioning shall be provided to achieve an administrative option that allows restrictive access to sensitive information by user ID.

2.3 COMPUTERS, MONITORS AND ACCESSORIES

A. General

1. All supplied computers (Servers, Workstations, etc....) and peripherals (monitors etc....) shall meet or exceed software manufacturers' recommendations for running the software and operating the specified system.
 - a. Computers that meet the Access Control manufacturer's "minimum" computer requirements are not acceptable.

B. Work Station Computers

1. Provide software and install it on (5) work station computers, that shall be owner furnished or designated. The software shall also be compatible with Mac OS or the Mac OS Microsoft OS simulation.

2.4 DOOR HARDWARE (COORDINATE WITH ARCHITECTURAL HARDWARE SPECIFICATIONS AND SCHEDULE)

A. Coordinate with the published door hardware schedule and specifications to assure no duplication in the provision of components required for fully functioning access control and door hardware.

1. This includes but is not limited to:
 - a. Door locking device
 - b. Door locking device power supply(s)
 - c. Authentication devices
 - 1) Integral within the door hardware being provided
 - 2) Type of device being provided to assure interchangeable with the access control system provided
 - d. Door status device
 - 1) Integral with the door hardware being provided
 - 2) Assurance with the specified capabilities of the access control and intrusion alarm system(s)
 - e. Request to exit (REX) device
 - 1) Integral within the door hardware being provided
 - 2) Type of device being provided to assure interchangeable with the access control system provided
2. Where these devices are provided in the architectural door hardware specification, the contractor shall integrate them into the access control system.
 - a. This includes but is not limited to:
 - 1) Connection to the access control panel(s)
 - 2) Provision of cabling between the door hardware termination point and the access control panel(s)

2.5 AUTHENTICATION DEVICES

A. Card Reader Dual Frequency 125kHz & 13.56mHz

1. HID (interior only)
2. Essex Electronics (exterior only)

- B. Interior units shall be a HID sealed, single package weatherproof unit and shall be constructed of high impact ABS plastic.
- C. Exterior units shall be an Essex Electronics sealed unit, single package weatherproof unit faceplate shall be constructed of 1/8" stainless steel. Basis of Design shall be Essex IRXP-2
- D. Power for card reader shall be derived from the HID controller; therefore, the Contractor shall adhere to the manufacturer's guidelines for maximum distance from the reader to the controller.
- E. Access control devices shall incorporate a dual means of notification of door operation. Specifically, the access control reader shall supply an audible tone for access granted, access denied, out of service and door propped conditions. Additionally, the reader shall also supply a visual means of notification, such as colored LED's, for the above events. Each of these notifications shall be selectable by the host ACMS system.
- F. Typical access control readers shall be furnished and installed on a single gang backbox in accordance with the manufacturer guidelines. Standard card readers requiring a special mountings shall not be acceptable.

2.6 DOOR HARDWARE (SEE ARCHITECTURAL DOOR HARDWARE SCHEDULE)

- A. Door Status Switches (Provide if not integral with architectural door hardware)
 - 1. Two-piece design
 - 2. Designed for concealed installation
 - 3. Rare-earth magnet switch trigger
 - 4. Double Pull Double Throw (DPDT) contacts
- B. Request to Exit (REX) sensor (Provide if not integral with architectural door hardware)
 - 1. Passive Infrared (PIR) motion sensing type
 - 2. Adjustable time
 - 3. Variable coverage angle

2.7 CABLE

- A. General
 - 1. Supply cable that meets or exceeds the technical requirements of the components being interconnected suitable for the length and signal type and communication speed carried.
 - 2. Supply cable of sufficient gauge to ensure that connected components receive adequate voltage, power and signal integrity to ensure reliable operation of the system.
 - 3. Supply shielded version of cable for interconnection of system components that require such for proper operation.
 - 4. Safety listed by a nationally recognized safety testing laboratory (UL or equivalent)
 - 5. Code compliant for its purpose, location and method of installation.
 - a. For example, plenum rated cable shall be installed in plenum environments.
 - 6. Approved Cable Manufacturers: Windy City Wire.

- a. Basis of Design shall be Windy City Wire #NJ446110

EXECUTION

3.1 GENERAL

- A. Provide labor and all products necessary to render the system(s) complete and working.
- B. In addition to the requirements set forth by these project documents, provide additional work that is reasonable and customary for systems of the type and scope identified herein, as well as additional work recommended to be performed by the product manufacturers for completion of like systems.
- C. Perform work in a code-compliant manner to the satisfaction of the Authority having jurisdiction.
- D. Perform work according to the highest quality industry standards.

3.2 COORDINATION

- A. Refer to project drawings, including but not limited to architectural and electrical drawings for additional details that impact work of this section.
- B. Coordinate adequately with other trades to resolve conflicts.
- C. Review in detail the cabling pathway requirements for this system against the pathways indicated on the drawings.
 1. Review pathways with the pathway system provider.
 2. Take timely and proactive action to ensure that the pathway system is installed accurately and sufficiently supports this system.
- D. Provide qualified representation at project meetings to ensure that work of this section is adequately represented in the project schedule and that work is coordinated with other trades.
- E. Coordinate with the Owner's designated IT and security representative(s):
 1. Sufficiently early in the project so to negate negative impact on the project schedule and allow for timely completion of work.
 2. For the assignment of IP addresses and device naming conventions
 3. Communicate network configuration parameters material to the successful implementation of this system.

3.3 INSTALLATION

- A. General
 1. Install products in accordance these project documents and with product manufacturer's published installation instructions.

B. Conduits

1. All IDS cabling shall be encased in conduit **Blue** in color minimum of ¾".
2. All CCTV cabling shall be encased in conduit **Purple** in color minimum of ¾".
3. All ACMS cabling shall be encased in conduit **Orange** in color minimum of ¾".
4. All fire systems shall be encased in conduit **Red** in color minimum of ¾".
5. If conditions do not allow for colored conduit to be installed, the contractor is responsible for labeling the conduit and to inform the Owner as how to proceed immediately.

C. Authentication Devices

1. Coordinate with door hardware schedule and specifications.
2. Install authentication devices (e.g. card readers, keypads etc...) at the locations and height(s) designated on the drawings.
3. Install devices flat, plumb and level.

D. Door Controllers, Reader and I/O Modules

1. Install door controllers, reader and input/output modules in designated rooms as indicated on the drawings.
2. Equipment shall be mounted within approved communications rooms except where otherwise indicated on the drawings.
3. Equipment shall be mounted to plywood backboards installed over the finished walls within the rooms.
4. Where specific wall locations are indicated on the drawings, use these locations.
 - a. Where specific locations are not identified, review and coordinate mounting locations with the Owner's representative and other trades that also have work in the space.

E. Power Supplies

1. Supply and install power supplies of adequate capacity to allow for full rated operation of all system equipment.
2. Install and Provide power supplies for door hardware, controllers and other equipment within designated/approved rooms.
3. Connect power supplies to AC power.

F. Cabling

1. Install cabling that meets or exceeds the technical requirements of the components being interconnected suitable for the length and signal type carried.
2. Install cable of sufficient gauge to ensure that connected components receive adequate power, voltage and signal integrity to ensure reliable operation.
3. Install shielded cable for interconnection of system components that require such for proper operation.
4. Neatly dress and support all cables.
5. Take precautions to avoid damage to cable during installation, and to protect cables from damage after installation. Avoid cable bends and pulling tensions that are outside the manufacturer's recommended limits.
6. Maintain adequate separation of cables from sources of ingress interference that could negatively impact the performance of this system.
7. Utilize approved pathway products for supporting, securing and protecting cables. Ensure that horizontal cable runs are supported at increments not exceeding 48-inch.

8. Route cables in dedicated pathways, separated from cables serving other systems.
9. Label each end of each cable.
10. Use cable pulling compound/lubricant where necessary. Use only non-hardening compounds that do not deteriorate cable conductors, insulation or pathway components.

G. Grounding

1. All twisted pair shields shall be grounded at one point only. Cables that originate from equipment in systems/electrical rooms and terminate at field devices shall be grounded to the signal ground terminal in the system / electrical room. The field end shield shall be pulled back, trimmed, and taped in a good workmanlike manner.
2. Equipment, racks and associated devices shall be grounded per Division 27 specification
3. Ground products in accordance with industry standards, the NEC and in accordance with additional codes applicable at the project site.
4. Provide special grounding in accordance with referenced standards.

H. Labeling

1. Uniquely label the ends of every cable in the system using permanent computer generated self-laminating wrap-around cable labels.
2. Labels shall be clearly legible, using dark-black bold-type fonts.
3. Record actual label nomenclature on the as-built drawings.
4. Concealed Equipment
 - a. Identify the location of concealed equipment (e.g. TVSS devices) above ceilings, in walls, etc... using a labeling schema agreeable to Owner.

I. AC Power

1. Provide connection of supplied equipment to source(s) of AC power.
2. Provide services of licensed professional electrician to perform work required by code and the local jurisdiction to be performed by a licensed electrician.

3.4 PROGRAMMING

1. By Owner

3.5 TESTING

A. General

1. Conduct a complete inspection and test installed system equipment, inclusive of Owner furnished equipment utilized.
2. Include testing of interconnected equipment specified in other Divisions or Sections (e.g. Life Safety and Elevators).
3. Conduct tests recommended by all system equipment manufacturer(s).
4. Verify alarm condition scenarios perform as programmed
5. Exercise interactive maps and test each object/control.
6. Simulate alarm scenarios and verify each performs as intended by the Owner.
7. Update program to remediate problems encountered.

8. Replace malfunctioning and/or damaged items with new product and retest until satisfactory specification compliant conditions are achieved.

B. Access Control

1. Lock/Unlock based on credential presented
2. Lock/unlock based on time schedule
3. Door status alarm reported correctly on screen
4. Door status shut not reported
5. Schedules function as programmed
6. Special event override works when applied
7. Entry of credential works for each group applied, based on group access rights.
8. Exercise each authentication device, status switch, request to exit device and locking mechanism
9. Verify restoration of normal operation following simulated complete and partial power outage scenarios

3.6 ACCEPTANCE TESTING

- A. Acceptance testing shall be conducted after designer receipt and review of the pre-acceptance submittal aka "Sign Off Report". Allow (10) business days in the project schedule for the Designer's review.
- B. Acceptance testing may include, but may not necessarily be limited to:
 1. Visual and mechanical inspections of Contractor's workmanship.
 2. Inventory of equipment.
 3. Inspection of system components, sub-systems, software, component functionality, etc.
 4. Any other tests or inspections determined necessary by the Designer.
- C. The Contractor shall be onsite in advance of the scheduled acceptance testing time.
- D. Contractor shall have made adequate arrangements for access to all areas of work.
- E. Acceptance Testing will not pass if:
 1. Contractor's work does not appear to the Designer to be of Professional quality and/or the Contractor has failed to follow clearly established installation requirements.
 2. Detailed as-built drawings are not present on site for review and/or are found to be incomplete or inaccurate.
 3. More than one cable inspected is found to be missing required labels or if more than one cable is verified to be inaccurately recorded on the as-built drawings.
 4. Installed equipment does not match the equipment specified and/or reviewed by the Designer (in writing) during the course of the project.
 5. More than one piece of equipment, cable, connector, circuit, etc. fails to pass any test performed upon it by the Designer.
 6. Any substantive specification or workmanship issue judged by the Designer to be of material importance to the long-term usability, safety, professional appearance, or service and maintainability of the Contractor's work; any material deviation from the intent of these specifications.

7. Terminations of connectors ruled to be below the highest quality industry standards.

F. Contractor's Field Testing

1. The Contractor shall calibrate and test all equipment, place the systems in service, and test the systems. The Contractor shall deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the Owner that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure.
2. If any conditions or other conditions exist that cause degradation or interfere with any security device, the Contractor shall inform the Owner.
3. The field testing shall as a minimum include:
 - a. Verification that the any signal or control cabling have been installed, tested, and approved as specified. All cabling to be identified and labeled to be included in test report.
 - b. When the system includes remote control/monitoring stations or remote switch panels, verification that the remote devices are functional, communicate with the center, and perform all functions as specified.
 - c. Verification that all systems devices are fully functional, and that applicable software has been programmed as needed for the site configuration.
 - d. Operation of all electrical and mechanical controls and verification that the control performs the designed function.
 - e. Verification that all cables are terminated properly. Verification that the any signal or control cabling have been installed, tested, and approved as specified.
 - f. When the system includes remote control/monitoring stations or remote switch panels, verification that the remote devices are functional, communicate with the center, and perform all functions as specified.
 - g. Verification that all security devices are fully functional, and that applicable software has been programmed as needed for the site configuration.
 - h. Verification that applicable software is functioning correctly. All software functions shall be exercised.
 - i. Operation of all electrical and mechanical controls and verification that the control performs the designed function.
 - j. Verification that all data sources and data outputs provide a full bandwidth signal at all data inputs.
 - k. Verification that all cables are terminated properly.
4. Deliver a report describing results of functional tests, diagnostics, and calibrations including written certification to the Designer that the installed complete system has been calibrated, tested, and is ready to begin performance verification testing. The report shall also include a copy of the approved performance verification test procedure.

3.7 SYSTEM STARTUP

- A. Do not apply power to any systems until the following items have been completed:
 1. Equipment items have been set up in accordance with manufacturer's instructions.

2. A visual inspection has been conducted to ensure that defective equipment items have not been installed and that there are no loose connections.
3. System wiring has been tested and verified as correctly connected as indicated.
4. All system grounding and transient protection systems have been verified as properly installed and connected as indicated.
5. Power supplies to be connected to the Systems have been verified as the correct voltage, phasing, and frequency as indicated.
6. Verify network communications for the NVR, cameras, S2 controller, and network switch.
7. Provide written and signed checklist indicating this was done.
8. Satisfaction of the above requirements shall not relieve the Contractor of responsibility for incorrect installation, defective equipment items, or collateral damage as a result of Contractor work/equipment.

3.8 DEMONSTRATION AND ACCEPTANCE

- A. Create a written, step by step, plan to demonstrate the operation of all systems and submit it for approval two weeks prior to the demonstration date. The Owner will review and comment, or approve the plan at that time. Submit a suggested demonstration date and time along with the plan.
- B. On the accepted date, execute the demonstration plan in the presence of the Owner and their representatives. If the demonstration is successful, the systems will be considered accepted and a punch list will be generated. If the demonstration fails, the systems will be considered not accepted and another demonstration event shall be scheduled. This process will be repeated until the systems are accepted.
- C. Multiple Contractor User privilege levels will likely be established during the installation and testing periods of this Project. As a condition of system final acceptance, all Contractor User privileges shall be removed from the system, unless otherwise authorized in writing, by the Owner.

3.9 ON-SITE ASSISTANCE

- A. When requested by 2FM within one year of date of 2FM sign off/acceptance, provide on-site assistance in tuning and adjusting the system to suit actual occupied conditions and to optimize performance. Provide up to 36 hours of time by a qualified technician, on site, for adjustments of the system without additional cost.

3.10 CLEANING AND ADJUSTING

- A. Clean installed items using methods and materials recommended by manufacturer.

END OF SECTION 28 13 01

SECTION 28 13 02 - SIMULATION TRAINING VIDEO RECORDING SYSTEM**PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the materials, software and labor as required for a complete working system as follows:
 - 1. New Video Cameras with audio recording capability.
 - 2. Video Recording and Playback Server.
 - a. If the existing VMS hardware can be upgraded to support the new cameras being added with this work, then it may be utilized if not a new server shall be provided.
 - 3. Connection to existing head end equipment for recording and playback.
 - 4. Client Playback Software to be installed on owner supplied computer workstation.
 - 5. Provide all required software licenses.

- B. Related Sections
 - 1. All Division 27 and 28 Sections
 - 2. Technology Series Drawings

1.2 SUBMITTALS

- A. Product Data Submittal
 - 1. Manufacturer datasheets for each system component
 - 2. Bill of Materials (BOM) List

- B. Shop Drawing Submittal
 - 1. Plan Drawing(s)
 - a. Depicting the location of all devices and major equipment locations on the project site, coordinated with work of related sections.
 - 2. System Diagram(s).
 - a. Depicting the interconnecting cabling between system equipment located at different locations at the project site.
 - 3. Equipment Rack Elevations
 - a. Scaled
 - b. Depicting the locations of all system products installed within the rack, coordinated with work of other sections, as applicable.

- C. Training Plan Submittal

- D. Closeout Submittal

1.3 QUALITY ASSURANCE

- A. The contractor providing work of this section shall be engaged in the full-time business of providing integrated security systems of the type and scale of system specified herein.

- B. The contractor shall have been in the full-time business of providing like systems for the last contiguous (60) months. Contractor shall have completed not less the (6) systems of similar size, scope and complexity within the last 12 calendar months and shall be able to demonstrate proof of such upon request.
- C. Programming of the system shall be performed by individuals that are manufacturer certified and fluent in both the software and hardware used to build the system.
 - 1. Each individual shall possess a comprehensive knowledge of the programming options available and have no less than (2) years of actual programming experience for systems of this type.

1.4 SYSTEM DESCRIPTION

- A. General
 - 1. The system shall be constructed of products from one or more manufacturers that are designed by the manufacturer to integrate and interoperate with one another to the degree necessary to achieve compliance with these specifications.
 - 2. The system shall be capable of and enabled to communicate across a LAN and WAN for both fundamental and administrative functions.
 - 3. The system shall allow upgrades of both hardware and software seamlessly without the loss of database, system configuration, and historical data.
 - 4. The system shall feature integrated user interface maps that enable viewing of system status and control of devices (end points), e.g. doors.
- B. The Contractor shall configure the system as described and shown. The system shall include all connectors, adapters, and terminators necessary to interconnect all equipment. The Alarm Contractor's must be a licensed Alarm Contractor in the State of Illinois and City of Chicago, all personnel installing systems must have a State of Illinois Permanent Employee Registration Card (PERC) on their person and shall be furnished to 2FM Security before work is to begin. In the event of personnel changes the above requirements shall be updated and furnished to 2FM Security before that individual is to begin working.
- C. Data Entry
 - 1. The Contractor shall enter all data needed to make the system operational. The Contractor shall identify and request from the Owner, any additional data needed to provide a complete and operational security system. The completed forms shall be delivered to the Owner for review and approval at least 10 days prior to the Contractor's scheduled needed date.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. This specification, the functionality, the products and the system capabilities that are represented herein are based upon capabilities achievable through integration of products from a variety of listed product manufacturers. It is however the responsibility

of the Contractor to provide such combination that meets and exceeds all expressed and implied requirements of these project documents.

- B. Commercial Security Products from the following manufacturers will be considered acceptable
 - 1. VMS Software.
 - a. Genetec
 - 1) Genetec Security Center – Omnicast Enterprise
 - 2. VMS Server (hardware)
 - a. Genetec Certified
 - b. BCDVideo
 - 3. Switches
 - a. By AIS
 - 4. Surveillance Cameras
 - a. Axis
 - 5. Workstations
 - a. By AIS
- C. Latest Version
 - 1. Software supplied shall be the latest and most up-to-date official-release shipping version shipping at the time of acceptance.
 - 2. Hardware supplied shall be the latest and most up-to-date shipping version available at the time of installation, complete with the most current official-release firmware.

2.2 GENETEC SOFTWARE REQUIREMENTS

- A. Seamless Unification with VMS
- B. Through the USP, the ACS shall support integration with an IP Video Surveillance System or MVS. Integration with an IP video surveillance system shall permit the user to view live and recorded video.
- C. Users shall be able to associate one or more video cameras to the following entity types: doors, elevator, and hardware zone (input points) and more.
- D. The Monitoring UI shall present a true Unified Security Interface for access control and video surveillance. Advanced live video viewing and playback of archived video shall be available through the Monitoring UI.
- E. It shall be possible to view video associated with access control events when viewing a report.

2.3 VIDEO MANAGEMENT SYSTEM (VMS)

- A. The VMS shall be based on a true open architecture that shall allow the use of non-proprietary workstation and server hardware, non-proprietary network infrastructure and non-proprietary storage.
 - 1. The system shall feature IP based network video recording of all system cameras.

2. The system shall include the ability to record video from selected cameras based upon user defined access control activity.
3. The system shall include the ability to record video from cameras based upon preprogrammed video conditions;
 - a. Record at all times
 - b. Record only during selected times
 - 1) As a result of activity in the view of the camera
 - 2) As a result of setting minimum frames per second regardless of activity (time lapse)
 - c. Record at different frame rates or image quality based upon predetermined administrator selected conditions.
4. The VMS shall offer a complete and scalable video surveillance solution that shall allow cameras to be added on a unit-by-unit basis.
5. The VMS shall interface with analog-to-digital video encoders and IP cameras and with digital-to-analog video decoders, hereafter referred to as digital video servers (DVS). The VMS shall support DVS from various manufacturers.
6. The VMS shall integrate DVS using the DVS native SDK or using the following industry standards to interface to the DVS:
 - a. ONVIF
7. All video streams supplied from analog cameras or IP cameras shall be digitally encoded in MPEG-4, MPEG-2, MJPEG, H.264, Wavelet, or JPEG2000 compression formats and recorded simultaneously in real time.
8. All audio streams supplied from IP video servers shall be digitally encoded in g711 (u-law), g721, g723, or AAC compression formats and recorded simultaneously in real time.
9. Each camera's bit rate, frame rate, and resolution shall be set independently from other cameras in the system, and altering these settings shall not affect the recording and display settings of other cameras.
10. The system shall log alarm activity and enable users to search video and associated database for such activity.
11. The system shall include support for recording of all cameras simultaneously and the ability for 10 different computers to view unique combinations of cameras simultaneously.
12. The system shall be capable expansion in the future to accommodate additional concurrent viewing computers.
 - a. The expansion shall only require payment of a software license fee and installation of a licensing key to achieve this objective.
13. The system shall permit all of the following to occur simultaneously:
 - a. Record all cameras
 - b. View all cameras live (i.e. in real time)
 - c. Playback pre-recorded video from any and all cameras simultaneously.
 - d. The above shall be possible when cameras and/or video storage medium are physically located on premise or at remote facilities.
14. Video shall be stored in a non-volatile, expandable drive storage system that does not result in loss of data should a single drive unit within a chassis fail or when storage space is added to the system.
15. Each storage system chassis shall include at least one built-in spare drive unit designed to immediately take over in the event of another drive failure.
16. Data on the spare/replacement drive unit shall be reconstructed in less than 24 hours while the system continues to operate at normal operating capacity.

17. The system shall support distributed video storage, whereby storage of video does not need to be in one physical location.
18. Software shall support archival (back up) of system recordings
19. Software based remote control of cameras, associated optics and positioning devices shall be possible by administrator authorized users and groups of users.
20. Authorized users shall have the ability to create and store preset views containing 1 to multiple cameras.
 - a. Preset views shall be available for instant recall by the user.
21. Capable of matching camera resolution to the display or display area used for viewing
22. Authorized users shall have the ability to create and store preset views containing 1 to multiple cameras in a web-browser
23. The system shall enable users to search for and play back video by date, time, camera, and alarm condition as well as video analytics.
24. The system shall support recording and storage of video encoded in multiple (3) or more popular standards-based video encoding formats to accommodate future expansion using cameras from multiple manufacturers.
25. The system shall include the ability to export pre-recorded camera video of any duration to commonly recognized popular portable storage mediums.
26. Provide with Genetec Mobile APP for IOS and Android.

B. Image Storage Capacity

1. Although configuration settings at time of installation will be different, the system shall be provided with storage capacity sufficient to store (5) days of images, based upon the following specific criteria:
 - a. All system cameras recording simultaneously;
 - b. Highest scene activity based on camera location;
 - c. Highest image resolution settings available on system equipment;
 - d. Framerate (fps) based on the following criteria:
 - 1) Highest frame rate that specific camera supports
 - e. 20% additional storage capacity in reserve for future camera additions.

2.1 NVR SERVER

A. Manufacturer: Genetec Omnicast Streamvault appliance line

1. 2U rack mount type.
2. Minimum 16 IP camera licenses.
3. Required license and programs to make system fully functional must be provided to owner.
4. The NVR server hardware shall be capable of running Microsoft's latest Server OS.

B. NVR HARDWARE FEATURES

1. The NVR server shall have recording resolutions of CIF, 2CIF, and D1 and shall be user selectable for each individual analog camera attached to the server. Standard resolution and high resolution mega-pixel IP cameras shall also be selectable. MPEG-4 ASP or MJPEG video compression format shall be user selectable on any camera. Video recording shall be available at up to 30 images per second per input channel depending on IP camera type and server model selected.

2. The NVR server shall have video outputs for multi-monitor and spot monitors touring (switching) between analog camera video in either full, quad (2 x 2), 3 x 3, and 4 x 4 screen display modes.
 - a. The exacqVision Server shall be capable of recording line level audio, with synchronous video playback as well as playing live audio from any single audio channel selected.
3. Each server shall have the capability of automatically exporting a predetermined time frame of video to the internal server DVD/CD device upon an external trigger input connected to the server or by depressing a specific switch on the server. Such input shall export to the DVD/CD device a user defined amount of video and video camera source both pre and post event schedulable to the maximum capacity of the DVD/CD media selected.
4. Server hardware shall have an internal DVD/CD device that will allow the server to export video clips to the device in Standalone.Exe (*.exe), AVI Files (*.avi) and PS Files (*.ps) formats.
5. Each Server shall have a watchdog system that monitors the system and automatically reboots the system should it lock-up or fail to operate.
6. Each server shall be capable of integration with the City's SMS, Manitou, from Bold Technology.
 - a. Common System components
7. MONITOR AND KEYBOARD
 - a. Provide a 22" color monitor, keyboard and mouse. A rack mounted tray/shelve to serve as an operator interface for the NVR

2.2 ENTERPRISE SYSTEM MANAGEMENT

1. The Storage Server System Manager ("storage manager") shall be a software package installed on a dedicated server at the Network Operations Center (NOC) and provide the following functionality for compatible storage servers reachable via Internet Protocol.
2. The system shall provide a browser-based dashboard to view and monitor health and events related to storage servers and the cameras connected to them, including:
 - a. Camera Events
 - b. Video loss - IP video signal lost.
 - c. Camera Disconnected - Network cannot connect to analog or IP camera
 - d. Storage Server Events
 - e. Archive Alarm - Failure on archiving target, such as bad mount point
 - f. Content Age Alarm - Video deleted before configured retention period
 - g. Login Failure - Login attempt failed on server
 - h. Server Disconnected - Connection to server lost
 - i. Storage Alarm - Drive capacity threshold reached
 - j. Storage Hardware Alarm - Server storage malfunctioned
 - k. Temperature Sensor Alarm - System temperature not within recommended range
 - l. Voltage Sensor Alarm - System voltage not in recommended range
3. Provides e-mail notifications of user selected system events and conditions in real time or batch fashion
4. Provides software updates to storage servers on a configurable schedule
5. The system shall allow the configuration of user and server groups, consisting of monitored systems with identical settings of monitored features.

6. Provides color coded status of servers, cameras, and unacknowledged events in the following categories in list or chart format:
 - a. Server or camera device not detected
 - b. Health warning on server (such as temperature, storage alarm, archive alarm, CPU fan)
7. Allows creation of reports to:
 - a. view and manage a list of unacknowledged events
 - b. view a list of open events
 - c. search for specific events based on various criteria
8. Allows events to be searched based on various criteria, including event time, event type, and associated cameras and servers
9. Permits viewing of server licenses
10. Database compatibility
 - a. Microsoft SQL
 - b. MySQL
11. The system shall run as a service. The system manager shall not require any application to be running in order to operate.
12. The system shall run on a mobile application at no additional cost.
13. Hardware Requirements
 - a. Storage Manager Server
 - 1) The storage manager shall operate on the following minimum requirements:
 - a) Processor: Intel E3-1275 Xeon or Better
 - b) RAM: 32GB
 - c) Hard drive: 250GB SSD minimum
 - d) Operating system: Windows 10, Windows Server 2012 or 2016 R2

2.3 CAMERAS, MOUNTS & ACCESSORIES

A. Cameras

1. IP Cameras must be either a fixed type, 180*, 360* type camera depending on its location and use. PTZ type cameras are not acceptable.
2. Baseline Camera Features
 - a. Listed by a national recognized safety testing laboratory (UL or equivalent)
 - b. 10/100/1000 mbps Ethernet output for transmission of video over IP network
 - c. Lens Vari-focal
 - 1) Auto-iris / P-Iris lens
 - 2) Motorized auto focus
 - d. Camera settings shall be remotely configurable via IP communications
 - e. CMOS sensor type imaging device
 - 1) Backside illumination
 - f. Resolution scalable
 - 1) Range between CIF – UHD 4K
 - g. Bandwidth scalable
 - 1) Range between 64 Kbps and 20 Mbps
 - h. Light Sensitivity
 - 1) 0.3 (color)/0.04 (BW), 0 Lux with IR illuminator on, measured with DSS off at 30 IRE

- i. Capable of transmitting 30-progressive frames of video per second at the full native resolution of the camera
 - j. Commercial grade camera
 - k. Onscreen menu for local camera setup
 - l. Auto gain control
 - m. Auto white balance
 - n. Wide dynamic range
 - 1) True or digital WDR
 - o. Signal to noise ratio \geq 50dB
 - p. IR illuminator
 - q. Support for powering via Power Over Ethernet (PoE) enabled input, and local power.
 - r. Capable of being Low-voltage (12-24 V) powered
 - s. Support for one or more of the following standards based encoding algorithms: MJPEG, MPEG-4, H.264 and H.265 (HEVC).
 - t. Capable of simultaneously transmitting \geq 3 streams at varying rates
 - u. ONVIF Profile S compatible
3. Additional baseline features of cameras used outdoors
- a. Resolution scalable
 - 1) Range between CIF – UHD 4K
 - b. Dual modes of operation – Color during normal lighting conditions; black-and-white during low light conditions
 - c. Physical auto switching removal of the infrared filter for increased sensitivity in low-light conditions.
 - d. Backlight compensation.
 - e. Install transient voltage surge suppression protection devices in line with cables connecting outdoor equipment with indoor equipment. Protection device shall provide a margin of protection of outdoor equipment against surges originating within the building and margin of protection of indoor equipment originating from electrical surges outside the building.
 - f. Install protection devices in each conductive circuit that interconnects outdoor equipment to indoor equipment. This includes power, video and control circuits.
 - g. Protection devices shall be installed within a Ingress Protection (IP65 minimum) rated enclosure installed within 10 cable feet of cable entrance into the building. Enclosure shall be installed above accessible ceiling and sized to accommodate the fully connectorized TVSS equipment.
 - h. See Labeling for additional requirements.
4. Additional features for pole-mounted cameras
- a. Dynamic Image stabilization feature for reduction of the visual effects of minor pole swaying movement.
- B. Lens Optics
- 1. Provide high quality CCTV lenses sized according to the intended area of coverage as shown on the drawings and in accordance with the following minimum specifications:
 - a. Fixed cameras shall be provided with aspherical varifocal lens optics. Lenses provided for fixed cameras shall be aspherical varifocal length type and shall include provisions for automatic iris adjustment and standard "CS" or "C" mounting. Adapter rings shall be provided for all "C" mount lenses, aspherical varifocal lenses shall also be compatible with a CCD camera

imager. Exact focal lengths of the lenses will be coordinated with the Owner based on the scene to be viewed.

- b. The average video level sampled from the camera will determine automatic iris operation. Iris control signals and operating voltage shall be obtained from the camera and the lens will include a pre-wired plug assembly compatible with the cameras being provided.
- c. Lenses for speed-dome cameras shall be provided as an integral part of the speed-dome camera configuration.
- d. Lens optics shall be high quality precision ground glass. All optics shall be color corrected to provide accurate color scene reproduction.

C. Mounts

1. Camera Mounts

- a. Camera mounts shall be 100% compatible with the housing being provide and shall have the following characteristics:
- b. The Contractor shall field verify each camera location, prior to ordering.
- c. Mounts shall be constructed from steel or aluminum and shall prevent corrosion.
 - 1) Mounts shall be 100% compatible with the housing.
 - 2) Fixed cameras mounts and their installation shall be coordinated with the owner as to maintain the esthetics of the installation sites.
2. Provide commercial grade mounts heavy duty mounts and mounting hardware for cameras.
3. Outdoor mounts shall be designed for outdoor mounting and exposure to the elements
 - a. All outdoor hardware shall be stainless steel.
4. Refer to drawings and camera matrix for mounting form-factors of individual camera locations.
5. Provide custom painted mounts and mounting hardware where indicated on the drawings.

D. CCTV Camera Housing

1. The Contractor shall provide all cameras with permanent connections. Specifically, wiring shall not be open or loose. It is the contractors responsibility to provide rigid conduit for all installations to prevent wire tampering.
2. Camera housings and their installation shall be coordinated with the owner as to maintain the esthetics of the installation sites.
3. Camera platform shall be constructed of a non-conductive or insulated to eliminate grounding problems.
4. Exterior camera housing shall be equipped with internal heating element.
5. Camera housings shall also have the following characteristics:
 - a. All cables shall be terminated, encapsulated in rigid conduit.
 - b. The housing shall be constructed with the intent to provide quick and easy servicing of the camera within it. Specifically, a slip in tray or cover with 180° opening.
 - c. The Contractor shall coordinate with the Owner the exact architectural style of the housing and finish, prior to ordering.
 - d. It the Contractors responsibility to perform all necessary calculations to verify that lens and camera combination can be accommodated by the housing being furnished.

- e. Camera Housing shall have tamper resistant screws. The Contractor shall provide the Owner (2FM Alarm Section) with a tool to remove the tamper resistant screws allowing them to service the housing themselves

2.4 ACCESSORIES

- A. Provide microphone at each Training camera location.
 - 1. An ultra-low-noise microphone with an SNR of 80 dBA. It comes included with a Terminal Block to 3.5 mm Audio Extension, and could be installed with AXIS P32-LV Network Cameras in combination with AXIS TP3201.
 - 2. Specification: Frequency response 20 Hz – 20 kHz, ± 2 dB. Signal-to-noise ratio (SNR): 80 dBA (relative 1 kHz @ 1 Pa, 94 dB SPL). Sensitivity -28 dB ± 3 dB (at 1 kHz, 0 dB=1 V/Pa). Max sound pressure level (SPL): 119 dB at 1 kHz. Impedance 1.5 k Ω @ 1 kHz. Temperature range: -20 °C to 60 °C (-4 °F to 140 °F)
 - 3. Basis of Design shall be Axis Device Microphone B.
- B. Provide speaker at each Training camera location.
 - 1. See specification section 27 41 00 for speaker details.

2.5 COMPUTERS, MONITORS AND ACCESSORIES

- A. General
 - 1. All supplied computers (Servers, Workstations, etc...) and peripherals (monitors etc...) shall meet or exceed the software manufacturers' recommended specifications for running the software and operating the specified system.
 - a. Computers that meet the VMS manufacturer's "minimum" computer requirements are not acceptable.
 - 2. Computers shall be furnished fully loaded and configured with operating system software client user licenses necessary to allow the system to operate capacity. The operating system and database software shall be the latest version supported by the security system software.
- B. Server Computers
 - 1. Provide minimum (1) dedicated rack mount server-class computer to run the Video Management System surveillance server.
 - a. The access control server software may be virtualized on the dedicated video surveillance server where this feature is supported by both the video surveillance manufacturer and the access control manufacturer.
 - 1) This includes systems that have been expressly manufactured for this purpose by the video surveillance and access control system manufacturers.
 - b. This function shall result in no degradation in performance of either access control or video system's server software.
 - 2. Provide (1) rack mount LCD monitor (17"-class minimum), plus rack mount computer keyboard and mouse drawer system.
 - 3. Provide rack mount hardware based KVM switching system that enables all security system servers to be accessed, controlled and viewed by a single keyboard, monitor and mouse.

- a. Combination rack mount monitor, keyboard, mouse and KVM units where the features described above have been met shall be acceptable.
4. Provide servers with operating system, database software and sufficient Client Access Licenses and other applicable licensing to ensure that full operation of the system, and concurrent access by all access control and video client software computers.

C. Work Station Computers

1. Provide software and install it on (5) work station computers, that shall be owner furnished or designated. The software shall also be compatible with Mac OS or the Mac OS Microsoft OS simulation.

2.6 MASS STORAGE

- A. Hard-disk-drive (HDD) or Solid-state-drive (SSD) based arrays.
- B. Expandable without loss of existing data.
- C. Self-healing configuration with integral hot-swappable spare drives.
- D. Sufficient read/write data bandwidth to accommodate writing of data from all system video sources simultaneously (multiplied by a factor of 4) at the full resolution and frame rate of the video source, plus an equivalent amount of bandwidth for playing back (i.e. reading) data.
- E. 19" Rack mountable

2.7 CABLE

A. General

1. Supply cable that meets or exceeds the technical requirements of the components being interconnected suitable for the length and signal type and communication speed carried.
2. Supply cable of sufficient gauge to ensure that connected components receive adequate voltage, power and signal integrity to ensure reliable operation of the system.
3. Supply shielded version of cable for interconnection of system components that require such for proper operation.
4. Safety listed by a nationally recognized safety testing laboratory (UL or equivalent)
5. Code compliant for its purpose, location and method of installation.
 - a. For example, plenum rated cable shall be installed in plenum environments.
6. Approved Cable Manufacturers: West Penn, Belden, CommScope, General Cable Corporation and Windy City Wire.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Provide labor and all products necessary to render the system(s) complete and working.
- B. In addition to the requirements set forth by these project documents, provide additional work that is reasonable and customary for systems of the type and scope identified herein, as well as additional work recommended to be performed by the product manufacturers for completion of like systems.
- C. Perform work in a code-compliant manner to the satisfaction of the Authority having jurisdiction.
- D. Perform work according to the highest quality industry standards.

3.2 COORDINATION

- A. Refer to project drawings, including but not limited to architectural and electrical drawings for additional details that impact work of this section.
- B. Coordinate adequately with other trades to resolve conflicts.
- C. Review in detail the cabling pathway requirements for this system against the pathways indicated on the drawings.
 - 1. Review pathways with the pathway system provider.
 - 2. Take timely and proactive action to ensure that the pathway system installed accurately and sufficiently supports this system.
- D. Coordinate the location of camera rough-in to ensure it allows for professional quality camera installation with serviceability and with aesthetic appeal.
- E. Review existing conditions (where applicable).
- F. Provide qualified representation at project meetings to ensure that work of this section is adequately represented in the project schedule and that work is coordinated with other trades.
- G. Coordinate with the Owner's designated IT and security representative(s)
 - 1. Sufficiently early in the project so to negate negative impact on the project schedule and allow for timely completion of work.
 - 2. For the assignment of IP addresses and device naming conventions
 - 3. Communicate network configuration parameters material to the successful implementation of this system.

3.3 INSTALLATION

- A. General

1. Install products in accordance these project documents and with product manufacturer's published installation instructions.
 2. All CCTV cabling shall be encased in conduit Purple in color minimum of ¾".
- B. Power Supplies
1. Supply and install power supplies of adequate capacity to allow for full rated operation of all system equipment.
 2. Install and Provide power supplies for cameras, controllers and other equipment within designated/approved rooms.
 3. Connect power supplies to AC power.
- C. Cameras
1. Terminate cabling provided
 2. Mount cameras per the manufacturer's instructions and as additionally detailed in these project documents.
 3. Install cameras at the locations identified on the plans, coordinating with field conditions as appropriate.
 - a. Unless identified by scaled or dimensioned detail, camera mounting heights are for reference. Actual mounting heights shall be verified in the field and coordinated with architectural detail for aesthetic appeal and with obstacles that may have negative impact on visual coverage or impact serviceability.
 - b. Seek the direction of the Designer should any consequential issues arise from the use of an identified camera location or mounting height.
 4. Set camera angles and field of view in collaboration with the Owner's designated security representative.
 - a. Make adjustments to the satisfaction of the Owner.
 - b. Clean, lens, cover, housing anything that may impede or obstruct the view and assure camera is performing optimally.
 5. Assure that power source for camera is set to the proper voltage to match the cameras specified requirements.
- D. Equipment Racks
1. Secure equipment within racks using approved rack-mounting products.
 2. Utilize manufacturer accessory rack mounts where available;
 - a. Utilize custom fabricated product-specific rack mounts for other equipment.
 - b. Open shelves shall not be permitted for equipment mounting except where expressly specified, detailed or otherwise approved by the Designer.
 3. Securely attach non-portable racks to the building floor or other approved structure.
 - a. Racks that require movement for equipment installation or service shall be secured using such means that allow the rack to be deliberately moved to achieve this objective. Review proposed mounting with the Designer.
 4. Internal Cabling
 - a. Neatly route and support cables level and plumb.
 - b. Bundle and route cables of different signal types independently.
 - c. Use removable Velcro-like wire ties for bundling of cables. Do not use standard wire ties
 - d. Route vertical runs of cables along the sides of the rack.
 - e. Support horizontal runs of cables using horizontal support bars.
 - f. Fan cables to equipment neatly between horizontal lacing bars and equipment.

- g. Provide a service loop of adequate length between lacing bars equipment so as permit ease of installation and service access to equipment.
 - h. Ensure that cable connections are not subjected to any stress or strain at the point of termination during idle installation or routine servicing of system equipment.
 - 5. Filler Panels
 - a. Install solid and vent-type filler panels in all unused spaces of equipment racks. Use combinations that ensure adequate cooling of installed product.
 - 6. Power Distribution
 - a. Install AC power distribution sufficient to serve all housed equipment.
 - b. Connect power distribution equipment to local area AC power, utilizing the services of a licensed electrician where required by code.
 - c. Provide a minimum of 20% spare outlets within each rack to accommodate future equipment.
- E. Cabling
 - 1. Install cabling that meets or exceeds the technical requirements of the components being interconnected suitable for the length and signal type carried.
 - 2. Install cable of sufficient gauge to ensure that connected components receive adequate power, voltage and signal integrity to ensure reliable operation.
 - 3. Install shielded cable for interconnection of system components that require such for proper operation.
 - 4. Neatly dress and support all cables.
 - 5. Take precautions to avoid damage to cable during installation, and to protect cables from damage after installation. Avoid cable bends and pulling tensions that are outside the manufacturer's recommended limits.
 - 6. Maintain adequate separation of cables from sources of ingress interference that could negatively impact the performance of this system.
 - 7. Utilize approved pathway products for supporting, securing and protecting cables. Ensure that horizontal cable runs are supported at increments not exceeding 48-inch.
 - 8. Route cables in dedicated pathways, separated from cables serving other systems.
 - 9. Label each end of each cable. See Labeling.
 - 10. Use cable pulling compound/lubricant where necessary. Use only non-hardening compounds that do not deteriorate cable conductors, insulation or pathway components.
- F. Grounding
 - 1. Ground products in accordance with industry standards, the NEC and in accordance with additional codes applicable at the project site.
 - 2. Provide special grounding in accordance with referenced standards.
- G. Labeling
 - 1. Uniquely label the ends of every cable in the system using permanent computer generated self-laminating wrap-around cable labels.
 - 2. Labels shall be clearly legible, using dark-black bold-type fonts.
 - 3. Record actual label nomenclature on the as-built drawings.
 - 4. Concealed Equipment
 - a. Identify the location of concealed equipment (e.g. TVSS devices) above ceilings, in walls, etc. using a labeling schema agreeable to Owner.

- H. AC Power
 - 1. Provide connection of supplied equipment to source(s) of AC power.
 - 2. Provide services of licensed professional electrician to perform work required by code and the local jurisdiction to be performed by a licensed electrician.

3.4 PROGRAMMING

- A. Perform initial programming of the system to establish fundamental operational parameters; parameters shall represent industry standards for best practice.
- B. Following initial programming, collaborate with the Owner's designated security representative to formulate specific programming to satisfy Owner's objectives. Present baseline programming already in place to the Owner at the start of this collaboration.
 - 1. The programmer shall advise the Owner of the fundamental choices that must be made to render the system useful for its intended purpose and shall supply forms which the Owner shall use to aid in making programming influencing decisions.
- C. Create dynamic graphical user-interface maps of each facility and site served by the system.
 - 1. Maps shall be programmed to reflect doors and readers that are controlled and/or monitored.
 - a. Status of doors featuring status switches shall be reported.
 - b. Doors with locking mechanisms shall be remotely controllable via map.
 - 2. Maps shall include status indicators that reflect the status of other sensors identified to be connected to or monitored by this system.
 - 3. Maps shall include interactive icons reflecting the location of each video surveillance camera. The camera icon shall allow users to interact with the icon to view live video from the associated camera.
 - 4. The programming shall include the ability for the administrator to grant map based control based upon user rights.
 - 5. Map navigational hierarchy shall allow for easy navigation to maps associated with remote facilities that are connected to the system.
- D. Video Surveillance
 - 1. Enter system configuration data necessary to render the system operational and usable to the Owner.
 - 2. Programming shall include setting up Owner designated views of cameras and sequencing behaviors.
 - 3. Programming shall include setting up separate views and behaviors for each viewing location; up to maximum of (5) separate locations.
 - 4. Enable remote control of remote controllable cameras in the system.
 - 5. Program the recording behaviors of cameras.
 - a. Program when cameras are recorded;
 - b. Program when cameras are recorded at a low frame rate and / or resolution
 - c. Program when cameras are recorded at higher frame rate and / or resolution.
 - 6. If pre-recording is an option of the system, program pre-recording of designated cameras in collaboration with the Owner's direction.
 - 7. Provide programming to integrate camera behaviors with the access control functionality and maps.

8. Provide programming that results in cameras being recorded when credentials are presented to authentication device.
9. Log unauthorized credential presentation as a searchable alarm condition.
10. Program masking zones of each fixed position camera.
 - a. Where required by the owner
11. Program areas of interest on each fixed position camera.

3.5 TESTING

A. General

1. Conduct a complete inspection and test installed system equipment, inclusive of Owner furnished equipment utilized.
2. Include testing of interconnected equipment specified in other Divisions or Sections (e.g. Life Safety and Elevators).
3. Conduct tests recommended by all system equipment manufacturer(s).
4. Verify alarm condition scenarios perform as programmed
5. Exercise interactive maps and test each object/control.
6. Simulate alarm scenarios and verify each performs as intended by the Owner.
7. Update program to remediate problems encountered.
8. Replace malfunctioning and/or damaged items with new product and retest until satisfactory specification compliant conditions are achieved.

B. Video Surveillance

1. Verify restoration of normal operation following simulated complete and partial power outage scenarios
2. View, record and playback video from cameras, singularly and in combination with other cameras.
3. Exercise remote control functions of cameras

3.6 ACCEPTANCE TESTING

- A. Acceptance testing shall be conducted after designer receipt and review of the pre-acceptance submittal aka "Sign Off Report". Allow (10) business days in the project schedule for the Designer's review.
- B. Acceptance testing may include, but may not necessarily be limited to:
 1. Visual and mechanical inspections of Contractor's workmanship.
 2. Inventory of equipment.
 3. Inspection of system components, sub-systems, software, component functionality, etc.
 4. Any other tests or inspections determined necessary by the Designer.
- C. The Contractor shall be onsite in advance of the scheduled acceptance testing time.
- D. Contractor shall have made adequate arrangements for access to all areas of work.
- E. Acceptance Testing will not pass if:

1. Contractor's work does not appear to the Designer to be of Professional quality and/or the Contractor has failed to follow clearly established installation requirements.
 2. Detailed as-built drawings are not present on site for review and/or are found to be incomplete or inaccurate.
 3. More than one cable inspected is found to be missing required labels or if more than one cable is verified to be inaccurately recorded on the as-built drawings.
 4. Installed equipment does not match the equipment specified and/or reviewed by the Designer (in writing) during the course of the project.
 5. More than one piece of equipment, cable, connector, circuit, etc. fails to pass any test performed upon it by the Designer.
 6. Any substantive specification or workmanship issue judged by the Designer to be of material importance to the long-term usability, safety, professional appearance, or service and maintainability of the Contractor's work; any material deviation from the intent of these specifications.
 7. Terminations of connectors ruled to be below the highest quality industry standards.
- F. The Contractor's staff may, if permitted by the Designer, undertake very minor corrections of encountered problems while acceptance testing continues provided that such corrective action does not in any way impede Acceptance Testing progress.

3.7 SPECIAL REQUIREMENTS

- A. Preventative Maintenance
1. Following final acceptance of the system the contractor shall return to each of the project sites to perform basic cleaning and maintenance of cameras, make minor focus and/or viewing angle adjustments to cameras as requested by the Owner.
 2. Visits shall occur as 6 and 12 months following acceptance.
 3. During each visit, the contractor shall clean the exposed optical components (lens, dome, glass, etc.) of each camera in the system.
 4. Check in with the Owner's designated security representatives to determine if there are any issues with the system that need to be addressed under warranty.
- B. Software Assurance
1. Contractor shall supply and install software patches or upgrades that are made available from the software manufacture for the first 365 calendar days following final acceptance of the system.
 - a. Such upgrades shall be coordinated with the Owner and undertaken only after discussion with and approval of the Owner's designated representative.
- C. Installing and Updating VMS Client Software.
1. Installing a new release of the VMS Client software shall be easily accessed by clicking on an icon in the Client software that will connect to a website and give an option to automatically download the new software. If the most recent version of the VMS software is already installed a message box will be displayed informing you have the most recent release.
 2. Provide required power outlets, interconnecting cables, hardware and equipment for a complete and operable system.

3. Perform complete programming of the system, including matrix switch, and NVR(s) in coordination with the Owner, or designated representative. Programming shall include, but not be limited to, elimination of duplicate or redundant titling information, synchronization of system clocks, camera sequences, dome presets, salvos and tours. Programming of any system passwords or limiting of accessibility prior to commissioning and training is prohibited.
4. Obtain IP addresses from 2FM Alarm Section for initial setup of all devices

3.8 TRAINING

- A. Train Owner's designated personnel on the procedures and schedules involved in daily use of the system, administration, troubleshooting, and preventative maintenance.
- B. Provide advanced and detailed technical and administrative training (to the level desired by Owner's Security and IT) personnel covering advanced software and hardware configuration and administrative aspects of the system.
- C. Provide not less than (16) hours of dedicated training on the system, not exceeding (8) independent trips to the project site.
- D. A detailed training agenda shall be worked out with the Owner's security representative in advance of conducting the formal training intended by this section.
- E. Time spent by the contractor discussing the system prior to 100% completion, and without an agreed upon clear training agenda shall not be considered training as intended by these specifications.
- F. Training shall be conducted by factory trained and certified individuals fluent with the hardware and software used to make up the system.
- G. Schedule training with Owner at least (14) days in advance each training session.

END OF SECTION 28 13 02

SECTION 28 31 11 – MULTIPLEX FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

- A. Section provides the requirements for the installation of a complete Power Limited, Addressable, Fire Detection Alarm System including fire alarm and control panels, manual fire alarm stations, automatic smoke and heat detectors, notification appliances, and auxiliary alarm equipment and installation materials.
- B. There is an existing FACP in Room 106 in the previous project. The new addition is to be connected the existing FACP utilizing a Remote Control Panel to be located in the main electrical room in the new addition.
- C. Related Sections
 - 1. Section 23 - Building Automation and Control.
 - 2. Section 21 - Wet-Pipe Fire Suppression Sprinklers: Flow detection and alarm devices.
 - 3. Section 21 - Standpipes and Hoses: Flow detection and alarm devices.
 - 4. Section 21 – Stationary Pumps for Fire Protection
 - 5. Section 26 – Low Voltage Electrical Power Conductors and Cables.
 - 6. The General Provisions of the Contract, including Conditions of the Contract and Division 1 of the Specifications, apply to the work in this Section.
 - 7. This Section is hereby made a part of all other sections of Division 26 as fully as if repeated in each therein.
 - 8. Architectural enclosure for fire alarm panel(s).
 - 9. Security alarms and access control.
 - 10. Emergency electrical systems
- D. Furnish, wire and test under this Section. Installation specified elsewhere
 - 1. Duct smoke detectors with accessible remote mounted keyed switches with LED indicators Summary
- E. Related Sections
 - 1. All Division 27 and 28 Sections
 - 2. Technology Series Drawings

1.2 REFERENCES

- A. The work is subject to applicable portions of the following standards in affect at the time of bidding the project.
 - 1. NFPA 70 “National Electrical Code”, National Fire Protection Association.
 - 2. NFPA 72 “National Fire Alarm Code”, National Fire Protection Association.
 - 3. NFPA 90 A, Air Conditioning and Ventilation Systems

10. Illinois Accessibility Code (IAC).
11. Applicable standards of IEEE (Institute of Electrical and Electronic Engineers).

1.3 QUALITY ASSURANCE

- A. Fire alarm system engineer/designer shall be certified by a nationally recognized certification organization acceptable to the authority having jurisdiction. System designer shall be factory trained and certified for design of the fire alarm and emergency communication systems.
- B. Fire alarm system installation personnel shall be factory trained and certified for installation of fire alarm and emergency communication systems and certified by the national recognized certification organization acceptable to the authority having jurisdiction.
- C. Fire alarm equipment and all of the system components shall be listed by UL and approved by FM Global.

1.4 SYSTEM DESCRIPTION

Furnish and install an approved fully tested and functional Class I fire alarm system.

Furnish and install the following work:

1. Fire Alarm System – Digital, Addressable.
 2. Fire Alarm, Sprinkler Waterflow, Sprinkler Supervisory and Fire Pump Status Indication.
 3. Interface to Building Automation System for Fan Status.
 4. Emergency Power Status Indication.
 5. Fire Pump and Jockey Pump Status Indication.
 6. Trouble bell indication at Fire Alarm Annunciator Panel at main lobby.
 7. Duct smoke detectors with accessible keyed test switches with LED indicator at each.
 8. All cabling shall be encased in the appropriate conduit Red in color, minimum of $\frac{3}{4}$ ".
 9. All electronic locking hardware if associated with the fire alarm shall operate on 24 volts DC.
- B. Operation of a manual station, spot-type space smoke detector, (duct) smoke detector, heat detector or sprinkler flow switch, shall automatically:
1. Sound an audible alarm signal at the Fire Alarm Control. The audible signal shall be capable of being silenced during the alarm condition.
 2. Illuminate a general "Alarm" LED at the Fire Alarm Control Panel as well as the specific "zone" annunciator LED, which shall remain lit, until the alarm condition is reset.

3. Print a record at the system printer by time, date, and alarm zone or device number followed by a complete English language emergency description for that alarm "zone" or device and for all control circuits automatically operated in response to the alarm condition for that individual zone. Each alarm zone shall print its own emergency message up to eighty (80) characters and spaces. All restorations to normal shall likewise be recorded except the emergency message shall not be repeated.
 4. Display on the fire alarm control panel (FACP) the time, date and zone or device number followed by a complete emergency description for that alarm zone. All restorations to normal shall likewise be displayed. The FACP shall display messages according to their priority and shall hold any message on the display until such time as the operator acknowledges the message. No message shall be lost or scroll off the display due to operator delay. Time of day and the number of messages waiting to be acknowledged, number of abnormal points, number of disabled points shall be displayed at all times on the FACP.
 5. Activate the respective Form "C" contact(s) (one N.O. and one N.C.) to the building automation system (BAS) to indicate the floor(s) in alarm and allow that system to activate appropriate HVAC response to fire alarm condition. Exception: Operation of manual stations shall not activate BAS interface for fire response.
 6. Active control relay to initiate the transmission of an "alarm" condition to the Fire Department. Coordination of connections and testing of the system upon connection to the Central Station are the responsibility of the Contractor as part of this work.
 7. Operate control relays to de-energize (release) secured stairwell door locks.
 8. Operate control relays to release electrically held open doors.
 9. Sound audible alarms.
 10. Activate visual alarms.
- C. Elevators: In addition to functions described in B:
1. The operation of an elevator machine room smoke detector, elevator shaft smoke detectors or elevator lobby smoke detector or sprinkler flow switch shall initiate recall of the elevator car serving that lobby or controlled from that machine room. Detection at the "designated" recall floor lobby shall initiate recall to the "designated alternate" level for the affected cars. Coordinate with the Fire Department and Elevator Contractor to determine the designated recall and alternate recall levels for each elevator bank. Detection of smoke in the elevator shaft shall initiate a separate signal to the associated elevator controller. Interface to the elevator equipment shall be via addressable control modules in the elevator machine rooms.
 2. The operation of an elevator machine room or shaft elevator heat detector or sprinkler flow switch for a dedicated elevator zone shall provide a contact closure to disconnect power to the elevator machines.
- D. The operation of a duct smoke detector shall initiate a trouble signal, activate a programmable output relay wired to the supply fan motor controller location to shut down the affected fan motor(s). Initiate a trouble condition only in the Fire Alarm System.
- E. In the event of a malfunction in an alarm initiating device, signaling line circuit(s) or power supply, illuminate trouble light for the respective "zone" in the fire alarm annunciator panel(s) and a common trouble light in the fire alarm control panel.

- F. In the event of a malfunction in the alarm indicating circuits, illuminate the trouble light for the respective alarm circuit in the fire alarm annunciator panel and a common trouble light on the fire alarm control panel(s).

- G. Sprinkler Supervisory Functions
 1. Actuation of a sprinkler valve tamper switch, pressure supervisory switch, water level, water temperature, room temperature, the fire pump "Pump Running", "Power Failure" or "Phase Reversal" contact, or the emergency generator "On" or "Start Failure" contact shall automatically:
 2. Sound an audible signal at the FACP and annunciator panels. The audible signal shall be capable of being silenced during the supervisory condition. The silencing of a trouble condition in any zone shall not prevent the resounding of audible signal should a subsequent trouble condition occur.
 3. Illuminate a general trouble LED at the FACP and annunciator panels. The LED shall remain lit, until the trouble condition is cleared.
 4. Active control relay to initiate the transmission of a "supervisory" (or trouble, where supervisory signals are not able to be indicated) signal to the Fire Department.
 5. On the system printer, print a record for the monitor point.
 6. On the FACP and annunciator panels, display the information for the monitor point.

- H. System Supervision
 1. The fire alarm control equipment, power supplies and field located devices and wiring shall be electrically supervised to automatically detect and report trouble conditions to the FACP.
 2. Any opens, grounds or disarrangement of system wiring or a short across any device or system wiring shall automatically:
 3. Sound an audible signal at the FACP. The audible signal shall be capable of being silenced during the trouble condition.
 4. Illuminate a general trouble LED at the FACP. The LED shall remain lit, until the trouble condition is cleared.
 5. Visually annunciate, via the alphanumeric display, the individual circuit in trouble, at affected control panel. The LED shall remain lit, until the trouble condition is cleared.
 6. On the system printer, print a record for the panel and circuit in trouble.
 7. Grounds shall annunciate as a system trouble.
 8. Detection of fault or trouble conditions in control equipment and power supplies shall indicate as a common trouble and shall indicate the specific module or power supply.

- I. Standby Power:
 1. Upon failure of normal and/or emergency power, standby power shall be provided for the entire system by means of lead-calcium batteries including a battery cabinet/panel with battery capacity as specified herein. The control panel shall monitor battery voltage, current capacity and charge rate and shall report all changes in status to the fire alarm control panel central processing unit. Provide separate chargers, supervision, switching and batteries for the Fire Alarm System with battery capacity as follows:

NFPA 72	Local Protective Systems 24 hours standby 5 minutes of alarm
NFPA 72	Auxiliary Protective System 60 hours standby 5 minutes of alarm
NFPA 72	Remote Station Systems 60 hours standby 5 minutes of alarm
NFPA 72	Proprietary Signaling Systems 24 hours standby 5 minutes of alarm

2. The emergency power source circuits serving the Fire Alarm Control Panel shall be labeled "FIRE ALARM CIRCUIT CONTROL."
3. Each and every power supply input and power supply output shall have transient protection which shall prevent component failures and shall prevent false alarms.

1.5 SUBMITTALS

- A. Refer to Section 013300 – Submittal Procedures.
- B. For all work specified in Division 26, submittals to include Type 1 (Manufacturer's Name) and Type 2 (Product Data) information. In addition, submittals for the work listed below shall include the indicated type of information.
- C. Shop Drawings: Prepare shop drawings indicating system wiring diagram showing each device and wiring connection; complete one-line riser diagram; indicate annunciator layout and submit stamped drawings by the nationally recognized agency acceptable to the local authority having jurisdiction.
 1. Architectural floor plans shall be prepared at 1/8" = 1'-0". Fire Command Center details shall be prepared at 1/4" = 1'-0". Remote panel details shall be prepared at 1/4" = 1'-0".
 2. The shop drawings shall contain the actual location of all initiating, indicating, extinguishing, trouble, communication and supervisory equipment as required by these specifications.
 3. Each device and control equipment shall be noted with the designation of its zone/circuit. The audible devices shall also indicate its rated sound output in dbA at a distance of 10 feet.
 4. On each floor plan, provide a schedule including all zone circuit(s) on that floor.
 5. A master zone/circuit list, on 8-1/2" x 11" sheets of paper, in column form, to show all of the zone circuits within the system for all equipment. At a minimum, the master zone/circuit list shall provide designations for each individual zone/circuit floor level, location on floor, description of the monitored, controlled, detected and/or function the zone/circuit is performing, the number and type of equipment for each zone/circuit (include total wattage load for all audible equipment and available wattage remaining for each zone/circuit).

6. Provide a detail layout of all status and annunciator panels. The zone/circuit indicator shall include, but not limited to level, location and what is monitored/function (example 3FLR SPRK).
7. Provide a ½" scale elevation of all panels in each Fire Command Center.
8. Device wiring diagram for each type of device furnished.
9. Points of interface connections including sound systems, elevator, mechanical equipment, security systems, etc.
10. Complete narrative on the operation of the system detailing each event in the system and the resulting actions throughout the system and interconnections to other systems.
11. Shop drawings shall be sent to the respective contractors, suppliers, etc. for proper coordination; where their work is interdependent upon signals or controls from the fire alarm system. These would include those associated with vertical transportation, automatic temperature controls, security, door locks, motorized doors, etc.
12. Shop drawings shall be revised and resubmitted in accordance with the specified shop drawing procedures. The Contractor shall submit all shop drawings along with the voltage drop & power supply calculations to all the authorities having jurisdiction for approval only after review by the Architect/Engineer prior to start system installation.

- D. Product Data: Submit catalog data showing electrical characteristics and connection requirements.
- E. Test Reports: Indicate procedures and results for specified field testing and inspection. Provide a "Record of Completion" (NFPA 72).
- F. Manufacturer's Field Reports: Indicate activities on site, adverse findings, and recommendations.

1.6 CLOSEOUT SUBMITTALS

- A. Section 017700 - Execution Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of fire alarm equipment.
- C. A complete record of all tests and operation of each service
- D. Operation and Maintenance Data: Submit manufacturer's standard operating and maintenance instructions.

1.7 MAINTENANCE SERVICE

- A. Section 017823 - Execution Requirements: Maintenance service.
- B. Provide service and maintenance of fire alarm equipment for one year from system acceptance.

1.8 MAINTENANCE MATERIALS

- A. Spare Equipment:
1. Furnish the following spare equipment to the Owner at the completion of the project.
 - a. Two detectors of each type, with bases.
 - b. Two addressable control modules.
 - c. Two addressable monitor modules.
 - d. Five keys to system cabinets.
 - e. Two one-way life safety audible/visual units.
 - f. Two strobe units.
 - g. Twelve glass rods or plates for manual pull stations.
 - h. Two spare fuses for each size (ampere rating) fuse furnished in the control panel.
- B. The above equipment shall be installed in a surface cabinet, furnish as part of these specifications, red in color with 1/4" high white lettering, "Spare Fire Alarm Equipment", silk screened or cabinet door. The cabinet shall be furnished and installed adjacent to the main fire alarm control panel or as directed by the Owner

PART 2 - PRODUCTS**2.1 APPROVED MANUFACTURERS**

- A. Honeywell
1. Firelite.

2.2 FIRE ALARM CONTROL PANEL (FACP)

- A. Furnish and install a fire alarm control panel which shall act as the master (Main Central Processing Unit CPU) in a multiplexed network for the operation of the fire alarm system. This unit shall be wall mounted and shall contain all main microprocessors, memory, alpha-numeric display, and operator controls. The FACP cabinet shall contain a 24 VDC power supply and batteries for all central processing, displays, and controls operations. The FACP shall be mounted in a steel cabinet with lockable door. Panel installation to be coordinated with /area layout/ /room layout/ and other electrical equipment within the /area/ /room/.
- B. The FACP shall utilize distributed processing techniques and communicating device technology, be totally solid state (except for relay associated outputs), microprocessor-based use communication between control equipment and field located panels and approved by the City of Chicago Bureau of Fire Prevention.
- C. The FACP shall differentiate between long term drift above the prealarm threshold (maintenance alert, indicative of the need for cleaning) and a fast rise above the prealarm threshold (indicative of a smoldering fire). The Maintenance Alert shall be annunciated as an alert only and shall not be confused as a Trouble or an Alarm.

- D. The FACP shall incorporate the central processing unit (CPU) which shall be microprocessor based and provide the necessary system logic circuitry and interrogate/response polling to perform all required automatic control-by-event, time of day functions and trouble switching as delineated by the drawings, specifications and City of Chicago Code and Chicago Fire Prevention Bureau requirements. The CPU shall include non-volatile memory for emergency file lists and system program instructions. All system operating program instruction code, configuration and sequence programming shall be completely non-volatile. The system shall not utilize moving disk technology where dust, humidity, or temperature can cause adverse operating performance. The CPU shall be completely field programmable on site by the manufacturer's representative. Systems requiring off-site PROM burning without on-site editing capability from this panel shall not be acceptable. Edited changes must be non-volatile. Any system remote controller (field located panel) shall also be completely field programmable
- E. The CPU shall be software equipped to provide automatic control-by-event programming, whereby the receipt of an alarm, supervisory or trouble report from a system point may be programmed to operate any or all of the control points within the system. Automatic control-by-event actions for life safety functions shall be retained in non-volatile memory for reliability.
- F. Control unit shall be supervised so that a trouble signal shall sound in the event of loss of either operating or supervising power. Light-emitting diodes (LED's) shall be installed and shall remain illuminated to indicate both operating and supervisory power are energized.
- G. Provide signaling line circuits (SLC's) to communicate with all field devices including initiating devices and remote-control equipment in the system. The FACP shall include SLC's and controllers to provide and perform the following:
- H. Monitor intelligent devices which are addressable by device and which report all status changes by individual device.
- I. Communicate with each intelligent detector and addressable module on its SLC to verify its proper function and individual status. Communication with all devices shall be performed. Maximum time to detect an alarm shall comply with UL Listings.
- J. Maintenance alert function shall be provided. This function shall automatically warn of contaminated detectors and of defective detectors before false alarms occur.
- K. The system shall provide a minimum capacity of SLC's which shall control intelligent devices and addressable modules plus **25%**. Each SLC shall be provided with a dedicated microprocessor-based controller and shall have the capacity to monitor a minimum of 240 intelligent initiating devices and addressable control/monitor modules per line. Systems not providing the signaling line circuit capacity specified shall be installed with additional signaling line circuits as required to provide the difference between the specified capacity and the system capability, while not exceeding the device loading limitations specified herein for any individual SLC.

- L. Each and every SLC shall be provided with transient surge protection located and terminated within an enclosure separate from the main control panel to prevent component failure and to prevent false alarms due to transients, lightning and surges.
- M. Class "B" for all SLC circuits.
- N. Style "B" supervised wiring for Initiating Device Circuits (IDC) and control wiring.
- O. Basic system configuration shall support a minimum of **1000** addressable and/or monitor points and control points with expansion capability for supporting up to **1000** supervised inputs/outputs. The CPU shall be provided with sufficient memory, card slot and enclosure cabinet capacity to allow system expansion.
- P. The panel face display unit shall contain as a minimum the following:
 - Q. 80-character backlit liquid crystal display (LCD).
 - R. Full key operated alpha-numeric keypad.
 - S. Local alarm/trouble sounders.
 - T. Light emitting diode annunciator for the display of the following system operating parameters:
 - 1. System AC power normal.
 - 2. System Alarm condition.
 - 3. System Supervisory condition.
 - 4. System Trouble condition.
 - 5. Alarm silence.
- U. Control keys for the following functions:
 - 1. Alarm/Trouble Acknowledgement.
 - 2. Local Alarm Silence.
 - 3. System Reset.
 - 4. Lamp Test.
- V. All system operational and test parameters shall be capable of being set through the alpha-numeric keypad.
- W. The panel face display unit shall include a password feature to prevent unauthorized manual control or programming.
- X. The panel face display unit shall contain, and display as needed, custom alpha-numeric labels for all intelligent devices and all addressable modules. Zone/device nomenclature information shall be stored in programmable, non-volatile memory.
- Y. The alpha-numeric visual display shall show the time-of-day, day-of-week, month, day-of-month, and year. Upon operator request, the normal visual display shall be replaced with the status of any system point or system trouble called up.

- Z. Separate module with amber trouble LED and disconnect switch shall be provided for system the Municipal Master Box. An amber LED shall be provided to indicate "circuit disconnected".
- AA. In the event of total power loss and restoration, the status of the initiating and indicating devices shall remain unchanged.

2.3 REMOTE CONTROL PANELS

- A. Remote Control Panels (RCP's) panels are to be used as indicated to provide addressable Signaling Line Circuits, circuits, Notification Appliance Circuits (NAC) and as a means of connecting auxiliary reporting devices such as CRT's, printers and alphanumeric displays into the system network. Each RCP shall be connected to the master Fire Alarm Control Panel (FACP) via a Style 6 Class A signaling line trunk (SLC). Communications between the CPU and RCP's shall be in digital form. Failure of the RCP to respond shall result in a communication failure indication at the FACP with a resulting display, audible alarm and printout.
- B. A status change in any addressable device shall be reported to the FACP by the RCP via the signaling line trunk (SLC), with "status changed" data accepted as valid after receipt of two alarm reports for a particular device.
- C. An LED indicator shall be provided for each SLC in each RCP to indicate the normal communication with devices. Additionally, an LED shall be provided to indicate normal communication from the RCP to the master FACP. This permits verification of polling response at the RCP location.
- D. Power for the RCP's shall be provided from a local power supply in the RCP enclosure. This shall be connected to an emergency AC power circuit and include battery back-up to operate the panel devices upon AC power failure in accordance with NFPA 72 requirements.
- E. Failure of or power loss to an RCP shall not affect any devices not directly connected to that panel and shall not prevent any other panels or network devices on the signaling trunk from reporting to the FACP.
- F. An open or shorted line between an RCP and the receiving equipment shall activate audible and visual trouble signals at the receiving equipment. In addition, the FACP memory will retain the last valid status signal received and not permit any status changes to be reported to the alarm indicators until valid status signals are received indicating such change.
- G. Where two or more cabinets are required to house control equipment, the control equipment shall be furnished with factory-wired interconnection cables with disconnect plugs and sockets so that no field wires need be added by contractor unless an open, ground or wiring connection of any such wire does not affect the operation of the alarm system.
- H. All circuitry between the RCP's and FACP shall be supervised. RCP malfunction or power failure at the panel shall activate audible and visual trouble signals at the receiving

equipment. The visual trouble signal shall include indication of the specific devices and/or circuits affected by the malfunction for rapid diagnosis of the problem.

- I. RCP's shall be /surface mounted in an approved, locked steel enclosure within a fire rated room.

2.4 FIRE-ALARM GRAPHIC ANNUNCIATORS

A. Performance Criteria:

1. Regulatory Requirements:
 - a. NFPA 72.

B. General Characteristics:

1. Graphic Annunciator Panel: Mounted in aluminum frame with nonglare, minimum 3/16 inch (4.76 mm) thick, clear acrylic cover over graphic representation of facility. Detector locations must be represented by red LED lamps. Normal system operation must be indicated by lighted, green LED. Trouble and supervisory alarms must be represented by amber LED.
2. Comply with UL 864.
3. Operating voltage must be 24 V(dc) provided by local 24 V power supply provided with annunciator.
4. Include built-in voltage regulation, reverse polarity protection, RS 232/422 serial communications, and lamp test switch.
5. Surface] mounted in NEMA 250, Type 1 cabinet, with key lock and no exposed screws or hinges.
6. Graphic representation of facility must be CAD drawing and each detector must be represented by LED in its actual location. CAD drawing must be at 1:96 (1:100) scale or larger.
7. LED representing detector must flash [two] <Insert number> times per second while detector is in alarm.

2.5 SYSTEM PRINTER

- A. The system printer shall be panel mounted type and shall provide a permanent hard copy record of all pertinent details of system activity. Included on this record shall be all unscheduled status change events, all automatic control commands and all operator control commands into the system and the time and date of all occurrences.
- B. The printer shall reflect all alarm, trouble and status change signals by device or circuit in the system. The alarm shall be printed out in English language text so that the type, device or circuit, time and date of alarm is clearly understood without referring to a code directory. Printout by code number or holes in paper tape will not be considered functionally equivalent.
- C. The printer shall have automatic paper feed, receive print messages in the 80-column format and at a minimum print rate of two-hundred (200) characters per second.

- D. In addition to event logging, the unit shall print a system off-normal status summary. The summary is initiated by manual operator command on the multi-function panel and shall list:
 - 1. All off-normal system monitor points.
 - 2. All "commanded" system control points.
- E. The printer shall include a report capability to list the sensitivity of all analog intelligent detectors in the system.
- F. The printer shall provide a summary alarm to be activated on a printer power failure, printer trouble signal or out of paper signal. Contact shall be prewired to the FACP.

2.6 REMOTE ANNUNCIATOR

- A. Description: Annunciator functions shall match those of fire-alarm control unit for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control unit, including acknowledging, silencing, resetting and testing.
- B. Mounting shall be flush or surface mounted cabinet as determined by the architect, NEMA 250, Type 1.
- C. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control unit. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.
- D. All electronics shall be assembled on factory-standard circuit boards. Interconnection of circuit boards shall be accomplished by the use of quick-disconnect wire harness assemblies. The annunciator shall have terminal strips with hold-down clamps that accept 14 to 22-gauge cabling. The panel shall have a lamp-test push button switch that, when depressed, activates all LED's.
- E. All electronics shall be factory mounted to a metal backplane that will be mounted to the backbox at the time of final annunciator installation. All field connections to the backplane must be made through system-standard terminal strips. All front panel LED's must be connected to the backplane by quick-disconnect ribbon cables.
- F. The panel shall be point back-lighted and use socket-mounted LED's to facilitate replacement and any future changes. LED's shall be available in red, orange, yellow and green. Incandescent lamps are not acceptable.
- G. The unit shall be graphically and electronically expandable. Field updates of graphic information must be possible through the use of factory-supplied change kits. More extensive changes (major modifications of graphic elements, adding or deleting LED's, etc.) must be possible without requiring full replacement of the original panel. Major changes to the annunciator, when pre-approved, shall be accomplished at the factory within a 48 hour period. A complete set of detailed, CAD generated drawing files of the panel shall be provided to the Owner from the manufacturer upon completion, installation and final testing of the annunciator panel.

- H. The panel shall be U.L. listed.

2.7 STATUS INDICATOR PANEL (SIP)

- A. Provide a SIP as part of the FACP. It shall contain:
 - 1. Fire Pump and Jockey Pump Supervision
- B. Fire pump supervision shall be an integral part of the main fire alarm control panel and annunciator panel.
- C. Each fire pump shall have status indication for:
 - 1. Power failure.
 - 2. Pump running.
 - 3. Phase reversal.
- D. Jockey pump supervision shall be an integral part of the Jockey pump controller.
- E. The Jockey pump shall have status indication for:
 - 1. Power failure
- F. An audible trouble signal shall sound until acknowledged and automatically restored.

2.8 ALARM INITIATING DEVICES

- A. Provide intelligent smoke and thermal sensors as shown. The address shall be set at the sensor by the installer using the rotary or toggle switches located in the sensor head or module. Where module/sensor addresses are required to be "programmed" into the device, the programmer device and complete instructions for use shall accompany the system. All intelligent analog sensors shall be interchangeable and shall use common twist-lock bases. All sensors shall provide alarm LED. LED shall flash under normal operating and communication conditions and shall illuminate steady state when the sensor's sensitivity level (analog value) exceeds the predetermined limit and commands from the FACP place the sensor into the alarm state. All sensors shall include a test means, whereby the sensor's actual analog value and the sensor alarm verification mode shall be displayed on the FACP display.
- B. When the sensors reach a predetermined sensitivity, the FACP shall automatically display an alert message. All single I/O modules shall contain an alarm LED that shall flash during normal operation and communication and shall go to a steady state when commanded by the control panel that an alarm or supervisory value has been detected. All intelligent devices shall connect to and communicate with the FACP or RCP via the SLC serving the respective area(s) and shall incorporate built-in type identification to allow the FACP to identify the type of sensor.
- C. Intelligent Ionization Sensor shall be continually monitored to measure any change in sensitivity because of the environment (dirt, smoke, temperature, humidity, etc.). The sensor shall use the ionization principle to measure products of combustion and shall on command from the FACP send data to the panel representing the analog value of the

smoke density, providing indication of the analog value of the products of combustion to the FACP. The sensor sensitivity shall be adjustable per device (within UL limits).

- D. Intelligent Photoelectric Sensor shall be continually monitored to measure any change in sensitivity because of the environment (dirt, smoke, temperature, humidity, etc.). The sensor shall use the photoelectric principle to measure smoke density and shall on command from the FACP send data to the panel representing the analog value of the smoke density, indication of the analog value of the level of smoke density to the FACP. The sensor sensitivity shall be adjustable by device (within UL limits).
- E. Intelligent Thermal Sensor shall be continually monitored to measure any change in sensitivity because of environment (dirt, temperature, humidity, etc.). The sensor shall use dual solid-state thermistors and shall monitor the ambient temperature from -10 degrees C. to +60 degrees C. and provide a fast response to rapid increases in temperature. The sensor, on command from the control panel, shall send data to the panel representing the analog value of the ambient temperature.
- F. Intelligent Duct Detector shall be analog /dual chamber Ionization/ /photoelectric sensor/ and shall provide (2) Form-C relay output contacts for local control purposes. Output contact shall activate upon programmed control from the FACP only. Each duct detector also shall provide address- setting means using rotary decimal or toggle switches and shall also store an internal identifying code which the FACP shall use to identify the type of device.
- G. Each detector shall be supplied with duct mount housing tubes, sized according to duct width. Provide remote alarm pilot lamp at all concealed duct smoke detector locations. For above ceiling applications, provide junction box above ceiling and whip to pilot lamp mounted on ceiling near detector access location. At each duct smoke detector location provide an accessible remote mounted keyed switch with LED indicators.
- H. Intelligent Monitor Module shall be used to connect a supervised conventional initiating device or zone of supervised conventional initiating devices (water flow switches, tamper switches, etc.). The module shall mount in a 4-inch square, 2 1/8-inch deep electrical box and shall be capable of Style B or Style D supervised wiring to the initiating device. In order to maintain proper supervision, there shall be no T-taps allowed. The Monitor Module shall provide address setting means using rotary decimal or toggle switches and also store an internal identifying code which the FACP shall use to identify the type of device. The Monitor Module shall contain an integral LED that flashes each time the monitor module is polled.
- I. Intelligent Control Module shall be used to connect and supervise a conventional indicating device or zone-of indicating devices that require an external power supply, such as horns, strobes, or bells to the /FACP via the SLC's. The Control Module shall be capable of operating as a relay (dry contact form C), to control Door Holders, Air Handling units, etc. The module shall mount in a 4-inch square, 2-1/8-inch deep electrical box and shall be capable of Class "A" or "B" supervised wiring to the indicating or control device. The Control Module shall contain an integral LED that shall flash each time the module is polled. The Control Module shall provide address setting means using rotary decimal or toggle switches and also store an internal identifying code which the control panel shall use to identify the type of device.

- J. Isolation Module shall be an automatic switch, which will open when the SLC line voltage drops below a prescribed limit, indicating a condition which could prohibit reliable operation on the line. The Isolator Module shall be placed, at a maximum vertical interval of two (2) floors, between groups of sensors/intelligent modules on each SLC in order to protect the line if a "short" should occur. If a short occurs between any two (2) isolators, then both isolators switch to an open circuit condition and isolate the group of sensors/modules between them.
- K. The remaining devices on the intelligent loop shall continue to operate and communicate normally. The number of devices between isolators shall be twenty-five (25) or less. The Isolator shall be designed to mount in a 4-inch square, 2 1/8-inch electrical box. Additional isolation modules shall be installed to meet local code requirements.
- L. Automatic Heat Detectors (Conventional Type):
- M. Rate of Rise and Fixed Temperature
- N. Automatic heat detectors shall be the combination rate-of-rise and fixed temperature type - rated at 135°F for areas where ambient temperatures do not exceed 100°F and rated at 200°F for areas where ambient temperatures exceed 100°F but not 150°F.
- O. The rate-of-rise element shall consist of an air chamber, a flexible metal diaphragm, and a factory-calibrated moistureproof, trouble-free vent and shall operate when the rate of temperature rise exceeds 15F. per minute.
- P. The fixed temperature element shall consist of a heat collector held by standard sprinkler fusible solder.
- Q. Detectors shall have a smooth ceiling rating of 2500 square feet and an electrical rating of 3 amps at 6 to 125 volts A.C. and 1 amp at 6 to 28 volts D.C. (fixed temperature detectors shall have the same temperature and electrical ratings as combination thermostats but a smooth ceiling rating of 625 square feet).
- R. 190°F heat detectors used in elevator machine rooms for power disconnection shall provide 2 sets of N.O. contacts.
- S. Sprinkler Water Flow, Valve Tamper and Air Supervisory Switches:
 - 1. Sprinkler valve tamper switches, sprinkler supervisory switches and water flow switches shall be furnished and installed under Section Fire Protection and wired under this Section. All water flow, valve tamper, air supervisory switches, low building temperature and water level shall be provided with Monitor Modules for monitoring at the FACP. Furnish and install all Monitor Modules to monitor and supervise the sprinkler system as part of this work.
- T. Intelligent Manual Fire Alarm Stations:
 - 1. The manual stations shall have a durable red finish with white raised letters, and shall be of the break-glass rod type. Hardware and backbox shall be of metal construction with a key reset switch for positive resetting action.

2. The Manual Station shall, on command from the FACP, send data to the panel representing the state of the manual switch. The Manual Station shall provide address-setting means using rotary decimal switches and shall also store an internal identifying code which the FACP shall use to identify the type of device.
3. Surface mounted stations shall mount on a red finish backbox. Flush mounted stations shall mount directly on a standard electrical outlet box.
4. The pull lever of the station shall remain in the actuated position until restored to normal by means of a special key or tool.
5. The station shall be activated by dual action.

2.9 NOTIFICATION APPLIANCES

- A. Horn Unit:
 - B. Operation shall be from 24 VDC supervised parallel notification appliance circuits.
 - C. Field selectable tones; reversible Temp 3 pattern or non-temporal continuous pattern.
 - D. Horn to be installed flush mounted in finished areas and surface or semiflush mounted in other areas.
 - E. Minimum sound pressure level shall be 92 DB on axis at 10 feet.
 - F. Unit shall be U.L. listed for use in fire protective signaling systems.
- G. Strobe Unit:
 - H. Strobe unit shall consist of a visual alarm strobe device, wall mounted, housed in a metal backbox. They shall be constructed for safe use in boiler rooms, kitchens and all indoor locations.
 - I. The visual device shall be a high intensity Xenon flasher with a minimum intensity of 15, 30, 75, and/or 110 (depending on location) candela per UL 1971. The unit shall be in full compliance with City of Chicago requirements and have terminal connections.
 - J. The strobe lens shall be clear with red lettering on the housing for "FIRE". Orientation of lettering on housing shall be such that upright letters are provided when unit is installed.
 - K. The strobe unit shall flash at a frequency of 1 to 3 Hz with maximum pulse duration of .2 seconds and maximum duty cycle of 40%.
 - L. Visual devices shall be activated, by zone, when the associated one-way communication zone is selected at the Fire Command Panel.
 - M. Power for visual devices shall be from separate, supervised 24 VDC indicating circuits, zoned for each floor and stairwell. Multiple circuits shall be provided per level to accommodate distance and loading. Visual indicators shall be synchronous by circuit, zone and area.

- N. The unit shall be U.L. listed for use in fire protective systems.
- O. Units shall be flush mounted in finished areas and surface mounted in unfinished areas and shall be provided with appropriate back boxes.
- P. Units mounted in plenum areas or ceilings shall include plenum box and mounting hardware.
- Q. Horn/Strobe Unit:
 - 1. Power for the unit shall be from separate, supervised 24 VDC indicating circuits, zoned for each floor, floor-area, and stairwell. Multiple circuits shall be provided per level to accommodate distance and loading.
 - 2. The horn assembly shall be housed in a die-cast enclosure.
 - 3. Minimum sound pressure level shall be 92 dBA on axis at 10 feet.
 - 4. The visual device shall be a high intensity Xenon flasher with a minimum intensity of 75 candela per UL 1971. /The unit shall have terminal connections/
 - 5. The strobe lens shall be clear with red lettering on the housing for "FIRE". Orientation of lettering on housing shall be such that upright letters are provided when unit is installed. Strobes shall be synchronous by circuit, zone and area.
 - 6. The strobe unit shall flash at a frequency of 1 to 3 Hz with maximum pulse duration of .2 seconds and maximum duty cycle of 40%.
 - 7. The unit shall be U.L. listed.
- R. Alarm Bell:
 - 1. Alarm bells shall be of the underdome vibrating type with gongs no smaller than (6", 8" or 10") in diameter with red finish. Outdoor bells shall be 10" in diameter.
 - 2. Bells shall be polarized and operate at 24 VDC. Bells shall be suitable for surface or semi-flush mounting. Surface mount shall be weatherproof.
 - 3. Semi-flush shall mount to any standard 4-inch square, 4 inch octagon or single-gang box with a maximum projection of 2-1/2".

2.10 DOOR HOLDERS

- A. Magnetic door holder mechanisms consist of an electromagnet (wall portion) and an armature (door portion) for operation at voltage as required for the door hardware. Furnishing of the mechanisms and installation of the armatures upon the doors are specified under Section Finish Hardware. However, complete electrical installation of the electromagnets in the walls in accordance with manufacturer's recommendations shall be the responsibility of the contractor under this section. Cooperate and coordinate respective responsibilities in order that a complete, aligned, and functioning door hold/release system is integrated into the fire alarm system.

2.11 DIGITAL ALARM COMMUNICATOR TRANSMITTER

- A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 632 and be listed and labeled by an NRTL.
- B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control unit and automatically capture direct dial telephone line(s) and dial a

preset number for a remote central station. When contract is made with central station(s), signals shall be transmitted. If service on [either] line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.

- C. Local functions and display at the digital alarm communicator transmitter shall include the following:
1. Verification that both telephone lines are available.
 2. Programming device.
 3. LED display.
 4. Manual test report function and manual transmission clear indication.
 5. Communications failure with the fire-alarm control unit.
- D. Digital data transmission shall include the following:
1. Address or zone of the alarm-initiating device.
 2. Zone of the supervisory signal.
 3. Zone of the trouble-initiating device.
 4. Loss of ac supply or loss of power.
 5. Low battery.
 6. Abnormal test signal.
 7. Communication bus failure.
 8. Secondary Power: Integral rechargeable battery and automatic charger.
 9. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

2.12 IDENTIFICATION

- A. Fire alarm terminal and junction locations shall be identified in accordance with NFPA70, Section 760-3. Junction and terminal boxes shall be painted red and stenciled "Fire Alarm", preventing unintentional interference with the signaling circuits during testing, servicing, and additional modifications to the system.

2.13 WIRING

- A. All Fire alarm system cabling shall be encased in conduit Red in color minimum of $\frac{3}{4}$ ".
- B. Wiring shall be color coded as follows:
- C. Initiating circuits (from monitor modules) -
1. #14 AWG Red/Brown
 2. #14 AWG Blue/Brown
- D. Indicating circuits:
1. General Alarm (horns) - #14 AWG Orange/Brown.

2. General Alarm (strobes) - #14 AWG Purple/Brown.
 3. Pre-Signal (chimes) - #14 AWG Yellow/Brown.
 4. Auxiliary relays/functions - #14 AWG Green/Brown.
- E. Addressable SLC's and signaling trunks shall be Style 6 Class A, with wire type as required by system manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Division 01 - Administrative Requirements: Coordination and project conditions.
- B. Verify products and systems receiving devices are ready for installation.

3.2 INSTALLATION

- A. Install manual station with operating handle 42 inches above floor.
- B. Install audible signal devices 80 inches above floor.
- C. Install strobe units and horn/strobe units 80 inches above floor.
- D. All wiring for the System shall be in accordance with Articles 760, 725, and 800 of the National Electric Code and all local amendments to applicable Codes.
- E. Provide complete wiring and conduit between all equipment. Unless specified otherwise, all system wiring shall be in separate raceway, maximum 40% fill, with approved fire alarm cable as recommended by manufacturer. Where cabling (in lieu of individual conductors) is used, conduits of proper size, minimum $\frac{3}{4}$ " , shall be installed from all equipment and devices into accessible spaces and all devices shall be mounted upon and all connections made within Listed boxes. Wiring splices are to be avoided to the extent possible and coloring of cables and wiring shall be consistent throughout the entire system, and from end-to-end on each and every circuit. Mixing and/or changing colors of wiring will not be permitted.
- F. All Equipment shall be held firmly in place. Fastening and supports shall be adequate to support the loads with a safety factor of five (5).
- G. Wiring shall be checked and tested by the contractor in accordance with the instructions provided by the manufacturer to assure that the system is free of grounds, opens and shorts.
- H. Mount end-of-line device box with last device or separate box adjacent to last device in circuit.
- I. Mount outlet box for electric door holder to withstand 80 pounds (36.4 kg) pulling force.

- J. Connect conduit and wire to door release devices, sprinkler flow switches, sprinkler valve tamper switches, fire suppression system control panels, duct smoke detectors.
- K. Automatic Detector Installation: Conform to NFPA 72 and City of Chicago Fire Department requirements.
- L. Install engraved plastic nameplates in accordance with Section 260553.
- M. Ground and bond fire alarm equipment and circuits in accordance with Section 260526.
- N. Provide ceiling mounted smoke detector at the FACP and RCP locations.
- O. Provide heat detector (190°F.) within two feet of each sprinkler located in an elevator shaft or elevator machine room.

3.3 FIELD QUALITY CONTROL

- A. Test in accordance with NFPA 72 and City of Chicago Fire Department requirements.
- B. Test Report: A complete commissioning package including letter of system Certification and copy of all test report documentation shall be submitted indicating proper installation and functioning of the system, conformance to the specifications and that the completed system is in operating condition and all components have been tested and operating satisfactory. The test shall be performed by factory-trained qualified technicians. Each and every device shall be tested, and the corresponding dated printout from the system printer during testing shall be included with the system Test Report.
- C. Manufacturer shall guarantee all system equipment for a period of one (1) year from date of final acceptance of the system.
- D. The contractor shall guarantee all raceways and wiring to be free from inherent mechanical or electrical defects for one (1) year from date of final acceptance of the system.
- E. Complete system testing and documentation in accordance with NFPA 72 is required as part of this Section. Submit completed and signed test report in quantities as required by General Conditions but not less than four (4) copies. Upon completion of the installation of fire alarm and protective systems equipment, this contractor shall provide to the Architect/Engineer a completed NFPA 72 "Record of Completion" and a signed written statement, substantially in form as follows:
 - 1. "The undersigned, having engaged as the Fire Alarm Contractor on the (NAME OF PROJECT), confirms that the fire alarm and protective system equipment was installed in accordance with the wiring diagrams, instructions, and directions provided."
 - 2. After receipt of the test report, completed record of completion form and written statement, demonstrate the operation of the system to the Owner, Architect, Engineer and Local Code Authorities (AHJ). The final acceptance test shall include complete tests as required to show compliance with these specifications and State/Local Codes.

3. In the event the system does not operate properly, corrections shall be made and the procedure repeated until it is acceptable to the Architect/Engineer and Local AHJ.
4. Submit a Fire Alarm System Service Contract for up to five (5) years, renewable annually with cost for each year for Owner=s approval as part of base contract.

3.4 SMOKE DETECTORS

- A. All area smoke detectors and sampling tubes of all duct type detectors shall be covered with UL approved plastic bags sealed airtight. A bag shall be installed immediately after installation of detector and on each device. Bags shall be removed when directed.

3.5 MANUFACTURER'S FIELD SERVICES

- A. Section 014000 - Quality Requirements: Manufacturer's field services.
- B. Include services of a NICET Certified technician to supervise installation, adjustments, final connections, and system testing.

3.6 DEMONSTRATION AND TRAINING

- A. Factory technician shall instruct owner's designated personnel in the complete operation of the system. Training sessions shall be presented by a fully qualified, trained representative of the equipment manufacturer who is thoroughly knowledgeable of the specific installation. Instruction shall include, but not be limited to, activation and restoration of:
 - B. Smoke detectors - ceiling mounted and duct type.
 - C. Waterflow and valve tamper switch zones.
 - D. Operation of the Fire Command Panel including all annunciation, status indication, interpretation of all signals, and readouts at the Command Panel.
 - E. Initiating all system inquiry and system status reports.
 - F. Replacing fuses at FACP, FAA and RCP locations.
 - G. Operation and resetting procedure for all types of initiating and output devices.
 - H. The Contractor shall post the name, address and telephone number of the Contractor, all subcontractors and the Fire Alarm Installer and Service Organization (including 24 hour-a-day response telephone number) within a non-flammable, plastic laminated cover firmly secured on the inside cover of the main control panel.

END OF SECTION 28 31 11

Section 28 55 00 – ENTRANCE SECURITY INTERCOM

PART 1 - GENERAL

1.1 SYSTEM DESCRIPTION

A. General Requirements

1. The specified unit shall be of manufacturer's official product line, designed for commercial and/or industrial 24/7/365 use.
2. The specified unit shall be based upon standard components and proven technology using open and published protocols.

B. Sustainability

1. The specified unit shall be manufactured in accordance with ISO 14001.
2. The specified unit shall be compliant with the EU directives 2011/65/EU (RoHS) and 2012/19/EU (WEEE).
3. The specified unit shall be compliant with the EU regulation 1907/2006 (REACH).

C. The specified unit shall carry the following EMC approvals:

1. EN55032: 2015
2. EN55024: 2010
3. 2014/35/EU
4. 2014/30/EU
5. 2012/19/EU
6. 2011/65/EU
7. EN 55032 Class A
8. EN 55032 Class B
9. EN 55024
10. FCC Part 15 - Subpart B Class A
11. FCC Part 15 - Subpart B Class B
12. FCC Part 15 - Subpart B Class A + B
13. ICES-003 Class A
14. ICES-003 Class B

D. The specified unit shall meet the following product safety standards:

1. IEC/EN/UL 60950-1

E. The specified unit shall meet the following standards

1. Audio:
 - a. G.711
 - b. G.729
 - c. G.722 (wideband)
 - d. L16 / 16kHz (wideband)
2. Video:
 - a. H.264 (MPEG-4 AVC)

3. Networking:

- a. IEEE 802.3af/802.3at (Power over Ethernet) [applies to products with PoE]
- b. IEEE 802.1X (Authentication)
- c. IPv4 (RFC 791)
- d. QoS
4. Mechanical Environment:
 - a. EN90529 IP69K
 - b. IEC/EN 62262 IK10

1.2 QUALITY ASSURANCE

- A. The Contractor or security sub-contractor shall be a licensed security Contractor with a minimum of five (5) years' experience installing and servicing systems of similar scope and complexity and evidence that is completed at least three (3) projects of similar design and is currently engaged in the installation and maintenance of systems herein described.
 1. All installation, configuration, setup, program and related work shall be performed by electronic technicians thoroughly trained by the manufacturer in the installation and service of the equipment provided.
 2. The contractor or designated sub-contractor shall submit credentials of completed manufacturer certification, verified by a third-party organization, as proof of the knowledge.
 3. The Contractor shall provide four (4) current references from clients with systems of similar scope and complexity that became operational in the past three (3) years. At least three (3) of the references shall be utilizing the same system components, in a similar configuration as the proposed system
 4. The specified unit shall be manufactured in accordance with ISO9001.

1.3 WARRANTY

- A. All security system components and labor furnished by the contractor including wiring, software, hardware and custom parts shall be fully warranted for parts, materials, labor and travel expenses for a minimum of three (3) years.
- B. The manufacturer shall provide warranty and optional extended warranty for the unit for a total period of maximum five years. If enacted as part of the contract, the contractor will repair or replace parts and/or labor per the warranty for the length of this warranty at no cost to the client.

1.4 System Description

1. Master Station
 - a. Aiphone IX-MV7-H (Existing – Previous Project)
2. Door Station
 - a. Aiphone IX-DVF
 - b. Provide to access existing master station
 - 1) Re-Configure master station
 - 2) Duplicate existing functionality for door/gate stations
 - 3) Coordinate mounting with bollards provided by others
 - 4) Cable for gate actuation.

PART 2 - PRODUCTS**2.1 General**

- A. Intercoms shall be IP-based and comply with established network and video standards.
- B. Intercoms shall be powered by the switch utilizing the network cable.
- C. Intercoms shall be fully supported by an open and published API (Application Programmers Interface), which shall provide necessary information for integration of functionality into third party applications.

2.2 Intercom schedule

- A. Intercom types listed below describing various resolutions, form-factor and features shall be supplied by a single intercom manufacturer.
- B. The intercom manufacture will be as follows:
 - 1. AI Phone.
 - a. IX-DV(F)

2.3 Intercom

- A. IP intercom
 - 1. The intercom shall meet or exceed the following design specifications:
 - 2. Power Source
 - a. PoE (IEEE 802.3af class 0)
 - 3. Power Draw
 - a. 5.28 Watts
 - 4. Camera
 - a. 1/3" CMOS 1.23 megapixel
 - 5. Min. illumination
 - a. 5 lux
 - 6. Audio Codec
 - a. G.711 (μ -law, A law), G.722
 - 7. Video Codec
 - a. H.264/AVC, motion JPEG
 - 8. Protocols
 - a. IPv4, IPv6, TCP, UDP, SIP, HTTP, HTTPS, RTSP, RTP, RTCP, IGMP, MLD, SMTP, FTP, DHCP, NTP, DNS
 - 9. Port Security
 - a. IEEE 802.1X
 - 10. Operating Temp
 - a. -40° - 140°F (-40° - 60°C)
 - 11. Protection
 - a. IP54, IK08
 - 12. Dimensions
 - a. 8-1/16" H x 4-1/2" W x 2-1/16" D

13. Mounting
 - a. Surface mounted with included bracket.

PART 3 - Execution

3.1 Installation

- A. The Contractor shall carefully follow instructions in documentation provided by the manufacturer to ensure all steps have been taken to provide a reliable, easy-to-operate system.
 1. System shall be configured to connect to existing
- B. All equipment shall be tested and configured in accordance with instructions provided by the manufacturer prior to installation.
- C. All firmware found in products shall be the latest and most up-to-date provided by the manufacturer.
- D. All equipment requiring users to log on using a password shall be configured with user/site-specific password/passwords. No system/product default passwords shall be allowed.

END OF SECTION 28 55 00

SECTION 31 10 00 – SITE CLEARING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. Protecting existing trees and vegetation to remain.
2. Removing trees and other vegetation.
3. Clearing and grubbing.
4. Topsoil stripping and stockpiling.
5. Removing debris
6. Removing above-grade site improvements.
7. Removal of paving, curbs, gutters, gravel, concrete blocks, concrete barrier walls, wood, fences, posts, utility poles, utility structures and pipes, guard rail, railroad ties etc. or other structures.

B. Related Sections include the following:

1. Division 01 Specifications.
2. Division 02 Section 02 41 19 Selective Demolition.
3. Division 31 Section 31 23 16 Excavation.
4. Division 31 Section 31 23 17 Excavating, Backfilling, and Compacting for Utilities.

1.2 DEFINITIONS

- A. Topsoil: See Specification Section Topsoil. Natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 2 inches in diameter; and free of weeds, roots, and other deleterious materials..

1.3 SUBMITTALS

- A. Not Required

1.4 MATERIALS OWNERSHIP

- A. Except for materials indicated to be stockpiled or to remain Owner's property, cleared materials shall become Contractor's property and shall be removed and disposed from the site.

1.5 PROJECT CONDITIONS

- A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.
 - 1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
 - 2. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
- B. Improvements on Adjoining Property: Authority for performing indicated removal and alteration work on property adjoining Owner's property will be obtained by Owner before award of Contract.
- C. Salvable Improvements: Carefully remove items indicated to be salvaged and store where indicated.
- D. Notify utility locator service for area where Project is located before site clearing.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

- A. Satisfactory Soil Materials: Requirements for satisfactory soil materials are specified in Division 31 Section 31 23 23.01 "Fill."
 - 1. Obtain approved borrow soil materials off-site when satisfactory soil materials are not available on-site.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protect and maintain benchmarks and survey control points from disturbance during construction.
- B. Provide erosion-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.
- C. Locate and clearly flag trees and vegetation to remain. Contractor to provide temporary tree protection.
- D. Conform to applicable codes and local, state and federal regulations for disposal of removals and use

of herbicides. Burning of debris, lumber or scrap will not be permitted.
- E. Coordinate clearing work with the Owner's representative.
- F. Protect existing site improvements to remain from damage during construction.
 - 1. Restore damaged improvements to their original condition, as acceptable to Owner.

3.2 TREE PROTECTION

- A. Erect and maintain a temporary fence around drip line of individual trees or around perimeter drip line of groups of trees to remain. Remove fence when construction is complete.
 - 1. Do not store construction materials, debris, or excavated material within drip line of remaining trees.
 - 2. Do not permit vehicles, equipment, or foot traffic within drip line of remaining trees.
- B. Do not excavate within drip line of trees, unless otherwise indicated.
- C. Where excavation for new construction is required within drip line of trees, hand clear and excavate to minimize damage to root systems. Use narrow-tine spading forks, comb soil to expose roots, and cleanly cut roots as close to excavation as possible.
 - 1. Cover exposed roots with burlap and water regularly.
 - 2. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.
 - 3. Coat cut faces of roots more than 1-1/2 inches in diameter with emulsified asphalt or other approved coating formulated for use on damaged plant tissues.
 - 4. Cover exposed roots with wet burlap to prevent roots from drying out. Backfill with soil as soon as possible.
- D. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations, in a manner approved by Architect.

3.3 UTILITIES

- A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
 - 1. Notify Owner not less than two days in advance of proposed utility interruptions.
- B. Excavate for and remove overground/underground utilities indicated to be removed.

3.4 CLEARING AND GRUBBING

- A. Remove obstructions, trees, shrubs, grass, and other vegetation to permit installation of new construction. Removal includes digging out stumps and obstructions and grubbing roots.
 - 1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
 - 2. Cut minor roots and branches of trees indicated to remain in a clean and careful manner where such roots and branches obstruct installation of new construction.
 - 3. Completely remove stumps, roots, obstructions, and debris extending to a depth of 24 inches below exposed subgrade. Remove the remaining stump if found in conflict with proposed facilities/utilities.

4. Use only hand methods for grubbing within drip line of remaining trees.
- B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material, unless further excavation or earthwork is indicated.
 1. Place fill material in horizontal layers not exceeding 8-inch loose depth, and compact each layer to the required percentage of density.

3.5 TOPSOIL STRIPPING

- A. Remove sod and grass before stripping topsoil.
- B. Strip topsoil to whatever depths are encountered in a manner to prevent intermingling with underlying subsoil or other waste materials.
 1. Strip surface soil of unsuitable topsoil, including trash, debris, weeds, roots, and other waste materials.
- C. Stockpile topsoil materials away from edge of excavations without intermixing with subsoil. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust.
- D. Provide silt fence in accordance with the local requirements for erosion control.

3.6 SITE IMPROVEMENTS

- A. Remove existing above- and below-grade improvements as indicated and as necessary to facilitate new construction.
- B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.
 1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut length of existing pavement to remain before removing existing pavement. Saw-cut faces vertically.

3.7 DISPOSAL

- A. Disposal: Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials, including trash and debris, and legally dispose of them off Owner's property.

END OF SECTION 31 10 00

SECTION 31 13 00 - LANDSCAPE REMOVALS, PRUNING & PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

- A. This Section includes the protection of trees and other existing landscape areas from damage by the Contractor's equipment and operations during construction at locations shown on the plans. It also includes the pruning of trees that interfere with, or are affected by, execution of the Work, whether temporary or new construction.
 - 1. In advance of Project Work, coordinate with Architect and transformer installer to minimize damage to existing trees and other landscape areas.
 - 2. Remove existing trees which are in the way of installation of transformers, being careful to minimize damage to existing trees and turf areas.

- B. Related Sections include the following:
 - 1. Applicable provisions of Division 01 – General Requirements shall govern work under this specification section.
 - 2. Applicable provisions of "Owner" General and Detailed Technical Specifications utilized for this project.
 - 3. Section 01 81 13 -- Sustainable Design Requirements – LEED For New Construction And Major Renovations.
 - 4. Section 01 81 13.13 -- Sustainable Design Requirements.
 - 5. Division 31 – Earthwork
 - 6. Section 32 93 11 – Landscape Plantings.
 - 7. Section 32 92 01 – Sod and Seed.

1.2 SUBMITTALS

- A. LEED Submittals: Product Data as required to show compliance with LEED MR Credit Sourcing of Raw Materials, meeting all documentation requirements, including back-up documentation.

- B. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

- C. Manufacturer's Product Data: Submit descriptions for all products, including organic fertilizer, commercial fertilizer, burlap, and each source of supply prior to the beginning of work under this Section. Delivery of materials may begin only after descriptions or samples have been approved.

- D. Bark Mulch Sample: Submit sample of specified wood mulch to Architect for review prior to placement of mulch. Sample shall be submitted in plastic bag equal to one quart size, sealed and labeled as to contents, name, brand, type, and supplier.

- E. Maintenance Recommendations: From a qualified arborist for care and protection of trees affected by construction during and after completing the Work.

- F. Certification: From a qualified arborist that trees indicated to remain have been protected during construction according to recognized standards and that trees were promptly and properly treated and repaired when damaged.

1.3 QUALITY ASSURANCE

- A. Qualifications: Installer of tree removals and protection fencing shall be the same installer as for Landscape Plantings.
- B. Arborist Qualifications: If Architect determines that existing trees require pruning, pruning shall be done by an arborist certified by the International Society of Arboriculture or licensed in the jurisdiction where Project is located, is required for all pruning.
- C. Tree Pruning Standards: Comply with ANSI A300, "Tree, Shrub, and Other Woody Plant Management--Standard Practices (Pruning)" unless more stringent requirements are indicated.
- D. Pre-installation Conference: Conduct conference at Project site to comply with requirements in Division 1 Section "Project Meetings."
 - 1. Before starting tree and landscape protection, meet with Architect. Review tree and landscape protection procedures and responsibilities. Notify participants at least three working days before convening conference. Record discussions and agreements and furnish a copy to each participant.
- E. Compliance: Comply with all applicable governmental laws, codes and ordinances, including all regulations regarding the disposal of organic wastes.
- F. Warranty: Repair or replace existing plant material which was designated to remain but damaged by the Contractor.

1.4 PRODUCT HANDLING:

- A. Fertilizers: Deliver in standard size bags, showing weight, analysis and name of processor, and store in weatherproof storage place and kept dry so that its effectiveness is not impaired.
- B. Maintenance Materials: Deliver anti-desiccant spray in containers of the manufacturer; mix and use according to manufacturer's direction. Deliver insecticide spray in the manufacturer's containers; mix and spray according to manufacturer's directions. Deliver fungicide in manufacturer's containers; mix and apply according to manufacturer's directions only with the acceptance of the Architect. Deliver herbicide in the manufacturer's containers; apply per manufacturer's directions, only with the acceptance of the Architect.
- C. Other Materials: Store all other materials so as to keep them clean and protected from damage, according to manufacturer's recommendations.

1.5 JOB CONDITIONS:

- A. Site Information: The existing conditions of areas where tree removal is required, as shown on the Drawings, were prepared from survey information provided by the Owner and visual

inspection of the site by the Landscape Architect. The existing conditions shown on the Drawings are not intended to be an exact representation of the conditions that the Contractor may encounter. It is expressly understood that the Owner and Landscape Architect will not be responsible for the interpretations and conclusions drawn by the Contractor. Data are made available solely for the convenience of the Contractor.

- B. Confirm Existing Conditions: Confirm existing conditions and report discrepancies to Architect prior to start of work.
- C. Coordination of Work: Coordinate work with all pertinent installers, including installer of transformers to minimize construction damage.
- D. Protection of Work: Provide temporary fences, barricades, coverings or other protection devices to preserve existing vegetation and improvements to remain. All trees designated for protection as shown on the plans or as directed by the Owner's Representative shall be identified with surveyor's flagging tape placed around the trunks at eye level.
- E. Protection of Adjacent Property and Dust Control: Prevent any substances from blowing, spilling, dropping, or depositing on adjacent property. Keep the construction area sufficiently dampened to control dust caused by operations.
- F. Permits: Obtain all necessary permits for the performance of work, including any permits required by state and local authorities.
- G. Utility Locations: Prior to performing removals or opening an excavation, determine whether underground installations; i.e., sewer, telephone, water, fuel, electricity lines, etc., will be encountered, and if so, where such utilities are located. Stake the exact location with the Utility Owner. When uncovered, provide proper supports for the existing installation. Contact and advise Utility companies of proposed work prior to the start of actual excavation.
- H. Tree Removals Around Existing Utilities: Data on the location and nature of existing and proposed utilities, as shown on the Drawings, are made available solely for the convenience of the Contractor. Contractor shall investigate the location, size, depth and nature of all utilities which may interfere with his work. Stake locations with Utility Owner, report discrepancies and consult with Utility Owner and Architect immediately prior to proceeding with work.

PART 2 - PRODUCTS

2.1 MATERIALS:

- A. General: All materials removed during demolition, except plants or other materials designated to be stockpiled, transplanted and reinstalled, shall be considered unsuitable and shall be legally disposed of outside the limits of the site.
- B. Fences:
 - 1. Fabric Fence:
 - a. Fence Fabric: 48" height, orange plastic fence, such as Tenax Alpi, or as manufactured by Du Pont, or approved equivalent. Attach securely every 6" to posts and rails.
 - b. Metal Posts: 6' foot metal T-posts.
 - c. Wood Posts and Top Rails: Pressure treated pine; posts 4" x 4" x 8 feet long, driven min. 3 feet deep spaced at 6 feet on center maximum; top rails 2" x 4",

nailed to posts.

- C. Bark Mulch: Clean shredded hardwood bark, not to exceed 2" in its largest dimension, free of foreign matter, sticks, stones and clods.
- D. Burlap Wrapping Materials: New, clean, plain burlap, manufactured for horticultural purposes. Secure with rope, strong twine or wooden stakes with staples.
- E. Wood Protection for Tree Trunks: 2" x 8" x 8 feet pressure treated pine, continuously banded with metal straps at 12 inch intervals.
- F. Commercial Fertilizers: Complete fertilizer, uniform in composition, free flowing and suitable for application with approved equipment. Type and application rate shall be determined by testing agency's soil test but may contain the following percentages by weight: 10% nitrogen, 10% phosphorous, and 10% potash.
- G. Plant Maintenance Materials:
 - 1. Anti-desiccant Spray: An emulsion which provides a protective film over plant surfaces, permeable enough to permit transpiration, such as "Wiltpruf", NCF Nursery Specialty Products, Inc., Grotan Falls, N.Y., or equivalent.
 - 2. Insecticides, Herbicides, Fungicides: Materials used for the control of pests shall be appropriate to the pest or pests which pose a problem to the materials, and shall be used by licensed personnel in strict accordance with the manufacturer's recommendations. No phytotoxic materials shall be used in areas where ornamental plants could be damaged.
- H. Drainage Fill: Selected crushed stone, or crushed or uncrushed gravel, washed, ASTM D 448, Size 24, with 90 to 100 percent passing a 2-1/2-inch (63-mm) sieve and not more than 10 percent passing a 3/4-inch (19-mm) sieve.
- I. Topsoil: Fertile, friable, surface soil, containing natural loam and complying with ASTM D 5268. Provide topsoil that is free of stones larger than 1 inch (25 mm) in any dimension and free of other extraneous or toxic matter harmful to plant growth. Obtain topsoil only from well-drained sites where soil occurs in depth of 4 inches (100 mm) or more; do not obtain from bogs or marshes.
- J. Filter Fabric: Manufacturer's standard, nonwoven, pervious, geotextile fabric of polypropylene, nylon, or polyester fibers.

PART 3 - EXECUTION

3.1 PREPARATION:

- A. Examination: Examine areas of protection and pruning operations prior to start of operations and report discrepancies in existing conditions to Architect prior to start of work of this Section. Do not proceed with installation or operations until conditions are corrected.
- B. Prohibited Practices: Do not move, park or maneuver vehicles or machinery and do not dump, stockpile or store any materials, including debris and excavated materials, within the protection fence zone before, during or after erection of the fence. Do not allow fires under or adjacent to remaining trees or other plants.

C. Protect Root Systems:

1. Protect root systems from flooding, eroding, or excessive wetting caused by dewatering operations.
2. Protect tree root systems from damage due to noxious materials caused by runoff or spillage while mixing, placing, or storing construction materials.
3. Tunnel the utilities through tree protection zones. Do not use machinery within or trench through site protection zones.
4. Prevent soil compaction over root systems. Do not operate machinery in tree protection zones to make grade changes. Hand dig the areas to make changes in grades.

B. Erect Protection Fencing: Prior to any demolition, site clearing or removals, construct temporary protection fences around all vegetation designated to remain, protect or preserve. Manually install fences true to line, plumb and level. The drip line is shown on Drawings as the outer edge of the tree canopy. Multiple trees may be enclosed by a single fence line provided the fence is located at drip lines of all trees. See Drawings.

1. Install temporary fencing located as indicated or at least one foot outside the drip line of trees to protect remaining vegetation from construction damage.
2. Where possible, fences shall be installed ten feet beyond the drip lines of the trees to be protected.
3. Where adjacent to pavement, install one foot outside the pavement edge.
4. Completely surround vegetation to be protected unless otherwise shown on the Drawings.
5. Install chain link fence according to ASTM F 567 and manufacturer's written instructions.
6. Securely stake fence posts into ground with fence fabric facing outward.

D. Other Protections: Prior to any demolition, site clearing, or removals, erect all other barricades and other protection devices as shown on the Drawings.

1. **Tree Trunk Protection:** Tree trunk protection will be allowed only where construction takes place closer than the drip line of existing trees. Place stakes in vertical position against tree trunk, edge to edge with edges touching and secure with metal straps.
2. **Burlap Coverings:** Entirely cover designated shrubs with burlap as shown on the Drawings. Secure with rope, strong twine or stapled to wooden stakes.
3. **Tie Up Branches:** Tie up or back any branches which may interfere with construction clearance and safety. Provide a minimum vertical clearance for equipment of twenty feet from finish grade, outside of protection fence. Tie back branches which interfere with sight distance or pose other safety hazards during the construction process.

F. Pruning for Safety and Clearance: With acceptance of Landscape Architect, prune to provide vertical clearance for equipment of twenty feet from finish grade, outside of protection fence. Prune for sight distance and safety with the acceptance of the Landscape Architect. Do not break off of branches to remain during clearing operations.

3.2 SITE CLEARING:

A. Clearing: Remove and dispose of all landscape obstructions such as debris, rubbish, fences, walls, foundations, footings, stones, boulders, paths, logs, shrubs, saplings, grass, weeds other vegetation and stumps.

1. Do not use heavy machinery in tree protection zones to accomplish clearing. Use low impact methods of removal and clearing.

- B. Inspection Prior to Removals: Removals shall be as determined by the Architect with the clear understanding by all that all removals of existing trees shall be replaced. See Drawings and refer to Section 32 93 11 – Landscape Plantings.
- C. Removals: Remove trees and other large plant materials by cutting and grubbing. Do not damage other vegetation including the roots of adjacent trees and existing landscape areas designated to remain, protect or preserve during removal process. Completely remove and legally dispose off the site all trees which are identified to be in the way of transformer installation, including branches, trunks, stumps and roots over 2 inches in diameter.
 - 1. Remove to a depth of two feet (24”) below finish grade elevation and repair grade with new topsoil. Refer to Section 32 93 11 – Landscape Plantings.

3.3 EXCAVATION AROUND EXISTING TREES

- A. Do not excavate within drip line of trees, unless otherwise indicated.
- B. Where excavation for new construction is required within drip line of trees, minimize damage to root zones.
 - 1. Install shoring or other protective support systems to minimize sloping or benching of excavations.
 - 2. Hand clear the area; do not use machinery.
 - 3. Minimize damage by using narrow-tine spading forks and comb soil, or use an air spade to expose roots.
 - 4. Relocate roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and relocate them without breaking. If encountered immediately adjacent to location of new construction and relocation is not practical, cut roots approximately 3 inches (75 mm) back from new construction.
 - 5. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.
- C. Where utility trenches are required within drip line of trees, tunnel under or around roots by drilling, auger boring, pipe jacking, air spading, or digging by hand.
- D. Root Pruning: Do not cut main lateral roots or taproots; cut only smaller roots that interfere with installation of utilities or foundations. Cut roots with sharp pruning instruments; do not break or chop.

3.4 REGRADING AROUND EXISTING TREES

- A. Maintain existing grades within drip line of trees whenever possible.
- B. Grade Lowering: Where new finish grade is indicated below existing grade around trees, slope the grade away from trees as recommended by qualified arborist, unless otherwise indicated. Follow natural contours, where feasible to maintain the natural drainage patterns of the site so as not to cause the tree to get reduced moisture.

1. Root Pruning: Prune tree roots exposed during grade lowering. Do not cut main lateral roots or taproots; cut only smaller roots. Cut roots with sharp pruning instruments; do not break or chop.
- C. Minor Fill: Where existing grade is 6 inches (150 mm) or less below elevation of finish grade, fill with topsoil. Place topsoil in a single uncompacted layer and hand grade to required finish elevations.
- D. Moderate Fill: Where existing grade is more than 6 inches (150 mm), but less than 12 inches (300 mm), below elevation of finish grade, place drainage fill, filter fabric, and topsoil on existing grade.
1. Carefully place drainage fill against tree trunk approximately 2 inches (50 mm) above elevation of finish grade and extend not less than 18 inches (450 mm) from tree trunk on all sides. For balance of area within drip-line perimeter, place drainage fill up to 6 inches (150 mm) below elevation of grade.
 2. Place filter fabric with edges overlapping 6 inches (150 mm) minimum.
 3. Place fill layer of topsoil to finish grade. Do not compact drainage fill or topsoil. Hand grade to required finish elevations.
- E. Move Fence to Install Walkways: Where walkways are shown through tree protection fence areas, do not remove the entire fence. Move fence the minimum distance necessary to install walkways.

3.5 TREE PRUNING

- A. Prune existing trees and shrubs to remain, protect or preserve only where directed by the Architect.
1. Season: Prune in dormant condition if possible. Do not prune in late fall until plants are dormant. Obtain acceptance of season by Landscape Architect prior to pruning plants not in dormant state.
 2. Remove Dead Wood: Remove all dead wood, suckers and broken branches from all existing trees and shrubs. After pruning for dead wood is complete, inspect trees for injury, improper pruning and insect infestation and take corrective measures.
 3. Other Pruning: Review all existing trees and shrubs with Landscape Architect to determine extent of aesthetic pruning and structural enhancement. Remove crossing or rubbing branches and growth which interferes with the natural form of the plant. Do not cut tree leaders. Do not tip-prune or shear trees or plants. No more than 30% of the mass of each tree or shrub shall be removed during aesthetic pruning. Drop crotch all limbs in excess of 2" inches.
 4. Pruning Due to Damage: Damage to root zones shall be balanced with pruning of an equivalent amount of top vegetative growth, as determined by the Landscape Architect, within one week of damage.
 5. Use clean sharp pruning implements at all times. Do not break or chop branches. Disinfect between cuts if pruning out fireblight or other spreadable disease.
- B. Provide subsequent maintenance during Contract period as recommended by qualified arborist.
- C. Pruning Standards: Prune branches for aesthetic effect and structural enhancement per referenced standards. Prune trees according to ANSI A300 as follows:
1. Type of Pruning: Crown cleaning.

2. Type of Pruning: Crown thinning.
3. Type of Pruning: Crown raising.
4. Type of Pruning: Crown reduction.
5. Type of Pruning: Vista pruning.
6. Type of Pruning: Crown restoration.

D. Remove all branches and remains from removed trees.

E. Root Pruning: If construction is to occur within the root zone of existing plants, perform root pruning, using a mechanical root pruning saw acceptable to the Landscape Architect.

1. Perform work by certified arborist.
2. Cleanly cut and remove damaged root ends where roots are to remain exposed during construction. Do not leave smashed or frayed root ends unattended.
3. Whenever roots become damaged, immediately restore soil to area and mulch area with 3 inches specified bark mulch.

3.6 MAINTENANCE AND REMOVAL OF PROTECTION FENCE:

A. Maintain Fences and Other Protections: Maintain protection fences and other protection devices throughout the construction period. Make repairs and replacements if fence or other devices become damaged or missing.

B. Remove Fences and Other Protections: Remove protection fences and other protection devices after construction in the area is complete and just prior to substantial completion of the landscape work. Refer to Section 32 93 11.

C. Remove all tree protection as directed by the Landscape Architect. Ensure the final site conditions are equal to the original condition of the tree protection area upon removal of fencing, including all grading, topsoil, and landscaping, sod and mulch to match adjacent site conditions as the end of the project.

D. Tree Protection Deficiencies: The protection of trees is extremely important. Tree Protection deficiencies are determined by the Owner's Representative and may include but is not limited to:

1. Tree Protection not in place at the start of construction.
2. Tree Protection fencing is damaged or down.
3. Unauthorized removal of Tree Protection fencing.
4. Contractor vehicles or equipment or personal vehicles driving or parking under trees.
5. Any encroachment in Tree Protection fencing.
6. Placement of any materials within the Tree Protection fencing or tree drip lines.
7. Damage to any tree.
8. Unauthorized removal of trees.
9. Unauthorized changes in grade.

3.8 TREE REPAIR AND REPLACEMENT

A. Promptly repair trees damaged by construction operations within 24 hours. Treat damaged trunks, limbs, and roots according to written instructions of a certified arborist. On active construction sites, it is recommended that trees be inspected every 7 days for compliance. Inspection should include a listing of trees with:

1. Damage to trunks.
 2. Mounding of soil around the trunk.
 3. Evidence of root damage.
 4. Evidence of improper pruning.
- B. In the event that a tree or plant is damaged by the Contractor's operation or personnel, the Contractor shall be responsible for repairs or remediation of the damage as determined by the Owner's Representative.
- C. In the event that the damage to a tree or plant is beyond repair and requires removal determined by the Architect, replace the tree.
1. Any damaged trees and plants shall be replaced in kind, inch for inch; plant and maintain as specified in Section 32 93 11.

3.5 REPAIR, CLEANING AND DISPOSAL OF MATERIALS:

- A. Repair: Repair any work to remain that is damaged during performance of work of this Section.
- B. Clean-up: Clean up area of all unused material and debris resulting from work.
- C. Disposal of Materials: Remove all excess material, removed trees, branches, debris, soil and excess chips and mulch from Owner's property. Legally dispose of all cleared and removed materials.

END OF SECTION 31 13 00

SECTION 31 22 00 – GRADING**PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Removal and storage of topsoil.
- B. Rough grading the site.
- C. Finish grading.

1.2 SUBMITTALS

- A. See Section 01 33 00 - Submittal Procedures.
- B. See Section 01 81 13 - LEED Sustainable Design Requirements, when required.
- C. Project Record Documents: Accurately record actual locations of utilities remaining by horizontal dimensions, elevations or inverts, and slope gradients.

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. Topsoil: Conforming to project specifications and in compliance with Section 31 23 23 - Acceptance of Backfill, Topsoil, and CU Structural Soil.
 - 1. Topsoil may be excavated on site if it meets specified requirements.
- B. Other Fill Materials: See Section 31 23 23 – Acceptance of Backfill, Topsoil, and CU Structural Soil and Section 31 23 23.01 - Fill.

PART 3 - EXECUTION**3.1 EXAMINATION**

- A. Verify that survey benchmark and intended elevations for the Work are as indicated.
- B. Verify the absence of standing or ponding water.

3.2 PREPARATION

- A. Identify required lines, levels, contours, and datum.
- B. Stake and flag locations of known utilities.

- C. Provide temporary means and methods to remove all standing or ponding water from areas prior to grading.

3.3 ROUGH GRADING

- A. Remove topsoil from areas to be further excavated, re-landscaped, or re-graded, without mixing with foreign materials.
- B. Do not remove topsoil when wet.
- C. Remove subsoil from areas to be further excavated, re-landscaped, or re-graded.
- D. Do not remove wet subsoil unless it is subsequently processed to obtain optimum moisture content.
- E. When excavating through roots, perform work by hand and cut roots with sharp axe.
- F. Stability: Replace damaged or displaced subsoil to same requirements as for specified fill.
- G. Remove and replace soils deemed unsuitable by classification and which are excessively moist due to lack surface water control.
- H. Uniformly grade the area, including adjacent transition areas. Smooth finished surfaces within specified tolerances, compact with uniform levels or slopes between elevation points, or between such points and existing grades.

3.4 SOIL REMOVAL

- A. All soils, fill and topsoil requiring removal from the site shall be handled in accordance with Section 31 23 18.13 "Soil, Fill, Backfill, CU Structural Soil & Construction".
- B. Stockpiles: Use areas designated on site; pile depth not to exceed 8 feet; protect from erosion. Removal of stockpiles of soil material off property as waste material shall be handled in accordance with the Contract Specifications.

3.5 FINISH GRADING

- A. Before Finish Grading:
 - 1. Verify building and trench backfilling have been inspected.
 - 2. Verify subgrade has been contoured and compacted.
- B. Remove debris, roots, branches, stones, in excess of 1/2 inch in size. Remove soil contaminated with petroleum products.
- C. In areas where vehicles or equipment have compacted soil, scarify surface to depth of 3 inches.
- D. Fine grade topsoil to eliminate uneven areas and low spots. Maintain profiles and contour of subgrade.

- E. Grassed Areas: Finish areas to receive topsoil to within not more than 0.10' above or below the required subgrade elevations, compacted as specified, and free from irregular surface changes to prevent ponding of water after rains.
- F. Walks: Shape the surface of areas under walks to line, grade and cross section, with the finish surface not more than 0.00' above or 0.10' below the required subgrade elevation, compacted as specified, and graded to prevent ponding of water after rains.
- G. Pavements: Shape the surface of the areas under pavement to line, grade and cross section, with the finish surface not more than 1/4" above or below the required subgrade elevation, compacted as specified, and graded to prevent ponding of water after rains.
- H. Maintain stability of topsoil during inclement weather. Replace topsoil in areas where surface water has eroded thickness below specifications.

3.6 REPAIR AND RESTORATION

- A. Protect newly graded areas from traffic and erosion and keep free of trash and debris and growth of weeds.
- B. Repair and reestablish grades in settled, eroded, and rutted areas to the specified tolerances.
- C. Reconditioning Compacted Areas: Where completed compacted areas are disturbed by subsequent construction operations or adverse weather scarifies the surface, reshape, and compact to the required density prior to further construction.
- D. Restoration: Restore all areas affected by construction both on and off Owner's property to original condition.

3.7 FIELD QUALITY CONTROL

- A. See Section 31 23 23 - Acceptance of Backfill, Topsoil, and CU Structural Soil for compaction density testing.

3.8 CLEANING

- A. Remove unused stockpiled topsoil. Grade stockpile area to prevent standing water.
- B. Leave site clean and raked, ready for further construction.

END OF SECTION 31 22 00

SECTION 31 23 16 – EXCAVATION

PART 1 - GENERAL

1.1 SUMMARY

- A. Excavating for building volume below grade, footings, pile caps, slabs-on-grade, paving, and site structures.
- B. Trenching for utilities outside the building to utility main connections.
- C. Related Requirements:
 - 1. Sections 01 01 40 “Erosion and Sedimentation Control” and 01 57 23 “Temporary Storm Water Pollution Control” for erosion control measures.

1.2 SUBMITTALS

- A. See Section 01 33 00 - Submittal Procedures.

1.3 PROJECT CONDITIONS

- A. Verify that survey benchmark and intended elevations for the Work are as indicated.
- B. Site Information
- C. Traffic: Conduct operations to ensure minimum interference with roads, streets, walks, and other adjacent occupied or used facilities. Do not close or obstruct streets, walks or other occupied or used facilities without permission from authorities having jurisdiction.
- D. Protection of Existing Improvements:
 - 1. Provide barricades, coverings, or other types of protection necessary to prevent damage to existing improvements to remain in place.
 - 2. Restore damaged improvements to their original condition, as acceptable to the Owner and other parties or authorities having jurisdiction.
- E. Improvements on Public Property: Obtain authority for performing removal and alteration Work on public property.
- F. Existing Utilities:
 - 1. Locate existing underground utilities in the areas of Work before starting earthwork operations. If utilities are to remain in place, provide adequate means of protection during earthwork operations.
 - 2. Contact D.I.G.G.E.R. (312-744-7000) to verify locations of existing underground utilities before starting excavation.

3. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, consult the Architect immediately for directions as to procedure.
 4. Cooperate with the Owner and public and private utility companies in keeping their respective services and facilities in operation.
 5. Demolish and completely remove from the site underground utilities indicated to be removed. Coordinate with local utility companies for shutoff of services if lines are active.
- G. Protect existing improvements on and off the site from damages caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.
- H. Use of Explosives: The use of explosives shall not be permitted.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that survey benchmark and intended elevations for the work are as indicated.

3.2 PREPARATION

- A. Identify required lines, levels, contours, and datum locations.
- B. Before mobilizing and starting Work on the site, institute, expand as necessary, and maintain throughout the project a sediment and erosion control system specific to site that complies with Section 01 01 40 Erosion and Sedimentation Control.
1. Control erosion and sediment damage to roadways, adjacent properties and water resources through the use of basins, ditch checks, temporary ditches, mulch barriers, mulches, grasses, silt filter fences, hay or straw bales, aggregate barriers, inlet and pipe protection and other appropriate means.
 2. Remove and legally dispose of debris resulting from the project when no longer required in accordance with Section 31 23 18.13 - Soil, Fill, Backfill, CU Structural Soil & Construction & Demolition Debris Removal.
- C. Protect utilities that remain and protect from damage.
- D. Grade top perimeter of excavation to prevent surface water from draining into excavation. Provide temporary means and methods, as required, to maintain surface water diversion until no longer needed, or as directed by Architect.

3.3 CLEARING

- A. Environmental Hazards: Before starting Work and thereafter as appropriate, report conditions indicative of environmental hazards to the Owner's Representative and proceed as directed.
- B. See Section 31 22 00 - Grading for soil removal from surface of site.
- C. Remove vegetation, improvements, or obstructions that interfere with installation of new construction. Removal includes new and old stumps and their roots.
- D. Carefully and cleanly cut roots and branches of vegetation to be left standing, where such roots and branches obstruct new construction.
- E. Comply with the environmental protection and safety requirements of all authorities having jurisdiction. Keep dust to a minimum. Maintain streets free of mud, dirt and debris at all times.
- F. Topsoil Removal:
 - 1. Topsoil is defined as friable clay loam surface soil found in a depth of not less than 4". Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones, and other objects, and without weeds, roots, and other objectionable material.
 - 2. Strip topsoil to whatever depths encountered, and in such manner so as to prevent intermingling with the underlying subsoil or other objectionable material. Remove heavy growths of grass from areas before stripping.
 - 3. Where vegetation is to be left standing, stop topsoil stripping a sufficient distance from such vegetation to prevent damage to the main root system.
 - 4. Stockpile top soil in storage piles for reuse or remove from the site in compliance with other Division 31 Sections. Construct storage piles to freely drain surface water. Cover storage piles if required to prevent windblown dust.
- G. Removal of Improvements: Remove improvements that interfere with construction.

3.4 EXCAVATING

- A. Comply with the requirements of other Division 31 Sections.
- B. Excavate to accommodate new structures and construction operations.
 - 1. Excavation consists of the removal and disposal of materials encountered when establishing the required grade elevations. Such excavation is unclassified regardless of the materials encountered and all materials to be disposed of in accordance with other Division 31 Sections.
 - 2. Unauthorized excavation consists of removal of materials beyond indicated or required elevations. Replace unauthorized excavation by backfilling and compacting as specified for select fill at no cost to Owner.

3. Excavate under Building to the extent required to establish subgrades.
 4. Excavate under pavements as required to comply with cross sections, elevations and grades.
 5. Excavate elsewhere as required to establish new finish grades, allowing not less than 4" for topsoiling.
 6. Cap and remove abandoned underground piping or conduit.
- C. Notify Architect of unexpected subsurface conditions and discontinue affected Work in area until notified to resume work.
- D. Dewatering: Prior to commencing work, the Contractor shall provide a storm water management plan. This plan shall stipulate provisions for dewatering, pumping, collection, temporary storage, and discharge or disposal of storm water, perched water and other liquids, contaminated and/or uncontaminated, at the site so as to facilitate soil removal and minimize disposal costs for contaminated fluids.
1. Do not allow water to accumulate in excavations. Remove water from excavations to prevent softening of foundation bottoms, undercutting footings, and soil changes detrimental to the stability of subgrades and foundations. Provide and maintain pumps, sumps, suction and discharge lines, and other dewatering system components necessary to convey the water away from the site.
 2. Convey water removed from excavations and rainwater to collecting or run-off areas acceptable to authorities having jurisdiction. Do not use trench excavations for site utilities as temporary drainage ditches.
 3. Comply with requirements of authorities having jurisdiction, including but not limited to, the City of Chicago and the Water Reclamation District of Greater Chicago.
- E. Stability of Excavations: Slope the side of excavations to comply with local codes, authorities having jurisdiction, and the City of Chicago, and maintain same. Secure, shore, and brace where sloping is not possible either because of space restrictions or stability of material excavated.
1. Maintain sides and slopes of excavations in a safe condition until completion of backfilling.
- F. Shoring and Bracing: Provide shoring and bracing to comply with local codes, authorities having jurisdiction and the City of Chicago.
1. Provide materials for shoring and bracing, such as sheet piling, uprights, stringers and cross braces, in good serviceable conditions.
 2. Maintain shoring and bracing in excavations regardless of the time period excavations will be open. Carry down shoring and bracing as the excavation progresses.

- G. **Material Storage:** Stockpile excavated materials classified as satisfactory soil material in accordance with other Division 31 Sections until required for backfill or fill. Place, grade and shape stockpiles for proper drainage. Stockpile soil materials without intermixing. Place, grade, and shape stockpiles for proper drainage. Cover to prevent windblown dust. Stockpile soil materials away from edge of excavations. Do not store within drip line of trees to remain.
 - H. **Excavation for Structures:** Excavate to the subgrade elevations required within a tolerance of plus or minus 0.10' to balance, and extending a sufficient distance from footings and foundations to permit placing and removal of concrete formwork, installation of services, other construction required, and for inspection.
 - 1. Take care not to disturb the bottom of the excavation. Excavate by hand to final grade just before concrete is placed. Trim bottoms to the required lines and grades to leave a solid base to receive concrete.
 - I. **Excavation for Pavements:** Cut the surface under pavements to comply with cross sections, elevations and grades.
 - J. **Removal of Unsatisfactory Soil Materials:** Excavate unsatisfactory soil materials encountered that extend below the required elevations, to the additional depth established by the Design-Builder's testing agency and approved by Owner.
 - 1. If excavated unsatisfactory materials are to be removed from the property, all such materials shall be disposed of in accordance with other Division 31 Sections.
 - 2. Such additional excavation, provided it is not due to the fault or neglect of the Contractor, will be measured and paid for as a change in the work if approved by Owner.
 - K. **Closing Abandoned Underground Utilities:** Close open ends of abandoned underground utilities, which are to remain permanently, and with sufficiently strong closures to withstand pressures which may result after closing.
 - L. **Cold Weather Protection:** Protect excavation bottoms against freezing when the atmospheric temperature is less than 35 degrees F. Maintain excavation free of water, ice and snow.
- 3.5 **PROOF ROLLING**
- A. Proof Roll entire area under building and pavements with a pneumatic roller or heavily loaded dump truck (minimum 25 tons).
 - B. Make at least 2 passes (second at right angle to first) in the presence of a representative of the Design-Builder's testing agency.
- 3.6 **FIELD QUALITY CONTROL**
- A. Design-Builder will engage a qualified independent testing and inspecting agency to sample materials, perform tests, and submit test reports during earthwork operations.

See Section 31 23 23.01 - Fill, for field inspection and testing requirements for all earthwork activities.

- B. Excavate unsatisfactory soil materials encountered to the additional depth established by the Design-Builder's testing agency and approved by Owner.
- C. Perform no further work until slab subgrades are acceptable to the representative of the Design-Builder's testing agency.

END OF SECTION 31 23 16

SECTION 31 23 17 – EXCAVATING, BACKFILLING, AND COMPACTING FOR UTILITIES

PART 1 - GENERAL

1.1 SUMMARY

- A. Section Includes trenching for all utilities outside the building including: water, sanitary sewer, site drainage, and storm sewer lines to the public utility location.
- B. Compacted bed and compacted fill over utilities to subgrade elevations.
- C. Compaction.

1.2 REFERENCE STANDARDS

- A. ASTM D1556/D1556M - Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method; 2015, with Editorial Revision (2016).
- B. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN m/m³)); 2012, with Editorial Revision (2015).
- C. ASTM D2487 - Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System); 2011.
- D. ASTM D3017 - Standard Test Method for Water Content of Soil and Rock in Place by Nuclear Methods (Shallow Depth); 2005.
- E. ASTM D6938 - Standard Test Methods for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth); 2017.
- F. 35 ILL. ADM CODE 740 APPENDIX A Target Compound List (TCL) parameters and Appendix B., Section 742, Table A.; Tiered Approach To Corrective Action Objectives (TACO): 35 Ill .Adm. Code 742.
- G. Illinois Department of Transportation (IDOT): IDOT Specifications for Road and Bridge Construction including all addenda.

1.3 SUBMITTALS

- A. See Section 01 33 00 - Submittal Procedures.

1.4 QUALITY ASSURANCE

- A. Tests and analysis of fill materials will be performed in accord with ASTM D1557, and with General Conditions and testing required by other Division 31 Sections for acceptability as fill material.

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. In accordance with the soil report the Design-Builder's testing agency representative shall determine if the excavated material is suitable for backfill. The suitable trench excavated material shall be used for trench backfill.
- B. Provide all backfill materials from off site in accordance with other Division 31 Sections.
- C. Granular Fill Type A:
 - 1. Material for granular fill shall be CA-6/CA-16/FA-6 in compliance with SSRBC IDOT 2016, Section 1003 and with other Division 31 Sections
 - 2. Bedding Material: Material for bedding shall be CA-6/CA-11/CA-16 in compliance with SSRBS IDOT 2016, Section 1004 and with other Division 31 Sections.
- D. Fill Material Type D: Fill material shall be cohesive soil obtained from on-site required excavations and approved by the Design-Builder's testing agency representative as suitable backfill material in accordance with ASTM D2487 and with other Division 31 Sections. It shall be used to backfill excavations where the excavated material is unsuitable for backfill.
- E. Fill Material Type E: Fill under landscaped areas shall be free from alkali, salt shall not exceed Appendix B, Section 742, Table A; Tiered Approach to Corrective Action Objectives (TACO); Ill Adm. Code 742 values for 35 ILL. ADM CODE 740 APPENDIX A Target Compound List (TCL) parameters. This fill shall be approved by the Design-Builder's testing agency representative as suitable material.
- F. Fill Material Type X: Off-site borrow material shall comply to soil types GP, GW, SC and CL in accordance with ASTM D2487, Uniform Soils Classification System and with other Division 31 Sections. It shall be used where needed under structural slabs, roads, pavement and landscaped areas. Landscaped areas must meet the testing requirements stated for Fill Material Type E above

PART 3 - EXECUTION**3.1 EXAMINATION**

- A. Verify that survey benchmarks and intended elevations for the work are as indicated.
- B. Verify stockpiled fill to be reused as approved in writing by Architect.
- C. Verify foundation perimeter drainage installation has been inspected and approved in writing by Architect.
- D. Verify and confirm in writing that areas to be backfilled are free of debris, snow, ice or water, and surfaces are not frozen.

3.2 PREPARATION

- A. Identify specified lines, levels, contours and data.
- B. Compact subgrade surfaces to density specified for backfill materials.

3.3 EXCAVATION

- A. Cut trenches wide enough to enable utility installation and allow inspection.
- B. Hand trim excavation and leave free of loose matter. Hand trim for bell and spigot pipe joints.
- C. Excavation shall not interfere with normal 45 degree bearing splay of foundations.
- D. Notify Architect of unexpected subsurface conditions and discontinue affected Work in area until notified to resume work.
- E. Dewatering: Prior to commencing work, the Contractor shall provide a storm water management plan. This plan shall stipulate provisions for dewatering, pumping, collection, temporary storage, and discharge or disposal of storm water, perched water and other liquids, contaminated and/or uncontaminated, at the site so as to facilitate soil removal and minimize disposal costs for contaminated fluids.
 - 1. Do not allow water to accumulate in excavations. Remove water from excavations to prevent softening of foundation bottoms, undercutting footings, and soil changes detrimental to the stability of subgrades and foundations. Provide and maintain pumps, sumps, suction and discharge lines, and other dewatering system components necessary to convey the water away from the site.
 - 2. Convey water removed from excavations and rainwater to collecting or run-off areas acceptable to authorities having jurisdiction. Do not use trench excavations for site utilities as temporary drainage ditches.
 - 3. Comply with requirements of authorities having jurisdiction, including but not limited to, the City of Chicago and the Water Reclamation District of Greater Chicago.
- F. Stability of Excavations: Slope the side of excavations to comply with local codes, authorities having jurisdiction, and the City of Chicago, and maintain same. Secure, shore, and brace where sloping is not possible either because of space restrictions or stability of material excavated.
 - 1. Maintain sides and slopes of excavations in a safe condition until completion of backfilling.
- G. Shoring and Bracing: Provide shoring and bracing to comply with local codes, authorities having jurisdiction and the City of Chicago.

1. Provide materials for shoring and bracing, such as sheet piling, uprights, stringers and cross braces, in good serviceable conditions.
 2. Maintain shoring and bracing in excavations regardless of the time period excavations will be open. Carry down shoring and bracing as the excavation progresses.
- H. Locate and retain reusable excavated materials away from the edge of excavation.
- I. Close open ends of abandoned underground utilities with plugs, which are to remain permanently, and with sufficiently strong closures to withstand pressures which may result after closing. If required, abandoned utilities may also need to be filled with grout or injected with flowable fill

3.4 BACKFILLING

- A. Support pipes, and conduits during placement and compaction of bedding fill.
- B. Backfill trenches to contours and elevations shown. Backfill systematically, as early as possible to allow maximum time for natural settlement. Do not backfill over porous, wet or spongy subgrade surfaces.
- C. Place compact fill materials in continuous layers as specified in Section 31 23 23.01 - Fill.
- D. Use a placement method that will not disturb or damage utilities in trenches, perimeter drainage.
- E. Maintain optimum moisture content of backfill materials, determined by laboratory analysis, to obtain specified compaction density.

3.5 FILL TYPES AND COMPACTION

- A. Compact all fill and backfill to specified values based on Modified Proctor Test in accordance with Section 31 23 23.01 - Fill.

3.6 COLD WEATHER PROTECTION

- A. Quality Control Testing During Construction: An independent inspection and testing agency employed by the Design-Builder shall inspect and approve each subgrade and fill layer before further backfill and fill work is performed.
1. The inspection and testing agency shall perform field and laboratory density tests in accordance with either ASTM D1556/D1556M or ASTM D1557 as applicable.
 2. Field density tests may also be performed by the nuclear method in accordance with ASTM D6938. The calibration curves shall be periodically checked and adjusted to correlate to tests performed using ASTM D1556/D1556M. In conjunction with each density calibration check, the calibration curves furnished with the moisture gauges shall be checked in accordance with ASTM D3017.

3. If field tests are performed using nuclear methods, the inspection and testing agency shall make calibration checks on both density and moisture gauges at beginning of work, on each different type of material encountered, and at intervals as specified by the equipment manufacturer.
4. If, in the opinion on the Design-Builder testing agency representative, based on the inspection and testing agency reports and inspections, subgrade or fills have been placed by specified density, the Contractor shall perform additional compaction and retesting until specified density is achieved. Contractor to pay for all retesting work.
5. The Contractor shall assist the inspection and testing agency by providing access to the excavation and fill areas, and by removing loose materials from compacted soil layers prior to testing.

3.7 CLEANING

- A. Remove surplus backfill materials and materials unsuitable for backfill from the site to a permitted Subtitle D Landfill as per Section 31 23 18.13 - Soil, Fill, Backfill, CU Structural Soil & Construction & Demolition Debris Removal.

END OF SECTION 31 23 17

**SECTION 31 23 18.13 – SOIL, FILL, BACKFILL, CU STRUCTURAL SOIL AND
CONSTRUCTION AND DEMOLITION DEBRIS REMOVAL**

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes the following:

1. This specification section applies to Contaminated Soil and General Construction & Demolition Debris that does not meet the definition of the Clean Construction or Demolition Debris (CCDD), Uncontaminated Soil or Hazardous Waste.
2. Description of Work: This specification is for the excavation, stockpiling, loading, hauling, removal, and disposal of any materials including soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris. Locations of non-special waste and non-hazardous special waste on the project site shall be determined by the Design-Builder. The Contractor shall perform the work under this section in accordance with all applicable local, county, IEPA, USEPA, and OSHA regulations. The Work shall include the following:
 - a. Removal and disposal
 - 1) Prior to excavation of any soil (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris material, obtain authorization for ultimate disposition of materials from an open and active Subtitle D facility approved by the Design-Builder. The Subtitle D facility shall be permitted to accept both Non-Hazardous Special Waste and Special Waste.
 - 2) The waste characterization analytical must be sent to the Design-Builder for approval prior to sending the profile to the landfill.
 - 3) Perform the analytical testing required by the landfill for waste stream authorizations as necessary to secure all required disposal permits for all materials. All costs associated with collecting waste stream samples and performing analytical tests shall be at Contractor's own expense.
 - 4) Obtain authorization from an open and active Permitted Subtitle D landfill indicating acceptance of materials at the facility. The Authorization must be signed by the owner of the open and active Permitted Subtitle D landfill and state that the facility complies with all local zoning codes and all local, state, and federal rules and regulations, that all required laboratory analyses has been received by the facility, and that the facility has agreed to accept the soils (including non-special waste soils, and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris materials. The Authorization shall further state that the soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, general construction and demolition debris materials are being

accepted for permanent placement on site under the cap, and that the material will not be removed from the site unless required by a local, state or federal regulations.

- 5) Prepare daily reports, transport manifests, weight tickets and receipts (as applicable) prior to starting any soil removal activities.

- 6) Excavation of soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris materials to the depth required to complete the proposed site preparation/construction work activities as specified in the Contract Documents.
- 7) Load and transport all materials to the approved open and active Permitted Subtitle D landfill into approved containers or vessels.
- 8) Provide copies of all daily reports, signed transport/waste manifest, signed weight tickets, and disposal receipts (as applicable) to the Design-Builder on a daily basis documenting proper disposal of soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris materials.

1.2 DEFINITIONS

- A. Agency: Illinois Environmental Protection Agency (IEPA).
- B. Backfill: granular or cohesive material used to fill the excavation to design grade as referenced in design plans and specifications.
- C. CU Structural Soil: a uniformly blended mixture of crushed stone, clay, loam and hydrogel by weight consisting of approximately 83% crushed limestone (3/4 to 1.5 inch, highly angular with limited fines), 17% clay loam and hydrogel (1 oz. per 200 pounds of stone).
- D. Fill: any earthen or non-earthen materials including but not limited to any sediment, granular or cohesive non-native earthen materials, cinders, ash, wood, and brick, concrete, and asphalt fragments, glass, and building debris encountered above naturally occurring undisturbed soils or bedrock in built-up areas.
- E. General Construction and Demolition (C&D) Debris: non-hazardous, uncontaminated materials resulting from construction, remodeling, repair, and demolition of utilities, structures, and roads as defined in Public Act 92-0574, the Environmental Protection Act, 415 ILCS 5 Section 3.160 and regulated under Title 35: Environmental Protection; Subtitle G: Waste Disposal; Chapter I: Pollution Control Board; Subchapter i: Solid Waste and Special Waste Hauling. General Construction and demolition (C&D) debris may include soil, wall coverings, reclaimed asphalt pavement, rock, plaster, glass, non-hazardous painted wood, drywall, plastics, non-hazardous coated wood, non-asbestos insulation, bricks, wood products, roofing shingles, concrete, and general roof coverings.

- F. Open and Active Permitted Subtitle D Landfill: any open and active solid waste landfill facility in any state licensed and permitted to accept non-hazardous waste including both non-special waste soils and non-hazardous special waste soils, fill, general construction and demolition debris are to be deposited. If the landfill facility is located in Illinois, the landfill must be licensed/ open, active and permitted by the Illinois Environmental Protection Agency and other applicable local regulatory agencies as applicable. If the landfill is located outside of Illinois, the landfill facility must be open, active and permitted by applicable state and local regulatory agencies.
- G. IEPA: Illinois Environmental Protection Agency.
- H. IDOT: Illinois Department of Transportation.
- I. Manifest: the form provided or prescribed by IEPA and used for identifying name, quality, routing, and destination of special waste during its transportation from point of generation to the point of disposal, treatment, or storage.
- J. MSDS: Material Safety Data Sheet, required by OSHA for any substances that are toxic, caustic, or otherwise potentially hazardous to workers.
- K. OSHA means Occupational Safety and Health Administration.
- L. Remediation Area: any area on site where underground storage tanks, non-special waste and/or non-hazardous special waste, or soil that do not meet Tier 1 SROs for residential properties is present.
- M. Soil: any granular or cohesive materials designated for removal as specified in the Architect/Engineer drawings and specifications and includes soils that are determined to be non-special and special waste.
- N. Special Waste: any wastes as defined in Title 35: Environmental Protection; Subtitle G: Waste Disposal; Chapter I: Pollution Control Board; Subchapter i: Solid Waste and Special Waste Hauling; Part 808: Special Waste Classifications; Subpart A: General Provisions; Section 808.110, AND Any wastes as defined in Title 35: Environmental Protection; Subtitle G: Waste Disposal; Chapter I: Pollution Control Board; Subchapter i: Solid Waste and Special Waste Hauling; Part 809: Non Hazardous Special Waste Classifications; Subpart A: General Provisions; Section 809.103.
- O. SROs: Soil Remediation Objectives for various exposure routes identified in 35 Illinois Administrative Code 742: Tiered Approach To Corrective Action Objectives (TACO).
- P. Stormwater: water deposited at the site in the form of rain, snow or other natural weather event.
- Q. TACO: TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO) per 35 Illinois Administrative Code 742.
- R. Top Soil: soils placed to design grade and used to promote vegetative growth and which meets Top Soil criteria (percentages of organic matter, inorganic matter (silt,

clay, and sand)), deleterious material, pH, and mineral and plant-nutrient content as referenced in the contract specifications and drawings.

- S. Uncontaminated Soil: soil generated during construction, remodeling, repair or demolition of utilities, structures and roads that does not contain contaminants in concentrations that pose a threat to human health and safety and the environment. [415 ILCS 5/3.160(c)]
- T. USEPA: United States Environmental Protection Agency.
- U. User or User Agency: the entity for which or on whose behalf the Board has undertaken to cause the Work to be performed.

- V. Work: the obligations of the Contractor under the Contract Documents. Work includes, unless specifically excepted by the Contract Documents, the furnishing of all materials, labor, equipment, supplies, plant, tools, scaffolding, transportation, superintendence, permits, inspections, occupancy approvals, insurance, taxes, and all other services, facilities and expenses necessary for the full performance and completion of the requirements of the Contract Documents. Work also means that which is furnished, produced, constructed, or built pursuant to the Contract Documents.

1.3 ACTION SUBMITTALS

- A. Copies of the following submittals shall be prepared and submitted to the Design-Builder at Contractor's own cost and within ten (10) days prior to start of Work:
 - 1. Refer to Section 01 50 00 – TEMPORARY FACILITIES AND CONTROLS for Stormwater Management Plan submission requirements.
 - 2. Refer to Section 01 56 11 – GENERAL DUST, FUME, AND ODOR CONTROL for requirements for managing dust on site.
 - 3. Contractor's Site Specific Health and Safety Plan for all workers engaged in excavation, stockpiling, loading, hauling, removal, and disposal of any soils (including non-special waste soils and non-hazardous special waste soils), fill, general construction and demolition debris from the property. The plan shall comply with all OSHA requirements utilizing information attained in existing environmental reports. The Work shall be performed under the direct supervision of a trained experienced site supervisor. The plan should at a minimum include the following:
 - a. Name of key personnel and alternates responsible for site safety.
 - b. Describe the risks associated with each operation conducted.
 - c. Describe chemical contaminants to be encountered by employees on work site and specific hazards if any to the workers as required by OSHA.

- d. Type of personnel training and responsibilities and to handle the specific hazardous situations they may encounter.
 - e. Describe the protective clothing and equipment to be worn by personnel during various site operations.
 - f. Describe any site-specific medical surveillance requirements.
 - g. Describe the program for the periodic air monitoring, personnel monitoring, and environmental sampling if needed.
 - h. Describe the actions to be taken to mitigate existing hazards to make the work environment less hazardous.
 - i. Define site control measures including a site map.
 - j. Establish procedures for personnel and equipment and transporting trucks to ensure that impacted soils are not tracked off site on to non-impacted areas of the site.
 - k. Set forth the site Standard Operating Procedures (SOPs). SOPs are those activities that can be standardized (i.e., decontamination procedures and respirator fit testing).
 - l. Set forth a Contingency Plan for the safe and effective response to emergencies.
4. Soil Management Plan outlining proposed excavation work sequences and procedures to separate each type of material to be removed from the site from clean materials. The Soil Management Plan shall show the locations of each type of material to be stored on site, location of clean materials to be stored at the site for reuse, and location of material to be stored on site for future disposal. The Design-Builder must review and approve this plan.
 5. Disposal Facility Information Name, address and telephone number of the open and active Permitted Subtitle D Landfill facility where soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, top soil, CU Structural Soil, and general construction and demolition debris materials are to be deposited. The Subtitle D facility shall be permitted to accept both Non-Hazardous Special Waste and Special Waste.
 - a. This submittal must be made thirty days (30) prior to removal of any materials from the site. This information should include, at a minimum, the following:
 - 1) Facility Name and Address and Telephone Number.
 - 2) Site Contact.
 - 3) Facility Identification Number issued by Illinois, U.S. EPA, or other state licensing agencies for Special Waste Disposal facility.
 - 4) State and/or Local Operational Permit Number(s) for the impacted Construction and Demolition Debris Disposal sites.
 6. The Contractor shall fill out the waste profile including the waste characterization laboratory results to be utilized for landfill requirements and send it to the MEC for approval. The MEC will forward the waste profile to the Board Representative designee for signature. The Contractor shall assume this signature process will take five (5) business days to accomplish.
 7. Waste Stream authorization and/or permit from the Subtitle D Landfill facility where soils (including non-special waste soils and non-hazardous special waste

soils), fill, general construction and demolition debris are to be deposited prior to removal from the site. The authorization must be signed by the Subtitle D landfill facility representative and state that the facility complies with all local zoning codes and all local, State, and Federal rules and regulations, that all required laboratory analyses has been received by the facility, and that the facility has agreed to accept the soils (including non-special waste soils, and non-hazardous special waste soils), fill, and general construction and demolition debris materials. The Authorization shall further state that the soils (including non-special waste soils and non-hazardous special waste soils), fill, general construction and demolition debris fill materials are being accepted for permanent placement on site, and that the material will not be removed from the site unless required by a local, state or federal Authority.

8. Analytical Testing Laboratory including the name, address, and State of Illinois Environmental Protection Agency accreditation in accordance with the Illinois Administrative Code, Title 35, Subtitle A Chapter II, Part 186, for the laboratory which will be utilized by the Contractor to perform analytical testing prior to the start of Work.
9. Copies of Special/Hazardous Waste Hauler Licenses/Permits for each proposed transporter prior to removal of soil from the site, pursuant to 35 IAC 809. Include current copy of IEPA and/or USEPA approval letter/permit, and details of haul route(s) from site to the disposal facilities.
10. Copies of Waste Disposal Manifests and Weight Tickets to the Design-Builder on a daily basis. Manifests and weight tickets must be fully executed by the generator, transporter, and designated disposal/recycling facility. These shall be presented in dated order with attached summary table. All manifests and weight tickets must be received by the Design-Builder within ten (10) working days of completion of the project.
11. Daily Reports/Logs summarizing excavation activities generating waste, locations of where the disposed materials derived, any temporary stockpile locations, transporter information, equipment, and labor. Contractor shall submit these records on weekly basis.
12. Air Sampling Data collected during the course of the Work, including OSHA compliance air monitoring, as applicable.

1.4 SUBMITTAL REVIEW

- A. See Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Review of submittals or any comments made does not relieve the Contractor from compliance with the requirements of the drawings and specifications. The purpose of this check is to review for general conformance with the design concept of the project and general compliance with the information given in the contract documents. The Contractor is responsible for confirming and correlating all quantities and dimensions;

electing techniques of construction; coordinating the Work; and performing the Work in a safe and satisfactory manner.

- C. The Contractor must not begin any Work applicable to this section until all required submittals have been reviewed and accepted by the Design-Builder.

1.5 NOTIFICATIONS

- A. The Contractor shall notify the Design-Builder no less than forty-eight (48) business hours prior to loading and transporting any materials from the site.

1.6 RECORDKEEPING

- A. The Contractor shall provide documentation of labor, equipment, materials, tickets, manifests, and disposal laboratory analysis used for soil removal, when requested by the Design-Builder.

1.7 COORDINATION

- A. The Contractor shall coordinate and schedule the Work so as to cause the least possible disruption to the daily site activities, if any.
- B. The Contractor shall cooperate with and coordinate work progress with the Design-Builder and any other contractors working on site. Excavated soil shall be stockpiled near the excavation or at an area deemed suitable by the Design-Builder. The Contractor shall assist the Design-Builder with its machinery and operator to inspect and obtain soil samples, if necessary, from the open excavation(s) at no additional cost to the project.

1.8 PROJECT CONDITIONS

- A. The Contractor shall perform all Work without creating hazardous conditions anywhere on site.
- B. All excavation, truck loading, grading, and backfilling operations will be conducted so as to ensure minimum interference with traffic. Roads, streets, walks, and other adjacent occupied and used facilities shall not be closed or obstructed without permission from the applicable governing agency and the User. Alternate routes around closed or obstructed traffic ways must be provided if required by the governing agency.
- C. Any damage caused to adjacent pavement, utilities, or facilities by earth work operations will be promptly replaced or repaired at no additional cost to the Design-Builder or Owner and to the satisfaction of the Design-Builder, Owner, or Authorities Having Jurisdiction.

PART 2 - PRODUCTS

- 2.1 REMOVAL OF SOIL, FILL, BACKFILL, CU STRUCTURAL SOIL, AND CONSTRUCTION AND DEMOLITION DEBRIS
- A. The Contractor shall furnish all necessary means, products, tools, and equipment required to remove soil (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris from the site as directed by the Design-Builder.
 - B. The Contractor shall also furnish all necessary means, products, tools, and equipment required to fulfill the scope of work described in the contract specifications and drawings. The Contractor, by submitting a bid for the Work, represents itself as knowledgeable and an expert in the performance of the Work, and includes all things usually and customarily necessary to provide a complete and finished job, whether specifically mentioned or not.
 - C. The Contractor must have a complete plan for the entire process of soil removal and disposal in accordance with the project requirements. Contractor must provide schedule of all Work activities in accordance with the approved construction schedule.

PART 3 - EXECUTION

- 3.1 AUTHORIZATIONS
- A. Obtain authorization from the open and active Permitted Subtitle D landfill owner where soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris are to be deposited. The Authorization must be signed by the User and shall state that the User has received a copy of one or more laboratory analyses of representative sample(s) collected from the site by the contractor and has agreed to accept the material. The Authorization shall further state that the site owner agrees to accept the material for permanent placement on their site and that the material will not be removed from their site unless required by a local, state or federal rules and regulations. The Authorization further shall state that the site complies with all local zoning codes, and local, state and federal laws, rules, and regulations.
 - B. Obtain prior authorization from Design-Builder to backfill excavations and utility lines, and apply top soil. All backfill, CU Structural Soil, and top soil shall comply with other Division 31 Sections.
 - C. Haulers for transportation shall hold a current, valid hauling permit for materials being transported off-site. Haulers shall hold, and present upon request, a current valid Commercial Driver's License (CDL). Non-hazardous special wastes and hazardous wastes must be hauled by an IDOT-approved, licensed, and permitted transporter and must be valid during transportation.

- D. Obtain prior authorization from Design-Builder on the Waste Profile at least (5) days in advance of removing waste materials.

3.2 MATERIAL SAMPLING

- A. Soil, Fill, Backfill, CU Structural Soil, Construction and Demolition debris
 - 1. The Contractor shall collect sufficient amount of representative sample(s) from each type of material being removed from the site for analytical testing to obtain authorization for the ultimate disposition of the materials. The Contractor is responsible to provide the proper collection, handling and transportation of the samples to the laboratory. The Contractor is responsible for acquisition of any required permits and payment of all fees.
 - 2. The Contractor shall be responsible for obtaining liquid samples as needed for characterization for liquid disposal offsite or disposition onsite as applicable. The Contractor is responsible to the acquisition of any required disposal permits and the payment of any fees associated with liquid disposal.
 - 3. The Contractor shall submit the soil and liquid samples (as applicable) to the laboratory and pay for the cost of analyzing the constituents required for the ultimate disposition of soils and liquids.
 - 4. The Design-Builder, under special circumstances, may collect samples for laboratory analysis or field Photo-ionization Detector (PID) screening, or liquid samples for laboratory analysis. The Contractor shall provide the necessary equipment and manpower to assist the Design-Builder to collect materials to be sampled at no additional cost to the project.
 - 5. The Contractor shall immediately notify the Design-Builder if any materials, (solid or liquid) requiring special handling (i.e., stained soil, soil with odors, or liquids) are encountered in areas other than those identified in the contract drawings and referenced documents. No further work shall proceed in the area until approval is provided by the Design-Builder.
 - 6. All excavated soils, liquids, and other material shall be removed from the site in accordance with applicable specifications, and local, state and federal requirements and guidelines.

3.3 EXCAVATION

- A. Prior to starting any excavation work at the site, the contractor shall layout an alpha-numeric grid in 25-foot intervals which designates rows and columns around the perimeter of the site. Columns shall be labeled numerically along the east fence line,

beginning on the north side of the site, in 25-foot intervals towards the south side of the site. Rows shall be labeled alphabetically along the north fence line, beginning on the east side of the site, in 25-foot intervals towards the west side of the site. 12"x12", waterproof placards, showing the row number or column letter shall be placed on fence posts at the 25-foot intervals around the perimeter of the site. Placards shall be secured at a height of 4 feet above the ground and shall be maintained throughout the duration of the project. The contractor shall repair or replace placards if they become damaged or illegible.

- B. The Contractor shall perform excavation of soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris to the extent shown on the contract drawings, as necessary to complete the Work and/or as directed by the Design-Builder.
- C. All excavation shall be performed in accordance with the design drawings and local, state and federal requirements and guidelines.
- D. All excavation, truck loading, grading, and backfilling operations will be conducted so as to ensure minimum interference with traffic. Roads, streets, walks, and other adjacent occupied and used facilities shall not be closed or obstructed without permission from the applicable governing agency and the Design-Builder. Alternate routes around closed or obstructed traffic ways must be provided if required by the governing agency
- E. Any damage caused to adjacent pavement, utilities, or facilities by earth work operations will be promptly replaced or repaired at no additional cost to the Design-Builder or Owner and such work shall be performed to the satisfaction of the Design-Builder, Owner, or Authority Having Jurisdiction.
- F. The Contractor is responsible for keeping the soils/materials which are classified differently separated during excavation activities. If Contractor commingles soils/materials, the Contractor must properly dispose of the all commingled soils/materials at their own expense.
- G. If an underground storage tank (UST), drum or other unknown container is discovered during excavation activities, the Contractor must stop excavation work and immediately inform the Design-Builder. The Design-Builder will assess the site conditions and instruct the Contractor how to proceed with the Work. Contractor may be asked by the Design-Builder to perform further limited excavation in the area in order to gather information on size and/or quantity of newly discovered item(s). Contractor shall perform this limited excavation work at no additional cost.

3.4 LOADING

- A. The Contractor shall load soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris materials directly from the site or from temporary stockpiles into hauling trucks for subsequent transportation and ultimate disposal.

- B. Conduct all excavation, truck loading, grading, and backfilling operations so as to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities. Do not close or obstruct roads, streets or walks without permission from the applicable Authority Having Jurisdiction and the Design-Builder. Alternate routes around closed or obstructed traffic ways must be provided by Contractor if required by the governing agency.
- C. The Contractor shall maintain streets clean and free of mud and dirt generated from their Work and operations.
- D. The Contractor is responsible for complying with State and local road/street weight limits.

3.5 HAULING

- A. The Contractor shall remove soils, dusts, rocks, etc. from the exterior of trucks, trailers, or other heavy equipment leaving the site before they leave the site.
- B. The Contractor shall clean the tractor-trailers or trucks that are loaded with materials for off-site placement/salvage by removing clinging soils, or rocks from the exterior of the equipment.
- C. The Contractor shall not create dust and shall maintain adequate dust suppression equipment on site if conditions warrant.
- D. The Contractor shall maintain streets clean and free of mud and dirt.
- E. The Contractor shall conduct soil (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris removal in a manner that ensures minimum interference with roads; streets, walks and other adjacent occupied and used facilities. Do not close or obstruct streets, walks or other occupied or used facilities without permission from the Authority Having Jurisdiction and Design-Builder. Provide alternate routes around closed or obstructed traffic ways if required by the governing agency.

3.6 TRANSPORTATION

- A. The Contractor shall remove soils, dusts, rocks, etc. from the exterior of trucks, trailers, or other heavy equipment leaving the site before they leave the site. The Contractor shall provide and complete copies of all daily reports, weight tickets and receipts (as applicable) for transportation and ultimate off-site disposal of materials removed from the property to the Design-Builder.
- B. All soil/materials must be transported directly to the designated disposal facility from the site. Intermediate storage is not permitted.
- C. The Contractor shall provide complete copies of disposal documentation for removal of all soil/materials to the Board for review and signature as required. The Contractor

shall provide completed manifests and/or other waste removal documentation to the Design-Builder a minimum of two (2) days prior to shipment, if signature is required.

- D. The Transporter shall present evidence of special or hazardous waste hauling permits and CDL upon request by the Design-Builder, as applicable.
- E. The soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris materials shall be transported by a hauler licensed in the State of Illinois to transport applicable soils/materials.
- F. The Contractor shall have properly signed manifests or disposal documentation in hand prior to leaving the site with materials to a landfill.

3.7 STOCKPILING

- A. Contractor may temporarily stockpile soils (including non-special waste soils and non-hazardous special waste soils), fill, backfill, CU Structural Soil and construction and demolition debris on site for a maximum of five (5) working days, unless otherwise approved by the Design-Builder.
- B. The Contractor shall be responsible for keeping such stockpiles separated. If soils/materials designated separately are commingled by Contractor, the Contractor shall dispose of such soil/material newly designated at his own expense. The Contractor will be responsible for sampling and analysis costs associated with characterization of newly designated soil/materials.
- C. Acceptable locations for soil stockpiles shall be approved by the Design-Builder and it shall be in accordance with the City of Chicago requirements. The maximum height of the stockpile shall not exceed 10 feet. The Contractor shall containerize or place special waste, non-hazardous waste, or hazardous waste soils on 6 mil plastic sheeting, covered with 6 mil plastic sheeting, and protect with 12-inch to 18-inch berms until subsequent loading, transportation, and disposal. Base sheeting shall overlap the dike/berm.
- D. The Contractor shall not allow runoff from stockpiled soil or material to enter storm drains or leave the site.

3.8 DUST CONTROL

- A. Refer to section 01 56 11 – GENERAL DUST, FUME, AND ODOR CONTROL

3.9 LIQUID (WATER) MANAGEMENT

- A. The Contractor shall subscribe to a weather notification system and manage the Work so as not to accumulate storm water on the site during excavation.

- B. Prior to commencing Work, the Contractor shall provide a Stormwater Management Plan. This plan shall stipulate provisions for dewatering, pumping, collection, temporary storage, and discharge or disposal of storm water, perched water and other liquids, contaminated and/or uncontaminated, at the site so as to facilitate soil removal and minimize disposal costs for contaminated fluids.
- C. The Contractor shall ensure that contamination of water, perched water and previously uncontaminated water or perched water does not occur by preventing the contact of such liquid with materials that exceed Title 35: Environmental Protection Subtitle G: Waste Disposal Chapter I: Pollution Control Board Subchapter F: Risk Based Cleanup Objectives, Part 742, Tiered Approach To Corrective Action Objectives, Appendix B, Table A values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. Earthen berms, plastic (polyethylene) sheeting, pumping, and other such means, as specified in the approved Stormwater Management Plan, may be used.
- D. If the Contractor, through negligence, allows stormwater to contact materials that exceed Title 35: Environmental Protection Subtitle G: Waste Disposal Chapter I: Pollution Control Board Subchapter F: Risk Based Cleanup Objectives, Part 742, Tiered Approach To Corrective Action Objectives, Appendix B, Table A values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters, the water must be disposed of as water that exceeds Title 35: Environmental Protection Subtitle G: Waste Disposal Chapter I: Pollution Control Board Subchapter F: Risk Based Cleanup Objectives, Part 742, Tiered Approach To Corrective Action Objectives, Appendix B, Table A values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. The Contractor will be responsible for the additional costs incurred for any disposal analysis and disposal costs.
- E. Stormwater Run-on /Run-off, Groundwater, and Dewatering: Contractor shall manage and remove water from site excavation in accordance with the City of Chicago and MWRDGC's requirements. The Contractor shall not discharge onsite water into the City of Chicago sewer without first obtaining all required permits in accordance with the following procedures:
1. If there is no evidence of water contamination as determined by the Design-Builder, Contractor shall obtain pumping permit from the City of Chicago Building Department.
 2. If the Design-Builder determined the presence of contaminated water at the site, Contractor shall collect and analyze representative water sample in accordance with MWRDGC Environmental Remediation Wastewater (ERW) Ordinance requirements. Submit a copy of the analytical result to the Design-Builder within seven (7) working days of sample collection.

3. If the analytical result of the water sample is below the maximum concentrations acceptable for discharge of ERW into sewerage system. The Contractor shall perform the following:
 - a. Secure a special discharge authorization from the MWRDGC for discharging contaminated water into the sewer system.
 - b. Install and operate flow meters for measuring the volume of water discharged into the sewer system at each discharging manhole. Flow meters can be either installed on the settling tank, if used, or at each discharging manhole. The flow meter must meet the MWRDGS's requirements including a non-resettable totalizer and must be equipped with recorder charts. Totalizers must be read a minimum of once per week and a log of such readings, with the appropriate conversion factors, and recorder charts must be provided to the Design-Builder. The flow-measurement devices must be calibrated monthly and prior to its initial use. The accuracy of the device must be certified by a factory-authorized representative with documentation of this certification provided to the Design-Builder and submit to the MWRDGC.
 - c. Collect and analyze representative water samples on monthly basis for the parameters required by the MWRDGC ERW special authorization. Analytical results and Sample Collection, Analysis and Report Certification shall be provided to Design-Builder within 7 working days of sample collection.

4. If the analytical results of the water exceed the MWRDGC ERW ordinance requirements, water should be either pumped into a holding tank for future transportation and disposal at treatment facility, or pumped directly into vacuum truck for disposal at a treatment facility as non-hazardous special waste. Prior to pumping and transporting water into the treatment facility, the Design-Builder may collect confirmation water samples to verify that the analytical results do not meet the MWRDGC's requirements. The Contractor shall provide all required equipment and access to collect such samples.

3.10 QUALITY CONTROL

- A. Visual inspections and damage repairs shall be made daily by the Contractor and/or as directed by the Design-Builder to assure that erosion, drainage and containment control measures are functioning properly.
- B. The Contractor shall take all necessary precautions to protect structures, equipment, pavement, walks and utilities against movement or settlement during the course of Work.
- C. Damages: Promptly replace or repair any damage caused to adjacent pavement, utilities or facilities by removal operations at no additional cost. Work shall be performed to the satisfaction of the Design-Builder.
- D. Submittal Timeframe Compliance: The Contractor shall ensure that all required submittals are in compliance with time frames specified.

- E. Utility Services: Maintain existing utilities and protect against damage during removal operations.

END OF SECTION 31 23 18.13

SECTION 31 23 18.14 – CLEAN CONSTRUCTION OR DEMOLITION DEBRIS AND UNCONTAMINATED SOIL DISPOSAL

PART 1 - GENERAL

1.1 Related Requirements:

- A. SECTION 01 50 00 – TEMPORARY FACILITIES AND CONTROLS for Stormwater Management Plan requirements.

1.2 SUMMARY

- A. This Section includes the following:

1. This section applies to all demolition, construction and renovation projects that require removal and off-site transfer of Clean Construction or Demolition Debris (CCDD) and Uncontaminated Soil as defined in this Specification.
2. This specification is for the excavation, loading and off-site transfer of CCDD and Uncontaminated Soil to permitted CCDD fill sites for use as fill. The Contractor shall perform the Work in accordance with all applicable local, state, and federal regulations. The Work shall include the following for CCDD Disposal:
 - a. All CCDD shall be taken to a permitted CCDD fill site. Uncontaminated asphalt, clean concrete and/or brick that are free of other soil/fill or debris shall be taken to Design-Builder approved recycling facilities for recycling.
 - b. The Contractor shall identify the selected CCDD fill site and/or recycling facility. Once identified in the formal submittals, the Contractor may not change the CCDD fill site or recycling facility without written authorization from the Design-Builder.
 - c. The Contractor shall identify the hauler or haulers to be used for the transportation of CCDD. Once identified in the formal submittals, the Contractor may not change the haulers without written authorization from the Design-Builder.
 - d. At least 48 hours prior to commencing any excavation activities, the Contractor shall contact the Design-Builder for field oversight and documentation of CCDD removal and disposal.
 - e. The Contractor shall excavate, load, and transport identified CCDD to the identified CCDD fill site or recycling facility.
 - f. The Contractor shall provide copies of CCDD fill site receipts to the Design-Builder. The fill site receipts shall be per-truck, and shall be legible. The receipts must include the date and time of transfer, the name of the hauler, the receiving fill site, and the volume of CCDD material transferred per truck. The Contractor shall also provide a Daily Report to the Design-Builder. The Daily Report shall include, at a minimum, the name of hauler, the name of the receiving fill site, and the volume of CCDD disposed of or recycled that day. The fill site receipts shall be attached to the Daily Report.
 - 1) Uncontaminated Soil Disposal:
 - a) At present the site has not identified CCDD material on site, Contractor may undertake post excavation stockpile sampling to identify a discrete volume of soil that meets the MACs and is

accepted by a CCDD facility. Contractor shall be responsible for determining additional sampling and signing form 663 as the PE.

- b) The Contractor shall excavate, load and transport the identified Uncontaminated Soil to the selected CCDD fill site.
- 2) Other Materials:
- a) Material removed from the site that is not identified as CCDD or Uncontaminated Soil should be managed in accordance with Section 31 23 18.13 Soil, Fill, Backfill, CU Structural Soil & Construction & Demolition Debris Removal, and/or Section 01 52 40 Construction Waste Management and Disposal, as applicable.

1.3 DEFINITIONS

- A. Clean Construction or Demolition Debris (CCDD): any of the following materials, alone or in combination, that (i) have been generated from construction or demolition activities and (ii) are uncontaminated:
 - 1. Broken concrete without protruding metal bars,
 - 2. Bricks,
 - 3. Rock,
 - 4. Stone,
 - 5. Reclaimed or other asphalt pavement
 - 6. Uncontaminated soil which is comingled with any of the above materials is also considered CCDD.
- B. General Construction and Demolition (C&D) Debris: non-hazardous, uncontaminated materials resulting from construction, remodeling, repair, and demolition of utilities, structures, and roads as defined in Section 3.160 of the Environmental Protection Act, 415 Illinois Compiled Statutes (ILCS) 5/3.160 and regulated under Title 35: Environmental Protection; Subtitle G: Waste Disposal; Chapter I: Pollution Control Board; Subchapter i: Solid Waste and Special Waste Hauling. C&D debris may include soil, wall coverings, reclaimed asphalt pavement, rock, plaster, glass, non-hazardous painted wood, drywall, plastics, non-hazardous coated wood, non-asbestos insulation, bricks, wood products, roofing shingles, concrete, and general roof coverings.
- C. IEPA: Illinois Environmental Protection Agency.
- D. LPE: licensed professional engineer.
- E. MWRDGC: Metropolitan Water Reclamation District of Greater Chicago.
- F. OSHA: the federal agency with responsibility for worker safety, the Occupational Safety and Health Administration.
- G. Soil: any granular or cohesive materials designated for removal as specified in the bid documents and includes soils and soil-like materials, such as clay, that are determined to be Uncontaminated Soil, Contaminated Soil, and Special and/or Hazardous Waste soil.

- H. Stormwater: water deposited at the site in the form of rain, snow or other natural weather event.
- I. TACO: TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES in accordance with 35 ILLINOIS ADMINISTRATIVE CODE (ILL. ADM. CODE) Part 742.
- J. Uncontaminated Soil: soil generated during construction, remodeling, repair or demolition of utilities, structures and roads that does not contain contaminants in concentrations that pose a threat to human health and safety and the environment. [415 ILCS 5/3.160(c)] User or User Agency means the entity for which or on whose behalf the Board has undertaken to cause the Work to be performed.
- K. Work: the obligations of the Contractor under the Contract Documents. Work includes, unless specifically excepted by the Contract Documents, the furnishing of all materials, labor, equipment, supplies, plant, tools, scaffolding, transportation, superintendence, permits, inspections, occupancy approvals, insurance, taxes, and all other services, facilities and expenses necessary for the full performance and completion of the requirements of the Contract Documents. Work also means that which is furnished, produced, constructed, or built pursuant to the Contract Documents.

1.4 ACTION SUBMITTALS

- A. The Contractor shall ensure that submittals are provided in compliance with specified time frame(s) to avoid delays in Work.
- B. The Contractor shall prepare and submit the following documents to the Design-Builder for the off-site removal and transfer of CCDD:
 - 1. Name, address and telephone number of the CCDD fill site where CCDD to be transported. This submittal must be made at least 15 working days prior to removal of any materials from the site. Once this submittal is made, the Contractor cannot change the fill site without written authorization from the Design-Builder. This information should include, at a minimum, the following.
 - a. CCDD fill site name and address and telephone number;
 - b. Site contact information, including contact person and phone number;
 - c. Fill Site Identification number assigned by the IEPA;
 - d. Executed CCDD Acceptance Agreement from the facility, setting forth its agreement and authorization to accept the identified material.
 - 2. Name of Haulers to be used for the transportation of CCDD and Recycled Material. This submittal must be made at least 15 working days prior to removal of any materials from the site. This information shall include, at a minimum, the following.
 - a. Hauler name, address, contact information, including name and telephone number of authorized representative.
 - 1) Any relevant transportation license numbers.
 - 3. Soil Management Plan (SMP). Prior to commencing any Work, the Contractor shall provide a SMP outlining proposed excavation Work sequences and procedures to separate each type of material to be removed from the site, separating any contaminated materials from any uncontaminated materials, and

shall ensure that haulers are fully informed as to the appropriate destination for the materials. The SMP shall show the locations of each type of material to be stored on site, pending reuse as specified in the Contract Documents, or off-site transfer to appropriate location.

4. Reports and Other Submissions. The Contractor shall provide the Design-Builder with the following on a weekly basis:
 - a. Copies of all fully executed CCDD facility receipts, which shall be legible and dated and shall contain a complete description of the material taken per truck.
 - b. Copies of daily reports providing information regarding hauler names and volume or weight of material removed, and location taken, per truck.
- C. Contractor shall submit the following for each Recycling Facility:
 1. Name, Address, and Contact Information for each proposed Recycling Facility.
 2. Copy of document (license, permit, etc.) that indicates that the facility is authorized to operate a recycling operation for proposed material(s).
 3. Copies of recycling facility receipts for each load of material transported to the approved recycling facility.

1.5 SUBMITTAL REVIEW

- A. See Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Review of submittals or any comments made does not relieve the Contractor from compliance with the requirements of the drawings and specifications. The purpose of this check is to review for general conformance with the design concept of the project and general compliance with the information given in the contract documents. The Contractor is responsible for confirming and correlating all quantities and dimensions; electing techniques of construction; coordinating the Work; and performing the Work in a safe and satisfactory manner, in compliance with all contract documents, specifications, and applicable laws and regulations.
- C. The Contractor must not begin any Work applicable to this section until all required submittals have been reviewed and accepted by the Design-Builder.
- D. In order to ensure appropriate oversight of removal activities, the Contractor shall provide notification to the Design-Builder no less than forty-eight (48) business hours prior to excavating, loading and transporting of any materials from the site.

1.6 RECORDKEEPING

- A. The Contractor shall maintain and provide all records provided for in this Section. The Contractor shall also provide documentation of labor, equipment, and materials used for the CCDD and Uncontaminated Soil removal as required to fulfill the scope of work described in the Contract Document or as requested by the Design-Builder.

PART 2 - PRODUCTS

2.1 CLEAN CONSTRUCTION OR DEMOLITION DEBRIS AND UNCONTAMINATED SOIL DISPOSAL

- A. The Contractor shall furnish all necessary means, products, tools, and equipment required to remove and dispose CCDD and Uncontaminated Soil from the site as directed by the Board Representative.
- B. The Contractor shall also furnish all necessary means, products, tools, and equipment required to fulfill the scope of work described in the contract specifications and drawings. The Contractor, by submitting a bid for the Work, represents itself as knowledgeable and an expert in the performance of the Work, and includes all things usually and customarily necessary to provide a complete and finished job, whether specifically mentioned or not.
- C. The Contractor must have a complete plan for the entire process of soil removal and disposal in accordance with the project requirements. Contractor must provide schedule of all Work activities in accordance with the approved construction schedule.

PART 3 - EXECUTION

3.1 AUTHORIZATIONS

- A. The Contractor shall obtain appropriate authorization from the permitted CCDD fill site or from the authorized recycling facility where the material will be taken.

3.2 MATERIAL SAMPLING

- A. As directed by the Design-Builder, the Contractor shall provide the necessary equipment and manpower to assist the Design-Builder in any necessary field verifications to complete these activities at no additional cost to the Owner or Design-Builder.
- B. The Contractor shall not perform any field sampling or testing without a written authorization from the Design-Builder.

3.3 EXCAVATION

- A. The Contractor shall perform all site excavation in accordance with the Contract Documents.

- B. The Contractor shall perform excavation of materials in accordance with all applicable regulations and project specifications. All excavation shall be performed in accordance with OSHA requirements and guidelines.
- C. The Contractor shall immediately notify the Design-Builder if any materials, (solid or liquid) requiring special handling (i.e., contaminated soil, soil with odors, or liquids) are encountered during excavation. Such materials shall be separately stockpiled and shall not be loaded into hauling trucks without a written authorization from Design-Builder.
- D. The Contractor shall coordinate all soil excavation and hauling from the site activities with the Design-Builder. The Contractor must provide a written notification to the Design-Builder at least 48-hour prior to starting any soil excavation and hauling from the site.
- E. The Contractor shall review all of the Contract Documents to become familiar with locations of materials designated as Uncontaminated Soils, Clean Construction or Demolition Debris, General Construction or Demolition Debris, Contaminated Soils, Special Waste, or Hazardous Waste. The Contractor shall excavate each type of material separately as practical and consistent with the Contractor's SMP, and shall clean excavation equipment prior to excavating CCDD and Uncontaminated Soil.
- F. The Contractor shall be responsible for maintaining the structural integrity of all surrounding streets, underground utilities, buildings, and structures (walkways, sidewalks, underground tunnels, etc.)
- G. The Contractor shall secure, shore, and brace where sloping is not possible either because of space restrictions or stability of material excavated. Excavations shall be braced or sloped in compliance to the latest OSHA requirements and shall comply with local codes, authorities having jurisdiction, and the City of Chicago, and maintain same. Maintain sides and slopes of excavations in a safe condition until completion of backfilling. Provide materials for shoring and bracing, such as sheet piling, uprights, stringers and cross braces, in good serviceable conditions. Maintain shoring and bracing in excavations regardless of the time period excavations will remain open. Carry down shoring and bracing as the excavation progresses.

3.4 STOCKPILING

- A. The Contractor may stockpile excavated materials on site as approved by the Design-Builder and as set forth in the Contractor's approved SMP. The location of the stockpile area shall be approved by the Design-Builder and it shall be in accordance with the City of Chicago requirements, including Section 13-32 & 125 of the Municipal Code. The maximum height of the stockpile is 10 feet, provided appropriate setbacks, as set forth in the Code, are met.
- B. The Contractor shall be responsible for keeping CCDD and Uncontaminated Soil separated from Contaminated Soils and General Construction and Demolition Debris, Special Waste, and Hazardous Waste. If CCDD and Uncontaminated Soil come in contact with Contaminated Soils or General Construction or Demolition Debris, Special

Waste or Hazardous Waste, the former CCDD and Uncontaminated Soils will now be considered contaminated materials, and the Contractor shall dispose of newly designated soils as contaminated soils at his own expense in accordance with Section 31 23 18 13 as applicable. The Contractor will be responsible for any sampling analysis costs associated with characterization of soil that has become contaminated pursuant to this Subsection.

3.5 LOADING

- A. The Contractor shall notify the Design-Builder 48 hours in advance of soil loading and hauling activities. No soil shall be removed from the site without the presence of the Design-Builder.
- B. Prior to loading, the Contractor shall prepare and provide hauler with appropriately marked CCDD tracking receipts, for acceptance and confirmation at the receiving site.
- C. The Contractor shall load excavated materials directly from the site or from temporary stockpiles into hauling trucks equipped with tarp for direct transportation to the approved CCDD fill site or recycling facility.
- D. The Contractor shall conduct operations in a manner that minimizes interference with roads, streets, walks and other adjacent occupied and used facilities. The Contractor shall not close or obstruct streets, walks or other occupied or used facilities without permission from the applicable governing agency and the Design-Builder. If required by the appropriate governmental entity, the Contractor shall provide alternate routes around closed or obstructed traffic ways.
- E. The Contractor shall ensure compliance with all State and local Road/Street weight limits.

3.6 TRANSPORTATION

- A. All trucks shall be properly covered prior to leaving the site as required by the City of Chicago Municipal Code.
- B. All CCDD and Uncontaminated Soil shall be transported directly to the approved CCDD fill site or recycling facility on a daily basis. No off-site temporary storage is allowed. All materials not transported to the CCDD fill operation or recycling facility shall be returned to the project site for overnight storage.
- C. The Contractor shall immediately notify the Design-Builder if any CCDD or Uncontaminated Soil loads are rejected by the CCDD fill operation. A field order allowing for a change in transfer, to an appropriate facility, will be executed.
- D. The Contractor shall provide completed and executed copies of disposal/recycling CCDD tracking receipts to the Design-Builder on a weekly basis.
- E. Drivers shall hold, and present upon request, a current valid Commercial Driver's License (CDL).

3.7 STORMWATER RUNOFF AND GROUNDWATER MANAGEMENT

- A. Refer to Section 01 50 00 – TEMPORARY FACILITIES AND CONTROLS

3.8 DUST CONTROL

- A. Refer to Section 01 56 11 – GENERAL DUST, FUME, AND ODOR CONTROL

3.9 NOISE CONTROL

- A. The Contractor shall not start any Work activities prior to the time specified in the City of Chicago Noise Ordinance.
- B. The Contractor shall control the noise, in accordance with the City of Chicago Noise Ordinance, or as directed by the Design-Builder where there are sensitive project-specific concerns, such as during school operating hours at school construction projects.

3.10 QUALITY CONTROL

- A. Visual inspections and damage repairs shall be made daily by the Contractor to assure that erosion, drainage and containment control measures are functioning properly.
- B. The Contractor shall take all necessary precautions to protect structures, equipment, pavement, walks and utilities against movement or settlement during the course of Work.
- C. Damage: The Contractor shall promptly replace or repair any damage caused to adjacent pavement, utilities or facilities by removal operations at no additional cost to the Design-Builder or Owner. Work shall be performed to the satisfaction of the Design-Builder, Owner, or Authority Having Jurisdiction.
- D. Submittal Timeframe Compliance: The Contractor shall ensure that all required submittals are in compliance with time frames specified.

Utility Services: The Contractor shall maintain existing utilities and protect against damage during removal operations.

END OF SECTION 31 23 18.14

SECTION 31 23 23.01 – FILL

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes filling, backfilling, and compacting for building volume below grade.
- B. Filling holes, pits, and excavations generated as a result of removal (demolition) operations.

1.2 REFERENCE STANDARDS

- A. ASTM D1556/D1556M - Standard Test Method for Density and Unit Weight of Soil in Place by Sand-Cone Method; 2015, with Editorial Revision (2016).
- B. ASTM D1557 - Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³ (2,700 kN m/m³)); 2012, with Editorial Revision (2015).
- C. ASTM D2167 - Standard Test Method for Density and Unit Weight of Soil in Place by the Rubber Balloon Method; 2015.
- D. ASTM D2487 - Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System); 2011.

1.3 SUBMITTALS

- A. See Section 01 33 00 - Submittal Procedures.
- B. Copies of environmental analytical results of all backfill material, topsoil, and CU structural soil verifying that these materials meet all the requirements outlined in Section 31 23 23 "Acceptance of Backfill, Topsoil & CU Structural Soil".

1.4 QUALITY ASSURANCE

- A. Soil Testing and Inspection Agency:
 - 1. The Design-Builder will engage a soil testing and inspection agency, to include testing soil materials proposed for use in the Work and initial quality control testing during fill operations. The Contractor is responsible for payment of all Backfill, Top Soil and CU Structural Soil sampling, historical data and analytical fees.
 - 2. Furnish soil survey for satisfactory soil materials and samples of soil materials to the testing agency.
 - 3. The date of the environmental analysis of the backfill shall be within 60 days of importing such materials to the site. The contractor shall immediately be

responsible for removing any material from the site not complying with this requirement.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. When necessary, store materials on site in advance of need.

PART 2 - PRODUCTS

2.1 FILL MATERIALS

- A. All Materials: Comply with requirements listed in Section 31 23 23 "Acceptance of Backfill, Topsoil & CU Structural Soil."
- B. General Fill: Provide soil materials conforming to ASTM D2487 soil groups GW, GR, GM, SW, SP or SM or a combination that are free of debris, waste, frozen materials, vegetable, organic and other deleterious matter and having maximum particle size of 2" in all dimensions.
- C. Select Fill: Clean natural or crushed stone or gravel conforming to State of Illinois, Department of Transportation Gradation CA 6.
- D. Underbed Material: Naturally or artificially graded mixture of natural or crushed stone or gravel conforming to State of Illinois, Department of Transportation Specifications for Gradation CA 8, or CA 7, or CA 6.
- E. Use Contractor supplied off-site material except that general fill may be used from excavation if found acceptable by the Design-Builder's testing agency provided that all off-site and general fill material meets all requirements of Section 31 23 23 "Acceptance of Backfill, Topsoil & CU Structural Soil". Provide all materials required to complete the Work in the Contract.

2.2 SOURCE QUALITY CONTROL

- A. See Section 01 40 00 - Quality Requirements, for general requirements for testing and analysis of soil material.
- B. Where fill materials are specified by reference to a specific standard, testing of samples for compliance will be provided before delivery to site.
- C. If tests indicate materials do not meet specified requirements, change material and retest.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that survey benchmarks and intended elevations for the Work are as indicated.
- B. Identify required lines, levels, contours, and datum locations.

- C. Verify subdrainage, dampproofing, or waterproofing installation has been inspected.
- D. Verify areas to be filled are not compromised with surface or groundwater.

3.2 PREPARATION

- A. Prepare excavations per 31 23 16 - Excavation.
- B. Compaction: Control soil compaction during construction, providing the minimum percentage of density specified.
 - 1. Percentage of Maximum Density Requirements: Provide not less than the following percentages of density of soil material compacted at + 2% optimum moisture content, for the actual density of each layer of soil material-in-place:
 - a. Compact top 12" of subgrade and each layer of backfill or fill material to 75% relative density for cohesionless soils (ASTM D 4253 & D 4254) and 95% maximum density for cohesive soil per ASTM D1557.
 - 2. Moisture Control:
 - a. Where the subgrade or layer of soil material must be moisture conditioned before compaction, uniformly apply water to the surface of subgrade, or layer of soil material, to prevent free water appearing on the surface during or subsequent to compaction operations.
 - b. Remove and replace, to scarify and air dry, soil material that is too wet to permit compaction to specified density.

3.3 FILLING

- A. Backfill excavations as promptly as the Work permits, but not until completion of the following:
 - 1. Review of construction below finish grade.
 - 2. Code required inspection, testing, approval, and recording locations of underground utilities.
 - 3. Removal of concrete formwork.
 - 4. Removal of shoring and bracing, and backfilling of voids with satisfactory materials. Cut off temporary sheet piling driven below bottom of structures and remove in manner to prevent settlement of the structure or utilities or leave in place if required.
 - 5. Removal of trash and debris.
 - 6. Permanent or temporary horizontal bracing is in place on horizontally supported walls.

- B. Ground Surface Preparation: Remove vegetation, debris, unsatisfactory soil materials, obstructions, and deleterious materials from ground surface prior to placement of fills. Plow, strip, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so that fill material bonds with existing surface.
1. When the existing ground surface has a density less than that specified under "Compaction" for the particular area classification, break up the ground surface, pulverize, bring moisture condition to the optimum moisture content, and compact to the required depth and percentage of maximum density.
- C. Placement and Compaction: Place backfill and fill materials to required grades in layers not more than 8" in loose depth for materials compacted by heavy compaction equipment and not more than 4" in loose depth for materials compacted by hand operated tampers. Before compaction, moisten or aerate each layer as necessary to provide the optimum moisture content of the soil material. Compact each layer to the required percentage of density.
1. Place backfill and fill materials evenly on all sides of structures to required elevations and uniformly along the full length of each structure.
 2. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.
 3. Backfill and fill under Building slabs to an elevation required to allow for thickness of underbed shown or a minimum of 6" if not shown.
 - a. Use select fill material.
 4. Backfill and fill under pavements as required to comply with cross sections, elevations and grades shown.
 - a. Use select fill material, except below 3-foot, general fill may be used.
 5. Fill and backfill under footings where not on undisturbed ground using select fill material.
 6. Backfill and fill elsewhere as required to establish new finished grades, allowing not less than 4" for top soiling using select fill except below 3-foot, general fill may be used.
- D. Under Bed: Place and compact underbed material under all slabs-on-grade.
- E. Slope grade away from building minimum 2 inches in 10 feet, unless noted otherwise. Make gradual grade changes. Blend slope into level areas.
- F. Reshape and re-compact fills subjected to vehicular traffic.
- G. Maintain temporary means and methods, as required, to remove all water while fill is being placed as required, or until directed by the Architect. Remove and replace soils deemed unsuitable by classification and which are excessively moist due to lack of dewatering or surface water control.

3.4 FIELD QUALITY CONTROL

- A. See Section 01 40 00 - Quality Requirements, for general requirements for field inspection and testing.
- B. Design-Builder will engage a qualified independent testing and inspecting agency to sample materials, perform tests, and submit test reports during earthwork operations.
 - 1. The Design-Builder's testing agency must inspect and approve sub-grades and fill layers before further construction work is performed thereon.
 - 2. If, in the opinion of the Design-Builder's testing agency, based on reports of the testing agency and inspection, the subgrade or fills which have been placed are below the specified density, additional compaction and testing shall be required until satisfactory results are obtained at no additional cost to Design-Builder. In such event, retesting shall be paid by the Contractor.
- C. Contractor's Responsibilities
 - 1. Notify Design-Builder's testing agency sufficiently in advance of operations to allow for assignment of personnel and scheduling of tests.
 - 2. Coordinate with Agencies' personnel; provide access to Work, to manufacturer's operations.
 - 3. Provide preliminary representative samples of materials to be tested, in required quantities.
 - 4. Furnish casual labor and facilities to provide access to Work to be tested to obtain and handle samples at the site to facilitate inspections and tests, and storage and curing of tests.
 - 5. Arrange with laboratory, pay for, additional samples and tests required when initial tests indicate Work does not comply with Contract Documents.
- D. Tests for Proposed Soil Materials:
 - 1. Test soil materials proposed for use in the Work and promptly submit test result reports. Soil samples shall be provided by Contractor.
 - 2. Provide one optimum moisture-maximum density curve for each type of cohesive soil. Determine maximum densities in accordance with ASTM D1557.
 - 3. Determine the suitability of materials to be used as fill and backfill.
 - 4. Perform a mechanical analysis (AASHTO T88), plasticity index (AASHTO T91), and frost susceptibility analysis.
- E. Verification of Footing Subgrades:
 - 1. Provide one optimum moisture-maximum density curve for each type of soil encountered.

2. For each strata of soil on which footings are to be placed, conduct at least one test to verify the required design bearing capacities. Subsequent verification and approval of each footing subgrade may be based on a visual comparison of each subgrade with the related tested strata.

F. Compaction Testing:

1. Inspect, test, and approve each lift of fill and backfill before next lift is placed. Test in accordance with ASTM D1556/D1556M or ASTM D2167 as appropriate.
2. Take a field density test for each 2,000 sq. ft. of backfill and fill under slabs and pavements.
3. Take a field density test at 100-foot intervals along the inside of continuous footings, but not less than one (1) test per 20-foot run.
4. Take a field density test for each four (4) isolated footings.
5. Take a field density test at 50-foot intervals along utility trench backfill under slabs and pavements.

G. Proofrolling Observation:

1. Provide continuous observation of proofrolling of entire building area. Four passes shall be made.
2. Approve subgrade or make recommendations for removal.

H. Submittals: Submit copies of the following reports:

1. Report and certification of granular fill and drainage fill.
2. Test reports on fill and backfill material.
3. Verification of each footing subgrade.
4. Field density test reports.
5. One optimum moisture-maximum density curve for each type of soil encountered.
6. Report of actual unconfined compressive strength and/or results of plate bearing tests of each strata tested.
7. Other tests' and materials' certificates, as required.

- I. If tests indicate work does not meet specified requirements, remove work, replace and retest.

3.5 CLEANING

- A. Burning is not permitted on the Owner's property.

END OF SECTION 31 23 23.01

SECTION 31 23 23.25 – ACCEPTANCE OF BACKFILL, TOPSOIL, AND CU STRUCTURAL SOIL**PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes the following:
1. This section applies for all demolition, construction and renovation projects that require the importation of backfill material
 2. This specification is for the importation and acceptance of clean backfill. All imported material must meet the requirements presented in this specification. No proposed imported material will be accepted for use prior to its pre-approval from the Design-Builder. Where there is a conflict between the contract documents and actual site conditions, the Contractor shall comply with any appropriate field order changes directed by the Design-Builder. The Contractor shall perform the work under this section in accordance with all local, state, and federal rules and regulations including but not limited to Illinois EPA, United States Environmental Protection Agency (USEPA), Illinois Department of Transportation, and Occupational Safety and Health Agency (OSHA) regulations.

1.2 DEFINITIONS

- A. Agency: Illinois Environmental Protection Agency (IEPA).
- B. Backfill: granular or cohesive material used to fill the excavation to design grade as referenced in design plans and specifications IEPA: Illinois Environmental Protection Agency.
- C. CU Structural Soil: a uniformly blended mixture of crushed stone, clay, loam and hydrogel by weight consisting of approximately 83% crushed limestone (3/4 to 1.5 inch, highly angular with limited fines), 17% clay loam and hydrogel (1 oz. per 200 pounds of stone).
- D. IEPA: Illinois Environmental Protection Agency
- E. Managing Environmental Consultant (MEC): the entity with overall responsibility for the direction and control of the environmental investigations, assessments, designs, and supervision of remediation work.
- F. Topsoil: any soils placed to design grade and used to promote vegetative growth. All topsoil shall not exceed Title 35: Environmental Protection Subtitle G: Waste Disposal Chapter I: Pollution Control Board Subchapter F: Risk Based Cleanup Objectives, Part 742, Tiered Approach To Corrective Action Objectives (TACO), Appendix B, Table A values for 35 Illinois Administrative Code (Ill. Adm. Code) 740 Appendix A Target Compound List (TCL) parameters.
- G. User: the entity for which or on whose behalf the Board has undertaken to cause the Work to be performed.

- H. Work: the obligations of the Contractor under the Contract Documents. Work includes, unless specifically accepted by the Contract Documents, the furnishing of all materials, labor, equipment, supplies, plant, tools, scaffolding, transportation, superintendence, permits, in sections, occupancy approvals, insurance, taxes, and all other services, facilities and expenses necessary for the full performance and completion of the requirements of the Contract Documents. Work also means that which is furnished, produced, constructed, or built pursuant to the Contract Documents.

1.3 ACTION SUBMITTALS

- A. Copies of environmental analytical results of all backfill material, topsoil and CU Structural Soil verifying that these materials do not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For samples from virgin sources material must be analyzed for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For virgin sources, Contractor shall submit a certification letter from the Owner of the source that all imported material is virgin material mined directly from the source quarry. For samples from recycled sources material must be analyzed for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For recycled sources, the Contractor must identify the source of the recycled material including the owner, the address, imported fill environmental history, and a written demonstration that the property source is not in any regulated environmental related cleanup program. All materials must be sampled at least 1 per 1,000 tons of material and testing shall be within 60 days of import.
- B. Name and address and telephone number of the laboratory that will be used by the Contractor to perform the environmental analytical testing for backfill, topsoil and CU Structural Soil samples prior to starting Work. The laboratory performing the analysis must be an IEPA accredited laboratory.
- C. Copies of all daily reports, transport records and receipts to the Design-Builder on a daily basis.

1.4 SUBMITTAL REVIEW

- A. See Section 01 33 00 – SUBMITTAL PROCEDURES.
- B. Review of submittals or any comments made does not relieve the Contractor from compliance with the requirements of the drawings and specifications. The purpose of this check is to review for general conformance with the design concept of the project and general compliance with the information given in the contract documents. The Contractor is responsible for confirming and correlating all quantities and dimensions; electing techniques of construction; coordinating the Work; and performing the Work in a safe and satisfactory manner, in compliance with all contract documents, specifications, and applicable laws and regulations.

PART 2 - PRODUCTS

2.1 BACKFILL, TOPSOIL, CU STRUCTURAL SOIL

- A. The Contractor shall supply only backfill, topsoil and CU Structural Soil that does not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For samples from virgin sources, where applicable, one representative sample must be analyzed for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. Material sources will not be accepted from sources that have had applications of biosolids that were obtained from publicly owned sewage treatment works. For virgin sources, where applicable, Contractor shall submit a certification letter from the Owner of the source that all imported material is virgin material mined directly from the source quarry. For samples from recycled sources, where applicable, material must be analyzed for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For recycled sources, the Contractor must identify the source of the recycled material including the owner, the address, imported fill environmental history, and a written demonstration that the property source is not in any regulated environmental related cleanup program. All materials must be sampled at least 1 per 1,000 tons of material and testing shall be within 60 days of import.

PART 3 - EXECUTION

3.1 AUTHORIZATIONS

- A. Haulers for transportation of backfill, topsoil or CU Structural Soil shall hold and present upon request a current, valid Commercial Driver's License (CDL).

3.2 MATERIAL SAMPLING

- A. The Contractor shall collect sufficient amount of representative (no composite samples) backfill, topsoil and CU Structural Soil sample(s) for analytical testing sufficient to verify that these materials do not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. The Contractor is responsible for payment of all backfill, topsoil and CU Structural Soil sampling and analytical fees.
- B. The Design-Builder may collect backfill, topsoil or CU Structural Soil samples for laboratory analysis on behalf of the Contractor at no additional cost to the project.
- C. The Design-Builder may collect samples for laboratory analysis or field Photo-ionization Detector (PID) screening, or liquid samples for laboratory analysis. The Contractor shall provide the necessary equipment and manpower to assist the Design-Builder to collect materials to be sampled at no additional cost to the project and in compliance with OSHA and all other Rules and Regulations.

3.3 HAULING

- A. The Contractor shall not create dust and shall maintain adequate dust suppression equipment on site if conditions warrant.
- B. The Contractor shall maintain streets clean and free of mud and dirt.
- C. The Contractor shall place backfill, topsoil and CU Structural Soil to ensure minimum interference with roads; streets, walks and other adjacent occupied and used facilities. Do not close or obstruct streets, walks or other occupied or used facilities without permission from the applicable Authority Having Jurisdiction and the Design-Builder. Provide alternate routes around closed or obstructed traffic ways if required by the Authority Having Jurisdiction.

3.4 TRANSPORTATION

- A. The Contractor shall provide and complete copies of all daily reports, weight tickets, and receipts (as applicable) for transportation and ultimate placement of the backfill, topsoil, and CU Structural Soil to the Design-Builder for review and signature within 5 business days or as directed by the Design-Builder.

3.5 BACKFILL

- A. The backfill material shall be granular or cohesive material that meets the project specified requirements.
- B. For each off-site source of backfill materials, the Contractor shall provide to the Design-Builder as required, environmental laboratory analyses and certification that the imported backfill does not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. For samples from virgin sources, samples must be analyzed for Appendix B, Section 742 Table A parameters. For virgin sources, Contractor shall submit a certification letter from the owner of the source that all imported material is virgin material mined directly from the source quarry. For samples from recycled sources, samples must be analyzed for Appendix B, Section 742 Table A parameters. For recycled sources, the Contractor must identify the source of the recycled material including the owner, the address, imported fill environmental history, and a written demonstration that the property source is not in any regulated environmental related cleanup program. All materials must be sampled at least 1 per 1,000 tons of material and testing shall be within 60 days of import.
- C. The Contractor shall not place backfill material without approval of the Design-Builder. If the Contractor backfills the excavation area without obtaining approval from the Design-Builder, the backfill materials shall be excavated, if required, at the Contractor's expense.

3.6 TOPSOIL

- A. The Topsoil material shall meet the project specified requirements.
- B. For each off-site source of Topsoil, the Contractor shall provide to the Board Representative and/or MEC, as required, environmental laboratory analyses and certification that the imported materials do not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. The Contractor must identify the source of the material including the owner, the address, imported fill environmental history, and a written demonstration that the property source is not in any regulated environmental related cleanup program. All materials must be sampled at least 1 per 1,000 tons of material and testing shall be within 60 days of import.
- C. The Contractor shall not place topsoil without approval of the Design-Builder. If the Contractor places topsoil without obtaining approval from the Design-Builder, the topsoil shall be excavated, if required, at the Contractor's expense.

3.7 STRUCTURAL SOIL

- A. CU Structural Soil shall meet the project specified requirements.
- B. For each off-site source of CU Structural Soil, the Contractor shall provide to the Board Representative and/or MEC, as required, environmental laboratory analyses and certification that the imported materials do not exceed APPENDIX B, SECTION 742, TABLE A; TIERED APPROACH TO CORRECTIVE ACTION OBJECTIVES (TACO): 35 ILL. ADM. CODE 742 values for 35 ILL. ADM. CODE 740 APPENDIX A Target Compound List (TCL) parameters. The Contractor must identify the source of the material including the owner, the address, imported fill environmental history, and a written demonstration that the property source is not in any regulated environmental related cleanup program. All materials must be sampled at least 1 per 1,000 tons of material and testing shall be within 60 days of import.
- C. The Contractor shall not place CU Structural Soil without approval of the Design-Builder. If the Contractor places CU Structural Soil without obtaining approval from the Design-Builder, the CU Structural Soil shall be excavated, if required, at the Contractor's expense.

3.8 DUST CONTROL

- A. The Contractor shall control dust by all necessary means, including but not limited to covering trucks, stockpiles and open materials, watering haul roads, sweeping paved roads, and limiting the speed of all on-site vehicles.

3.9 QUALITY CONTROL

- A. The Contractor shall take all necessary precautions to protect structures, equipment, pavement, walks and utilities against movement or settlement during the course of Work.
- B. The Contractor shall promptly replace or repair any damage caused to adjacent pavement, utilities or facilities by removal operations at no additional cost to the Design-Builder or Owner. Work shall be performed to the satisfaction of the Design-Builder, Owner, or Authority Having Jurisdiction.
- C. The Contractor shall maintain existing utilities and protect against damage during removal operations.

END OF SECTION 31 23 23.25

SECTION 31 63 29 – DRILLED CONCRETE SHAFTS**PART 1 - GENERAL****1.1 RELATED DOCUMENTS**

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:
 - 1. Dry-installed drilled shafts.

1.3 UNIT PRICES

- A. Drilled shafts: Actual net volume of drilled shafts in place and approved. Actual length, shaft diameter, and bell diameter if applicable, may vary, to coincide with elevations where satisfactory bearing strata are encountered. These dimensions may also vary with actual bearing value of bearing strata determined by an independent testing and inspecting agency. Adjustments are made on net variation of total quantities, based on design dimensions for shafts and bells.
 - 1. Base bids on indicated number of drilled shafts and, for each shaft, the design length from top elevation to bottom of shaft, extended through the bell, if applicable, and the diameter of shaft and bell.
 - 2. Unit prices include labor, materials, tools, equipment, and incidentals required for excavation, trimming, shoring, casings, dewatering, reinforcement, concrete fill, testing and inspecting, and other items for complete drilled-shaft installation.

1.4 PREINSTALLATION MEETINGS

- A. Preinstallation Conference: Conduct conference at Project site.
 - 1. Review methods and procedures related to drilled shafts including, but not limited to, the following:
 - a. Review geotechnical report.
 - b. Discuss existing utilities and subsurface conditions.
 - c. Review coordination with temporary controls and protections.
 - d. Review measurement and payment of unit prices.

1.5 ACTION SUBMITTALS

- A. Product Data: For each type of product.

- B. Design Mixtures: For each concrete mixture. Submit alternative design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
 - 1. Indicate amounts of mixing water to be withheld for later addition at Project site.
- C. Shop Drawings: For concrete reinforcement, detailing fabricating, bending, supporting, and placing.

1.6 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer land surveyor.
- B. Material Certificates: From manufacturer, for the following:
 - 1. Cementitious materials.
 - 2. Admixtures.
 - 3. Steel reinforcement and accessories.
- C. Material Test Reports: For each material below, by a qualified testing agency:
 - 1. Aggregates: Include service record data indicating absence of deleterious expansion of concrete due to alkali aggregate reactivity.
- D. Field quality-control reports.

1.7 CLOSEOUT SUBMITTALS

- A. Record drawings.

1.8 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer that has specialized in drilled-shaft work.
- B. Testing Agency Qualifications: Qualified according to ASTM C 1077, ASTM D 3740, and ASTM E 329 for testing indicated.

1.9 FIELD CONDITIONS

- A. Existing Utilities: Locate existing underground utilities before excavating drilled shafts. If utilities are to remain in place, provide protection from damage during drilled-shaft operations.
 - 1. Should uncharted or incorrectly charted piping or other utilities be encountered during excavation, adapt drilling procedure if necessary to prevent damage to utilities. Cooperate with Owner and utility companies in keeping services and facilities in operation without interruption. Repair damaged utilities to satisfaction of utility owner.
- B. Interruption of Existing Utilities: Do not interrupt any utility to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility according to requirements indicated:

1. Notify Owner no fewer than two days in advance of proposed interruption of utility.
 2. Do not proceed with interruption of utility without Owner's written permission.
- C. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by geotechnical engineer. Owner is not responsible for interpretations or conclusions drawn from this data.
1. Make additional test borings and conduct other exploratory operations necessary for drilled shafts.
 2. The geotechnical report is included elsewhere in the Project Manual.
- D. Survey Work: Engage a qualified land surveyor or professional engineer to perform surveys, layouts, and measurements for drilled shafts. Before excavating, lay out each drilled shaft to lines and levels required. Record actual measurements of each drilled shaft's location, shaft diameter, bottom and top elevations, deviations from specified tolerances, and other specified data.
1. Record and maintain information pertinent to each drilled shaft and indicate on record Drawings. Cooperate with Owner's testing and inspecting agency to provide data for required reports.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Drilled-Shaft Standard: Comply with ACI 336.1 except as modified in this Section.

2.2 STEEL REINFORCEMENT

- A. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- B. Plain-Steel Wire: ASTM A 82/A 82M, as drawn.
- C. Deformed-Steel Wire: ASTM A 496/A 496M.
- D. Joint Dowel Bars: ASTM A 615/A 615M, plain. Cut bars true to length with ends square and free of burrs.

2.3 CONCRETE MATERIALS

- A. Cementitious Material: Use the following cementitious materials, of same type, brand, and source, throughout Project:
1. Portland Cement: ASTM C 150/C 150M, Type I or Type I/II.
 - a. Fly Ash: ASTM C 618, Class C or Class F.
 - b. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
- B. Normal-Weight Aggregate: ASTM C 33/C 33M, graded, Maximum 1-inch.

1. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
- C. Water: ASTM C 94/C 94M and potable.
- D. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that do not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 2. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 3. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 4. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

2.4 REINFORCEMENT FABRICATION

- A. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

2.5 CONCRETE MIXING

- A. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M, and furnish batch ticket information.
1. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, vibration, and other hazards created by drilled-shaft operations.

3.2 EXCAVATION

- A. Unclassified Excavation: Excavate to bearing elevations regardless of character of surface and subsurface conditions encountered. Unclassified excavated materials may include rock, soil materials, and obstructions.
1. Obstructions: Unclassified excavated materials may include removal of unanticipated boulders, concrete, masonry, or other subsurface obstructions. Payment for removing obstructions that cannot be removed by conventional augers fitted with soil or rock teeth, drilling buckets, or underreaming tools attached to drilling equipment of size, power, torque, and downthrust necessary for the Work is according to Contract provisions for changes in the Work.
- B. Prevent surface water from entering excavated shafts. Conduct water to site drainage facilities.

- C. Excavate soils for drilled shafts to indicated elevations. Remove loose material from bottom of excavation.
 - 1. Excavate bottom of drilled shafts to level plane within 1:12 tolerance.
 - 2. Remove water from excavated shafts before concreting.

- D. Temporary steel casings will be necessary during drilling in order to maintain stability of the soils during construction. Casings shall extend through fill material and extend a minimum of two feet into cohesive soils. Refer to geotechnical report for additional information.

- E. Notify and allow testing and inspecting agency to test and inspect bottom of excavation. If unsuitable bearing stratum is encountered, make adjustments to drilled shafts as determined by A/E.
 - 1. Payment for additional authorized excavation is according to Contract provisions for changes in the Work.

- F. End-Bearing Drilled Shafts: The bearing surface of each drilled shaft shall be inspected by the testing and inspection agency. The inspector may probe with auger to a depth below bearing elevation, equal to diameter of the bearing area of drilled shaft. Determine whether voids, clay seams, or solution channels exist.
 - 1. Test first three drilled shafts and one of every six drilled shafts thereafter.
 - 2. Contractor shall fill auger-probe holes with grout.

- G. Tolerances: Construct drilled shafts to remain within ACI 336.1 tolerances.
 - 1. If location or out-of-plumb tolerances are exceeded, provide corrective construction. Submit corrective construction proposals to A/E for review before proceeding.

3.3 STEEL REINFORCEMENT INSTALLATION

- A. Comply with recommendations in CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.

- B. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy bond with concrete.

- C. Fabricate and install reinforcing cages symmetrically about axis of shafts in a single unit.

- D. Accurately position, support, and secure reinforcement against displacement during concreting. Maintain minimum cover over reinforcement.

- E. Use templates to set anchor bolts, leveling plates, and other accessories furnished in work of other Sections. Provide blocking and holding devices to maintain required position during final concrete placement.

- F. Protect exposed ends of extended reinforcement, dowels, or anchor bolts from mechanical damage and exposure to weather.

3.4 CONCRETE PLACEMENT

- A. Place concrete in continuous operation and without segregation immediately after inspection and approval of shaft by a qualified Special Inspector.
 - 1. Construct a construction joint if concrete placement is delayed more than one hour. Level top surface of concrete and insert joint dowel bars. Before placing remainder of concrete, clean surface laitance, roughen, and slush concrete with commercial bonding agent or with sand-cement grout mixed at ratio of 1:1.
- B. Dry Method: Place concrete to fall vertically down the center of drilled shaft without striking sides of shaft or steel reinforcement.
 - 1. Where concrete cannot be directed down shaft without striking reinforcement, place concrete with chutes, tremies, or pumps.
 - 2. Vibrate top 60 inches of concrete.
- C. Screed concrete at cutoff elevation level and apply scoured, rough finish. Where cutoff elevation is above the ground elevation, form top section above grade and extend shaft to required elevation.
- D. Protect concrete work, according to ACI 301, from frost, freezing, or low temperatures that could cause physical damage or reduced strength.
 - 1. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
 - 2. Do not use calcium chloride, salt, or other mineral-containing antifreeze agents or chemical accelerators.
- E. If hot-weather conditions exist that would seriously impair quality and strength of concrete, place concrete according to ACI 301 to maintain delivered temperature of concrete at no more than 90 deg F.
 - 1. Place concrete immediately on delivery. Keep exposed concrete surfaces and formed shaft extensions moist by fog sprays, wet burlap, or other effective means for a minimum of seven days.

3.5 FIELD QUALITY CONTROL

- A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:
 - 1. Drilled shafts.
 - 2. Excavation.
 - 3. Concrete.
 - 4. Steel reinforcement inspection.
 - 5. Anchor bolt placement.
- B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.
- C. Drilled-Shaft Tests and Inspections: For each drilled shaft, before concrete placement.

1. Soil Testing: Bottom elevations, bearing capacities, and lengths of drilled shafts indicated have been estimated from available soil data. Actual elevations and drilled-shaft lengths and bearing capacities are determined by testing and inspecting agency. Final evaluations and approval of data are determined by the A/E.
 - a. Bearing Stratum Tests: Testing agency takes undisturbed rock core samples from drilled-shaft bottoms; tests each sample for compression, moisture content, and density; and reports results and evaluations.

- D. Concrete Tests and Inspections: ASTM C 172/C 172M except modified for slump to comply with ASTM C 94/C 94M.
 1. Slump: ASTM C 143/C 143M; one test at point of placement for each compressive-strength test but no fewer than one test for each concrete load.
 2. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F and below and 80 deg F and above, and one test for each set of compressive-strength specimens.
 3. Compression Test Specimens: ASTM C 31/C 31M; one set of four standard cylinders for each compressive-strength test unless otherwise indicated. Mold and store cylinders for laboratory-cured test specimens.
 4. Compressive-Strength Tests: ASTM C 39/C 39M; one set for every three drilled shafts but not more than one set for every three truck loads. Test one specimen at seven days, test two specimens at 28 days, and retain one specimen in reserve for later testing if required.
 5. Strength of each concrete mixture is satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi.
 6. Report test results in writing to A/E, concrete manufacturer, and Contractor within 48 hours of testing. List Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests in reports of compressive-strength tests.
 7. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but not be used as sole basis for approval or rejection of concrete.
 8. Additional Tests: Testing and inspecting agency to make additional tests of concrete if test results indicate that slump, compressive strengths, or other requirements have not been met, as directed by Architect.
 - a. Continuous coring of drilled shafts may be required, at Contractor's expense, if temporary casings have not been withdrawn within specified time limits or if observations of placement operations indicate deficient concrete quality, presence of voids, segregation, or other possible defects.
 9. Perform additional testing and inspecting, at Contractor's expense, to determine compliance of replaced or additional work with specified requirements.
 10. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.

- E. An excavation, concrete, or a drilled shaft will be considered defective if it does not pass tests and inspections.

- F. Prepare test and inspection reports for each drilled shaft as follows:
1. Actual top and bottom elevations.
 2. Actual drilled-shaft diameter at top and bottom.
 3. Description of soil materials.
 4. Description, location, and dimensions of obstructions.
 5. Final top centerline location and deviations from requirements.
 6. Variation of shaft from plumb.
 7. Shaft excavating method.
 8. Design and tested bearing capacity of bottom.
 9. Levelness of bottom and adequacy of cleanout.
 10. Ground-water conditions and water-infiltration rate, depth, and pumping.
 11. Description, purpose, length, wall thickness, diameter, tip, and top and bottom elevations of temporary or permanent casings. Include anchorage and sealing methods used and condition and weather tightness of splices if any.
 12. Date and time of starting and completing excavation.
 13. Inspection report.
 14. Condition of reinforcing steel and splices.
 15. Position of reinforcing steel.
 16. Concrete placing method, including elevation of consolidation and delays.
 17. Locations of construction joints.
 18. Concrete volume.
 19. Concrete testing results.
 20. Remarks, unusual conditions encountered, and deviations from requirements.

3.6 DISPOSAL OF SURPLUS AND WASTE MATERIALS

- A. Disposal: Remove surplus satisfactory soil and waste material, including unsatisfactory soil, trash, and debris, and legally dispose of it off Owner's property or as directed by the A/E.

END OF SECTION 31 63 29

SECTION 32 12 16 – ASPHALT PAVING

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes asphalt pavement, sidewalks, and other asphalt pavement indicated.
- B. Aggregate base course.
- C. Single course bituminous concrete paving.
- D. Double course bituminous concrete paving.
- E. Pavement Marking

1.2 REFERENCE STANDARDS

- A. AASHTO M 288 - Standard Specification for Geosynthetic Specification for Highway Applications; 2017.
- B. ASTM C979/C979M - Standard Specification for Pigments for Integrally Colored Concrete; 2016.
- C. ASTM D1073 - Standard Specification for Fine Aggregate for Asphalt Paving Mixtures; 2016.
- D. ASTM D1188 - Standard Test Method for Bulk Specific Gravity and Density of Compacted Bituminous Mixtures Using Coated Samples; 2007.
- E. ASTM D2041/D2041M - Standard Test Method for Theoretical Maximum Specific Gravity and Density of Bituminous Paving Mixtures; 2011.
- F. ASTM D2726/D2726M - Standard Test Method for Bulk Specific Gravity and Density of Non-Absorptive Compacted Asphalt Mixtures; 2017.
- G. ASTM D2950/D2950M - Standard Test Method for Density of Bituminous Concrete in Place by Nuclear Methods; 2014.
- H. ASTM D3549/D3549M - Standard Test Method for Thickness or Height of Compacted Asphalt Mixture Specimens; 2017.
- I. ASTM D3910 - Standard Practices for Design, Testing, and Construction of Slurry Seal; 2015.
- J. ASTM D6690 - Standard Specification for Joint and Crack Sealants, Hot Applied, for Concrete and Asphalt Pavements; 2015.
- K. ASTM D979 - Standard Practice for Sampling Bituminous Paving Mixtures; 2015.

1.3 ADMINISTRATIVE REQUIREMENTS

- A. Preinstallation Meeting: Conduct a preinstallation meeting one week prior to the start of the work of this section; require attendance by all affected installers. Review methods and procedures related to hot-mix asphalt paving including, but not limited to, the following:
1. Ensure required submittals have been provided with sufficient time for review prior to scheduling the Preinstallation Meeting.
 2. Review proposed sources of paving materials, including capabilities and location of plant that will manufacture hot-mix asphalt.
 3. Review condition of subgrade and preparatory work.
 4. Review requirements for protecting paving work, including restriction of traffic during installation period and for remainder of construction period.
 5. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
 6. Require attendance by all affected installers including but not limited to
 - a. Contractor's Superintendent
 - b. Installer
 - c. Manufacturer/Fabricator Representative
 - d. Other affected Subcontractors
 - e. Architect
 - f. Owner's Representative
 7. Record minutes and distribute copies within 5 days after meeting to participants as well as Architect, Owner and those affected by decisions made.

1.4 SUBMITTALS

- A. LEED Submittals: Comply with submittal requirements as detailed in Section 01 81 13.
- B. Product Data: Provide product data for each product specified.
- C. Job-Mix Designs: For each job mix proposed.
1. Job-mix design documentation shall include the amount of RAP material, by percentage of total mix, to be utilized.
 2. Job-mix design documentation shall clearly indicate source/origin of RAP material.

- D. Qualification Data: For IDOT qualified manufacturer and installer.
- E. Material Certificates: For each paving material, from manufacturer.
- F. Material Test Reports: For each paving material and mix.

1.5 QUALITY ASSURANCE

- A. Perform Work in accordance with Illinois Department of Transportation "Standard Specifications for Road and Bridge Construction " (IDOT SSRBC).
 - 1. Measurement and payment provisions and safety program submittals included in IDOT Standard Specifications do not apply to this Section.
- B. Obtain materials from same source throughout.
- C. Manufacturer Qualifications: Hot mix asphalt manufacturer shall have valid and current IDOT approvals for materials and work specified.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Deliver pavement marking materials to project site in in original packages with seals unbroken and bearing manufacturer's labels containing brand name and type of material, date of manufacture, and directions for storage.
- B. Store pavement-marking materials in a clean, dry, protected location within temperature range required by manufacturer. Protect stored materials from direct sunlight.

1.7 FIELD CONDITIONS

- A. Do not apply asphalt materials if subgrade is wet or excessively damp, if rain is imminent or expected before time required for adequate cure, or if the following conditions are not met. Temperatures are to be taken in the shade, away from exposed pavement and stone aggregate fill and other artificial heat sources.
 - 1. Prime Coat: Minimum surface temperature of 60 deg F.
 - 2. Slurry Coat: Comply with weather limitations in ASTM D3910.
 - 3. Asphalt Base Course: Minimum surface temperature of 40 deg F and rising at time of placement.
 - 4. Asphalt Binder Course: Minimum surface temperature of 40 deg F and rising at time of placement.
 - 5. Asphalt Surface Course: Minimum surface temperature of 60 deg F at time of placement.

PART 2 - PRODUCTS**2.1 MATERIALS**

- A. Aggregate for Base Course: Complying with requirements of IDOT Standard Specifications, Section 311, for type B base course with gradation CA-6 crushed stone.
- B. Hot-mix Asphalt Surface Course: Complying with IL-9.5L, Ndes = 30 of the IDOT Standard Specifications. Hot-mix Asphalt Surface Course for City Streets restoration work shall comply with CDOT Rules and Regulations for Construction in Public Way, Latest Edition.
- C. Hot-Mix Asphalt Binder Course: Complying with IL-19L, Ndes = 30 of the IDOT Standard Specifications. Hot-mix Asphalt Binder Course for City Streets restoration work shall comply with CDOT Rules and Regulations for Construction in Public Way, Latest Edition.
- D. Reclaimed Asphalt Pavement (RAP): RAP, complying with IDOT Standard Specifications, specifically 9/17/17 Memorandum "Special Provision for Reclaimed Asphalt Pavement (RAP) and Reclaimed Asphalt Shingles (RAS)" as applies to work in this section.
 - 1. RAP material shall be free of contamination, including, but not limited to, dirt, sand, brick, debris, concrete, sheet asphalt, sealant materials, and clean stone.
- E. Herbicide: Commercial chemical for weed control, registered by the Environmental Protection Agency (EPA). Provide in granular, liquid, or wettable powder form.
- F. Paving Geotextile: AASHTO M 288, nonwoven polypropylene; resistant to chemical attack, rot, and mildew; and specifically designed for paving applications.
- G. Joint Sealant: ASTM D6690, Type II or III, hot-applied, single-component, polymer-modified bituminous sealant.
- H. AUXILIARY MATERIALS:
 - 1. Pavement Marking Paint- Parking lot markings, including parking bays, crosswalks, arrows, handicapped symbols, curb markings and No Parking" curb painting in project property according to Section 780 of the IDOT SSRBC.
 - 2. Pavement Marking Thermoplastic – Crosswalks, stop bar, lane and center-lane markings, pavement markings and symbols in City right of way, CTA Access Drive, and driveways in project property according to Section 780 of the IDOT SSRBC.
 - 3. Pavement Marking Colors: As indicated below. For items not indicated below, provide color(s) as indicated on the Drawings or, if not indicated, as required by the Architect.

- a) Standard Parking Stalls: White.
- b) Accessible Parking Stalls and Access Aisles: Yellow.
- c) International Symbol of Accessibility: Blue field with international symbol of accessibility either yellow or white.
- d) Stop Lines, Cross Walk and Other Traffic Symbols: White.
- e) Lane markings- Yellow, white per standards.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify that compacted subgrade is dry and ready to support paving and imposed loads.
- B. Verify gradients and elevations of base are correct.
- C. Proceed only after unsatisfactory conditions have been corrected. Commencement of work in this section will be an indication of the acceptance of sub-grade and the Contractor will be held responsible for the satisfactory execution and results of the finished work.

3.2 BASE COURSE

- A. Immediately before placing asphalt materials, remove loose and deleterious material from substrate surfaces.
- B. Place and compact base course. Base course shall have a minimum Illinois Bearing Ratio (IBR) of 2.5 and comply with requirements of IDOT Standard Specifications, Section 301. Subgrade shall be proof-rolled in accordance with Section 31 23 23.01 - Fill.
- C. Herbicide Treatment: Where required or as directed by Architect, apply herbicide according to manufacturer's recommended rates and written application instructions. Apply to dry, prepared subgrade or surface of compacted aggregate base before applying paving materials.
 - 1. Mix herbicide with prime coat if formulated by manufacturer for that purpose.

3.3 PREPARATION - PRIMER

- A. Apply primer in accordance with manufacturer's instructions.
- B. Apply primer on aggregate base or subbase at uniform rate of 0.25 - 0.50 gal/sq yd. Apply enough material to penetrate and seal, but not flood surface. Allow prime coat to cure before applying hot-mix asphalt paving.
- C. Use clean sand to blot excess primer. Remove loose sand before pavement is placed and after volatiles have evaporated.

3.4 PREPARATION - TACK COAT

- A. Apply tack coat in accordance with manufacturer's instructions.
- B. Apply tack coat on asphalt or concrete surfaces over subgrade surface at uniform rate of 0.1 gal/sq yd.
- C. Avoid smearing or staining adjoining surfaces, appurtenances, and surroundings. Remove spillages and clean affected surfaces.
- D. Allow tack coat to cure undisturbed before applying hot-mix asphalt paving.
- E. Prohibit traffic across tack coat for period not less than that required by manufacturer.

3.5 PLACING ASPHALT PAVEMENT - SINGLE COURSE

- A. Install Work in accordance with Illinois Department of Transportation (IDOT) "Standard Specifications for Road and Bridge Construction" Section 406 and 407.
- B. Machine-place asphalt within 24 hours of applying primer or tack coat.
- C. Place asphalt mix by hand to areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.
 - 1. Place hot-mix asphalt surface coat in single lift.
 - 2. Spread mix at minimum temperature of 250 deg F.
 - 3. Begin applying mix along centerline of crown for crowned sections and on high side of one-way slopes unless otherwise indicated.
 - 4. Regulate paver machine speed to obtain smooth, continuous surface free of pulls and tears in asphalt-paving mat.
- D. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.
 - 1. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips. Complete a section of asphalt base course before placing asphalt surface course.
- E. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with hot-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.6 PLACING ASPHALT PAVEMENT - DOUBLE COURSE

- A. Install Work in accordance with Illinois Department of Transportation (IDOT) "Standard Specifications for Road and Bridge Construction" Section 406 and 407.
- B. Machine-place asphalt binder course within 24 hours of applying primer or tack coat.

- C. Machine-place wearing course within two hours of placing binder course.
- D. Place asphalt mix by hand to areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.
 - 1. Place hot-mix asphalt base course/wearing course in two lifts and thicknesses indicated.
 - 2. Spread mix at minimum temperature of 250 deg F.
 - 3. Begin applying mix along centerline of crown for crowned sections and on high side of one-way slopes unless otherwise indicated.
 - 4. Regulate paver machine speed to obtain smooth, continuous surface free of pulls and tears in asphalt-paving mat.
 - 5. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.
 - a. After first strip has been placed and rolled, place succeeding strips and extend rolling to overlap previous strips. Complete a section of asphalt base course before placing asphalt surface course.
 - 6. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with hot-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.7 JOINTS

- A. Construct joints to ensure a continuous bond between adjoining paving sections. Construct joints free of depressions, with same texture and smoothness as other sections of hot-mix asphalt course. Joints between successive days' work shall be constructed to ensure thorough and continuous bond between the newly and previously placed paving.
 - 1. Clean contact surfaces and apply tack coat to joints.
 - 2. Offset longitudinal joints, in successive courses, a minimum of 6 inches.
 - 3. Offset transverse joints, in successive courses, a minimum of 24 inches.
 - 4. Construct transverse joints at each point where paver ends a day's work and resumes work at a subsequent time. Construct these joints using either "bulkhead" or "papered" method according to the Asphalt Institute MS-22, "Construction of Hot-Mix Asphalt Pavements," for both "Ending a Lane" and "Resumption of Paving Operations."
 - 5. Compact joints as soon as hot-mix asphalt will bear roller weight without excessive displacement.

6. Compact asphalt at joints to a density within two percent (2%) of specified course density.

3.8 COMPACTION

- A. General: Begin compaction as soon as placed hot-mix paving will bear roller weight without excessive displacement. Compact hot-mix paving with hot, hand tampers or with vibratory-plate compactors in areas inaccessible to rollers.
 1. Complete compaction before mix temperature cools to 185 deg F.
- B. Breakdown Rolling: Complete breakdown or initial rolling immediately after rolling joints and outside edge. Examine surface immediately after breakdown rolling for indicated crown, grade, and smoothness. Correct laydown and rolling operations to comply with requirements.
- C. Intermediate Rolling: Begin intermediate rolling immediately after breakdown rolling while hot-mix asphalt is still hot enough to achieve specified density. Continue rolling until hot-mix asphalt course has been uniformly compacted to the following density:
 1. Average Density: 92 percent of reference maximum theoretical density according to ASTM D2041/D2041M, but not less than 90 percent nor greater than 96 percent.
- D. Finish Rolling: Finish roll paved surfaces to remove roller marks while hot-mix asphalt is still warm.
- E. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while asphalt is still hot; compact thoroughly.
- F. Repairs: Remove paved areas that are defective or contaminated with foreign materials and replace with fresh, hot-mix asphalt. Compact by rolling to specified density and surface smoothness.
- G. Frames of subsurface structures:
 1. Coat surfaces of new and existing frames with oil to prevent bond with asphalt paving.
 2. Set cover rings to be flush with finish surface and surround with a ring of compacted asphaltic concrete to one inch below top of frame. Adjust as required to meet paving.
 3. Provide temporary covers over openings until completion of rolling operations
- H. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and sufficiently hardened, as determined by the Architect.
- I. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.9 TOLERANCES

- A. Flatness: Maximum variation of 1/4 inch measured with 10-foot straight edge.
- B. Compacted Thickness: Within 1/4 inch of specified or indicated thickness.
- C. Variation from True Elevation: Within 1/2 inch.

3.10 FIELD QUALITY CONTROL

- A. See Section 01 40 00 - Quality Requirements, for general requirements for quality control.
- B. Design-Builder will engage a qualified testing agency to perform quality assurance tests and inspections as follows:
 - 1. Thickness: In-place compacted thickness of hot-mix asphalt courses will be determined according to ASTM D3549/D3549M.
 - 2. Surface Smoothness: Finished surface of each hot-mix asphalt course will be tested for compliance with specified tolerances.
 - 3. In-Place Density: Testing agency will take samples of uncompacted paving mixtures and compacted pavement according to ASTM D979.
 - a. Reference maximum theoretical density will be determined by averaging results from four samples of hot-mix asphalt-paving mixture delivered daily to site, prepared according to ASTM D2041/D2041M, and compacted according to job-mix specifications.
 - b. In-place density of compacted pavement will be determined by testing core samples according to ASTM D1188 or ASTM D2726/D2726M.
 - 1) Take one core sample for every 1,000 square yards or less of installed pavement, with no fewer than three (3) core samples taken.
 - 2) Field density of in-place compacted pavement may also be determined by nuclear method according to ASTM D2950/D2950M and correlated with ASTM D1188 or ASTM D2726/D2726M.
 - 4. Testing agency shall perform quality control testing per IDOT specifications and provide test reports.
- C. Replace and compact hot-mix asphalt where core tests were taken.
- D. Remove and replace and/or install additional hot-mix asphalt where test results or measurements indicate that it does not comply with specified requirements.

3.11 PAVEMENT MARKING

- A. Do not apply pavement-marking until layout, colors, and placement have been verified with the Architect. Pavement marking shall be provided per Section 780 of IDOT SSRBC.

END OF SECTION 32 12 16

SECTION 32 13 13 – CONCRETE PAVING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes Concrete Paving including the following:

1. Driveways.
2. Roadways.
3. Parking lots.
4. Curbs and gutters.
5. Sidewalks and walkways.

B. Related Requirements:

1. Illinois Department of Transportation (IDOT) Standard Specifications for Road and Bridge Construction, latest edition.
2. Section 32 12 16 "Asphalt Paving" for pavement markings.

1.2 DEFINITIONS

A. Cementitious Materials: Portland cement alone or in combination with one or more of blended hydraulic cement, fly ash, slag cement, and other pozzolans.

B. W/C Ratio: The ratio by weight of water to cementitious materials.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Design Mixtures: For each concrete pavement mixture.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified installer, ready-mix concrete manufacturer and testing agency.

B. Material Certificates: For the following, from manufacturer:

1. Cementitious materials.
2. Steel reinforcement and reinforcement accessories.
3. Fiber reinforcement.
4. Admixtures.
5. Curing compounds.
6. Applied finish materials.
7. Bonding agent or epoxy adhesive.
8. Joint fillers.
9. Joint sealers.

- C. Field quality-control reports.

1.5 QUALITY ASSURANCE

- A. Ready-Mix-Concrete Manufacturer Qualifications: A ready mix plant registered with and approved by IDOT.
- B. Laboratory and Personnel Qualifications: Qualified according to IDOT Policy Memorandum "Minimum Private Laboratory Requirements for Construction Materials Testing or Mix Design".

1.6 PRECONSTRUCTION TESTING

- A. Preconstruction Testing Service: Engage a qualified independent testing agency to perform preconstruction testing on concrete paving mixtures.

1.7 FIELD CONDITIONS

- A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.
- B. Concrete Placement: Concrete placement shall be performed in accordance with the applicable portions of the Illinois Department of Transportation Standard Specifications for Road and Bridge construction, latest edition, Article 420.07.

PART 2 - PRODUCTS

2.1 CONCRETE, GENERAL

- A. Comply with the applicable portions of the Illinois Department of Transportation Standard Specifications for Road and Bridge construction, latest edition.
- B. Use paving materials with a three-year aged solar reflectance (SR) value of at least 0.28. If the three-year aged value information is not available, use materials with an initial SR of at least 0.33 at installation.

2.2 FORMS

- A. Form Materials: Meeting the requirements of the applicable portions of Article 424.05 of the Standard Specifications for Road and Bridge Construction, latest edition.
- B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and that will not impair subsequent treatments of concrete surfaces.

2.3 STEEL REINFORCEMENT

- A. Plain-Steel Welded-Wire Reinforcement: Meeting the requirements of the applicable portions of Article 1006.10 of the Standard Specifications for Road and Bridge Construction, latest edition.

- B. Epoxy-Coated Welded-Wire Reinforcement: Meeting the requirements of the applicable portions of Article 1006.10 of the Standard Specifications for Road and Bridge Construction, latest edition.
- C. Reinforcing Bars: Meeting the requirements of the applicable portions of Article 1006.10 of the Standard Specifications for Road and Bridge Construction, latest edition.
- D. Epoxy-Coated Reinforcing Bars: Meeting the requirements of the applicable portions of Article 1006.10 of the Standard Specifications for Road and Bridge Construction, latest edition.
- E. Epoxy-Coated Joint Dowel Bars: Meeting the requirements of the applicable portions of Article 1006.11 of the Standard Specifications for Road and Bridge Construction, latest edition.
- F. Epoxy-Coated Tie Bars: Meeting the requirements of the applicable portions of Article 1006.10 of the Standard Specifications for Road and Bridge Construction, latest edition.
- G. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars, welded wire reinforcement, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete of greater compressive strength than concrete, and as follows:
 - 1. Equip wire bar supports with sand plates or horizontal runners where base material will not support chair legs.
 - 2. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
- H. Epoxy Repair Coating: Liquid two-part epoxy repair coating, compatible with epoxy coating on reinforcement.

2.4 CONCRETE MATERIALS

- A. Portland Cement Concrete: Meeting the requirements of the applicable portions of Article 1020 of the Standard Specifications for Road and Bridge Construction, latest edition.
- B. Coarse Aggregate: Meeting the requirements of the applicable portions of Section 1004 of the Standard Specifications for Road and Bridge Construction, latest edition.
- C. Fine Aggregate: Meeting the requirements of the applicable portions of Section 1003 of the Standard Specifications for Road and Bridge Construction, latest edition.
- D. Air-Entraining Admixture: Meeting the requirements of the applicable portions of Section 1021.02 of the Standard Specifications for Road and Bridge Construction, latest edition.
- E. Chemical Admixtures: Meeting the requirements of the applicable portions of Section 1021 of the Standard Specifications for Road and Bridge Construction, latest edition.
- F. Water: Potable and complying with ASTM C94/C94M.

2.5 CURING MATERIALS

- A. Meeting the requirements of Section 1022 of the Standard Specifications for Road and Bridge Construction, latest edition.

2.6 RELATED MATERIALS

- A. Preformed Expansion Joint Fillers: Meeting the requirements of the applicable portions of Section 1051 of the Standard Specifications for Road and Bridge Construction, latest edition.
- B. Poured Joint Sealers: Meeting the requirements of the applicable portions of Section 1050 of the Standard Specifications for Road and Bridge Construction, latest edition.

2.7 CONCRETE MIXTURES

- A. Utilize mix designs meeting the requirements of Section 1020 of the Standard Specifications for Road and Bridge Construction, latest edition.

2.8 CONCRETE MIXING

- A. Ready-Mixed Concrete: Measure, batch, and mix concrete materials and concrete according to the requirements of Section 1020 of the Standard Specifications for Road and Bridge Construction, latest edition. Furnish batch certificates for each batch discharged and used in the Work.
- B. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to the requirements of Section 1103 of the Standard Specifications for Road and Bridge Construction, latest edition.

PART 3 - EXECUTION**3.1 GENERAL**

- A. Comply with materials, workmanship, and other applicable requirements according to the requirements of Section 420 of the Illinois Department of Transportation Standard Specifications for Road and Bridge Construction, latest edition.
 - 1. Measurement and payment provisions and safety program submittals included in standard specifications do not apply to this Section.

3.2 INSTALLATION OF DETECTABLE WARNINGS

- A. Blockouts: Form blockouts in concrete for installation of detectable paving units per approved list on CDOT's website (www.cityofchicago.org).
 - 1. Tolerance for Opening Size: Plus 1/4 inch, no minus.
- B. Cast-in-Place Detectable Warning Tiles: Form blockouts in concrete for installation of tiles. Screed surface of concrete where tiles are to be installed to elevation, so that edges of installed tiles will be flush with surrounding concrete paving. Embed tiles in fresh concrete to comply with CDOT Rules and Regulations for Construction in the Public Way immediately after screeding concrete surface.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: The Design-Builder will employ a separate testing laboratory to perform tests and inspections.
- B. Testing Services: Testing and inspecting of composite samples of fresh concrete shall be obtained and performed according to Section 1020 of the IDOT Standard Specifications for Road and Bridge Construction, latest edition; and Special Provisions for "Quality Control of Concrete Mixtures at the Plant" and "Quality Control/Quality Assurance of Concrete Mixtures".

3.4 REPAIR AND PROTECTION

- A. Remove and replace concrete paving that is broken, damaged, or defective or that does not comply with requirements in this Section. Remove work in complete sections from joint to joint unless otherwise approved by Architect.
- B. Drill test cores, where directed by Architect, when necessary to determine magnitude of cracks or defective areas. Fill drilled core holes in satisfactory paving areas with portland cement concrete bonded to paving with epoxy adhesive.
- C. Protect concrete paving from damage. Exclude traffic from paving for at least 14 days after placement. When construction traffic is permitted, maintain paving as clean as possible by removing surface stains and spillage of materials as they occur.
- D. Maintain concrete paving free of stains, discoloration, dirt, and other foreign material. Sweep paving not more than two days before date scheduled for Substantial Completion inspections.

END OF SECTION 32 13 13

SECTION 32 31 00 - ORNAMENTAL METAL FENCING**PART 1 - GENERAL****1.1 SUMMARY****A. Section Includes:**

1. Remove existing fencing to accommodate new gates, and connect all new gates with new fencing, as described below
2. New fusion welded and rackable ornamental steel picket fence system, including all components such as posts, top, couplings, rails, braces, bars, panels, gates, tracks, uprights, bracing, pickets, hardware, fittings, fasteners, finish hardware, locks, accessories and all other incidental components necessary thereto, including required screening. See Drawings for fence extensions required.
3. All new matching, automated, industrial sliding gate system, including components described above; with warning signs; screening; _____; and others as described in these specifications, manufactured and installed to comply with both current versions of UL 325 and ASTM F2200.
3. All new pedestrian gates, with accessible push bar and all components described above, installed in compliance with both current versions of UL 325 and ASTM F2200.
4. Renovate the existing sliding gate so that it complies with both current versions of UL 325 and ASTM F2200.
5. Pedestrian gates with push bar.
6. See Drawings for all system accessories and components required.

B. Related Sections:

1. Applicable provisions of Division 01 – General Requirements shall govern work under this specification section.
2. Applicable provisions of “owner” General and Detailed Technical Specifications utilized for this project.
3. Section 01 81 13 - LEED Sustainable Design Requirements
4. Section 01 81 13B – LEED Materials Submittal Form V4.
5. Division 03 – Concrete.
6. Division 31 – Earthwork.
7. Section _____ -- Retaining Walls
7. Section _____ -- Electrical (for all electrical components? OR ANOTHER SECTIONJ BY JRA?????)
8. Section _____ -- Technology (for all video, voice, sensors, detector loops, etc.)
9. Refer to Civil Drawing and Specification Section for all grading, pavement and curb additions and modifications required for compliance with applicable UL 325 and ASTM F2200 safety standards.

1.2 ACTION SUBMITTALS

- A. LEED Submittals: Product Data as required to show compliance with LEED MR Credit Sourcing of Raw Materials, meeting all documentation requirements, including back-up documentation.
- C. Manufacturer's Data: Submit manufacturer's data, including catalog cuts, materials compliance and specified options to Design Builder prior to construction. Submit manufacturer's warranty to Owner at Substantial Completion.
 - 1. The manufacturer's submittal package shall include gate elevations, hardware details, and installation details shall be submitted prior to installation.
- D. Shop Drawings: Submit three copies of Shop Drawings prior to construction. Shop Drawings shall include plans which show layouts of fences and gates with dimensions and elevations at not less than 1"=1'-0" scale; and details or sections of component accessories, finishes, post foundations, anchorages and connections at not less than 3"=1'-0".
 - 1. Note all step-downs due to elevation changes on shop drawings.

1.3 QUALITY ASSURANCE

- A. Qualifications: A single installer with a minimum of 5 years of experience on a comparable project building fences of similar materials, of similar length.
- B. Finish Quality: The finish fence shall stand straight, plumb, level, and true to line and grade. Finished fences shall cleanly meet building or other fences, as shown on the Drawings, leaving no gaps that could allow a person to penetrate security function.
- C. References for Fence:
 - 1. ASTM A653/A653M - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy Coated (Galvannealed) by the Hot-Dip Process.
 - 2. ASTM B117 - Practice for Operating Salt-Spray (Fog) Apparatus.
 - 3. ASTM D523 - Test Method for Specular Gloss.
 - 4. ASTM D714 - Test Method for Evaluating Degree of Blistering in Paint.
 - 5. ASTM D822 - Practice for Conducting Tests on Paint and Related Coatings and Materials using Filtered Open-Flame Carbon-Arc Light and Water Exposure Apparatus.
 - 6. ASTM D1654 - Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments.
 - 7. ASTM D2244 - Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates.
 - 8. ASTM D2794 - Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
 - 9. ASTM D3359 - Test Method for Measuring Adhesion by Tape Test.
 - 10. ASTM F2408 – Ornamental Fences Employing Galvanized Steel Tubular Pickets.
- D. References for Automated Sliding Gates:
 - 1. UL 325 – Standard to Which Vehicular Gate Operators are Manufactured and Tested. Deviations from these standards are not acceptable.

2. ASTM F2200 – Standard Specification for Automated Vehicular Gate Construction. Deviations from these standards are not acceptable.
 3. ASTM B117 - Practice for Operating Salt-Spray (Fog) Apparatus.
 4. ASTM B221 - Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
 5. ASTM D523 - Test Method for Specular Gloss.
 6. ASTM D822 - Practice for Conducting Tests on Paint and Related Coatings and Materials using Filtered Open-Flame Carbon-Arc Light and Water Exposure Apparatus.
 7. ASTM D1654 - Test Method for Evaluation of Painted or Coated Specimens Subjected to Corrosive Environments.
 8. ASTM D2244 - Test Method for Calculation of Color Differences from Instrumentally Measured Color Coordinates.
 9. ASTM D2794 - Test Method for Resistance of Organic Coatings to the Effects of Rapid Deformation (Impact).
 10. ASTM D3359 - Test Method for Measuring Adhesion by Tape Test.
 11. ASTM F1184 – Industrial & Commercial Horizontal Slide Gates
- E. Other Referenced Specification: See tables in Manufacturer’s specifications for specific product specified.
- F. Manufacturer’s Product Warranties: All structural fence and gate components (i.e. rails, pickets, posts and gates) shall be warranted within specified limitations, by the manufacturer for a period of 20 years from the date of original purchase. Warranty shall cover any defects in the material finish, including cracking, peeling, chipping, blistering or corroding.
1. Reimbursement for labor necessary to restore or replace components that have been found to be defective under the terms of the manufacturer’s warranty shall be guaranteed for five (5) years from date of original purchase.

1.4 PRODUCT HANDLING

- A. Upon receipt at the job site, check all materials to ensure that no damage occurred during shipping or handling.
- B. Store materials in such a manner to ensure proper ventilation and drainage, and to protect against damage, weather, vandalism and theft.

1.5 JOB CONDITIONS

- A. Coordination: Coordinate work with concrete and paving installers to assure proper alignment and leveling of fence and gates.
- B. Utilities: Determine whether utilities will be encountered, and if so, notify Commissioner immediately of obstructions to the work.
- C. Sequencing: Where possible, install fences and renovate existing chain link fence prior to landscape planting installation.

PART 2 - PRODUCTS**2.1 MANUFACTURERS**

- A. **Manufacturer's Qualifications:** Manufacturer shall have a minimum of five years of experience manufacturing ornamental picket fencing of fences which have equal design, size, gauge of metal parts and fabrication.
1. **Basis of Design Manufacturer:** Ameristar, Tulsa, Oklahoma; or approved equivalent. (Phone: 888.333.3422)
- B. **Fence Style and Height:** Ameristar Industrial Montage II Genesis style with the extended flat pickets at top; with two rails on top and one on bottom; with screening; 6 feet height as designated on the Drawings; or equivalent.
- C. **Automated Sliding Gate Style:** Automated Industrial cantilever gate system such as _____, without extended uprights, with 4" square posts; with screening; 6 feet height as designated on the Drawings; or equivalent.
1. Match surrounding fence as designated on the Drawings.
 2. Total Length: Submit Shop Drawings with gate lengths for approval.
 3. Self-latching and self-locking, automated opening and closing, with all accessories as components described on the Drawings, and specified in this Section.

2.2 FENCE AND GATE MATERIALS

- A. **Ornamental Fence:** Ornamental fence shall be heavy duty industrial grade ornamental iron fence, in the style as shown on the Drawings, finished as specified below, with the following components:
1. **General:** Metal surfaces shall be smooth, free of surface blemishes, including pitting, seam marks, roller marks, trade names and roughness.
 2. **Fence Panels and Posts:** Steel material for fence panels and posts shall conform to the requirements of ASTM A653/A653M, with a minimum yield strength of 45,000 psi (310 MPa) and a minimum zinc (hot-dip galvanized) coating weight of 0.90 oz/ft² (276 g/m²), Coating Designation G-90.
 3. **Pickets:** Material for pickets shall be 1" square x 14 Ga. tubing. The rails shall be steel channel, 1.75" x 1.75" x .105". Picket holes in the rail shall be spaced 4.715" o.c. Fence posts and gate posts shall meet the minimum size requirements of Table 1 of manufacturer's specification.
- B. **Fence Fabrication:**
1. Pickets, rails and posts shall be pre-cut to specified lengths. Rails shall be pre-punched to accept pickets.

2. Pickets shall be inserted into the pre-punched holes in the rails and shall be aligned to standard spacing using a specially calibrated alignment fixture. The aligned pickets and rails shall be joined at each picket-to-rail intersection by Ameristar's proprietary fusion welding process, thus completing the rigid panel assembly (Note: The process produces a virtually seamless, spatter-free good-neighbor appearance, equally attractive from either side of the panel).
3. The manufactured fence system shall be capable of meeting the vertical load, horizontal load, and infill performance requirements for Industrial weight fences under ASTM F2408.

C. Pedestrian Gate Materials:

D. Sliding Gate:

1. The materials used for cantilever gate framing (i.e., uprights, diagonal braces and pickets or pales) shall be manufactured from ASTM B221 aluminum (designation 6063-T-6) with a yield strength of 25,000 PSI, a tensile strength of 30,000 PSI and a standard mill finish. The TransPort® Fast-Trak™ rails shall be manufactured from ASTM B221 aluminum (designation 6063-T-6) with minimum yield strength of 25,000 PSI, a tensile strength of 30,000 PSI and a standard mill finish.
2. Material for diagonal bracing and uprights shall be 2" sq. x ¼" aluminum. The design of the top and bottom enclosed track shall conform to the manufacturers 5" x 2" Fast-Trak system. Material for chain link infill shall be per specification.
3. Internal roller truck assembly shall be self-aligning swivel ball-and-socket type running on four bearing wheels. Internal roller truck assembly shall be affixed to the hanger bracket by means of a 5/8" diameter industrial-grade rod end/center bolt, with a minimum static load rating of 10,000 pounds. Attachment of the center bolt to the truck body shall be by means of a swivel joint to ensure equivalent and consistent loading on all bearing wheels and internal track surfaces throughout the travel of the gate.

E. Gate Fabrication:

- A. Enclosed track, uprights and diagonal bracing shall be pre-drilled and labeled for easy assembly. All components shall be pre-cut to specified lengths.
- B. Top and bottom rail extrusions shall be mechanically fastened to vertical uprights and reinforced with diagonal braces, as required by drawing.

2.3 FENCE AND GATE FINISHES

- A. Polyester Powder Coat Finish: After components have been galvanized to provide maximum corrosion resistance, galvanized surfaces shall be pretreated, cleaned and prepared to assure complete adhesion of finish coat.
 1. Fence System: The manufactured panels and posts shall be subjected to an inline electrodeposition coating (E-Coat) process consisting of a multi-stage pretreatment/wash (with zinc phosphate), followed by a duplex application of an epoxy primer and an acrylic topcoat. The minimum cumulative coating thickness of epoxy and acrylic shall be 2 mils

(0.058 mm). The coated panels and posts shall be capable of meeting the performance requirements for each quality characteristic shown in Table 2 of Manufacturer's Specification for the specified fence which meet or exceed the coating performance criteria of ASTM F2408.

2. Gate System: For color coating, the manufactured components shall be subjected to the Ameristar thermal stratification coating process (high-temperature, in-line, multi-stage, and multi-layer) including, as a minimum, a six-stage pretreatment/wash and an electrostatic spray application of a polyester finish. The topcoat shall be a "no-mar" TGIC polyester powder coat finish with a minimum thickness of 2 mils (0.0508mm). The stratification-coated framework shall be capable of meeting the performance requirements for each quality characteristic shown in Table 1 of Manufacturer's Specification for the specified gate.

3. Color: Black.

2.4 SETTING MATERIAL

- A. Concrete: Concrete shall have minimum 28 day compressive strength of 3,000 psi.

2.5 SECURITY LOCKING MECHANISM

- A. Provide heavy duty industrial grade lock and 6 sets of keys for gates.

2.6 GATE OPERATOR

2.7 SCREENING

2.8 ACCESSORIES

PART 3 - EXECUTION

3.1 PREPARATION

- A. Verification: Verify areas to receive fencing are completed to final grades and elevations, and ensure that property lines and legal boundaries of work are clearly established.
 1. Where slopes occur, step fence up or down to meet grades and provide security.
 2. Confirm that concrete gutters have been installed for the proper function of the sliding gates, prior to fence and gate installation.
- B. Layout and Field Measuring: Stake layout of fence and gate for Design Builder's review and take field measurements prior to preparation of shop Drawings and fabrication, to assure proper fitting of work. Do not delay progress of work; allowing time for fitting and trimming in field if necessary.
- C. Anchoring: Furnish inserts, templates, anchoring devices or other incidentals for the setting into concrete footings where shown on the Drawings.

- D. Pre-Assembly: Preassemble items in shop to greatest extent possible to minimize field splicing and assembly at site and disassemble units only to extent necessary for shipping and handling. Units shall be clearly marked for reassembly and the Contractor shall coordinate installation.
- E. Gate Preparation:
 - 1. All hardware shall be installed in accordance with the Transport installation instructions. Transport cantilever gates shall be installed so they comply with current ASTM F2200 & UL325 standards.
 - 2. Gate stops shall be installed on each track in a way that conforms to current ASTM F2200 standards.

3.2 INSTALLATION

- A. Manufacturer's Instructions: Install fence, gates and all accessories in accordance with manufacturer's instructions, in locations shown on Drawings.
- B. Installing Fence: Install fence true to line, plumb and level and with accurate angles and surfaces and straight sharp edges. Accommodate changes of grade at posts by stepping up or down, and accommodate any angles as shown on the Drawings.
- C. Spacing Posts: Fence post shall be spaced according to Manufacturer's Table 3 of the Manufacturer's Specification for the specified fence, plus or minus ½". For installations that must be raked to follow sloping grades, the post spacing dimension must be measured along the grade.
- D. Concrete Set Posts: Drill holes into firm, undisturbed or compacted soil to depths and widths as specified, place concrete around posts in continuous pour and trowel finish around post, sloping to direct water away from posts.
 - 1. Posts shall be set in concrete footers having a minimum depth of 36" or greater depth).
- E. Installing Panels: Fence panels shall be attached to posts with brackets supplied by the manufacturer. Align fence panels between posts and firmly attach rail brackets to posts with 1/4" bolt and lock nut, ensuring panels and posts remain plumb.
- F. Check Alignment: Check each post and gate post for vertical and top alignment, and maintain in position during placement and finishing operation.
- G. Fence Installation: When cutting/drilling rails or posts adhere to the following steps to seal the exposed steel surfaces.
 - 1. Remove all metal shavings from cut area.
 - 2. Apply zinc-rich primer to thoroughly cover cut edge and/or drilled hole; let dry.
 - 3. Apply 2 coats of custom finish paint matching fence color. Failure to seal exposed

surfaces per steps 1-3 above will negate warranty.

4. Manufacturer's spray cans or paint pens shall be used to prime and finish exposed surfaces; it is recommended that paint pens be used to prevent overspray.
 5. Do not use non-manufacturer's parts or components as they will negate the manufacturer's warranty.
- H. Finish Accessories: Install post caps and other accessories to complete the fence.
- I. Securing Fence: Provide additional anchorages and accessories as necessary for adequate support for intended use as safety fence.
- J. Gate Installation: Install gates true to line, plumb, level, and secure for full opening without interference.
1. Gate posts shall be spaced according to the manufacturer's gate drawings, dependent on standard out-to-out gate dimensions and gate hardware selected.
 2. Gate post shall be spaced according to specified gate elevation.
 3. Posts shall be set in concrete footers having a minimum depth of 48" with a minimum diameter of 12".
- K. Gate Hardware: The manufacturer's gate drawings shall identify the necessary gate hardware required for the application. Gate hardware shall be provided by the manufacturer of the gate and shall be installed per manufacturer's recommendations. Attach and adjust all hardware for smooth operation and by means which will prevent unauthorized removal.
- L. Install _____.

3.3 RENOVATE EXISTING SLIDING GATE TO REMAIN

- A. Preparation: Straighten bent sections to the extent reasonably possible. Reattach panels

3.4 REPAIR AND CLEANING

- A. General: Perform final quality control work, repair and cleaning with specified materials and methods. Finish and color on repairs shall exactly match.
- B. Repair: Perform touch-up painting on abraded areas and repair or replace defective work.
- C. Clean-Up: Remove all resultant debris and unused material, including post hole excavation, and dispose of legally off site.

END OF SECTION 32 31 00

SECTION 32 31 11 -- GATE OPERATORS**PART 1 - GENERAL****1.1 SECTION INCLUDES**

- A. Electric Gate Operator: One gate operator which is designed to open and close the specified automated sliding gate, in conformance with UL325 and ASTM F2200.
- B. The Owner/Operator (End User) or facility architect shall assume responsibility for providing traffic and safety engineering, including all necessary safety features to be used at each automated vehicular gate location, including, but not limited to: sidewalks for pedestrian traffic, sufficient roadway lighting, entrapment protection devices, warning signage, traffic lights, audible warning alerts, visual warning alerts, secondary traffic control devices, guard/control booths or centers and other required accessories, components or elements required by UL3215 and F2200.
- C. Utilize all forms of safety equipment to the maximum extent possible. Such safety equipment includes, but is not limited to, entrapment protection devices, proper lighting, warning signs, traffic lights, gate arms and/or audible alarms.
- D. Sensors and controls.

1.2 RELATED SECTIONS

- A. Division 03 - Concrete
- B. Division 28 – Electronic Safety and Security
- C. Division 31 - Earthwork
- D. Division 32 – Exterior Improvements
- E. Division 34 – Transportation
- F. Section/Division _____ -- Technology

1.3 REFERENCES

- A. Underwriters Laboratories (UL): UL 325 – Standard for Safety for Door, Drapery, Gate, Louver, and Window Operators and Systems.
- B. Canadian Standards Association (CSA): CSA C22.2 No. 247.
- C. Underwriters Laboratories (UL): UL 991 – Standard for Tests for Safety Related Controls Employing Solid-State Devices.
- D. American Society Testing Materials (ASTM): ASTM F2200 – Standard Specification for Automated Vehicular Gate Construction.

- E. National Electrical Manufacturers Association (NEMA): NEMA ICS 6 – Industrial Control Systems: Enclosures.

1.4 SUBMITTALS

- A. Submit under provisions of Section 01 30 00 – Administrative Requirements.
- B. Product Data: Manufacturers data sheets on each product to be used, including:
 - 1. Preparation instructions and recommendations.
 - 2. Storage and handling requirements.
 - 3. Installation methods.
- C. Shop Drawings: Submit shop drawings showing layout, profiles, and product components, including anchorage, edge connections, and accessories.
 - 1. Operation, installation, and maintenance manuals including wire diagrams.
 - 2. Risers, layouts, and special wiring diagrams showing any changes to standard drawings.

1.5 DELIVERY, STORAGE, AND HANDLING

- A. Deliver, store, and handle materials and products in strict compliance with manufacturer's instructions and industry standards.
- B. Store products indoors in manufacturer's original containers and packaging with labels clearly identifying product name and manufacturer. Protect from damage.

1.6 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Substantial transformation and final assembly shall occur in the United States of America per Section 1605 of the ARRA-09.
- B. Installer Qualifications: Installation performed by factory authorized dealer contractor specifically trained in gate operator systems of the type found within this section; a qualified gate operator technician who is certified by the Institute of Dealer Education and Accreditation (IDEA) or the American Fence Association (AFA).
 - 1. Provide documentation of maintenance and repair service availability for emergency conditions.
 - 2. Provide quarterly maintenance for one year following Substantial Completion of the Project.
- C. This vehicular automated gate system has been carefully planned with safety as a paramount concern. This products specified are designed to control vehicle traffic.
 - 1. Provide review of system by a traffic safety engineer before installation.
 - 2. All forms of safety equipment shall be utilized to the maximum extent possible. Such safety equipment includes, but is not limited to, entrapment protection devices, proper lighting, warning signs, traffic lights, gate arms and/or audible alarms.

1.7 WARRANTY

- A. Manufacturers standard five (5) year warranty.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Basis of Design: DoorKing, Inc.; 120 S. Glasgow Ave; Inglewood, CA 90301; Toll-Free Tel: 800-826-7493; Tel: 310-645-0023; Fax: 310-641-1586; Email: ghendrix@doorking.com; The 9024 series system shall consist of one (or multiple) 9024 vehicular slide gate operator and additional items, as specified, or equivalent in compliance with UL325 and ASTM F2200.
- B. Substitutions: All substitutions must meet requirements of UL325 and ASTM 2200, and be operable and compatible with all required accessories and components necessary for the complete automation of the sliding gate.
- C. Requests for substitutions will be considered in accordance with provisions of Section 01 60 00 – Product Requirements.

2.2 SLIDING GATE OPERATORS

- A. Microprocessor based solid-state control board interacting with card readers, RF transmitters, access control systems, ticket machines, other activating devices as required, external devices (photo-eyes, contact edges) for entrapment protection and vehicle (loop) sensing systems. Control board shall include built-in close timer (1-25 seconds), built-in ports for two (2) plug-in loop detectors, partial open input, programming switches to set various operating modes, inherent current sensing reverse system.
 - 1. Compliance: Compliant to UL 325, UL 991 and CSA C22.2 No. 247 and listed by Intertek Testing Laboratories NA, Inc. (ETL), a Nationally Recognized Testing Laboratory.
 - a. This model is intended for use in IV vehicular slide gate applications.
 - 2. Warranty: Five (5) year manufacturer's standard warranty.
 - 3. Maximum Gate Length: 40 feet.
 - 4. Maximum Gate Weight: 1000 Lbs
 - 5. Operator speed: approximately 10-inches per second.
 - 6. Enclosure: polypropylene, 0.125 inch (3.175 mm) 390 texture gray.
 - 7. Configuration: Left or right hand mount; front, center or rear mounting configurations.
 - 8. Mounting: Pad or post mount.
 - 9. Electrical Power Requirements: 115/230 VAC or 24 VDC.
 - 10. Motor: 24 VDC Continuous Duty Motor.
 - 11. Manual Operation: Upon loss of primary (AC) power, a T-handle release is engaged allowing the gate to be manually pushed open.
 - 12. Primary Reduction: 30:1 gear reduction, single cog belt drive train.
 - 13. Pulling Medium: #40 roller chain

14. Mechanically set Limit Switches.
15. Operating Switches: Built-in AC and DC power (on-off), reset and operating switches.
16. Convenience Outlets: Two (2) 115 VAC for accessory transformers (115/230 VAC models only).
17. Entrapment Protection:
 - a. Photo-electric eye (non-contact sensor).
 - b. Sensing edge (contact sensor).
18. Accessories: Provide the accessories listed below.
 - a. Traffic control signal (red / green) mounted painted on metal post, with 2 yellow painted pipe bollards protecting the signals, each.
 - b. Thermostatically controlled heater kit.
 - c. Base Plate: Provide if post mount application.
 - d. Chain tray kit: Provide for roller support if required for specified 24' gate.
 - e. Plug-in loop detectors.
 - f. Electric reversing edge: Provide for reverse direction of gate on contact with an obstruction.
 - g. Photo-electric beams: Provide for reverse direction of gate if the light beam is obstructed.
 - h. Gate Tracker Expansion – provides time and date stamped electronic record of cycles, input errors, loop detector input errors, obstruction hits and power cycles.
 - 1) Basis of Design: Requires companion DoorKing 1830 Series access controller, or equivalent subject to compliance with UL 325 and ASTM F2200 standards.

PART 3 - EXECUTION

3.1 COORDINATION

- A. Coordinate with all required trades installing all portions of adjacent installations so that all safety requirements are met prior to substantial completion and final automation of the sliding gate.

3.2 INSTALLATION

- A. Gate operator shall be mounted, firmly secured, plumb and level, as required.
- B. Wiring shall be uniform and in accordance with national electric codes and manufacturer's instructions.
- C. All splices shall be in easily accessible junction boxes or on terminal boards.
- D. All cable runs in all junction boxes shall be tagged and identified.
- E. Coordinate all work with other effected trades and contractors.

3.3 SYSTEM INITIALIZING AND PROGRAMMING

- A. System shall be turned on and adjustment made to meet requirements of specifications and on-site conditions.
- B. System shall function as specified.

3.4 SYSTEM TEST PROCEDURES

- A. System shall be completely tested to assure that all components and accessories are hooked-up and in working order.
- B. System shall be pre-tested by contractor and certified to function in accordance with plans and specifications.
- C. System shall be tested in presence of owner's representative.

3.4 OWNER INSTRUCTIONS

- A. Installation contractor shall conduct up to (1) hour of instruction in use and operation of the system to designated owner representatives, within (30) days of acceptance.
- B. Installation contractor shall conduct up to (1) hour of technical training, in troubleshooting and service of the system, to designated owner representatives within (90) days of system acceptance.

3.5 MANUALS AND DRAWINGS

- A. Contractor shall provide owner with (2) copies of standard factory prepared operation, installation and maintenance manuals. Manuals shall include typical wiring diagrams.
- B. Contractor shall provide owner with (2) copies of any risers, layouts, and special wiring diagrams showing any changes to standard drawings, if required on project.

3.6 MAINTENANCE

- A. Provide periodic maintenance at one (1), three (3) and 12 month intervals as described in the installation and maintenance manual, for one year starting after Owner Training.
- B. Check external reversing devices at least once a month.

END OF SECTION 32 31 11

SECTION 32 31 20 - METAL FENCE SCREENING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Perforated aluminum fence panels attached to existing ornamental metal fence, polyester powercoat finish, including all attachment accessories necessary thereto.

B. Related Sections:

1. Applicable provisions of Division 01 – General Requirements shall govern work under this specification section.
2. Applicable provisions of “Owner” General and Detailed Technical Specifications utilized for this project.
3. Section 01 81 13 “Sustainable Design Requirements” for sustainable design requirements.

1.2 SUBMITTALS

- A. LEED Submittals: Product Data as required to show compliance with LEED MR Credit Sourcing of Raw Materials, meeting all documentation requirements, including back-up documentation.

- B. Manufacturer’s Data: Submit manufacturer's data, including catalog cuts, materials compliance and specified options to Architect prior to construction. Submit manufacturer’s warranty to Owner at Substantial Completion.

1. The manufacturer’s submittal package shall include gate elevations, hardware details, and installation details. Package shall be submitted prior to installation.

- C. Shop Drawings: Submit three copies of Shop Drawings prior to construction. Shop Drawings shall include plans which show layouts of fences and gates with dimensions and elevations at not less than 1"=1'-0" scale; and details or sections of component accessories, finishes, post foundations, anchorages and connections at not less than 3"=1'-0".

1. Note all step-downs due to elevation changes on shop drawings.

- D. Shop Drawings: Submit shop drawings for approval.

- E. Manufacturer’s Data: Submit manufacturer’s data regarding fence panel product, such that it conforms in every respect to the basis of design.

1.3 QUALITY ASSURANCE

- A. Qualifications: A single installer with a minimum of 5 years of experience on comparable projects building fences with screening materials, of similar length.
- B. Finish Quality: The finish fence panels shall be installed straight, plumb, level, and true to line and grade and securely attached to posts and each other. Finished fence panels shall cleanly meet each other and posts, as shown on the Drawings, leaving no gaps larger than 5.56 mm.
- C. Manufacturer's Product Warranties:
 - 1. Panel Manufacturer's Standard Warranty: Certify that panels are free from defects in material and workmanship. Provide a 20 year limited warranty for the galvanized polyester powder coated finish against cracks, peels, or blisters.
 - 2. Reimbursement for labor necessary to restore or replace components that have been found to be defective under the terms of manufacturer's warranty shall be guaranteed for five (5) years from date of original purchase.

1.4 PRODUCT HANDLING

- A. Upon receipt at the job site, check all materials to ensure that no damage occurred during shipping or handling.
- B. Store materials indoors in such a manner to ensure proper ventilation and drainage, and to protect against damage, weather, vandalism and theft. Do not store materials on site.
- C. When transporting panels to site, protect panel finishes so they are not damaged in transit.

1.5 JOB CONDITIONS

- A. Coordination: Coordinate work with other installers working in the area to avoid conflicts.
- B. Field Measurement: Field measure all fence sections (post to post) to order panels of proper size. Some panels shall be custom fabricated so that there are no gaps or overlaps.
- C. Utilities: Determine whether utilities will be encountered, and if so, notify Commissioner immediately of obstructions to the work.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

- A. Manufacturer's Qualifications: Panel manufacturer shall have a minimum of five years of experience manufacturing aluminum panels which have equal design, size, gauge, perforation size and pattern, and capable of powder coating panels in-house.
 - 1. Fence Panel Basis of Design: Ametco Manufacturing Corporation, Willoughby, Ohio; or approved equivalent. (Phone: 440.951.4300)

2.2 MATERIALS

- A. Fence Panels: Perforated aluminum infill panels, .125" thick, with 3/16" round holes on 1/4" staggered centers, and approximately 51% opening.
 - 1. Size: 48" by 72" panels, except where custom panels are needed to fit tightly without gaps.
 - 2. Two panels per fence section, tightly abutted, typical, except where custom panels are needed to fit tightly without gaps.
 - 3. Finished edges, four sides, with 2" margins on three sides and 1/2" margin where panels meet in center of fence section. Margins shall apply to standard and to custom panels.

2.3 PANEL FINISHES

- A. Polyester Powder Coat Finish: After components have been galvanized to provide maximum corrosion resistance, galvanized surfaces shall be pretreated, cleaned and prepared to assure complete adhesion of finish coat.
 - 1. The manufactured panels shall be subjected to an inline electrodeposition coating (E-Coat) process consisting of a multi-stage pretreatment/wash (with zinc phosphate), followed by a duplex application of an epoxy primer and an acrylic topcoat. The minimum cumulative coating thickness of epoxy and acrylic shall be 2 mils (0.058 mm). Meet or exceed the coating performance criteria of ASTM F2408.
 - 2. Powder coated standard color: Black Velvet.

2.4 FASTENERS

- A. Rivets: Stainless steel rivets, 3/16" diameter, with domed head, sized appropriately to securely attach aluminum panels to posts, to C Channel rails and to angle irons. Paint black to match fence after installation.
- B. Angle Irons: Stainless steel L Straps, pre-drilled with two holes; painted black to match fence.

- C. Zip Ties: Use only if approved by Architect. If approved, zip ties shall be Grade 304 stainless steel, cable zip ties, manufactured for outdoor use; flame resistant; temperature performance range of 112 degrees to 1000 degrees Fahrenheit; 200 lbs. tensile strength; with self-locking mechanism for secure attachments.
1. Sizes: .18" width. Zip ties come in various sizes; use appropriate length to wrap completely around rails and through panel with margins, or to abut panel to panel, with at least 2" to spare before trimming.
 2. Basis of Design: Uline Model numbers #S-13605 and #S-13606, or approved equivalent.
 3. Painted black to match fence.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Verification: Verify areas to receive fence panels are completed.
- B. Field Measuring: Take accurate field measurements prior to preparation of Shop Drawings, ordering and fabrication, to assure proper fitting of work. Do not delay progress of work; allowing time for fitting.

3.2 INSTALLATION

- A. Installing Panels: Install fence panels true to line, plumb and level, with edges of all panels tightly abutting each other.
 1. Some panels may need to be bent when post is out of alignment. Determine angle and precisely bend panel to post for secure installation.
 2. Finished panel installation shall leave no gaps larger than 5.56 mm.
- B. See Drawings for rivet placements, spacing and alignments. Installed rivets and ties shall align with each other, vertically and horizontally.
- C. Check Alignment: Check each panel for vertical and top alignment and maintain in position during placement and attachment operation.
- D. Securing Panels to Posts:
 1. Precisely align panels so that panel vertical edges are centered on posts.
 2. Pre-drill holes in panels, posts and rails to receive rivets.

3. Securely attach panels to posts with rivets.

4. Install rivets by inserting them through pre-drilled holes in both materials to be joined, and then deforming the end opposite the head to create a bond. Use a rivet gun designed to install rivet and pop off tail end.

5. If rivets cannot be installed in some circumstances, describe the circumstances with pictures and dimensions, and obtain Architect's approval to use zip ties.

E. Securing Panels to Rails:

1. After securing panels to posts, attach panels to top and bottom rails with rivets.

2. If the use of zip ties is approved, precisely tighten, tension and cut ties with a stainless steel cable tie gun. Cut ties cleanly leaving no sharp edges.

3.3 REPAIR AND CLEANING

A. General: Perform final quality control work, repair and cleaning with panel manufacturer recommended materials and methods. Finish and color on repairs shall exactly match.

B. Repair and Replacement: Perform touch-up painting on scratched or abraded areas under one inch length or under 1/2 inch diameter area, per manufacturer's recommendations. Panels with large abrasions shall be replaced at no additional cost to Owner.

C. Clean-Up: Remove all resultant debris and unused material and dispose of them legally off site.

END OF SECTION 32 31 20

SECTION 32 92 01 – SOD AND SEED**PART 1 - GENERAL****1.1 SUMMARY**

- A. This Section includes all replacement sod needed to re-sod disturbed areas which were previously sodded in the parking lot of JPSTC, and seeded areas indicated on the Drawings, as required by the Drawings and Specifications.

1. Water Supply: Provide all temporary water supply from source(s) on or off site. See Drawings.
2. Warranty: Warranty replacement sod through three mowings.
3. Warranty native seeded areas for one year, after a full stand is achieved, and including three mowings approximately 4-6 weeks apart.
4. Initial Maintenance: Maintain replacement sod through Substantial Completion of the landscape work. Maintain native seeded areas through three mowings, approximately 4-6 weeks apart after full germination.
5. First Year Maintenance First Year Maintenance: Provide landscape maintenance of work covered by this Section of the specifications for all seeded areas shown on the Drawings, for a period of approximately one year commencing with Substantial Completion of the landscape work and coinciding and terminating exactly with the First Year landscape maintenance of the plant materials. Provide continued maintenance of the seeded areas from the last required mowing through to the termination of all First Year Maintenance.

- B. Related Sections include the following:

1. Applicable provisions of Division 01 – General Requirements shall govern work under this specification section.
2. Applicable provisions of “owner” General and Detailed Technical Specifications utilized for this project.
3. Section 01 81 13 - LEED Sustainable Design Requirements
4. Section 01 81 13B – LEED Materials Submittal Form V4.
5. Section 31 13 00 - Landscape Removal, Pruning & Protection.
6. Section 32 93 11 – Landscape Plantings.

1.2 SUBMITTALS

- A. LEED Submittals: Product Data as required to show compliance with LEED MR Credit Sourcing of Raw Materials, meeting all documentation requirements, including back-up documentation.
- B. Source: Submit supplier name and certification of sod and seed content to Architect, including location of supplier.
- C. Review: The Architect reserves the right to review sod and seed for specified quality and variety, upon delivery to the site or during the progress of the work. All sod and seed furnished for the work will conform in every respect to the reviewed samples. Sod which does not conform will be removed from the site and immediately replaced with conforming material at the Contractor's expense.

- D. Certificates: Furnish required certificates accompanying shipments.
- E. Required Maintenance Instruction: Submit a report detailing recommended maintenance practices for the second year following seeding.

1.3 QUALITY ASSURANCE

A. Installer Qualifications:

1. For Sod: Installer shall be an approved landscape contractor who shall be the same installer as performing the landscape planting, having a minimum of five years of experience installing sod on projects of comparable scale and complexity.
2. For Seeded Areas: A firm specializing in the seeding of native plants, with a minimum of ten (10) years of experience on comparable projects which have seeded native prairies. Firms which are pre-qualified include Cardno, Pizzo, McGinty and Tallgrass. Equivalent firms shall show evidence of equivalent qualifications.
3. All installers shall use experienced crews who specialize in the creation of turf establishment and who recognize weeds and invasive species.

- B. Compliance: Comply with State and Federal laws with respect to inspection for plant diseases and insect infestation. Any inspection certificates required by law shall accompany each shipment and on arrival shall be filed with the Architect. The Contractor shall notify the Department of Agriculture, Division of Plant Industries, and furnish the following information:

Name of the supplier.

The amount of sod or seed to be used.

Location of sod field. Location of job site.

Approximate distance of sod field from job site.

Date of cutting.

- C. Seed Certificates: Obtain from seed supplier a statement which certifies that all seed is pure live seed, guaranteed to be true to name and varieties specified.

- D. Warranty: The Contractor shall and hereby does warranty that all work in this section shall be free from defects of materials and workmanship, and that sodded turf areas meet a green uniform standard of appearance, until the Contractor has maintained the sodded turf from substantial completion through three mowings. No-mow Native seeding areas shall be warranted to have a full stand of specified plants for one year from substantial completion through final acceptance by the Owner (coinciding with warranty period for landscape plantings). The Contractor shall correct any imperfect work whenever discovered until termination of warranty obligations. When the work is accepted in part, the warranty periods extend from each partial acceptance to the terminal date of the last warranty period. Thus the plant and seeded areas have warranty periods that terminate on the same date.

E. Acceptance Procedure:

1. Completion of Work: Upon completion of the work, a review will be made by the Architect upon written notice requesting such a review submitted by the Contractor at least ten (10) days in advance of the anticipated date. The purpose of the review shall be to determine whether or not the Contractor has completed all of the work of this contract, including maintenance of all sodded and hydroseeded areas.
2. Review for Substantial Completion: This review shall take place at the same time as the

maintenance review after a viable stand of sod and seeded turf has been achieved, and after at least one mowing of turf. The Architect will make a review to begin the warranty of turf areas on the date requested by the Contractor, as above specified, or as soon thereafter as possible. If the work is found to be in compliance with the Contract Documents, the Architect will notify in writing the Contractor and Owner of the beginning of the warranty period. The Contractor shall prepare an initial punch list for the Architect's review, noting any areas of sod or seed not in healthy condition at this time, recommending changes in maintenance procedures and creating a list of replacement areas. The Contractor and Architect shall then review the work together on-site.

3. Maintenance Review: Maintenance review and substantial completion review shall take place simultaneously, if possible. If turf areas are found to be defective, make necessary replacements, continue initial maintenance for at least another set of mowings, and request another inspection.
4. Warranty Period: Make periodic inspections during the warranty period to determine what changes should be made to the maintenance program. Submit in writing to the Architect any recommended changes. Upon completion of the warranty period submit a request for a review at least ten (10) days in advance of the anticipated date.
5. Review for Final Acceptance: The Architect will make a review for Final Acceptance of the Contract work, including maintenance but exclusive of replacements. If the work is found to be compliant, the Architect will recommend acceptance by the Owner, exclusive of replacement turf or seed subject to warranty. If there are any deficiencies in the maintenance, the Contractor will be notified of these deficiencies in writing and the work shall be subject to re-review before acceptance.

1.4 PRODUCT HANDLING

- A. Sod Handling: Transport sod either in a closed van or in an open truck properly covered. Deliver and install within a period of 48 hours. Do not harvest or transplant when moisture content (excessively dry or wet) may adversely effect sod survival. Protect sod from exposure to sun, wind and freezing prior to placing. Sod shall be in a moist condition at the time of cutting and until it is placed. Any sod that has dried out shall be immediately removed from the job site and replaced per specifications.
- B. Handling Seed: Seed shall be delivered in the original sacks received from the producer, and each sack shall be tagged in accordance with the Agricultural Seed Laws of the United States and local state ordinances. Store per supplier's or manufacturer's recommendation.
- C. Fertilizers: Deliver in standard size bags, showing weight, analysis and name of processor, and store in weatherproof storage place and kept dry so that its effectiveness is not impaired.
- D. Maintenance Materials: Deliver insecticide spray in the manufacturer's containers; mix and spray according to manufacturer's directions. Deliver fungicide in manufacturer's containers; mix and apply according to manufacturer's directions only with the acceptance of the Architect. Deliver herbicide in the manufacturer's containers; apply per manufacturer's directions, only with the acceptance of the Architect.

1.5 JOB CONDITIONS

- A. Acceptance of Site: Thoroughly review the site to determine if all grading, soil preparation, and irrigation installation has been satisfactorily achieved. Report unsatisfactory conditions to the Architect and make repairs prior to start of work.

- B. Confirm Water Source: Provide all required temporary water supply from source(s) provided by Owner. See Drawings for hose bib, quick coupler locations or other permanent sources of supply.
- C. Protection of the Work: Protect the entire project area against traffic, damage, erosion or other use by means accepted by the Architect. The Contractor shall not be responsible for repairing damage caused by Acts of God or acts of vandalism or malicious intent. Any barricades or temporary fencing and signs shall be maintained until acceptance. Upon final acceptance of the work, remove said barricades or temporary fences, or leave them if so desired by the Owner. Damage to existing structures, utilities, trees, lawns, shrubs, pavements or other property caused by the Contractor shall be restored to original conditions at the Contractor's expense.
- D. Weather: Do not sow seed or hydroseed during high winds.
- E. Coordination: Coordinate with all other installers working in the area.
 - 1. Coordinate with installers and installation of transformers to minimize replacement of existing prairie seeding. When transformers are installed, have the Contractor mark the path of any conduit traversing the existing landscape area.
 - 2. Coordinate with installers to minimize destruction or compaction of existing sod or seed areas and areas of new prairie seeding
 - 3. Schedule a meeting with the Architect to determine any additional damaged seeded or sodded areas to be replaced.
- F. Permits: Obtain, fill out and submit Highway Permit Forms and Highway Permit Bonds for Illinois Department of Transportation (IDOT), or other local governing agency, and obtain approval to plant or perform other operations in the right-of-way.
- G. Notices Required: Prior to or immediately following application of lawn care products, post all points of entry a white marker consisting of a 4" x 5" sign attached to a dowel or supporting device, at least 12" above the turf. The marker shall state with application -- Stay off Grass until Dry -- For information, Contact: (Insert your name and business phone number).
- H. Planning: Plan ahead for hydroseeding of native no-mow areas which require operations over several months.

PART 2 - PRODUCTS

2.1 MATERIALS

- A. Replacement Sod: This specification is for the replacement of sod which may become damaged with the work of this Project. All sod shall conform as follows:
 - 1. Variety: Salt Tolerant Sod, mineral grown with the following percentages of seed: 30% Buffalo Grass, 20% Amigo or Galway Turf Type Tall Fescue, 15% Dawson Creeping Red Fescue, 15% Scaldis Hard Fescue, Fufts Puccinella Distans, and 5% Rugby Kentucky Bluegrass.
 - 2. Quality: The sod used shall be mineral grown grass that is native to the locality of work. It shall be either nursery-grown or field grown and be well rooted. Sod that has been grown on soil high in organic matter, such as peat sod, is not acceptable quality. The consistency of adherent soil shall be such that it shall not break, crumble, or tear during handling and placing of sod. Each piece of sod shall be well covered with turf grass,

free from noxious weeds and other objectionable plants, and shall not contain substances injurious to growth. The grass shall be cut to a length of not less than 1-1/2", nor more than 4" before the sod is cut.

3. **Size, Thickness and Strength:** Individual pieces of sod shall be cut to the supplier's standard width and length. Maximum allowable deviation from standard widths and lengths is 5%. Sod pads shall not be broken, torn or have uneven ends. Sod shall be machine cut at a uniform soil thickness of 3/4", plus or minus 1/4", at the time of cutting. Measurement for thickness shall exclude top growth and thatch. Standard size sections of sod shall be strong enough to support weight and retain size and shape when suspended vertically from a firm grasp on the upper 10% of the section.

B. Seed Mixes: All seed shall conform as follows:

1. **Quality:** All seed shall be pure live seed, guaranteed by the vendor in writing to be true to name and variety. Supply all inoculants recommended by seed vendor.
 - a. **Source:** All grass seed shall be obtained from local sources which occur in USDA Zone 5A or Zone 4, USDA Plant Hardiness Zone Map, January 1990 edition.
2. **No Mow Native Seed Mix:** See Drawings for No-Mow Native Seed Mix Schedule, including Permanent Grasses, Forbs, Cover Crops and Seeding Rates.
3. **Design Basis Supplier:** Cardno Native Plant Nursery. Phone: 1-574-586-2412; or approved equivalent.

C. Sod Fertilizer: Triple superphosphate fertilizer to encourage root growth, applied and worked into the soil at the rate of 2-1/2 pounds per 1,000 square feet, or per soil test.

E. Maintenance Materials:

1. **Weed Killer:** A broad-leaf, broad-spectrum herbicide, not a pre-emergent, appropriate to the treatment of the specific pest, applied by licensed personnel per manufacturer's recommendations.
2. **Fungicide:** A fungicide appropriate to the treatment of the specific fungus identified as a pest, applied by licensed personnel per manufacturer's recommendations.
3. **Insecticide:** An insecticide appropriate to the treatment of the specific insect identified as a pest, applied by licensed personnel per manufacturer's recommendations.
4. **Commercial Fertilizers:** Complete fertilizer, uniform in composition, free flowing with elements partially derived from organic sources, and suitable for application with approved equipment.
 - a. **For General Maintenance:** For up to two years, type and application rate shall be determined by testing agency's soil test but may contain the following percentages by weight: 10% nitrogen, 10% phosphorous, and 10% potash.
 - b. Applications made after two years following installation shall contain no phosphorus unless a soil test shows the soil to be deficient in phosphorous.

PART-3 - EXECUTION

3.1 PREPARATION

- A. **General:** Prior to installation, clear surfaces of all stones larger than 1-1/2" in diameter, and all trash, debris, roots, brush, wire, grade stakes and other objects that would interfere with planting or maintenance operations. Keep prepared soil in friable condition by cultivation until

work in this section is installed.

1. Replacement Sod or Seed: Replacements shall be same as specified sod where existing sod is damaged, or specified prairie seed where existing seed is damaged.
- B. Verification of Grades: Verify grades established during final soil preparation as being true to finish contours shown and maintain such areas until the effective date to begin installation. Level any undulations or irregularities in the surface resulting from fertilizing, liming, tilling, or other causes. Reconstruct flooded, washed out areas or areas damaged otherwise and reestablished grades in accordance with the Contract Documents.
- C. Treated Soil: Do not place sod or seed on soil which has been treated with soil sterilizers until sufficient time has elapsed to permit dissipation of toxic materials. The Contractor shall assume full responsibility for any loss or damage to sod or seed arising from improper use of sterilizers or due to his failure to allow sufficient time to permit dissipation of toxic materials, whether or not such sterilizers are herein specified.
- D. Sod Season: The spring season for sodding lawns shall be from workable ground conditions and sod can be cut, from approximately April 1 through June 30; and from August 15 to November 15. Sod shall be placed when the ground is in a workable condition and temperatures are less than 95 degrees Fahrenheit. "Workable" ground condition is defined as ground conditions which are neither frozen nor muddy. Sod shall not be placed when the sod or ground surface is frozen or during extended drought. Special conditions exist which may warrant a variance in the sodding dates. Submit a written request for such variance to Architect.
- E. Hydroseed:
1. Season: The seasons for hydroseeding native turf shall be from workable ground conditions, from approximately April 15 through May 15; and from September 1 through October 1. Seed shall be placed when the ground is in a workable condition and temperatures are less than 95 degrees Fahrenheit. "Workable" ground condition is defined as ground conditions which are neither frozen nor muddy. Seed shall not be placed when the ground surface is frozen or during extended drought. Special conditions exist which may warrant a variance in the seeding dates. Submit a written request for such variance to Architect.
 2. Ground Preparation: Ground preparations shall start with complete removal of all existing vegetation in areas to be seeded by using a broad spectrum herbicide by licensed applicator. Wait until herbicide residue is inactive, per manufacturer's recommendations.
 3. Tilling: Till the soil repeatedly at regular intervals 2-3 weeks apart for a minimum period of two months prior to hydroseeding. If ground is wet, allow surface to dry before proceeding.
 4. Repair and stabilize any eroded areas as work progresses and de-compact any areas of concern.
 5. For persistent vegetation, selectively apply targeted herbicide and wait until herbicide residue is gone, per manufacturer's recommendations.
 6. Top surface of seedbed shall be pulverized to present a smooth, uniform, loose, well-broken and fine-grained soil, finish graded, with all large clods, boulders, earth balls, stumps, large roots, or other materials which would interfere with the work removed.
 7. Calibration: Calibrate hydroseeders and adjust to sow seeds at specified rate.
 8. Slopes: All slopes steeper than 4:1 shall receive a light application of wood fiber mulch.

- F. **Moistening the Soil:** During periods of high temperatures and after all unevenness in the soil surface has been corrected, the soil shall be lightly irrigated immediately prior to laying the sod or hydroseeding.

3.2 INSTALLATION

A. Sod:

1. **Laying the Sod:** Lay sod so that no voids occur, tamp and roll, and then thoroughly water. The completed sodded surface shall be true to finished grade, even and firm at all points. Lay the first row of sod in a straight line with subsequent rows placed parallel to and tightly against each other. Stagger lateral joints to promote more uniform growth and strength. Do not overlap or stretch sod. Butt tight all joints in order to prevent voids which would cause air drying of the roots.
 - a. **Slopes:** Place sod in ditches with the longer dimension perpendicular to the flow of water in the ditch. Place sod on slopes, starting at the bottom of the slope, with the longer dimension parallel to the contours of the ground. Bury the exposed edge flush with the adjacent sod.
 - b. **Staking:** On slopes where the sod may be displaced during sodding operations, work from ladders or treaded planks. Stake sod on all slopes of steeper than 3:1, with not less than four stakes per square yard, and with at least one stake for each piece of sod. Drive stakes, with the flat side against the slope, 6" into the ground, leaving approximately ½" of the top above the ground.
2. **Watering and Rolling:** Water sod immediately after installation to prevent excessive drying during the progress of the work. As sodding is completed in any one section the entire area shall be rolled. Thoroughly irrigate to a depth sufficient that the underside of the new sod pad and the soil immediately below the sod are thoroughly wet.
3. **Edges:** Where sod abuts hard edging, such as sidewalks, curbs, steel or wood edges, butt sod tightly to edge, leaving no gaps. Where sod abuts soft edge, such as at plant beds or tree pits, trim sod to form a neat line, accurately placed according to the Drawings. Where sod edge is shown as parallel or perpendicular, construct edge straight and true to line to within one inch tolerance. Where sod edge is shown as curvilinear, blend edge to create a smooth line with no bumps.

B. Hydroseeding: Hydroseeding is required. Increase seed count and application rate for hydroseeder as recommended by supplier.

1. **Protect adjacent fences and other surfaces from spray.**
2. **Equipment:** Use hydraulic equipment equivalent to that of Hydro-Turf Model 900.
3. **Operations:** Spray a uniform coat of homogenous slurry with green tint over area to be hydroseeded, including all areas of natural vegetation which have been disturbed by the construction process. Apply in multiple operations if required and operate equipment so as to accomplish complete coverage. Do not over-spray.
4. **Watering:** Watering period shall begin immediately following seeding operations and shall continue for a period of at least three weeks, or until a successful stand has established. A fine mist shall be used for initial watering that will not disturb the seed. It shall be the Contractor's responsibility, until acceptance, to provide all watering required for full germination and growth. Keep turf damp at all times until seed is well germinated. Carefully water as frequently as soil and site climate conditions require for maximum growth and coverage.

3.3 POST-INSTALLATION OPERATIONS

- A. Control of Weeds: Hand weed, if necessary, all turf areas to promote growth of desired species. Protect new turf from trampling. Selectively apply selective herbicide to pervasive weeds in native areas.
- B. Native and bio swale areas shall be mown three times, approximately 4-6 weeks apart after full germination by the installer.
- C. Re-Seeding: Immediately re-seed all areas not fully germinated, (areas larger than 60 square inches which fail to show 70% germination) prior to Architect's review.

3.4 REPAIR AND CLEANING

- A. Disposal of Surplus Material: Surplus and waste materials resulting from sodding and hydroseeding operations shall be disposed of by the Contractor daily as the work progresses.
- B. Protection: Protect turf against damage, including erosion and trespass, and provide proper safeguards as needed. Replant damaged areas. Repair or replace all such defective work, and all other work damaged thereby, which becomes defective during the term of the specified warranty.
- C. Replacements: Replace, without cost to the Architect, as soon as weather conditions permit and within a specified sodding or seeding period, all areas not in a vigorous, thriving condition, during and at the end of the warranty period. "Vigorous and thriving condition" is defined as turf which bears foliage of a normal density, size and color. Replacements shall closely match adjacent specimens of turf. They shall be furnished, planted, maintained and warranted as specified, and shall be subject to all requirements stated in this Specification. Make all necessary repairs due to replacements at no extra cost to the Architect.
- D. Patching: In the circumstance whereby the Owner requests repair of an area which has been accepted and then damaged by others, the Contractor shall repair said areas designated by the Architect, upon issuance of a written change order which specifies the cost to the Architect. Turf repair shall be accomplished in a manner which shall cause a minimum of disturbance to the existing stand of grass. This work shall be installed, maintained and warranted according to the same conditions as specified herein.

3.5 MAINTENANCE

- A. Maintenance Period: Perform landscape maintenance of turf areas, as specified hereunder, for the following periods:
 - 1. Initial Maintenance: Maintain each area until Substantial Completion and the warranty period is formally started. Maintenance shall begin immediately upon delivery to the site and as each portion is installed and shall continue for the specified period. Initial maintenance for seeded areas shall take place until the third mowing is complete.
 - 2. First Year Maintenance: Perform landscape maintenance of work covered by this section for a period of approximately one year commencing with Substantial Completion and coinciding and terminating exactly with the First Year Maintenance of the plant materials. First year maintenance for seeded areas shall start from the third mowing and end at the termination of the First Year maintenance for plantings.

- B. Work Subject to Maintenance: Perform work for the following portions of the site or the work:
1. Initial Maintenance: The work installed under this contract.
 2. First Year Maintenance: The work installed under this contract,
- C. Landscape Maintenance Season: The landscape maintenance season is defined as the months during which landscape maintenance operations are required and extends from April 1 to November 30 of any given year. When substantial completion occurs after April 1, the season extends from substantial completion through November 30.
- D. Turf Maintenance: Maintain all turf areas by inspecting, watering, weeding, replanting, mowing, trimming, edging, and other operations necessary to keep lawn areas green and uniform in appearance. All maintenance which is termed "annual" means those operations which take place yearly by the maintaining Contractor as specified under "Maintenance Period" herein. Monthly inspections of seeded areas is required; submit recommendations to Owner.
1. Annual Soil Tests: Turf soil shall be tested once a year at the beginning of the season in several locations for pH and essential nutrients. Submit test results and lab recommendations to the Owner.
 2. Watering: The Contractor shall provide all necessary watering to insure the success of all lawn areas. During the first week, keep sod pads and seeded areas moist at all times. In the absence of adequate rainfall, perform watering daily or as often as necessary during the first week, and thereafter for another week in sufficient quantities to maintain moist soil to a depth of at least 4". In subsequent weeks, water sod and seed areas as required to maintain adequate moisture in the upper inches of the soil necessary for the promotion of deep root growth. Water prior to the heat of the day to prevent wilting. Watering is required prior to acceptance of the work. Water at the rate necessary to keep installed sod and seed in thriving condition, as defined hereinabove.
 - a. Monitor Moisture: Monitor the application of water to prevent any too-dry or too-wet condition from occurring. Report immediately any excessive moisture condition to the Architect. If an automatic watering system is used, monitor and correct timing, frequency, and usage. Provide watering in those areas not covered by the irrigation system. The Contractor shall be so familiar with the state of sod and seed area moisture that he shall notify Architect immediately if sod or seed is endangered.
 3. Weed Control: Inspect turf areas for weed infestations at least monthly. Keep sod and seed areas free from weeds. If weeds or other undesirable vegetation threaten to smother the planted sod or seed, spray or drench said vegetation with weed killer, or in the case of rank growth, uproot manually, rake and remove from the site. If weed killer is used, apply per manufacturer's recommendations. Sprinkling shall not resume for a 24 hour period following application, or as manufacturer recommends. Contractor shall notify Owner and Architect of his intent to use weed killer.
 4. Sod Mowing: The first mowing shall not be attempted until the sod is firmly rooted and secure in place. Perform all mowing in a neat and orderly manner. Remove no more than 1/3 of the grass leaf. Grass height shall be maintained between 1-1/2" - 2-1/2" unless otherwise specified, with frequency of cuttings to be determined by growth rate of sod. Keep mowers sharp and in good adjustment. Cut sod cleanly and sharply, mow evenly so that no ridges are evident. All clippings shall be caught and removed from the site.
 5. Initial Mowing of Seeded Areas: Mowing can begin after establishment of the stand and

continue until close of the season the year it is seeded. If sown in the Spring, maintenance shall include 3 mowings by rotary mower for control of weeds, at specified heights. The approximate schedule shall be as follows but may be modified to earlier dates if conditions exist where weed are setting seed:

- a. August 15 - September 1: 6" minimum
 - b. September 15 - October 1: 6" minimum
 - c. October 15 - November 1: 12" minimum
6. Edging and Trimming: All turf areas adjacent to paving or cultivated areas shall be kept neat and attractive by edging and trimming. Under no circumstances shall the Contractor trim at the base of trees with a "weed eater" type of trimmer.
 7. Pest Control: Control of pests such as insects or fungus diseases shall be done as required to keep sod and seed areas in a thriving condition with appropriate spray applied by licensed personnel per manufacturer's recommendations. Notify Owner of intent to spray prior to performing this work.
 8. Annual Fertilization: Apply to all sod areas per soil test recommendations, in mid-spring after early flush of growth and again during late summer or early fall. Turf fertilizer application shall be limited to the outside of tree root zones.
 - a. Two years after installation, fertilizer applications of phosphorus are only permitted when soil tests indicate a deficiency of phosphorous in the soil.
 9. Annual Clean-ups: Annual clean-ups in sodded and seeded areas are included in maintenance.
 10. Clean-up: Cleaning operations shall be performed at least daily during and after all maintenance operations, so that the project site is kept in a neat and tidy condition at all times.

END OF SECTION 32 91 01

SECTION 32 93 11 -- LANDSCAPE PLANTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Landscaping work as shown and specified.

1. All Plantings of every description shown on the Drawings.
 - a. Work includes removal and replacement of any trees which are in the way of the installation of transformers or are damaged by construction. Although the trees which are likely to be in the way are identified on the Drawings, all existing trees are subject to this requirement. See Drawings.
2. Soil work, including agronomic soil testing, supplemental topsoil, amendments and soil mixes.
3. Water Supply: Provide all temporary water supply from source(s) on or off site. See Drawings.
4. Warranty: Warranty plants for one year.
5. Initial Maintenance: Maintain plantings through Substantial Completion of the landscape work.
6. First Year Maintenance: Provide landscape maintenance for the Project for one year, starting with substantial completion and exactly coinciding with the landscape guarantee period.

B. Related Sections include the following:

1. Applicable provisions of Division 01 – General Requirements shall govern work under this specification section.
2. Applicable provisions of “Owner” General and Detailed Technical Specifications utilized for this project.
3. Section 01 81 13 - Sustainable Design Requirements
4. Section 01 81 13.13 -- Sustainable Design Requirements.
5. Section 31 13 00 - Landscape Removal, Pruning & Protection.
6. Section 32 92 01 – Sod and Seed.
7. Environmental Soil Testing: Division 31 Section "Acceptance of Backfill, Topsoil and CU Structural Soil."

1.2 SUBMITTALS

- A. LEED Submittals: Product Data as required to show compliance with LEED MR Credit Sourcing of Raw Materials, meeting all documentation requirements, including back-up documentation.
- B. General: Submit samples and descriptions of materials to the Architect. For samples of plant materials see "Review" hereinafter. Delivery of materials may begin only after descriptions or samples have been approved.

- C. Plant Sources: Submit list of sources for plant material to be provided, with any deviations to size or variety noted, and coordinate directly with landscape Architect a tagging schedule with appointments arranged in geographic sequence, by:
1. Time and date of appointment.
 2. Nursery name, contact, location and phone number. Include name and location of nursery of origin for all imported, pre-dug material.
 3. Plant name, variety, size, and quantity to be tagged at proposed nursery.
 4. All varieties and sizes confirmed as specified.
 5. Or if not as specified, evidence that plant cannot be found and proposed substitution alternatives.
- D. Submit photographs of proposed plant material taken in the nursery where they are grown prior to requesting inspection and tagging.
- E. Comply with State of Illinois and federal laws with respect to inspection of all plants for plant diseases and insect infestation. Submit an inspection certificate, required by law to this effect, with each shipment.
- F. Samples:
1. Submit samples and certified analyses by recognized laboratory for humus, fertilizer, organic matter, commercial fertilizer, soil conditioner, amendments and each source of supply prior to the beginning of work under this Section. The manufacturer's analysis for standard products will be acceptable.
 2. For all topsoil materials, submit one representative soil samples of each topsoil proposed for use, whether imported and/or existing in stockpile on site to an agronomy laboratory certified by the Illinois Environmental Protection Agency and provide well-labeled analysis results with agronomist's name and signature, lab address and phone number, to the Architect for approval. Each sample shall be taken from three different locations of each proposed topsoil. Retest imported topsoil until acceptable topsoil is achieved.
 - a. Supplemental topsoil is required.
 - b. Coarse sand to be used as soil mix component.
 3. Review shall not be construed as final acceptance. The Architect may take samples of materials delivered to site and analyze them for compliance with specifications.
 4. Do not deliver topsoil to site, or spread existing topsoil, until amendments are determined, and soil is approved.
- G. LEED Soil Restoration Requirement: Submit source for topsoil. No topsoil shall be imported from greenfield or farm sites.
- H. Topsoil:
1. Data: Submit to Architect the location of all properties from which supplemental topsoil is to be obtained, approximate quantity available from each, names and addresses of owners of the said properties, and depth to which soil shall be taken.
 2. Soil Mix Materials: Submit one quart size plastic container with specified soil mix ingredients, such as sand, organic matter, etc.
 3. Fill Material: Submit product data consisting of certification that each material proposed for use complies with specified requirements.

- I. Soil Test Analysis:
1. Submit copies of test analyses for imported topsoil and existing topsoil from site.
 2. Soil testing required in this Section shall be performed by an agronomy lab and is not the same as other environmental testing which may be required in other Sections for imported soils.
 3. Submit soil test results at least two months prior to planting. If imported topsoil does not meet required analysis, submit for an alternate source of topsoil.
 4. Provide a mechanical analysis and a complete chemical analysis as described below of the following:
 - a. Any existing soil proposed for use left in place. Label the report "Existing Topsoil."
 - b. Any supplemental topsoil proposed to be imported to the site. Label the report "Supplemental Topsoil."
 5. The date of the topsoil analysis shall be within 60 days of importing soil to the site.
 6. The mechanical analysis shall include the percent of sand, silt and clay.
 7. The chemical analysis shall include:
 - a. Base: pH, conductivity (measure of soil salinity) and percent organic matter.
 - b. Anions: Sulfur, phosphorous and nitrate-N,
 - c. Cations: Potassium, calcium, magnesium and sodium.
 - d. Minor Elements: Iron, zinc, manganese, copper, boron and aluminum.
 - e. CEC (cation exchange capacity)
 8. Include in the analysis the agronomist's recommended amounts of the following needed to bring the topsoil into compliance with the requirements of this Section. Agronomist's recommendations shall include:
 - a. Amendments for pH to achieve a range of 6.8 to 7.2.
 - b. Amendments for soil composition and texture to achieve sandy loam to loam classification.
 - c. Amendments for organic matter to achieve 3-5% after amending for soil texture.
 - d. Fertilizer required for healthy growth of plants.
 - e. Other soil conditioners, such as gypsum, that may be helpful for plant growth.
 9. The Architect reserves the right to interview the agronomist regarding recommendations and to modify recommendations if not deemed responsive to the specifications.
 10. Furnish 5 copies of test analysis reports.
- J. Infiltration/Percolation Test Results: Perform infiltration/percolation tests in tree pits, by filling pits with water. Achieve an infiltration rate of at least 75 mm within 4 hours, or a percolation rate of 100% within 24 hours. Submit 5 copies of test results to Architect.
- K. Compaction Test: Perform a bulk density test on existing soil in area of the site where trees will be planted, measured as grams per cubic centimeter. Achieve bulk density between 1.40 to 1.65 g/cm, or if Proctor tested, 75-85%. Submit 5 copies of test results to Architect.
- L. Submit two copies of written landscape maintenance instructions for care of installed plants to be turned over to Owner after Substantial Completion.

1.3 QUALITY ASSURANCE

A. Ability to Deliver:

1. Investigate sources of supply and confirm they can supply plants specified on plant list in sizes, variety, growth characteristics, and quality noted and specified before submitting bid. Failure to take this precaution will not relieve responsibility for furnishing and installing plant material in accordance with Contract requirements.
2. Substitutions may be permitted only upon submission of written proof that specified plant is not obtainable locally. Such substitutions may be made upon written authorization by Architect.
3. Furnish and install plants shown on drawings in quantity, size, growth characteristics and quality designated.

B. Inspection:

1. Pre-Tagging Material and Selected Specimen: All trees, and plants identified as "selected specimen," shall be approved and pre-tagged at their place of growth from a source in Northern Illinois or Southern Wisconsin. See Drawings.
2. Submit photos of plant material as grown in the nursery for preliminary review by Architect. Select and pre-tag plant material before requesting inspection by Architect.
3. In addition to review of plant material photographs, Architect may inspect plant material at nursery. Such inspection shall be in addition to inspection at job site.
 - a. If plants and materials required to be inspected are located outside radius of 100 miles from Project site, Architect's direct and indirect cost including normal profit shall be borne and paid by Contractor.
4. Written Requests: Written requests for inspection of plant material at their place of growth shall be submitted to Landscape Architect 2 months prior to digging. Written requests shall state the place of growth, quantity of plants to be inspected, and confirmation of available quantity in specified variety, size and growth characteristics. The Landscape Architect may refuse inspection at this time if, in his/her judgment, a sufficient quantity of specified plants is not available for inspection.
 - a. Arrange initial tagging of all trees to be tagged within one or two days, from a minimum number of sources.
 - b. Arrange for back up sources of supply in the event that reviewed plants do not conform.
5. Upon delivery and before planting request inspection of plants by Architect.
6. Inspection and approval is for quality, size, and variety only, and in no way impairs right of rejection for failure to meet other requirements during progress of Work. All materials furnished for the work shall conform in every respect to reviewed samples.
7. Plants which do not conform shall be removed from the site and immediately replaced with conforming material at Contractor's expense.
8. The Contractor shall be present during required inspection or as may be required by Architect.
9. Furnish Certificates of Inspection as may be required by law to accompany shipments prior to acceptance of material.

- C. Qualifications of Installer: A single installer, performed by a Landscape Contracting firm which has a minimum of 5 years of experience successfully completing projects of a similar size and value, and supervised by an on-site full time IGIA Certified Landscape Technician, for soil preparation, sod and landscape plantings installations.
- D. Perform planting by personnel familiar with accepted landscape planting procedures. A qualified foreman, with a minimum of 5 years of experience installing plant material is to be on-site during planting procedures.
- E. Reference Standards:
 - 1. Provide specified analyses and tests of topsoil, fertilizer and humus in accordance with requirements of Association of Official Agricultural Chemists.
 - 2. Plant names used in plant list are in accordance with "Standardized Plant Names," published by American Joint Committee on Horticulture Nomenclature (current edition).
 - 3. Size grading standards of plant materials shall be in accordance with American Association of Nurseryman, Inc., (AAN) Code of Standards ANSI Z60.1.
- F. Agronomic Soil Testing: As soon as possible upon award of contract, employ at no additional expense a soil testing agency acceptable to the Architect. Using methods approved by the Association of Agricultural Chemists, conduct all tests, interpret results and prepare reports specified herein for topsoil to be provided.
 - 1. Each report shall state whether or not the test specimens conform to all requirements of the Contract Documents and shall specifically note any deviations there from.
 - 2. Contractor shall secure this test in a timely fashion.
 - 3. The date of the topsoil analysis report shall be within 60 days of the importing of such materials to the site.
 - 4. On the basis of the above tests, soil amendments other than those specified herein may be authorized.
 - 5. If samples of supplemental topsoil fail to meet requirements, find alternate sources and submit new test results.

G. Other Tests:

1.4 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Delivery Handling and Storage of Soil Mix Materials: Do not deliver, amend, place, spread, or grade topsoil while in a frozen or muddy condition. Coordinate staging areas for soil mix materials with Architect.
- B. Pre-Tagged Plant Materials: The Contractor shall arrange and be responsible for the successful movement of all plant materials which are pre-tagged. Arrange for plant materials to be picked up and shipped from the nursery to the site, or an alternative off-site location if the site is not ready. Take up all questions regarding plant material shipping with the nursery prior to shipment taking place. Document all conversations with the nurseryman and submit them to the Architect prior to shipment. Plants shall be dug, handled, shipped, held, and maintained at a location acceptable to the Architect as specified herein.
 - 1. Shipped Material: Carefully protect all plant material which is shipped from heat, freezing, desiccation and injury during transport.

2. Out of State Tagging: If out of state material sources are accepted, the entire cost of travel for the Landscape Architect will be borne by the Architect. Arrangements for travel will be made by the Landscape Architect at the Landscape Architect's convenience.
- C. Preparation for Delivery:
1. Balled and Burlapped (B&B) Plants: Low profile package trees are required.
 - a. Dig and prepare for shipment in a manner that will not damage roots, branches, shape, and future development of plant.
 - b. Originate from soil which will hold a firm ball when wrapped with burlap or similar material, bound with twine or cord so as to hold balls firm and intact. Treated burlap or nylon ropes around balls are not acceptable.
 - c. Ball Sizes: Not less than the standard established by AAN.
 - d. Drumlace plants 2 in. in caliper and over.
 - e. Plants moved with a ball will not be accepted if the ball is dry, cracked, or broken before or during planting operations.
 2. Potted or Container Plants: Provide container to hold ball shape protecting root mass during delivery and handling.
 3. Freshly Dug: All plants shall be freshly dug. Heeled-in plants or plants from cold storage will not be accepted. All nursery grown plants shall have been transplanted or root pruned at least once in the last 3 years.
- D. Delivery:
1. Plant Material: Take precautions in accordance with best trade practices to ensure the arrival of plant material at job site in good condition and without injury. Cover plants to prevent drying, transit disease or injury. Do not ship diseased or infested plant material.
 2. During shipment, all plants shall be properly protected by a shade tarpaulin of approximately 90 percent shade material. No plant shall be so bound with rope or wire at any time as to damage the bark, break branches or destroy its natural shape.
 3. Broken branches, bruised bark, broken balls or other damage shall constitute grounds for rejection. Handle plants from bottom of root ball only. Protect all plants from drying out. Do not transport plant materials in sub-zero weather. No plant with a frozen ball shall be accepted.
 4. Pruning: Do not prune before delivery or prior to planting or transplanting. New plants which show evidence of having been pruned or new trees which have fresh cuts of limbs over 1-1/4" not completely calloused shall be rejected.
 5. Fertilizer: Deliver fertilizer to site in original, unopened containers bearing manufacturer's guaranteed chemical analysis, name, trade name, trademark, and conformance to state law.
 6. Maintenance Materials: Deliver anti-desiccant spray in containers of the manufacturer; mix and use according to manufacturer's direction. Deliver insecticide spray in the manufacturer's containers; mix and spray according to manufacturer's directions. Deliver fungicide in manufacturer's containers; mix and apply according to manufacturer's directions only with the acceptance of the Architect. Deliver herbicide in the manufacturer's containers; apply per manufacturer's directions, only with the acceptance of the Architect.
 7. Other Materials: Store all other materials so as to keep them clean and protected from damage, in accordance with manufacturer's recommendations.

Notify Architect, a minimum of 24 hrs before delivery of plant material. Failure to notify Architect in advance, in order to arrange proper scheduling may result in loss of time or removal of plant or plants not installed as specified or directed.

8. Each shipment shall be accompanied by an invoice showing sizes and varieties of plants included in each shipment. Provide copy of invoice to Architect upon delivery of plant material.

E. Storage:

1. Plant Material:

- a. Set plants which are not to be planted within 4 hours on ground and heal in with peat, soil, mulch or other media, out of construction traffic.
- b. Protect roots of plant material from drying or other possible injury.
- c. Water plants as necessary until planted.
- d. Plants shall not remain unplanted for longer than 3 days.

2. Store fertilizer, humus, and spray materials in weatherproof storage areas in such a manner that their effectiveness will not be impaired.

1.5 JOB CONDITIONS

- A. Pre-installation Conference: Conduct preconstruction conference at the project site in compliance with requirements of Division 1 Section "Project Management and Coordination."

1. Review maintenance procedures for surrounding streets, walks, paving and site amenities.
2. Review procedures for work on public property.
3. Review plant locations and procedures for adjustment.
4. Coordinate timely soil installation for hydroseeding which will require operations over several months.

- B. Topography: Refer to existing grades, new grades for adjacent pavements, and new landscape grades shown on the Drawings. Data on existing elevations, grades, structures or other topographic features of the site were determined by a topographic survey. The data are not intended as representations or warranties of exact conditions that may be encountered at the time of construction. It is expressly understood that the Owner and Architect will not be responsible for interpretations or conclusions drawn there from by the Contractor. The Contractor shall examine the construction site, coordinate his work with the General Contractor and determine, to his own satisfaction, the existing conditions under which construction shall proceed.

- C. Construction Survey Staking: Provide field surveys for landscape finish grading at appropriate intervals to meet required grades.

- D. Review of Subgrade: Subgrade acceptance is subject to depths described herein, and the following conditions.

1. Confirm Subgrade Elevations: Confirm required subgrade elevations to within 1/10 foot tolerance. Refer to Drawings Soil Plans and Details for required depths.

2. Confirm Compaction: Inspect subgrade and all embankments to depth of 12", checking composition and stability. Fill material encountered within planting areas shall be "Suitable Subgrade Fill Material". Confirm compaction at subgrade, as follows, and notify Architect of any discrepancies before proceeding with work.
 - a. Under plant beds: 85%
 - b. Under pedestrian paved areas: 90 - 95%.

- E. Coordination: Coordinate with all other installers working in the area.
 1. Coordinate with installers and installation of transformers to minimize removal and replacement of existing trees. When transformers are installed, have the Contractor mark the path of any conduit traversing the existing landscape area. Schedule a meeting with the Architect to determine any additional damaged trees to be replaced.
 2. Coordinate with installers to minimize destruction or compaction of areas to receive new landscape areas, including areas to receive new planting or seeding.

- F. Protection of the Drainage Courses: Prevent damage to drainage courses including soil separator fabric during topsoil placement and grading operations.

- G. Protection of Adjacent Property and Dust Control: Prevent any substances from blowing, spilling, dropping, or depositing on adjacent property. Keep soil materials off of constructed retaining walls. Keep the construction area sufficiently dampened to control dust caused by operations.

- H. Excavation Around Existing Utilities: Data on the location and nature of existing and proposed utilities, as shown on the Drawings, are made available solely for the convenience of the Contractor. Neither the Owner nor the Architect guarantees the accuracy or completeness of the data. The Contractor shall investigate the location, size, depth and nature of all utilities which may interfere with his work. Stake locations with Utility Owner, report discrepancies and consult with Utility Owner and Architect immediately prior to proceeding with work.
 1. Utilities to Remain: If utilities are to remain in place, protect them from damage, and repair them if damaged to a condition satisfactory to the Utility Owner and Architect, at no additional cost to the Owner.
 2. Utilities to be Removed: If utilities are to be removed, they shall be demolished and completely removed from the site. Consult with the Architect and Utility Owner before any utility services are shut off or disconnected.
 3. Excavation in Gas Easements: Notify Architect immediately if plants are designated for locations on or near gas easements. All excavation located on or near gas easements shall be hand-dug only after utility is staked and depth known. Exercise all caution according to utility owner recommendations and industry standards necessary to insure safe operations.

- I. Planting Seasons:
 1. Spring Planting: From time soil becomes workable to June 15. Fall Planting: September 1 to November 15. Plant evergreen shrub plantings no later than November 1. Plant evergreen tree plantings no later than October 15. Plant perennial and groundcover plants no later than October 1.
 2. Summer Season: June 2 through August 31. Planting shall be considered unseasonable and shall require approval by the Architect. Approval to plant under

- such conditions shall in no way relieve the Contractor from the guarantee provisions of these specifications.
3. Container Plants: Planting season designated above may be extended for container grown plants when approved by the Architect.
 4. Digging Season: Dig plants labeled "Spring only" during the Spring season only; or, only with acceptance of Architect, may be pre-dug or stage dug.
- J. Plant only when weather and soil conditions are suitable in accordance with the best practices of industry.
- K. Protection:
1. Protect planted areas against damage by other work.
 2. Any barricades or temporary fencing and signs shall be maintained until acceptance. Upon final acceptance of the work, remove said barricades or temporary fences, or leave them if so desired by the Owner.
 3. Replace, repair, re-stake or replant sod or plantings which are damaged. Damage to existing structures, utilities, trees, lawns, shrubs, pavements or other property caused by the Contractor shall be restored to original conditions at the Contractor's expense.
 4. Protect lawn areas, and repair damage resulting from planting operations.
- L. Permits: Obtain, fill out and submit Highway Permit Forms and Highway Permit Bonds for Illinois Department of Transportation (IDOT); Chicago Bureau of Forestry, and other local governing agency, and obtain approval to plant or perform other operations in the right-of-way.
- M. Utilities: Have Utility Owners stake locations prior to excavation of plant pits or beds. The Contractor shall be responsible for locating all underground utilities and shall take all necessary precautions not to disturb or damage these utilities.
- N. Wherever landscape work is executed in conjunction with other work, arrange the schedule that will permit execution of landscape work as specified.
- O. Due to LEED performance requirements, the soil and plantings will need to be delegated design to achieve the performance criteria for soil pH, bulk density, infiltration, etc.

PART 2 - PRODUCTS

2.1 PLANTS

- A. Refer to the Plant List, or Drawings, for specific types and quantities of plants to be furnished. Quantities are included for convenience only. In the event that discrepancies occur, the actual plant designations as drawn on the Drawings shall govern.
1. Replacement Trees: Replace existing trees removed for transformer installation and all trees otherwise damaged by construction with new trees of same species, variety and size as existing trees prior to being removed or damaged. Record damage as it occurs and submit photographic evidence to Architect. All replacement trees are subject to the same requirements for trees as specified in this Section.
- B. General:

1. Provide plant material nursery grown in northern Illinois or within same hardiness zone as project site or have been acclimated to conditions of same hardiness zone for minimum of two years or growing seasons. Hardiness zones shall conform to "Zones of Plant Hardiness" as provided by U.S. Department of Agriculture.
2. Unless specifically noted otherwise, provide plants of selected specimen quality, have normal habit of growth and be sound, healthy, vigorous plants with well-developed root systems, free of disease, insect pests, their eggs or larvae, and injuries. They shall be of specimen quality, exceptionally heavy, symmetrical, tightly knit and so trained or favored in development and appearance as to be unquestionably and outstandingly superior in form, number of branches, compactness and symmetry. Under-grown, overgrown or root bound plants are not acceptable quality. All plants shall show evidence of satisfactory growth prior to Final Acceptance.
3. Do not prune before delivery. Prune only at time of planting.
4. Trees shall have a single leader. Trees which have damaged, crooked or multiple leaders, are not acceptable unless specifically specified. Trees with abrasion of bark, sun scalds, disfiguring knots, or fresh cuts of limbs over 1-1/4 in., which have not completely calloused, are not acceptable.
5. Shrubs shall be full plants with many branches after planting, as described above. Bare root plants shall have many fine hair-like roots. Container plants shall be thoroughly rooted within the container, but not root-bound.
6. Plants shall be freshly dug, balled and burlapped or container grown. No bare root, heeled-in plants or plants for cold storage will be accepted, except as otherwise specified, unless Contractor makes such request in writing and plants are inspected and approved.

C. Plant Name and Size:

1. Measure plants when branches are in their normal position. Height and spread refer to plant's main body and not from branch tip to branch tip.
2. Take caliper measurement at point on trunk 6 inches above natural ground line for trees up to 4 inches in caliper and at point 12 inches above natural ground line for trees 4 inches and over in caliper.
3. If range of size is given, no plant shall be less than minimum size and not less than 50% of plants shall be as large as upper half of range specified.
4. Measurements specified are minimum size acceptable and are measurements after pruning, where pruning is required. Plants meeting measurements specified, but not producing normal balance between height and spread, are not acceptable.
5. Shrubs shall be matched specimens from single block source.
6. Plants shall be true to species and variety and shall conform to measurement specified in Plant List, except that plants larger than specified may be used if approved by Architect. Use of such plants shall not result in increase in Contract price. If larger plants are approved, increase ball of earth in proportion to size of plant.
7. Where plants larger than specified have been submitted in writing for approval and approved in writing by Architect, Contractor shall assume responsibility of guarantee for plant in size as planted.
8. Labels: All plants shall be labeled with the correct plant name and size. Labels shall be securely attached to all plants, bundles, and containers of plant materials delivered.
9. Parkway and Parking Lot Trees: Trees for these areas are required by the Landscape Ordinance, shall be the minimum size specified, and the genus and species and variety specified.

- D. Substitutions: Substitution of plant materials is not permitted unless authorized in writing. If proof is submitted, substantiated in writing, that any plant specified is not obtainable, a proposal will be considered for the use of the nearest available size or similar variety with a corresponding adjustment of the Contract price.
- E. Balled and Burlapped Plants (Designated B&B):
1. Dig plants with firm natural balls of earth of diameter indicated below and of sufficient depth to encompass fibrous and feeding root system necessary for full recovery of plant.
 2. Plants having balls broken or cracked during delivery or at the time of planting will be rejected.
 3. For Evergreen trees, trunk diameter shall be used to determine minimum required ball dimensions. Minimum ball dimensions shall be those as specified for single stem trees.
 4. The diameter at top of each ball shall be diameter specified above and diameter at bottom of each ball shall not be less than 70% of specified top diameter. Top and bottom sources shall be parallel.
 5. Ball shall be of specified depth at points perpendicular to bottom of ball.
 6. Balls greater than 30" diameter shall be drum-laced.
 7. Architect may reject any plant specified as balled and burlapped which, in his opinion, fails to conform to balling requirements set forth.
- F. Container Plants and Pot Grown Plants:
1. Container grown plants shall have heavy fibrous root system, or well developed taproot, that has been developed by proper horticultural practice including transplanting and root pruning.
 2. The root system shall have developed sufficiently long for new fibrous roots to develop so root mass will retain its shape and hold together when removed from container.
 3. In no case should container strangle or girdle natural growth of plant.
 4. The diameter of spread shall determine the inside diameter of pot in which they shall be grown for at least 3 months prior to delivery.
 5. Plant container sizes shall conform to American Association of Nurseryman, Inc., ANSI Z60, 1.
- G. Deciduous (Shade and Ornamental) Trees:
1. Trees shall be limbed up six feet, prior to pruning, but no more than nine feet, and shall be matched in crown height and development.
 2. Trees shall also have crowns equivalent to 1/2 of tree height or so that crown of tree is in proportion to trunk as tree grows.
 3. Provide trees of specimen quality.
 4. All material shall be Balled and Burlapped.
- H. Perennial Forbs and Grasses:
1. Perennials and grasses specified as "container" or "pot" shall be provided as container grown plants or shall be provided with firm natural balls of earth with diameter and depth in accordance with American Standard for Nursery Stock for size specified on Plant List.
 2. See "Preparation for Delivery" in this Section.

2.2 PLANTING MATERIALS

- A. Water: Existing water supply from hose bibs at the project building may be used for all planting operations. Provide hose and equipment necessary for proper watering of plant material. Provide water at no extra cost if it is not available at the Project site.
1. See Drawings for sources of supply.
- B. Subgrade Fill Material: Suitable subgrade fill material shall be used only if required to fill in voids left by the Architect.
1. Suitable Subgrade Fill Material: Supplemental Topsoil as defined below.
 2. Existing Topsoil In Place: The area to be seeded has been topsoiled previously and that soil may be re-used specified requirements, procedures and amendments.
- C. General Requirements for LEED Soil Restoration:
1. Topsoil: No topsoil shall be imported from greenfield or farm sites.
 2. Organic Matter: Amend soils with mature stable specified compost materials such that top 12" of soil contains 3% minimum Organic Matter.
 3. Compaction: Meet required bulk densities within 100% of root zones, 30" minimum depth for tree pits and 12" minimum for seeded areas.
 4. Infiltration Rate: Achieve required infiltration rates (inches per hour) or saturated hydraulic conductivity (millimeters per second) comparable to loam.
 5. Chemistry/Biological Function: Meet required PH, cation exchange capacity indicating loam or sandy loam, and nutrient profiles with low salinity.
- D. Soils:
1. No-Mow Native Seeded Areas: Existing topsoil in place with supplemental topsoil as needed to meet existing grades if disturbed; worked and amended as specified to meet General Requirements for LEED Soil Restoration.
 3. Plant Beds for Perennials and Grasses: Supplemental Topsoil as specified to meet General Requirements for LEED Soil Restoration.
- D. Supplemental Topsoil: Topsoil shall be loamy soil from the A horizon of soil profiles of local soils or a naturally occurring natural topsoil classified as a sandy loam, typical of the site locality without a mixture of subsoil, having a pH of 6.8 to 7.3. Clay soils or topsoil contaminated with clay is not acceptable. Supplemental topsoil shall be stripped at source from A margins only. The top 3-6" of topsoil shall be shredded and screened. At least 90 percent must pass the 2.00 mm (No. 10) sieve prior to placement. It shall be relatively free from large roots, sticks, weeds, brush, or stones larger than 25 mm (1 inch) in diameter, or other litter and waste products.
1. All topsoil required to meet depths and grades shown shall be imported "Supplemental Topsoil." Test and amend supplemental topsoil to meet required composition, acidity, and organic matter content.
 2. "Supplemental topsoil" means all topsoil imported to the site which is required to meet finish grades shown.
 3. Composition: Sandy loam or loam classification.
 4. Acidity: 6.8 to 7.2 pH.
 5. Organic Content: 3-5% after amending for texture. Add if deficient.
 6. Import topsoil conforming to above requirements from off-site sources as required to complete the work. Do not obtain from greenfields, farmland, bogs or marshes.

7. Perform test analysis on each source of topsoil to demonstrate compliance with the above and submit reports as specified.
 - a. Existing in place topsoil.
 - b. Imported supplemental topsoil.
 8. Regardless of source of supply, the top three inches minimum of topsoil shall be finely pulverized prior to placement in all locations so that surfaces are not lumpy.
- E. Soil Conditioner for Tree Planting Soil Mix: Biochar, a fine grained charcoal made from a biomass blend of 50% corncob and 50% wood chips; high in carbon and largely resistant to decomposition, produced as a result of pyrolysis by heating biomass in a low or no oxygen environment; and finely ground with no pieces larger than the size of pea gravel.
- F. Biological Components For Soil Mix:
1. Mycorrhizae for Trees, commercially available, mycorrhizae fungi inoculants, consisting of a blend of at least 17 ectomycorrhizas and endomycorrhizas, and bio-stimulant complex containing time release 20-10-5 fertilizer, humic acids derived from leonardite and various vitamins and other macro and micronutrients; such as ROOT Myco Tabs, or approved equivalent.
 2. Mycorrhizae for Plant Beds: Mycorrhizae for Plant Beds: Commercially available, mycorrhizae fungi inoculants, consisting of a blend of at least 17 ectomycorrhizas and endomycorrhizas, and bio-stimulant complex containing a low dose of 0-2-8 fertilizer plus iron, such as IronROOTS with Mycorrhizae Soluble Rooting Stimulant, or approved equivalent.
- G. Planting Soil Mix: All tree pits and shrub beds shall be backfilled with the planting soil mix specified herein. All the specified soil mixes shall be adjusted with soil amendments to adjust pH and thoroughly mixed by hand or by mechanical means prior to placement.
1. Soil Mix: For all tree pits, expanded tree pit root zones and shrub beds which are not underdrained, use a soil mix of approved supplemental topsoil. Amend with sand to achieve loam or sandy loam texture, which meets all testing criteria.
 2. Add and thoroughly blend in 5% by volume approved bio-char.
 3. Add 1 tablet Mycorrhizae for Trees at time of planting trees for each ½ caliper tree trunk (i.e., 8 tablets for 4" caliper tree; 20 tablets for a 10" tree) after backfilling soil mix to within 6-12" of the top of the tree pit. Place tablets 1 inch adjacent to rootball, evenly distributed around circumference of rootball. Continue backfilling and water in.
 4. After placement and settlement of soil and planting of trees, add 1 inch pine bark fines organic matter to entire surface of planting soil mix throughout the expanded tree pit, and rake into top layer of soil.
- H. pH Adjustment: Adjustments to soil pH shall be pursuant to soil test recommendations to achieve a neutral to slightly acid soil.
1. Sulphur: Sulphur shall be wettable granular sulfur, mixed and applied according to the soil test recommendations and to the types of plantings in the area requiring amendments. Apply sulfur if pH is 7.2 or above. If soil pH is above 7.2, multiple applications may be required prior to end of guarantee period.
 2. Limestone: Do not apply limestone to soil unless pH of soil is less than 6.3. Ground limestone (calcium carbonate) if required, shall have the following analysis: At least 50% shall pass a No. 200 USS mesh sieve. At least 90% shall pass a No. 100 USS mesh sieve. 100% shall pass a No. 10 USS mesh sieve. Total carbonates shall not be less than 80% or 44.8% calcium oxide equivalent; for purposes of calculation total carbonates shall be considered as calcium carbonates.

- I. Sand: Clean, sharp, well-graded, coarse sand passing 1/4" mesh screen, free of foreign and organic matter, with a pH of 5.5 to 6.5.
- J. Organic Matter Compost: Organic content shall be three to five percent after amending with sand. Adjust soil in top 6-12" of planting soil mix to add organic matter if less than 5% by soil test. The following types of organic matter may be used.
 - 1. Pine Bark Fines: Finely shredded and composted pine bark, passing a 3/8 inch sieve, suitable for horticultural purposes, and free of harmful residues, lumps, roots, stones and other foreign matter, shall be worked into the top 12" of soil.
 - 2. One Step Conditioner: A soil conditioner consisting of mycorrhizae, ground southern yellow pine bark fines, composted rice hulls and organic compost with nutrients and supplements to improve soil condition. Apply soil conditioner at the rate of 3" deep across surface of all plant beds and tree pits and work into soil. This soil conditioner may be used in place of pine bark fines and mycorrhizae applied per manufacturer's recommendations for backfilling top layers of soil mix in tree pits and shrub plantings.
 - 3. Compost: Mature compost that enhances the soil's ability to support vegetation with a carbon ratio below 25:1; low pollutants concentrations that do not exceed limits established by USEPA in the 40 CFR Part 503 Biosolids Rule, Section 503.13, Pollutant Concentrations; and no weed seeds or invasive plant propagules.
 - 4. Other Organic Matter: Submit proposed alternative, approved by soil laboratory, for approval by Landscape Architect. Other organic materials may be acceptable only if they do not adversely affect pH of soil mix.
 - 5. No sphagnum peat moss shall be used.
- K. Gypsum: If magnesium is high, consult with lab agronomist and amend soil with gypsum per soil lab recommendations to balance calcium.
- L. Premium Shredded Hardwood Bark Mulch:
 - 1. Finely shredded, premium, triple milled, from mixed hardwood species and free of sticks, leaves, and wood chips, 60% shall range between 1 and 3 in. in length; remaining 40% shall not exceed 1-1/2 in.
 - 2. Maximum of 5% content by weight of shredded wood particles.
- M. Fertilizer:
 - 1. Commercial type, uniform in composition, free flowing, conforming to state and federal laws, and suitable for application with equipment designed for that purpose.
 - 2. Fertilizer to contain minimum basis percentage by weight of following:
 - a. Nitrogen: 6%, 1/4 of nitrogen shall be in form of nitrates, 1/4 in form of ammonia salts, and 1/2 in form of organic nitrogen.
 - b. Phosphorus: 24%, available phosphoric acid shall be derived from super phosphate having minimum analysis of 20% available phosphate.
 - c. Potash: 24%, potash shall be in form of sulphate of potash.
 - d. Balance of fertilizer shall be materials usually present in such products, free from dust, sticks, sand, stone, and other debris.
 - 3. Coordinate N-P-K requirements with those recommended by soils lab agronomist.

2.3 LANDSCAPE ACCESSORIES

A. Plant Maintenance Materials:

1. Anti-desiccant Spray: An emulsion which provides a protective film over plant surfaces, permeable enough to permit transpiration, such as:
 - a. "Wiltpruf", NCF Nursery Specialty Products, Inc., Groton Falls, N.Y.,
 - b. Volck Dormant Oil Spray, by The Scotts Company.
 - c. Approved equivalent.
2. Insecticides, Herbicides, and Fungicides: Materials used for the control of pests shall be appropriate to the pest or pests which pose a problem to the materials and shall be used by licensed personnel in strict accordance with the manufacturer's recommendations. No phytotoxic materials shall be used.
3. Do not use herbicides or glysohate on site without written approval by Owner and only propose it where hand weeding will not control a problem. Follow manufacturer's recommendations, using licensed personnel, and notify all parties of intent to spray, prior to use. Protect nearby plants from overspray.

B. Support Appurtenances: No initial guying is required.

1. Ground Anchors: 30" stamped steel all-purpose tree stake. Use three anchors per tree. Bury a minimum of 30" in compact soil.
2. Guy Cable: 1/4" galvanized twisted seven strand rope.
3. Guying Wire: 10 gauge annealed galvanized steel double strand.
4. Hose: 8" to 10" lengths of 2-ply, reinforced black rubber hose, at least 3/4" diameter.
5. Turnbuckles: Galvanized or dip-painted, with 3" minimum lengthwise opening, fitted with screw eyes.
6. Ties: Constructed of No. 10 gauge galvanized wire, single strand through an 8" to 12" length of plastic hose.
7. Flag: Flag guys with 18 inch sections of 1-inch diameter white PVC pipe.

C. Wrapping Materials: New, clean, plain burlap, manufactured for the purpose of wrapping trees, free of breaks and tears, seamed along one edge, at least 8 oz. in weight, and a minimum of 4 - 6" wide for tree trunks. All purpose burlap, crepe paper or other materials are not acceptable quality. Use twine to tie burlap at 12" intervals, running twine vertically on trunk as well as horizontally.

1. Source: Great Western Bag Company. 708-231-4205.
2. Source: Sea-Rich Co. 800-332-2247.
3. Approved equivalent.
4. If seamed wrap is not available, use 6" burlap and fold over exposed edge and tie every 6 inches.

D. Tree Irrigation Bag: Reinforced, UV treated, 10 mil polyethylene bags with heavy-duty nylon zippers with poly pro straps and heat sealed edges. Provide one for each tree over 2 inches in caliper. Each bag shall hold 20 gallons of water.

1. Design Basis: Treegators are available through Forestry Supply, Inc. P.O. Box 8397, Jackson, MS 39284-8397 (800.647.5368).
2. Tree Diapers will also be acceptable when installed and used per manufacturer recommendations.

3. Alternate manufacturers will be considered. Submit sample with manufacturer's technical information and instructions.
4. Approved equivalent systems for supply of a slow drip of water over an extended period of time will also be considered. Submit shop drawing and sample.

PART 3 – EXECUTION

3.1 INSPECTION

- A. Do not install plantings where depth of soil over underground construction, obstructions or rock is insufficient to accommodate roots or where pockets in rock or impervious soil will require drainage. Where such conditions are encountered in excavation planting areas and where stone, boulders or other obstruction cannot be broken or removed by hand methods and where trees to be planted found under overhead wires, bring to the attention of the Architect. Alternate locations for planting may be designated by Architect.
- B. Remove rock or other underground construction and drain planting areas only when approved by Architect. Payment of extra shall be based on in-place volume required to provide normal requirements for plantings.
- C. Verify location of underground utilities with appropriate sources prior to construction. Contact J.U.L.I.E. at least 48 hours before commencing with construction operations. Repair damaged utilities.
- D. Conflicts with utilities shall be called to the Architect's attention before proceeding with work. Alternate locations may be designated by the Architect.

3.2 INSTALLATION

- C. Topsoil/Finish Grading:
 1. Do not place or work topsoil in frozen or muddy condition.
 2. Establish final grade as shown on drawings. Grades not otherwise indicated are uniform levels or slopes between points where elevations are given or between such points and existing finished grades.
 3. Where drawings show existing grades of landscaped areas not to be changed remove enough material to allow placement of 18in. of new topsoil and 6 inches of drainage material beneath shrub plantings and 24 inches of topsoil minimum beneath tree plantings, unless existing topsoil to required depth is undisturbed and of equal or better quality than specified herein. In latter case, existing topsoil may be left in place and use only enough new topsoil to bring these areas up to grade.
- D. Prepare Existing Landscape Beds: Strip existing sod where it occurs. Scarify the top 6" of soil if supplemental soil is added to existing soil. Establish existing grades to blend with existing grades and eliminate uneven areas resulting from rough-grading operations.
- E. Soil Loosening: To reduce soil compaction, loosen grades of existing soil to an average depth of 12 inches. IN areas where there are trees, avoid tree roots.
- F. Soil Amendments and Fertilizer: Apply 3" of specified organic matter and incorporate it into soil to a depth of 6 inches. Apply fertilizer to perennial plant beds at rates according to manufacturer Do not fertilize no-mow areas unless recommended by testing laboratory.
- G. Tree Replacement Identification:

1. Conduct an inspection with the Architect, identify existing trees to be replaced, and stake new locations for planting.
- H. Preparation:
1. Planting Season: Conform to planting seasons defined in Part 1, 1.5 Job Conditions.
 2. Preparation of Planting Areas: Cover surrounding turf (if existing) in a manner to protect turf areas that are to be trucked or hauled over and upon which soil is to be temporarily stocked. Restore if damaged.
 3. Maintain at least one stockpile of planting soil mix for backfilling plants during planting operations. Do not backfill plant beds with un-amended topsoil.
 4. Stake or paint locations of plants and bed lines. Architect must approve locations before excavation is started. Provide 48 hours' notice for approval. Contractor to be present during approval. Make adjustments in locations and outlines as required. In the event that pits or areas for planting are prepared and backfilled with topsoil to grade prior to commencement of lawn operations, mark so they can be readily located when work of planting proceeds.
 5. Remove weed growth prior to planting installation.
- I. Excavation for Planting: See Drawings.
1. Comply with the requirements of Division 31 Sections. Excavate circular pits with sloped sides to limits as shown on the Drawings.
 - a. Dig oversize tree pits as shown on the Drawings.
 - b. Where limestone is encountered in tree pit areas, over-dig tree pit to five times the diameter of the tree rootball and backfill with planting soil mix.
 - c. Excavate entire shrub bed as one to depth shown on the Drawings.
 2. Depth of pits for trees shall be as indicated. Excavate to greater depth as suitable to accommodate ball, container or bare roots when plant is set to finish grade allowing for 6 in. of compacted, prepared soil in bottom of pit.
 3. Install aeration/drainage pipe system in tree planting pits as indicated.
- J. Testing of Plant Pits and Trenches:
1. Perform percolation tests for all plant pits. In many cases, underdrainage can daylight down the slope. Correct underdrainage for all pits which fail to drain, until they drain freely.
 2. Where obstructions below or above ground are encountered, alternate locations may be selected as approved by Architect.
 3. Where locations cannot be changed as determined by Architect, submit cost required to remove obstructions to depth of not less than 6 in. below required pit depth. Proceed with work after approval of Architect.
 4. Dispose of excavated material not suitable for backfilling offsite in legal manner.
- K. Prepare Supplemental Topsoil for Turf:
1. Provide, place and prepare pulverized topsoil for turf areas after placement.
 2. Evenly distribute, and thoroughly and uniformly mix pH adjusters and fertilizer into the top layer of dry topsoil. Apply pH adjustment per soil test recommendations.
 3. Lightly roll surface to firm the bed, and then re-level to the appropriate grade. Finished surface of no-mow areas shall show no evidence of clods or clumped soil.

4. Form grade so that turf is just below flush with paved areas, or as required for seeded areas.
- L. Prepare Planting Soil Mixes for Plant Beds, Tree Pits, and Planters:
1. Prepare planting soil mix prior to placement in plant beds and prior to backfilling tree pits.
 2. Topsoil shall be dry and pulverized prior to amending. Clean topsoil of lumps, stones, debris and noxious weeds before mixing. Mix specified soil amendments at rates according to soil test recommendations. Mix pH adjusters with dry soil prior to adding any fertilizers. Fertilize according to soil test recommendation.
 3. Provide supplemental topsoil to achieve required planting soil mix depths, volumes and ratios to meet required finish grades.
- M. Preparation of Planting Pits:
1. Confirm dimensions of required tree and plant beds. See Drawings. Loosen soil at bottom of pit to minimum depth of 4 inches by spading or other effective methods.
 2. Scarify walls of tree pits.
 3. Backfill bottom of pit with 6 inch layer of compacted topsoil to provide firm bedding.
 4. If drainage problems are encountered, correct or install underdrainage.
- N. Amend Existing Topsoil for No-Mow Areas: See Drawings.
1. Turf Areas: 6 inches minimum, with top 3" pulverized.
- O. Install Prepared Planting Soil Mix in Plant Beds Areas: See Job Conditions for division of responsibility. Install prepared, amended and adjusted planting soil mix to the following depths:
1. Tree Pits: 4 inches below bottom of root ball.
 2. Perennial Grass Beds: 24 inches minimum.
- P. Placing Planting Soil: Provide, place, spread and rough grade specified planting soil mixes to depths specified in all areas to be planted. Place no planting soil above the foundation line of any adjacent structure. Notify Architect immediately if such conditions exist, including conditions that would not allow enough space for required drainage courses and planting soils to be installed below the top of foundation. Place enough soil mix to meet finish grades within specified tolerances, including any berms or rolls to grades as described on the Drawings.
1. Finished surface of plant bed areas shall show no clods or clumped soil.
 2. Promptly plant and mulch all areas which have had topsoil amended to alleviate clay conditions to avoid cement or adobe crust formation.
- Q. Setting and Backfilling Plants: Set trees and container plants in center of pits on layer of soil mix, plumb and straight and at such level that, after settlement, the crown of the tree root balls shall be 2" above the adjacent finished grade, the root flare shall be at 2" above finish grade, and shrub root balls shall be at finish grade. Do not backfill beds with planting soil until they have been reviewed by the Architect. Brace plants rigidly in position until the planting soil has been tamped solidly around the ball and roots. Backfill plants with planting soil mix to one-half full, water thoroughly, eliminating all air pockets. Tamp thoroughly before installing the remainder of the planting soil to the top of pit, eliminating all air pockets. At the end of one year, the plant shall be at the same depth. Never plant groundcover or other plants over top of root ball of tree or other plant.

1. Balled and Burlapped (B&B) Plants:
 - a. Remove excess soil from crown of rootball so that root flare is exposed.
 - b. Adjust compacted soil so that top of root ball at its flare is 2" above finish grade. Place trees centrally in pits so that all tree trunks are straight and plumb. When shown in-line, plant trees so that they are in alignment when viewed from end of row.
 - c. Remove twine tied around tree trunk. Remove burlap around ball to expose top half of ball. Remove wire and all other non-decomposable materials from top half of the rootball. Leave no plastic or foreign materials in the pit.
 - d. Backfill planting pits with topsoil in 12-in. layers and lightly irrigate and tamp each layer to fill voids until the planting mixture is at final grade.
 - e. Remove nursery plant identification tags.
 - f. Remove Wrappings: See Drawings. Cut and remove ropes, strings and wrapping from the top half of the ball after plant has been set. Leave balance of wrapping intact around the ball. All waterproof, water repellent or rot resistant wrappings shall be removed from the ball. Wire baskets shall be removed if the ball will hold together once it is removed. If the ball will not hold together, remove the top half of the wire basket once the plant is in the planting hole.

2. Container Grown Plants:
 - a. Open and remove potted plants from containers.
 - b. If the growing medium is comprised of 75% or more of peat, perlite, sand or like material other than soil, pull visible roots away from container medium so as to leave roots partially exposed.
 - c. Place plants in plant pit or trench and carefully backfill with topsoil among exposed roots. Continue backfilling and tamping in 6-in. layers until topsoil is at final grade.
 - d. Remove nursery plant identification tags.

- R. Saucer Formation:
 1. Smooth planting areas to conform to specified grades after full settlement has occurred and mulch has been applied.
 2. Form a shallow saucer, 6" deep capable of holding water, about each plant around edge of pit by depressing soil slightly below finished grade.
 3. Raise basin rims above general finished grade on low side of sloped areas by placing a mound of topsoil around the edge of each pit.
 4. Water plants immediately after planting. Avoid puddled soil conditions.
 - a. Trees: Perform initial watering on all trees which are designated for root pruning. Water trees immediately by thoroughly saturating root balls.
 - b. Install tree irrigation bags immediately after planting by zipping together around base of tree trunk. Fill bags with water immediately upon installation. Keep root balls thoroughly saturated during first three weeks following planting. Thereafter refill bags as required, according to weather conditions, to keep root balls in a moist condition during growing seasons, through Initial Maintenance. Test root balls for optimal moisture once a week using a soil auger. Remove bags by November 1st.
 - c. Perennial Grasses: Soak plant by fully saturating plant pit with water to full depth of plant pit.

5. Incorporate required topdressing of organic matter and fertilizer into prepared planting mixture at rate specified.
- S. Finish Grading: Rake smooth and finish grade all planted areas. Any undulations or irregularities on the surface shall be raked to smooth planes prior to planting. All areas shall slope to drain as indicated on drawings. Elevations in landscape areas after planting shall be +/- .10 foot of the finished grades shown on the drawings.
- T. Final Grades: Final finish grades of all planting areas, including beds and pits, after settling, shall be as shown on the Drawings. Required final grades and elevations shall be as shown by figured elevations or dimensioned depths; or where none are indicated, final grades and elevations shall be even lines or planes between such figured elevations, or between figured elevations and tops of paving or curbs. Verify grades established during final grading as being true to finish contours shown and maintain such areas until the effective date to begin any operations.
- U. Mulching:
 1. Mulch all plantings immediately after planting, as planting progresses.
 2. Maintain mulch for shade trees with minimum 3-in. depth of shredded hardwood bark to cover a concentric circular mulch ring as shown on the Drawings. Do not bring mulch closer than 6" to the root flare of the tree. Volcano mulching is prohibited.
 3. Maintain mulch in all planting beds in their entirety with 2" of mulch being careful not to mulch over stems.

3.3 PROTECTION AND MAINTENANCE

- A. Fertilizer:
 1. First Application (Ratio 1-4-4): Prior to installation of mulch to plant beds and saucers, apply commercial fertilizer to plant bed or saucer area at rate of 1/2 lb of active ingredient per 100 sq. ft.
 2. Second Application (Ratio 5-3-2): Apply fertilizer 60 days after planting at rate of 1/2 lb of active ingredient per 100 sq. ft.
- B. Anti-Desiccant Spray: If deciduous trees or shrubs are accepted by Architect to be moved full leaf, spray with anti-desiccant at nursery before moving and again 2 weeks after planting. Apply anti-desiccant using power spray to provide an adequate film over trunks, branches, stems, twigs and foliage, immediately after planting.
- C. Wrapping: Wrap trunks of deciduous trees immediately after they are planted. Wrap trunks of trees spirally from bottom to top with specified burlap, with 2" overlap, snug and neat, and securely tie with suitable twine at the top and bottom and at 12" intervals along the trunk. Entirely cover the trunk with wrap from the ground to the height of the second branches.
- D. Guying: No guying is required unless the tree fails to maintain a plumb position. Guys shall be completed immediately after planting. Guying of trees is not required unless plant fails to maintain an upright and plumb position. Drive anchors into the ground outside of the planting pit to a depth that will securely hold the tree. Attach cables with hose around the trunk. Leave cables with just enough slack that they will go tight in a wind. Plants shall stand plumb after and guying.

1. Guying: Guy all specimen trees which fail to maintain a plumb position, as determined by the Architect. Guy wires shall run out from tree in 3 opposed directions and each guy wire shall have a white "flag" as a warning of existing obstruction. Tighten guy wires to firm tensions by approved methods. Flag guys with 18 inch sections of 1-inch diameter white PVC pipe if guys extend outside planting area or pose a tripping hazard.

E. Watering:

1. Thoroughly water all trees and plants immediately after installation.
2. Fill irrigation bags weekly and water perennial grasses as needed during period of initial maintenance.

F. Mulching:

1. Mulch shade trees, evergreen trees, ornamental trees, singularly planted shrubs, hedge plantings, and massed plantings. Cover entire tree pit with minimum 3-in. depth of shredded hardwood bark. Cover perennial grass beds in their entirety with 2" specified mulch.
2. Mulch within 3 days after installation.
3. "Volcano Mulching" is not allowed. Keep mulch away from tree trunk as shown on the Drawings.

3.4 CLEAN UP

- A. Furnish all labor and materials to perform daily cleaning operations as the work progresses and at the conclusion of work. Remove soil or similar material brought onto paved areas, keeping these areas clean. Keep sidewalks and other paved areas clean of debris.
- B. Upon completion of planting, remove excess soil, stones, and debris and dispose of off-site in legal manner. Remove all equipment and unused materials provided for work and put the premises in a neat and clean condition.
- C. Tree Seal Removal: Remove trees seals just prior to end of warranty period.
- D. Protection: Protect plants against damage, including erosion and trespass, and provide proper safeguards as needed. Replant damaged areas. Repair or replace all such defective work, and all other work damaged thereby, which becomes defective until substantial completion. Advise Architect at that time as to whether continuing protections are required, and leave in place, if acceptable.
- E. Repair of Grade Relationship: Plants that do not bear the correct relationship to finished grade after settlement shall be raised or lowered, regardless of size, at no additional cost to Owner, throughout the specified warranty period.

3.5 MAINTENANCE

- A. Maintenance: Maintain plant material until landscape operations have received substantial completion of the project. This includes not only plant material but also installation completion (preliminary acceptance) of seeded areas. The landscape maintenance season is defined as the months during which landscape maintenance operations are required and extends from April 1 to November 30 of any given year.

- B. First Year Maintenance: Continue to maintain, including watering for all plant material through November 30 of year of Substantial Completion and throughout the One Year warranty period.
- C. Maintenance begins immediately after each plant is installed and shall include watering, necessary cultivation, weeding, pruning, disease and insect pest control, protective spraying, resetting of plants to proper grades or upright position, restoration of damaged planting saucers, and any other procedure consistent with good horticultural practice necessary to ensure normal, vigorous, and healthy growth of work.
1. Watering: Provide all necessary watering to insure the success of all plantings by supplying a sufficient quantity of water to penetrate the root systems of the plants on a frequent enough basis so as to avoid any moisture related stress. Monitor the application of water to prevent any too-dry or too-wet condition from occurring. Immediately bring any excessive moisture condition to the attention of the Architect. Regardless of watering method, it is the responsibility of the Contractor to monitor the application of water and to correct and adjust its application to insure success of the plantings.
 - a. Confirm Water Source: See Job Conditions Section of this specification.
 - b. Trees: Refill bags at least weekly, according to weather conditions, to keep root balls in a moist condition during growing seasons. Test root balls for optimal moisture once a week using a soil auger. Remove bags the week of November 15. Do not keep bags on trees over winter.
 - c. Shrubs: Auger test root balls of plants on a weekly basis to assure consistent and adequate moisture content for their survival. Shrubs may be routinely watered with soakers, provided that the Contractor thoroughly saturates the root zones. Hand sprinkling of the shrubs is not acceptable.
 - d. Other Plantings: Planting beds may be watered with a hose that has a water dispersing attachment, provided that the beds are adequately and frequently watered to assure the success of those plantings.
 2. Tree Pit and Plant Bed Maintenance: Maintain a circular outline at the base of all trees where practical and possible until the trees have become established. Cultivate all shrubs beds, and other planting beds as required to keep areas free of weeds and grass. Keep tree pits free of weeds. On a weekly basis, clean all planted areas including tree pits, of litter including cigarette butts and paper items.
 3. Pruning: Architect will review all plantings with Contractor at the maintenance review to determine the need for pruning. Special reviews shall be made by the Contractor after severe storms to determine damage. Remove all rubbing, dead, broken or down limbs immediately. Prune to preserve growth lines of shrubs, evergreens and trees to conform to the objectives of the landscape design. Do not shear or tip-prune any plants without first consulting with the Architect. Use clean implements, disinfecting between each cut, if necessary. Remove all debris resulting from pruning operations and legally dispose of off the site as the work progresses, at least daily.
 - a. Trees: Prune trees to retain required height and spread. Do not cut tree leaders. Remove all dead wood, suckers and broken or badly bruised branches, remove only injured or dead branches from flowering trees, if any. Do not paint cuts. After pruning is completed, and before wrapping, inspect tree trunks for injury, improper pruning and insect infestation and take corrective measures required. If needed, apply IPM insecticide according to

manufacturer's instructions, and in accordance with local and state laws.

- b. Perennial Grasses: Cut back grasses to 6" height at start of annual maintenance season to retain natural character and accomplish their use in the landscape design.
4. Pest Control and Control of Damage: Perform all pest control operations to maintain all trees, shrubs, and plant beds in a flourishing condition, including control of insects, fungus and other diseases. Do not use phytotoxic materials on plants. Spray for pests using licensed personnel only. Keep all drain inlets in plant beds clean and draining freely and make frequent inspections to assure proper drainage.
 5. Weed Control: Perform weed control in all planted, mulched or gravel areas by pulling or cultivation. Spraying or drenching may be allowed only if accepted by Architect so that susceptible vegetation is protected.
 6. Fertilization: Fertilize all trees and shrubs at the start of the first year's Spring season.
 7. Other Maintenance Operations: Clean, rake and maintain all mulch areas at specified depths throughout the maintenance period. Monitor growth and adjust supports for trees, shrubs and perennials. Sweep or rake up and re-deposit gravel mulches, such as at tree grates or drip strips, which has spilled off of gravel areas.

3.6 ACCEPTANCE

- A. Planting Acceptance: Upon substantial completion of the project, the Architect will inspect landscape work for acceptance. Acceptance requires:
 1. Plant material shall conform to drawings with respect to quantity, quality, size, species, and location, except those items accepted or revised in field by Architect
 2. Plant material shall be in healthy condition as defined under guarantee requirements below.
 3. Items shall appear to be in general conformance with specifications.

3.7 GUARANTEE

- A. Contractor shall guarantee for period of one year from the date of Substantial Completion or Preliminary Acceptance, replacement of plant which had died, or is in dying condition, or which has failed to flourish in such manner that its usefulness or appearance has been impaired. Replace any tree with dead main leader or crown which is 25% or more dead.
 1. Exclusions: Contractor shall not be liable for replacement cost of plants damaged by deicing compounds, fertilizers, pesticides or other materials not specified in Contract Documents or not applied by the landscaper, by relocating or removal by others, by acts of God, or by vandalism, and losses due to curtailment of water by local authorities.
 2. Inspection of Maintenance: During guarantee period, Contractor shall, from time to time, inspect watering, cultivation, and other maintenance operations carried on by Owner with respect to such work, and promptly report to Owner any methods, practices or operations considered unsatisfactory and not in accord with interests of good horticultural practices.
 - a. Failure of Contractor to inspect or report shall be construed as an acceptance of Owner's maintenance operations, and Contractor shall not thereafter claim or assert that any defects which may later develop are result of such methods or practices or operations.

3.8 REPLACEMENTS

- A. Plants which die or require replacement for other reasons during the guarantee period shall be replaced as soon as possible during following acceptable planting seasons:
 - 1. Spring Replacement Season, All plants: From workable ground to June 15.
 - 2. Fall Replacement Season:
 - a. Deciduous plants - September 1 to November 15.
 - b. Evergreen plants, groundcovers and perennials - September 1 to October 15.
- B. Topsoil that does not conform to the environmental standards set by these Specifications shall be excavated and replaced with topsoil that does at Contractor's expense.
- C. Procedure:
 - 1. Dispose of all excess materials including excess plants off-site in legal manner.
 - 2. Replacements shall be of same size and species as original plant unless otherwise approved by Architect.
 - 3. Replacements shall be supplied and installed in accordance with specifications.
 - a. Additional one-year guarantee for replacement plants shall begin on date of final acceptance of plant material by Architect as documented in field report.
 - 4. Replacement and Damages:
 - a. Decisions of Architect for required replacements shall be conclusive and binding upon Contractor.
 - b. Contractor shall be responsible for repairing damage to property also caused by defective workmanship and materials.
 - c. In the circumstance whereby the Owner requests repair of planting areas which have been damaged by others, repair said areas designated by the Architect upon issuance of a written change order which specifies the cost to the Owner. Protect finished work where replacements are made. Replanting shall cause a minimum of disturbance to the existing plantings. This work shall be installed, maintained and warranted according to the same conditions as specified herein.

END OF SECTION 32 93 11

SECTION 33 10 13 – WATER SERVICE

PART 1 - GENERAL

1.1 SUMMARY

- A. This item shall include furnishing all labor, materials, tools, and equipment required to install the water service as established by Contractor in continuity to the plans and specifications for the complete systems. The work shall include excavation for water pipes, water service installation, backfilling trenches, and testing and disinfecting of the complete water systems as required.
- B. Ductile or other slip-joint connected pipe is to be made electrically continuous with exothermically welded bonds across joints. Dielectrics are to be installed at street connection.
- C. Related Sections: Requirements that relate to this section are included but not limited to the sections below.
 - 1. Section 01 31 00 "Submittal Requirements".
 - 2. Section 01 74 19 "LEED Construction Waste Management and Disposal" for Construction Waste management Plan.
 - 3. Section 31 23 16 "Excavation".
 - 4. Section 31 23 23.01 "Fill"
 - 5. Section 31 23 17 "Excavating, Backfilling, and Compacting for Utilities"

1.2 SUBMITTALS

- A. Manufacturers literature, installation instructions, dimensions, materials, standards, certifications and guarantees.

1.3 QUALITY ASSURANCE

- A. In accordance with Division 01 Sections.
- B. The work performed on joining all pipe and fittings, must be performed by a plumber licensed in the State of Illinois or the City. This work must include, but not be limited to, joining all pipe and fittings, installing joint gaskets, assembling all joints, installing continuity wedges, and tightening all gland nuts and bolts, as applicable for the installation.

PART 2 - PRODUCTS

2.1 MATERIAL

- A. Water service piping and fittings shall be as specified herein and in Section 22 11 16.
- B. The pipe 3-inch and larger shall be ductile iron conforming to standard ANSI/AWWA C151/A21.51, with mechanical joints. 3-inch pipe shall be class 54, 4-inch pipe and 6-inch pipe shall be class 55, and 8-inch through 12-inch pipe shall be class 56. The pipe and fittings shall

be cement lined to conform with standard ANSI/AWWA C104/A21.4. The size and pipe class shall be stenciled on all material delivered to the job site. Fittings to be furnished and installed as specified or shown on the Contract Plans shall be mechanical type with retainer glands, ductile iron in accordance with ANSI/AWWA C110/A21.10 standard and have a 250 psi pressure rating. All pipe and fittings shall be encased in 4 mil cross laminated high density polyethylene tubing.

- C. The pipe smaller than 3" shall be Type "K" soft copper to comply with ASTM B 88 latest edition and installed with wrought copper (95-5 Tin Antimony solder joint) fittings in accordance with ASME B16.22.
- D. Connection to city water main by City of Chicago. The contractor shall reimburse the City for their costs at the rate per service connection.
- E. Stops and fittings shall be fabricated of brass and provided with outlets suitable for copper connections.
- F. Bedding material shall be gradation CA-16/CA-11 per plans. Backfill material shall be satisfactory excavated material/CA-16/CLSM per plans.

2.2 VALVES

- A. 2 -inch water service and smaller:
 - 1. Roundway (curb stop) valves: Roundway valves are to be of the ball valve type, of bronze construction, with flared end connections, and Minneapolis style curb box threads. Roundway valves are to conform to ASTM B62 and ASTM C800 standards.
 - 2. Shut-off Boxes: Shut-off boxes must be Chicago Shut-off Water Boxes, Type B, as manufactured by C. P. Test Services – Valvco, Inc. Boxes are to be made of rigid ABS plastic, of a two piece, sliding friction type design. The bottom tube is to be fitted with a bonded metal female threaded end fitting for fasten the shut-off box to the roundway valve assembly. A cast iron lid and rim top casting is to be bonded to the top of the two piece assembly. The two piece assembly must be capable of providing adjustable lengths from 37 to 72-inches.
 - 3. Corporation Cocks and Tapping Connection: Corporation cocks must be of the plug type, and of brass construction. Corporation cocks must conform to ASTM B62 and AWWA C800 standards. Water mains must be tapped at a 45 degree angle from the vertical axis of the main. The corporation cock must be turned so that the T-handle is on top of the fitting. Service are to extend horizontally at a right angle from the water main to the existing or proposed curb stop.
- B. 3-inch water service and larger: The Contractor shall furnish and install Chicago Standard Gate Valves in the sizes required wherever shown on the plans or specified. All valves must give an unobstructed waterway of full size when open. Gates or stems must not extend into the waterway:
 - 1. Gate Valves: Gate valves are to be Chicago Standard Gate Valves, Series N, as manufactured by East Jordan Iron Works Inc., and comply with AWWA C500 standards. Gate valves must be used on all water mains up to and including 16-inches in diameter, and on building services 3-inches in diameter and larger. Valves are to be installed in precast concrete valve basins.

2. Resilient Wedge Valves: The use of resilient wedge valves is restricted and must be of type and installed per City of Chicago Water Design Section standards.
3. Butterfly Valves: Butterfly valves are to be used on all water mains larger than 16-inches in diameter and must be of type and installed per City of Chicago Water Design Section standards.

2.3 DUCTILE IRON PIPE RESTRAINT

- A. Mechanical joint thrust restraint glands must be used. Where such glands cannot be used to provide sufficient thrust restraint, concrete thrust blocks must be used.
- B. CONCRETE THRUST BLOCK RESTRAINT
 1. All concrete used in the construction of thrust blocks must be Class SI of the SSRBC.
 2. All reinforcing steel used in the construction of thrust blocks must conform to the requirements of ASTM A615.

PART 3 - EXECUTION

3.1 HORIZONTAL SEPARATION - WATER MAINS AND SEWERS

- A. The work under this section will be performed in accordance with applicable sections of the City of Chicago Building and Plumbing Code, latest edition.
- B. Water mains shall be located at least ten feet horizontally from any existing or proposed drain, storm sewer, sanitary sewer, combined sewer or sewer service connection.
- C. Water mains may be located closer than ten feet to a sewer line when:
 1. Local conditions prevent a lateral separation of ten feet; and
 2. The water main invert is at least 18 inches above the crown of the sewer; and
 3. The water main is either in a separate trench or in the same trench on an undisturbed earth shelf located to one side of the sewer.
- D. When it is impossible to meet (1) or (2) above, both the water main and drain or sewer shall be constructed of slip-on mechanical joint cast or ductile iron pipe. The drain or sewer shall be pressure tested to the maximum expected surcharge head before backfilling.

3.2 VERTICAL SEPARATION - WATER MAINS AND SEWERS

- A. A water main shall be separated from a sewer so that its invert is a minimum of 18 inches above the crown of the drain or sewer whenever water mains cross storm sewers, vertical separation shall be maintained for that portion of the water main located within ten feet horizontally of any sewer or drain crossed. A length of water main pipe shall be centered over the sewer to be crossed with joints equidistant from the sewer or drain.
- B. Both the water main and sewer shall be constructed of slip-on or mechanical joint cast or ductile iron pipe, prestressed concrete pipe, when:
 1. It is impossible to obtain the proper vertical separation as described in (A) above; or

2. The water main passes under a sewer or drain.

- C. A vertical separation of 18 inches between the invert of the sewer or drain and the crown of the water main shall be maintained where a water main crosses under a sewer. Support the sewer or drain lines to prevent settling and creaking the water main, as shown on the plans or as approved by the Engineer.
- D. Construction shall extend on each side of the crossing until the perpendicular distance from the water main to the sewer or drain line is at least ten feet.

3.3 WATER SERVICE LINES

- A. The horizontal and vertical separation between water service lines and all storm sewers, sanitary sewers, combined sewers or any drain or sewer service connection shall be the same as water main separation described above.
- B. Water pipe above shall be used for sewer service lines when minimum horizontal and vertical separation cannot be maintained.

3.4 CONSTRUCTION PROCEDURES

- A. Excavation: The Contractor shall do all excavation of whatever unclassified material is encountered to the depths established by Contractor. Trench depths, not established, shall be figured to allow a minimum of 5'-6" cover over the top of the pipe.
1. In open cut excavation, the Contractor shall keep the trench width at the top of the pipe not wider than established, unless the angle or repose of the soil is unsuitable.
- B. Pumping: The contractor shall remove, by pumping or other means, any water accumulated in the excavation and keep the trench dry during the pipe laying period. The contractor shall provide adequate pumps, well points, or other dewatering method at no extra cost to the Owner.
- C. Bedding: All water mains shall be laid on a six-inch (6") layer of CA-16/CA-11 limestone per plans.
1. As established by Contractor, or where necessary because of soil conditions, concrete cradles or concrete encasement shall be built. The pad section of a cradle or encasement shall be built at least twelve (12) hours before pipe laying. A sufficient number of No. 9 annealed iron pipes shall be embedded in the pad and subsequently tied around the pipe to prevent the pipe from moving off line and/or grade.
- D. Installation Of Pipe: Before lowering the pipe into the trench and while suspended, each pipe shall be inspected by the Contractor for defects. Defective, damaged or unsound pipe shall be immediately removed from the site. The interior of each pipe shall be inspected for cleanness and cleared of all dirt and foreign matter before being lowered into the trench.
1. Unless otherwise directed, pipe shall be laid with bell ends facing in the direction of laying. After a length of pipe is placed in the trench, the spigot shall be centered in the bell of the preceding pipe, the pipe shoved into position and brought to true alignment and there secured with sand tamped under and on each side of the pipe, excepting at bell holes. No earth or other foreign matter shall be allowed to enter into the joint space.
2. The bells, spigots and rubber gaskets shall then be thoroughly washed in soapy water so that no particles of sand or grit can damage the gasket. Slip-on joints shall be constructed in strict accordance with the manufacturer's recommendations.

3. CA-16/CA-11 crushed limestone shall be tamped into place to the spring line of the pipe.
- E. Cutting of Pipe: Where necessary to cut pipe, cutting shall be done with proper tools and cut end of pipe shall be square and regular. Cutting shall be done in strict conformance with manufacturer's instructions.
 - F. At locations where pipe thrust is anticipated to occur, pipe and fittings must be anchored or restrained. Polyethylene encasement is to be installed on all new water main pipe and fittings before pipe is installed and braced against movement. Care must be taken so as not to damage the polyethylene encasement during the installation or blocking of the pipe and fittings. If damage occurs, the Contractor must repair or replace the polyethylene encasement at his expense.
 - G. Installation of Valves and Fittings: Before connecting valves or fittings to the pipe, such valves shall be cleaned and inspected by the Contractor for defects. Defective, damaged or unsound valves shall have a mechanical joint and be placed as established by contractor. All bolts, valves or fittings shall have thrust blocks as required set to undisturbed earth. All bolts shall be sufficiently tightened to manufacturer's recommendation.
 - H. Backfilling:
 1. Support pipes, and conduits as required during placement and compaction of backfill/bedding fill.
 2. Backfill of auxiliary valves and line valves, shall be carefully tamped to insure proper alignment. Contractor shall properly align and set to grade all valve boxes after completion of curb and gutter construction.
 3. Pipe Zone: Crushed limestone granular backfill shall be carefully placed and thoroughly tamped and compacted around the pipe with hand tools up to the spring line of the pipe.
 4. Granular Trench Backfill: All trenches and the excavation around fire hydrants, valves and other appurtenances which occur within the limits of existing or proposed pavements, sidewalks and curb and gutters, or where the edge of the trench shall be within two feet (2') of said improvements shall be backfilled with compacted granular backfill.
 5. Guarantee: The contractor shall guarantee all work for a period of one year after acceptance by the Owner. Any trenches improperly backfilled or where settlement occurs shall be reopened and properly compacted. The cost of any corrections and/or repair of any damages to other facilities shall be the responsibility of the Contractor.

3.5 TESTING

- A. Hydrostatic testing of water mains must be performed in accordance with AWWA C600 and the City of Chicago Department of Water Management's (DWM) requirements. The disinfection of water mains must be performed in accordance with IEPA Regulations, AWWA C651, and DWM.
- B. After completion of the disinfection/chlorination process, the chlorination water must be thoroughly flushed from all pipelines per DWM. The water main must be flushed until the water flows clear.

3.6 REMOVAL AND DISPOSAL

- A. Connection to the water main shall be made by the City of Chicago Water Department. Contractor shall coordinate final connection with the city.

END OF SECTION 33 10 13

SECTION 33 41 00 – SEWERAGE AND DRAINAGE

PART 1 - GENERAL

1.1 SUMMARY

- A. Section includes all labor, materials, tools, and equipment required to install the exterior storm, sanitary, and combined sewer systems as established by the Contractor in accordance with the plans and specification for a complete system. The work shall include but is not limited to excavation for sewer pipes and structures, sewer pipe and structure installation, backfilling trenches, and testing of the complete systems as required, five feet from exterior of building footprint.

1.2 REFERENCE STANDARDS

- A. AASHTO LRFD - Bridge Design Specifications; 2017.
- B. ACI 318 - Building Code Requirements for Structural Concrete and Commentary; 2014 (Errata 2017).
- C. ACI 350 - Code Requirements for Environmental Engineering Concrete Structures and Commentary; 2006.
- D. ASTM A1064/A1064M - Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, for Concrete; 2017.
- E. ASTM A48/A48M - Standard Specification for Gray Iron Castings; 2003 (Reapproved 2016).
- F. ASTM A615/A615M - Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement; 2016.
- G. ASTM C150/C150M - Standard Specification for Portland Cement; 2017.
- H. ASTM C33/C33M - Standard Specification for Concrete Aggregates; 2016, with Editorial Revision (2016).
- I. ASTM C425 - Standard Specification for Compression Joints for Vitrified Clay Pipe and Fittings; 2004 (Reapproved 2013).
- J. ASTM C443 - Standard Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets; 2012 (Reapproved 2017).
- K. ASTM C478 - Standard Specification for Circular Precast Reinforced Concrete Manhole Sections; 2015a.
- L. ASTM C891 - Standard Practice for Installation of Underground Precast Concrete Utility Structures; 2011.
- M. ASTM C923 - Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals; 2008, with Editorial Revision (2016).
- N. AWWA C110/A21.10 - Ductile-Iron and Gray-Iron Fittings; 2012.

- O. AWWA C111/A21.11 - Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings; 2017.
- P. AWWA C151/A21.51 - Ductile-Iron Pipe, Centrifugally Cast; 2017.
- Q. AWWA C153/A21.53 - Ductile-Iron Compact Fittings; 2011.

1.3 DEFINITIONS

- A. Drainage Piping: System of sewer pipe, fittings, and appurtenances for gravity flow of storm drainage.

1.4 ADMINISTRATIVE REQUIREMENTS

- A. Coordinate with other utility work.

1.5 SUBMITTALS

- A. Shop drawings for precast concrete manholes and other structures. Include frames, covers, and grates.
- B. Inspection and test reports specified in the "Field Quality Control" Article.

1.6 QUALITY ASSURANCE

- A. Environmental Agency Compliance: Comply with regulations pertaining to sanitary sewerage and storm drainage systems.
- B. Utility Compliance: Comply with regulations pertaining to sanitary sewerage and storm drainage systems. Include standards of water and other utilities where appropriate.
- C. Product Options: Drawings indicate sizes, profiles, connections, and dimensional requirements of system components and are based on specific manufacturer types indicated.

1.7 PERFORMANCE REQUIREMENTS

- A. Gravity-Flow, Nonpressure-Piping Pressure Ratings: At least equal to system test pressure.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Protect pipe, pipe fittings, and seals from dirt and damage.
- B. Handle precast concrete manholes and other structures according to manufacturer's rigging instructions.

1.9 SITE CONDITIONS

- A. Site Information: Perform site survey, research public utility records, and verify existing utility locations.
- B. Existing Utilities: Do not interrupt existing utilities serving facilities occupied by the Owner or others except when permitted under the following conditions and then only after arranging to provide acceptable temporary utility services.

1. Notify Architect not less than 48 hours in advance of proposed utility interruptions.

2. Do not proceed with utility interruptions without receiving Architect's written permission.

PART 2 - PRODUCTS

2.1 PIPES AND FITTINGS

- A. Ductile-Iron Sewer Pipe class 52 or equivalent:
 1. Ductile-Iron Fittings: AWWA C110, ductile or gray iron, for push-on joints.
 2. Pipe joints must be push-on type joints with rubber gaskets unless otherwise shown on the Drawings, specified. Push-on type joints must conform to AWWA C111.
 3. Exterior of pipe and fittings must be coated with a petroleum asphaltic material in conformance with AWWA C110.
 4. Pipe encased in 4 mil cross laminated high-density polyethylene tubing. The tubing must comply with AWWA C105.
- B. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76 (ASTM C 76M), Class III, Wall B, with O-ring type joints.
 1. Gaskets: ASTM C 443 (ASTM C 443M), rubber.
- C. Extra Strength Vitrified Clay (ESVCP) Pipe:
 1. Pipe: ASTM C 700.
 2. Joints: ASTM C 425.
 3. Gaskets: ASTM C 425; high grade vulcanized elastomeric compound consisting of basic natural or synthetic rubber. Provide gaskets manufactured in compliance with Rubber Manufacturer's Association tolerances for gaskets.
- D. Perforated pipe: ASTM D3034; PVC-SDR-26. Provide four rows of perforations meeting AASHTO M278 specifications. Joints ASTM D2855 or ASTM D 3212.

2.2 MANHOLES

- A. Precast Concrete Manholes: ASTM C478/ASTM C478M, precast, reinforced concrete, of depth indicated, with provision for rubber gasket joints.
 1. Ballast: Increase thickness of precast concrete sections or add concrete to base section, as required to prevent floatation.
 2. Base Section: 6-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section, and having a separate base slab or base section with integral floor.
 3. Riser Sections: 4-inch minimum thickness, 48-inch diameter, and lengths to provide depth indicated.

4. Top Section: Eccentric cone type, unless concentric cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
 5. Gaskets: ASTM C443/ASTM C443M, rubber.
 6. Grade Rings: Include 2 or 3 reinforced-concrete rings, of 6- to 9-inch total thickness, that match a 24-inch- diameter frame and cover.
 7. Steps: ASTM C478/ASTM C478M individual steps or ladder. Omit steps for manholes less than 60 inches deep.
 8. Pipe Connectors: ASTM C923/ASTM C923M, resilient, of size required, for each pipe connecting to base section.
 9. Precast subsurface structures shall be rated to accommodate AASHTO LRFD HS-20 loading.
- B. Manhole Frames and Covers: Heavyweight manhole frame and heavy duty manhole lid ASTM A48, Class 35B, cast gray iron and per current City Of Chicago code - Department Of Water Management Regulations For Sewer Construction And Stormwater Management. Equip on-site manhole covers with lock-bolt or approved locking mechanism device if indicated on plans. Include indented top design with lettering cast into cover:
1. Drainage Piping Systems: Raised flush letters per current city code.
 2. Pipe Connectors: ASTM C923/ASTM C923M, resilient, of size required, for each pipe connecting to base section.
 3. Precast subsurface structures shall be rated to accommodate AASHTO LRFD HS-20 loading.

2.3 CATCH BASINS

- A. Precast Concrete Catch Basins: ASTM C478/ASTM C478M, precast, reinforced concrete, of depth indicated, with provision for rubber gasket joints.
1. Base Section: 6-inch minimum thickness for floor slab and 4-inch minimum thickness for walls and base riser section, and having a separate base slab or base section with integral floor.
 2. Riser Sections: 4-inch minimum thickness; 48-inch diameter, and lengths to provide depth indicated.
 3. Top Section: Eccentric cone type, unless concentric cone or flat-slab-top type is indicated. Top of cone of size that matches grade rings.
 4. Gaskets: ASTM C443/ASTM C443M, rubber.
 5. Grade Rings: Include 2 or 3 reinforced-concrete rings, of 6- to 9-inch total thickness, that match a 24-inch- diameter frame and grate.
 6. Steps: ASTM C478/ASTM C478M individual steps or ladder. Omit steps for catch basins less than 60 inches deep.

7. Pipe Connectors: ASTM C923/ASTM C923M, resilient, of size required, for each pipe connecting to base section.

B. Frames and Grates:

Manhole Frames and Grates: Heavyweight manhole frame and heavy duty Catch Basin lid ASTM A48, Class 35B, cast gray iron and per current City Of Chicago code - Department Of Water Management Regulations For Sewer Construction And Stormwater Management. Equip on-site manhole covers with lock-bolt or approved locking mechanism device if indicated on plans. Include indented top design with lettering cast into cover:

a. Drainage Piping Systems: Raised flush letters per city code

b. Install ADA [American Disabilities Act] approved grates for catch basins located within pedestrian path of travel (within property limits only).

2.4 CLEANOUTS

- A. Push-on-Joint, Ductile-Iron Fittings: AWWA C110/A21.10, ductile- or gray-iron standard pattern or AWWA C153/A21.53, ductile-iron compact pattern.
- B. Gaskets: AWWA C111/A21.11, rubber.

2.5 CONCRETE

- A. General: Cast-in-place concrete according to ACI 318, ACI 350, and the following:
 1. Cement: ASTM C150/C150M, Type II.
 2. Fine Aggregate: ASTM C33/C33M, sand.
 3. Coarse Aggregate: ASTM C33/C33M, crushed gravel.
 4. Water: Potable.
- B. Structures: Portland-cement design mix, 4000 psi minimum, with 0.45 maximum water-cement ratio.
 1. Reinforcement Fabric: ASTM A1064/A1064M, steel, welded wire fabric, plain.
 2. Reinforcement Bars: ASTM A615/A615M, Grade 60, deformed steel.

2.6 TRANSITION AND PIPE COUPLINGS

- A. Pipe transitions and Pipe couplings shall be water tight couplings with stainless steel band clamps or approved equal.

2.7 PROTECTIVE COATINGS

- A. General: Include factory- or field-applied protective coatings to structures and appurtenances according to the following:

- B. Coating: 1- or 2-coat, coal-tar epoxy, 15-mil minimum thickness, except where otherwise indicated.
 - 1. Manholes: On exterior and interior surfaces.
 - 2. Manhole Frames and Covers: On interior surfaces.
 - 3. Catch Basins: On exterior and interior surfaces.
 - 4. Catch Basin Frames and Grates: On interior surfaces.

PART 3 - EXECUTION

3.1 EARTHWORK

- A. Excavating, trenching, and backfilling is specified in Division 31.

3.2 IDENTIFICATION

- A. Install green warning tapes directly over piping and at outside edges of underground structures.
 - 1. Use warning tapes or detectable warning tape over ferrous piping.
 - 2. Use detectable warning tape over nonferrous piping and over edges of underground structures.

3.3 INSTALLATION, GENERAL

- A. General Locations and Arrangements: Drawings indicate the general location and arrangement of underground sewerage and drainage systems piping. Location and arrangement of piping layout take into account many design considerations. Install piping as indicated, to extent practical.
- B. Install piping beginning at low point of systems, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's recommendations for use of lubricants, cements, and other installation requirements. Maintain swab or drag in line and pull past each joint as it is completed.
- C. Install gravity-flow-systems piping at constant slope between points and elevations indicated. Install straight piping runs at constant slope, not less than that specified, where slope is not indicated.
- D. Install piping pitched down in direction of flow, at minimum slope of 1 percent (1:100) and 36-inch minimum cover, except where otherwise indicated.

3.4 PIPE JOINT CONSTRUCTION AND INSTALLATION

- A. General: Join and install pipe and fittings according to the following.
 - 1. Hub-and-Spigot, Vitrified Clay Pipe and Fittings: With rubber compression gaskets according to ASTM C425. Use gaskets that match class of pipe and fittings.

3.5 MANHOLE INSTALLATION

- A. General: Install manholes, complete with accessories, as indicated.
- B. Set tops of frames and covers flush with finished surface where manholes occur in pavements. Set tops 3 inches above finished surface elsewhere, except where otherwise indicated.
- C. Place precast concrete manhole sections as indicated, and install according to ASTM C891.
 - 1. Provide rubber joint gasket complying with ASTM C443/ASTM C443M, at joints of sections.
 - 2. Apply bituminous mastic coating at joints of sections.

3.6 TAP CONNECTIONS

- A. Make connections to existing piping and underground structures so finished work conforms as nearly as practical to requirements specified for new work.
- B. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe, install wye fitting into existing piping, and encase entire wye fitting plus 6-inch overlap, with not less than 6 inches of 3000-psi, 28-day, compressive-strength concrete.
- C. Make branch connections from side into existing piping, sizes 4 to 20 inches by removing a section of existing pipe and installing a wye fitting into existing piping. Encase entire wye with not less than 6 inches of 3000-psi, 28-day, compressive-strength concrete.
 - 1. Use concrete that shall attain a minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.
 - 2. Use epoxy bonding compound as an interface between new and existing concrete and piping materials.
- D. Protect existing piping and structures to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

3.7 FIELD QUALITY CONTROL

- A. Clear interior of piping and structures of dirt and superfluous material as the work progresses. Maintain swab or drag in piping and pull past each joint as it is completed.
 - 1. In large, accessible piping, brushes and brooms may be used for cleaning.
 - 2. Place plug in end of incomplete piping at end of day and whenever work stops.
 - 3. Flush piping between manholes and other structures, if required by authorities having jurisdiction, to remove collected debris.
- B. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of the Project.
 - 1. Defects requiring correction include the following:
 - a. Alignment: Less than full diameter of inside of pipe is visual between structures.

- b. Deflection: Flexible piping with deflection that prevents passage of a ball or cylinder of a size not less than 92.5 percent of piping diameter.
 - c. Crushed, broken, cracked, or otherwise damaged piping.
 - d. Improper infiltration: Water leakage into piping.
 - e. Improper exfiltration: Water leakage from or around piping.
- 2. Replace defective piping using new materials and repeat inspections until defects are within allowances specified.
 - 3. Reinspect and repeat procedure until results are satisfactory.

NOTES:

1. THE CONTRACTOR SHALL VERIFY AND COMPARE TO ALL EXISTING SURVEY POINTS BEFORE BEGINNING ANY CONSTRUCTION AND REPORT ANY DISCREPANCIES TO THE ARCHITECT IMMEDIATELY.
2. CONDUCT SITE DEMOLITION OPERATIONS ENSURING MINIMUM INTERFERENCE WITH STREETS, WALKS, AND OTHER ADJACENT FACILITIES.
3. REMOVAL WORK INCLUDES BUT IS NOT LIMITED TO PAVING, CURBS, GUTTERS, GRAVEL, CONCRETE BLOCKS, CONCRETE BARRIER WALLS, WOOD, FENCES, POSTS, UTILITY POLES, UTILITY STRUCTURES AND PIPES, GUARD RAIL, RAILROAD TIES, TIRES, METAL ETC. OR OTHER STRUCTURES. REMOVAL OF ALL THE EXISTING SITE ITEMS WITHIN PROJECT SITE INCLUDING BUT NOT LIMITED TO GRAVEL, CONCRETE BLOCKS, CONCRETE BARRIER WALLS, TIRES, RAILROAD TIES, WOOD, METAL ETC. ARE NOT SHOWN ON THE PLANS AND THE CONTRACTOR SHALL VISIT THE SITE BEFORE BIDDING AND ASCERTAIN THE EXTENT OF REMOVALS AND PROPOSED WORK. BURNING ON OWNER'S PROPERTY IS NOT PERMITTED.
4. REMOVE ALL DEMOLISHED MATERIALS (UNLESS NOTED OTHERWISE) FROM PROJECT SITE REGULARLY AND DISPOSE OF LEGALLY. THE CONTRACTOR SHALL COMPLY WITH CONTRACT DOCUMENTS, FEDERAL, STATE, AND LOCAL ORDINANCES WITH REGARDS TO REMOVAL AND DISPOSAL OF MATERIALS FOR ITEMS TO BE DEMOLISHED/REMOVED.
5. THE CONTRACTOR SHALL HAND DIG WITHIN 2' OF KNOWN UTILITIES BEFORE USING POWER EQUIPMENT. THE CONTRACTOR SHALL USE EXTREME CAUTION WHILE EXCAVATING NEAR THE SUBSURFACE FACILITIES/UTILITIES. ALL EXISTING FACILITIES/UTILITIES OR COMPLETED NEW CONSTRUCTIONS AND INSTALLATIONS NOT INDICATED FOR DEMOLITION, IF DAMAGED AS A RESULT OF ON GOING CONSTRUCTION WORK ON THIS PROJECT SHALL BE REPLACED OR REPAIRED BY THE CONTRACTOR AT NO COST TO THE OWNER.
6. THE CONTRACTOR SHALL COORDINATE ALL DEMOLITION/EXCAVATION WITH THE PROJECT PLANS AND CORRESPONDING DETAILS. WITHIN THE PROJECT SITE, EXISTING ABANDONED CONCRETE FOUNDATIONS AND UTILITIES, IF IN CONFLICT WITH PROPOSED FACILITIES/UTILITIES SHALL BE REMOVED.
7. SAWCUT, REMOVE, AND REPLACE PART OF CONCRETE PAVEMENT PANEL AND BASE. PROVIDE NEW CONCRETE PAVEMENT JOINT PER JOINTING PLAN.
8. NOT ALL THE POSTS FOR THE STAIRCASE AND PORCH STRUCTURE ATTACHED TO THE STAIRCASE ARE SHOWN. PROTECT EXISTING STAIRS, CONCRETE STAIR LANDING, AND STAIRCASE/PORCH FOUNDATIONS AND POSTS TO REMAIN.
9. SAWCUT ALL EXISTING CONCRETE PAVEMENT UP TO THE NEAREST JOINT, EXCEPT WHERE OTHERWISE NOTED.
10. THE CONTRACTOR TO CONTACT AND COORDINATE WITH STORMTRAP AT 815-941-4549 BEFORE PERFORMING ANY EXCAVATION OR CONSTRUCTION OVER AND AROUND THE EXISTING UNDERGROUND STORMTRAP DETENTION SYSTEM. THE CONTRACTOR SHALL USE EQUIPMENT/METHODS WHICH WILL NOT RESULT IN THE MAXIMUM WEIGHT AND GROUND PRESSURE BEING EXCEEDED PER STORMTRAP STANDARDS.
11. REMOVE AND LEGALLY DISPOSE OF ALL TREES AND SCRUB VEGETATION WITHIN JPSTC PROPERTY.
12. THE CONTRACTOR SHALL PROTECT ALL EXISTING TREES NOT CALLED OUT FOR REMOVAL THROUGHOUT THE PROJECT SITE. IF DAMAGED, THE CONTRACTOR SHALL REPLACE THE DAMAGED TREE WITH THE SAME SIZE AND SPECIES WITHOUT ANY COST TO THE OWNER.
13. EXISTING UTILITIES TO BE ABANDONED, SHALL BE REMOVED AT LOCATIONS IF IN CONFLICT WITH PROPOSED FACILITIES OR UTILITIES. SEE DETAIL 1 SHEET C908 FOR SEWER STRUCTURES AND PIPES TO BE ABANDONED.
14. THE HOLES CREATED DUE TO REMOVAL WORK SHALL BE FILLED WITH CA-6 BACKFILL AND COMPACTED TO 95% MODIFIED PROCTOR DENSITY.
15. EXCAVATION SHOULD START ONLY AFTER THE IRRIGATION LINES HAVE BEEN DRAINED, THE VALVES ARE SHUT OFF, AND THE SYSTEM IS CAPPED PER MEP/LANDSCAPE PLANS. EXISTING ABANDONED IRRIGATION LINES SHOULD BE REMOVED IF FOUND WITHIN THE LIMITS OF THE PROPOSED UTILITY TRENCHING OR WITHIN EXCAVATION FOR PROPOSED WORK.
16. REMOVE AND SALVAGE EXISTING ARM GATE WITH CONCRETE FOUNDATION AND ASSOCIATED CABLES/EQUIPMENT FOR REINSTALLATION PER SITE PLAN AND TECHNOLOGY SITE PLAN. ABANDON EXISTING SIGNAL DETECTOR LOOP.

10' RECYCLED SOLID PLASTIC SPEED BUMP WITH 5" LAGS & ANCHORS
(BY TRAFFIC SAFETY STORE 800-429-9030 OR APPROVED EQUAL)

- 10' LONG X 10" WIDE X 2" TALL
- APPROXIMATELY 43 LBS EACH
- INCLUDES FIVE (5) FASTENERS PER BUMP

12" RECYCLED PLASTIC SPEED BUMP END CAPS WITH FOUR (4) 5" LAG BOLTS & ANCHORS
(BY TRAFFIC SAFETY STORE 800-429-9030 OR APPROVED EQUAL)

- 12" LONG X 10" WIDE X 2" TALL
- 4 LBS EACH
- INCLUDES TWO (2) FASTENERS
- 2 END CAPS

THE SPEED BUMP HAS YELLOW COLOR MOLDED IN THROUGHOUT. THE SPEED BUMP IS MOLDED OF 100 PERCENT POST-CONSUMER PLASTIC, LEED QUALIFIED, FADE-PROOF, AND LIGHTWEIGHT WITH A LIFETIME ANTI-BREAKAGE GUARANTEE. SPEED BUMP INCLUDES RECESSED BOLT HOLES.

DETAILS

SHEET NUMBER

- LEGEND:**
- PROJECT LIMIT LINE
 - TREE PROTECTION FENCE
 - EXISTING 6' CHAIN LINK FENCE
 - x-x- EXISTING GUARDRAIL
 - ▨ GRAVEL
 - SEED
 - ▨ PROTECTION AREA
 - SINGLE PANEL LED LIGHT
 - ⊙ CARD READER
 - ⊙ GATE POSTS
- NOTES:**

1. THIS IS A CONCEPT PLAN - NOT FOR CONSTRUCTION.
2. SEE NOTES ON SHEET L302.
3. RENOVATE EXISTING GATE TO MEET UL325/ASTM F2200 STANDARDS

- NOTES:**
1. SLIDING GATES SHALL CONFORM TO THE CURRENT UL 325 AND ASTM F2200 STANDARDS.
 2. FOR CLASS IV - RESTRICTED ACCESS VEHICULAR GATE OPERATOR, WARNING SIGNS SHALL BE ATTACHED TO BOTH SIDES OF THE GATE AREA IN HIGHLY VISIBLE LOCATIONS.
 3. ENTRAPMENT AREAS SHALL BE COVERED WITH AT LEAST 2 SAFETY DEVICES IN EACH DIRECTION OF TRAVEL.
 4. GATES SHALL HAVE TWO BOTTOM EDGES.
 5. ALL OPERATORS AND ACCESS CONTROLS SHALL BE INSTALLED AT 6'-0" MINIMUM AWAY FROM THE GATE. ALSO SEE NOTES 15 AND 16.
 6. A SEPARATE PEDESTRIAN GATE, OUT OF REACH OF THE MOVING GATE, BUT WITHIN 10 FEET SHALL BE PROVIDED.
 7. PROVIDE ROLLER COVERS ON CANTILEVER WHEELS.
 8. PROVIDE VINYL COATED WIRE MESH SCREEN WITH OPENINGS LESS THAN 2-1/2 INCHES AFFIXED TO GATE AND FENCE TO 6 FOOT HEIGHT ABOVE GRADE.
 9. THE GATE SHALL NOT MOVE ON ITS OWN WHEN POWER IS TURNED OFF.
 10. THE GAP BETWEEN THE GATE AND THE STATIONARY FENCE POSTS SHALL BE LESS THAN 2-1/2 INCHES.
 11. PROVIDE POSITIVE STOPS AT BOTH THE FULLY OPEN AND CLOSED POSITIONS.
 12. RECEIVER GUIDES SHALL BE RECESSED BEHIND THE RECEIVER POST.
 13. PROVIDE A CATCH POST TO PREVENT GATE FROM FALLING IF DISCONNECTED FROM SUPPORTING HARDWARE.
 14. PROVIDE TWO SETS OF PHOTO SENSORS FOR EACH DIRECTION OF TRAVEL.
 15. PROVIDE DOUBLE HEIGHT CARD READER A MINIMUM OF 6 FEET AWAY FROM GATE.
 16. PROVIDE DETECTOR LOOPS A MINIMUM OF 6 FEET AWAY FROM GATE.
 17. PROVIDE EDGE SENSORS ON BOTH THE LEADING AND TRAILING EDGES OF THE GATES.
 18. CLASS IV GATES SHALL HAVE A GUARDHOUSE OR CCTV GATE MONITORING TO VERIFY CREDENTIALS OF VEHICLES ENTERING OR EXISTING THE FACILITY, AND TO ENSURE SAFE GATE OPERATION WHEN PEDESTRIANS ARE PRESENT.
 19. PROVIDE AN AUDIO ALARM ON GATE OPERATOR, COMPLYING WITH ASTM F2200.
 20. GATE SHALL HAVE SMOOTH BOTTOM EDGE.
 21. REFER TO ALL OTHER SAFETY MEASURES, PRECAUTIONS DEVICES AND STANDARDS REQUIRED IN UL 325 STANDARD TO WHICH GATE OPERATORS ARE MANUFACTURED AND TESTED, AND ASTM F2200 STANDARD SPECIFICATIONS FOR AUTOMATED VEHICULAR GATE CONSTRUCTION.
 22. SEE CIVIL DRAWINGS FOR RETAINING WALL, WALKWAYS, AND MODIFICATIONS TO EXISTING PAVEMENTS AND CURBS.
 23. ANY OMISSIONS OR DEVIATIONS FROM UL325 AND ASTM F2200 STANDARDS SHALL NOT BE THE RESPONSIBILITY OF JACOBS/RYAN ASSOCIATES.

PEDESTRIAN GATE DETAILS

SHEET NUMBER
L304 ③

1 SHADE TREE PLANTING DETAIL
SCALE: NTS

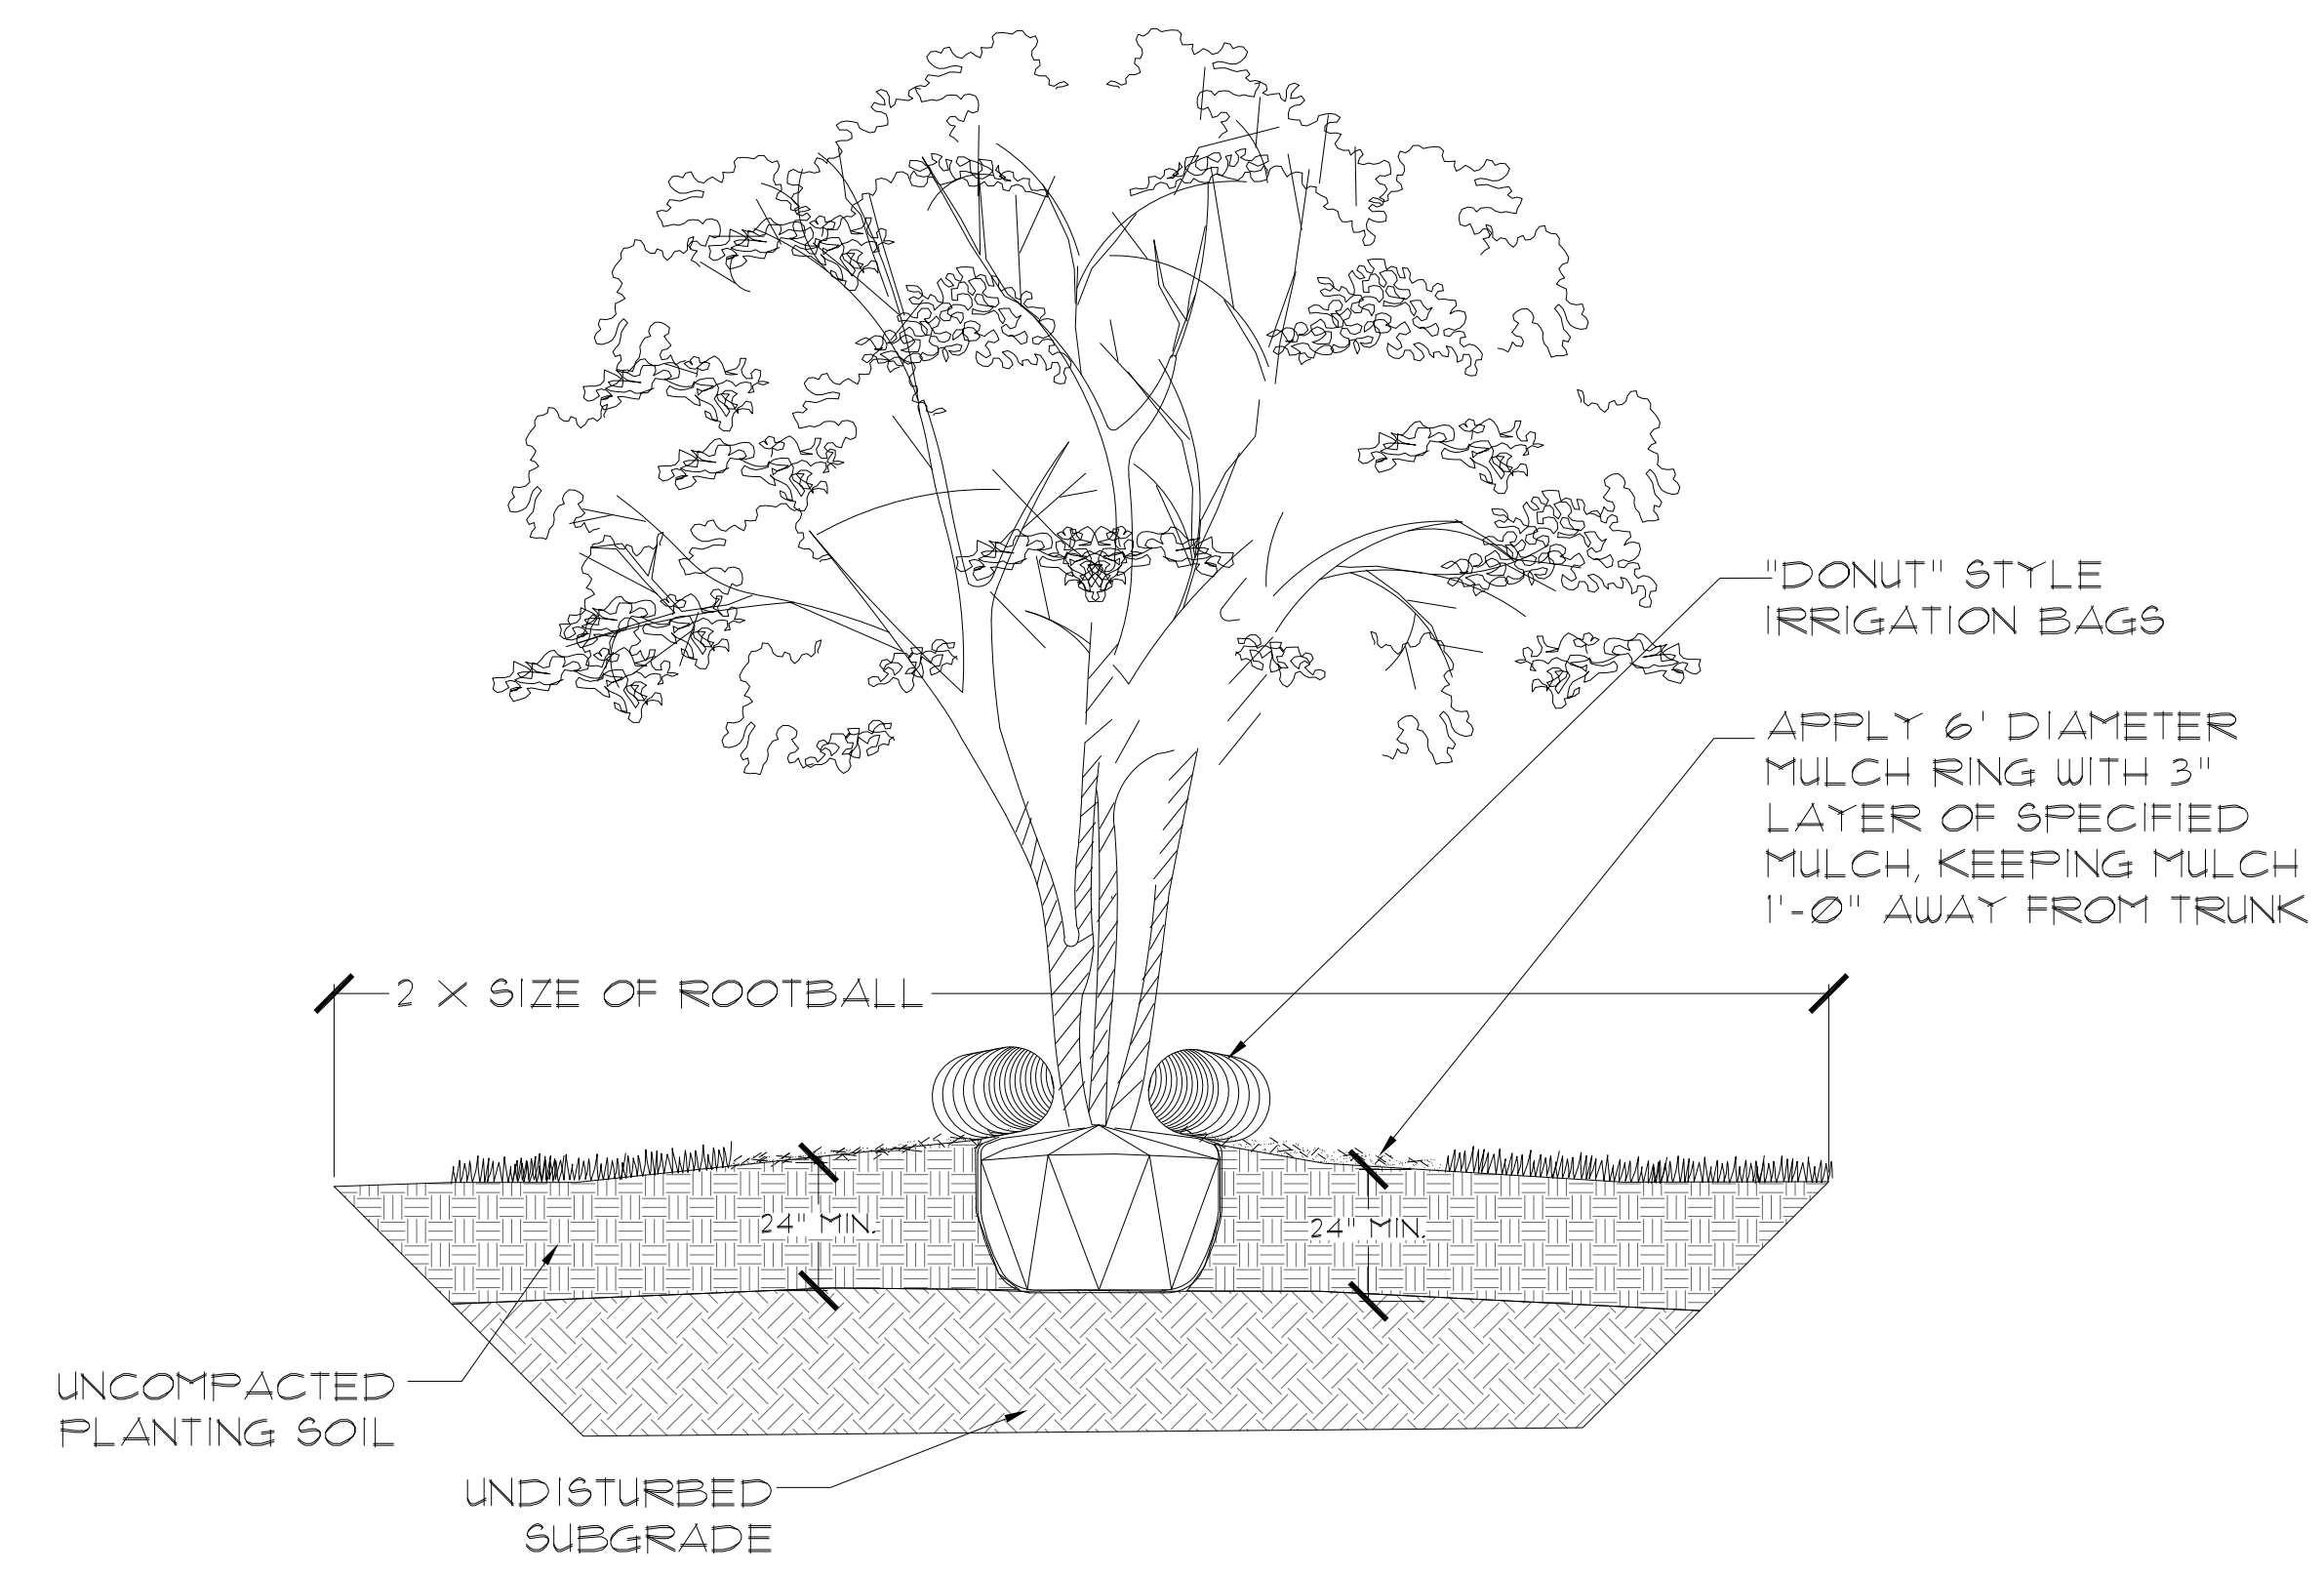

- NOTES:
- REMOVE ALL WIRE, BURLAP AND TWINE REMAINING ON ROOT BALL AFTER PLANTING.
 - USE OF SYNTHETIC BURLAP AND TWINE IS PROHIBITED.
 - IF ROOT BALL HAS BEEN REBURLAPPED, REMOVE BURLAP ON THE OUTSIDE OF BASKET AFTER ROOT BALL IS PLACED IN THE PLANTING PIT.
 - DO NOT LIFT "PACKAGE" BY WIRE BASKET AS IT CAN CAUSE WIRE TO EXTEND ABOVE SHOULDER OF ROOT BALL.
 - IF THE SIDES OF THE PLANTING PIT ARE GLAZED OR DRIED, USE A HAND TOOL TO BREAK UP THE SURFACE BEFORE PLANTING.

2 EVERGREEN TREE PLANTING DETAIL
SCALE: NTS

IF DIRECTED BY LANDSCAPE ARCHITECT, PRUNE TREES AFTER PLANTING. RETAIN NATURAL CHARACTER AND GENERAL SHAPE OF TREE. REMOVE ENOUGH INTERIOR BRANCHES TO REDUCE FOLIAGE BY 1/3. NEVER CUT A LEADER. SET TREE PLUMB IN PLANTING PIT. MAINTAIN PLUMB CONDITION THROUGHOUT GUARANTEE PERIOD.

- NOTES:
- THESE TREE PLANTING DETAILS APPLY TO NEW AND REPLACEMENT TREES.

3 ORNAMENTAL TREE PLANTING DETAIL
SCALE: NTS

PLANT LIST						
Key	Quantity	Botanical Name	Common Name	Size	Spacing	Comments
SHADE TREES						
QIM	4	Quercus imbricaria	Shingle Oak	2-1/2" cal. B&B	on plan	matched; 6' clear; spring dig only
GRASSES						
AGE	144	Andropogon gerardii	Big Bluestem	#1 container	18" o.c.	
CAL	282	Carex albicans	White-Tinged Sedge	#1 container	18" o.c.	
PVI	107	Panicum virgatum 'Shenandoah'	Shenandoah Switch Grass	#1 container	24" o.c.	
REPLACEMENT TREES						
CAS	1	Catalpa speciosa	Northern Catalpa	2.5" caliper B&B	on plan	
CHV	1	Chionanthus virginicus	White Fringetree	5' height B&B	on plan	Spring Dig Only
PGL	1	Picea glauca	Black Hills Spruce	8-10' height B&B	on plan	Spring Dig Only
ARF	1	Acer rubrum 'Frank Jr.'	Redpointe® Maple	2.5" caliper B&B	on plan	Spring Dig Only

3

4 GRASSES PLANTING DETAIL
SCALE: NTS

5 GUARDRAIL PLANTING DETAIL
SCALE: 1/2"=1'-0"

- NOTES:
- LOCATE TOP OF ROOT BALL AND ROOT FLARE 2" ABOVE FINISHED GRADE, DEPENDING ON TREE SIZE AND SITE CONDITIONS.
 - SUPPORT APPURTENANCES TO BE USED ONLY IF TREE FAILS TO REMAIN PLUMB.
 - PROVIDE ALL TREES AND PLANTS AS SPECIMEN QUALITY, TRUE TO SPECIES, VARIETY AND SIZE SHOWN.
 - DIG AND INSTALL TREES IN SPRING ONLY.
 - LOCATE TOP OF ROOT BALL AND ROOT FLARE 2" ABOVE FINISHED GRADE, DEPENDING ON TREE SIZE AND SITE CONDITIONS.
 - USE SUPPORT APPURTENANCES ONLY IF TREE FAILS TO REMAIN PLUMB.
 - PRUNE TREES AFTER PLANTING AND AT DIRECTION OF THE LANDSCAPE ARCHITECT.
 - ALL CONTAINER PLANTS SHALL BE FULLY ROOTED IN THEIR CONTAINERS AND SHALL BE FULLY SYMMETRICAL PLANTS WITH MANY CANES, BRANCHES, STEMS, AND FLOWER SPIKES.
 - PROVIDE 8'-0" DIAMETER TREE PITS AND 6'-0" MULCH RINGS FOR ALL NEW TREES. KEEP MULCH AWAY FROM TRUNKS.
 - MULCH ALL PITS AND BEDS IN THEIR ENTIRETY. MULCH EXISTING TREE TO REMAIN. PROVIDE PREMIUM TRIPLE SHREDDED HARDWOOD BARK MULCH, 3" FOR TREES AND 2" THROUGHOUT BEDS.
 - INSTALLED TREES SHALL SET CROWN OF ROOT BALL 2" ABOVE FINISH GRADE.
 - MULCH AND WATER IN PLANTS IMMEDIATELY AFTER PLANTING.

SHEET TITLE

SITE DETAILS & PLANT SCHEDULE

SHEET NUMBER

L200

1 SECOND FLOOR FOUNDATION PLAN - AREA EMS
Scale: 1/8" = 1'-0"

- PLAN NOTES:**
- TOP OF SLAB ELEVATION = 113'-0". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF CONCRETE AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - FLOOR CONSTRUCTION UNO: 5" CONCRETE SLAB WITH MACRO-FIBER ON 4" COMPACTED AGGREGATE.
 - COORDINATE WITH ALL DRAWINGS FOR LOCATION OF OPENINGS, SLEEVES, CONDUITS, DRAINS, DEPRESSIONS, EQUIPMENT PADS, ETC.
 - ALL COLUMNS ARE CENTERED ON PIERS OR CAISSONS, UNO.
 - TOP OF MAT ELEVATION = 112'-0", UNO.
 - ALL PIERS ARE P1, UNO.
 - TOP OF PIER/GRADE BEAM ELEVATION = 112'-0", UNO. TOP OF PIER EQUALS TOP OF GRADE BEAM, UNO.
 - SEE GENERAL NOTES ON SHEETS S202 AND S203.
 - SEE TYPICAL DETAILS ON SHEETS S204 AND S205.
 - SEE SHEETS S201 AND S202 FOR PIER, GRADE BEAM, WALL, CAISSON DETAILS AND SCHEDULES.
 - NOTE 1: PROVIDE (2) #4 x 4'-0" SPACED AT 3" OC IN SLAB, PLACED AT 1 1/2" FROM TOP OF SLAB.

- LEGEND:**
- INDICATES SLAB-ON-GRADE CONTROL/CONSTRUCTION JOINT. SEE DETAILS ON S204.
 - (XX-XX) INDICATES TOP OF FOOTING, PIER, GRADE BEAM, ETC.
 - GB1 INDICATES GRADE BEAM ON PLAN. SEE SCHEDULE.
 - P1 INDICATES PIER. SEE PIER DETAILS. SEE COLUMN SCHEDULE FOR PIER MARKS NOT DESIGNATED ON PLAN.

PROJECT NUMBER
PBC: #07215 AECOM: 60710711

SHEET TITLE
SECOND FLOOR FOUNDATION PLAN

SHEET NUMBER
S101

This drawing has been prepared for the use of AECOM's client and may not be used, reproduced or relied upon by third parties, except as agreed by AECOM and its client. AECOM and its client accept no responsibility for any liability whatsoever, to any party that modifies this drawing without AECOM's express written consent. Do not scale this document. All measurements must be obtained from the stated dimensions.

1 CHILLER PLATFORM FRAMING PLAN - AREA EMS
Scale: 1/8" = 1'-0"

- PLAN NOTES:**
- TOP OF STEEL ELEVATION = 163'-6". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF STEELJOIST BEARING ELEVATION AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - PLATFORM CONSTRUCTION UNO (D3): 1 1/2"x3/16" TYPE 19-4 STANDARD STEEL GRATING, GALVANIZED, ATTACH TO STEEL BEAMS PER GENERAL NOTES. TOP OF GRATING ELEVATION = 163'-7 1/2". EXTEND GRATING TO EXTERIOR EDGE OF BEAM FLANGE.
 - ALL STEEL SHALL BE HOT-DIPPED GALVANIZED.
 - COORDINATE WITH ALL DRAWINGS FOR LOCATION OF OPENINGS, SLEEVES, CONDUITS, DRAINS, DEPRESSIONS, EQUIPMENT PADS, ETC.
 - BEAMS ARE EQUALLY SPACED BETWEEN COLUMN OR INTERSECTING GIRDERS, UNO.
 - SEE GENERAL NOTES ON SHEETS S002 AND S003.
 - SEE TYPICAL DETAILS ON SHEETS S006 AND S007.
 - SEE ARCHITECTURAL DRAWINGS FOR HANDRAIL AND ACCESS LADDER.

- LEGEND:**
- INDICATES ROOF OPENING, SEE DETAIL 6/S006. COORDINATE WITH MECHANICAL DRAWINGS.
 - INDICATES MOMENT CONNECTION ON PLAN. MOMENT CONNECTION SYMBOLS WITH THE LETTER "MS" BESIDE IT INDICATES A MOMENT CONNECTION THAT DOES NOT REQUIRE COLUMN STIFFENER PLATES.
 - INDICATES SLAB OR DECK SPAN DIRECTION.
 - INDICATES KNEE BRACE, SEE DETAIL 17/S007.
 - INDICATES CROSS BRACING, SEE DETAIL 3/S006.
 - COORDINATE DIMENSION TO ALIGN WITH CHILLER SUPPLIER (SPRING ISOLATOR LOCATIONS).
 - INDICATES L6x4x3/8 LVL W/ 3/4" DIA EXPANSION ANCHORS AT 2'-0" OC.

2 STAIR ROOF FRAMING PLAN - AREA EMS
Scale: 1/8" = 1'-0"

- PLAN NOTES:**
- TOP OF STEEL ELEVATION = 166'-9". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF STEEL ELEVATION AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - (+/-) INDICATES CHANGE IN ELEVATION FROM TOP OF STEEL REFERENCE ELEVATION.
 - ROOF CONSTRUCTION UNO (D1): 3"x20 GAGE GALVANIZED STEEL DECK ATTACHED TO STEEL BEAMS PER GENERAL NOTES.
 - COORDINATE WITH ALL DRAWINGS FOR LOCATION OF OPENINGS, SLEEVES, CONDUITS, DRAINS, DEPRESSIONS, EQUIPMENT PADS, ETC.
 - BEAMS ARE EQUALLY SPACED BETWEEN WALLS, UNO.
 - SEE GENERAL NOTES ON SHEETS S002 AND S003.
 - SEE TYPICAL DETAILS ON SHEETS S006 AND S007.

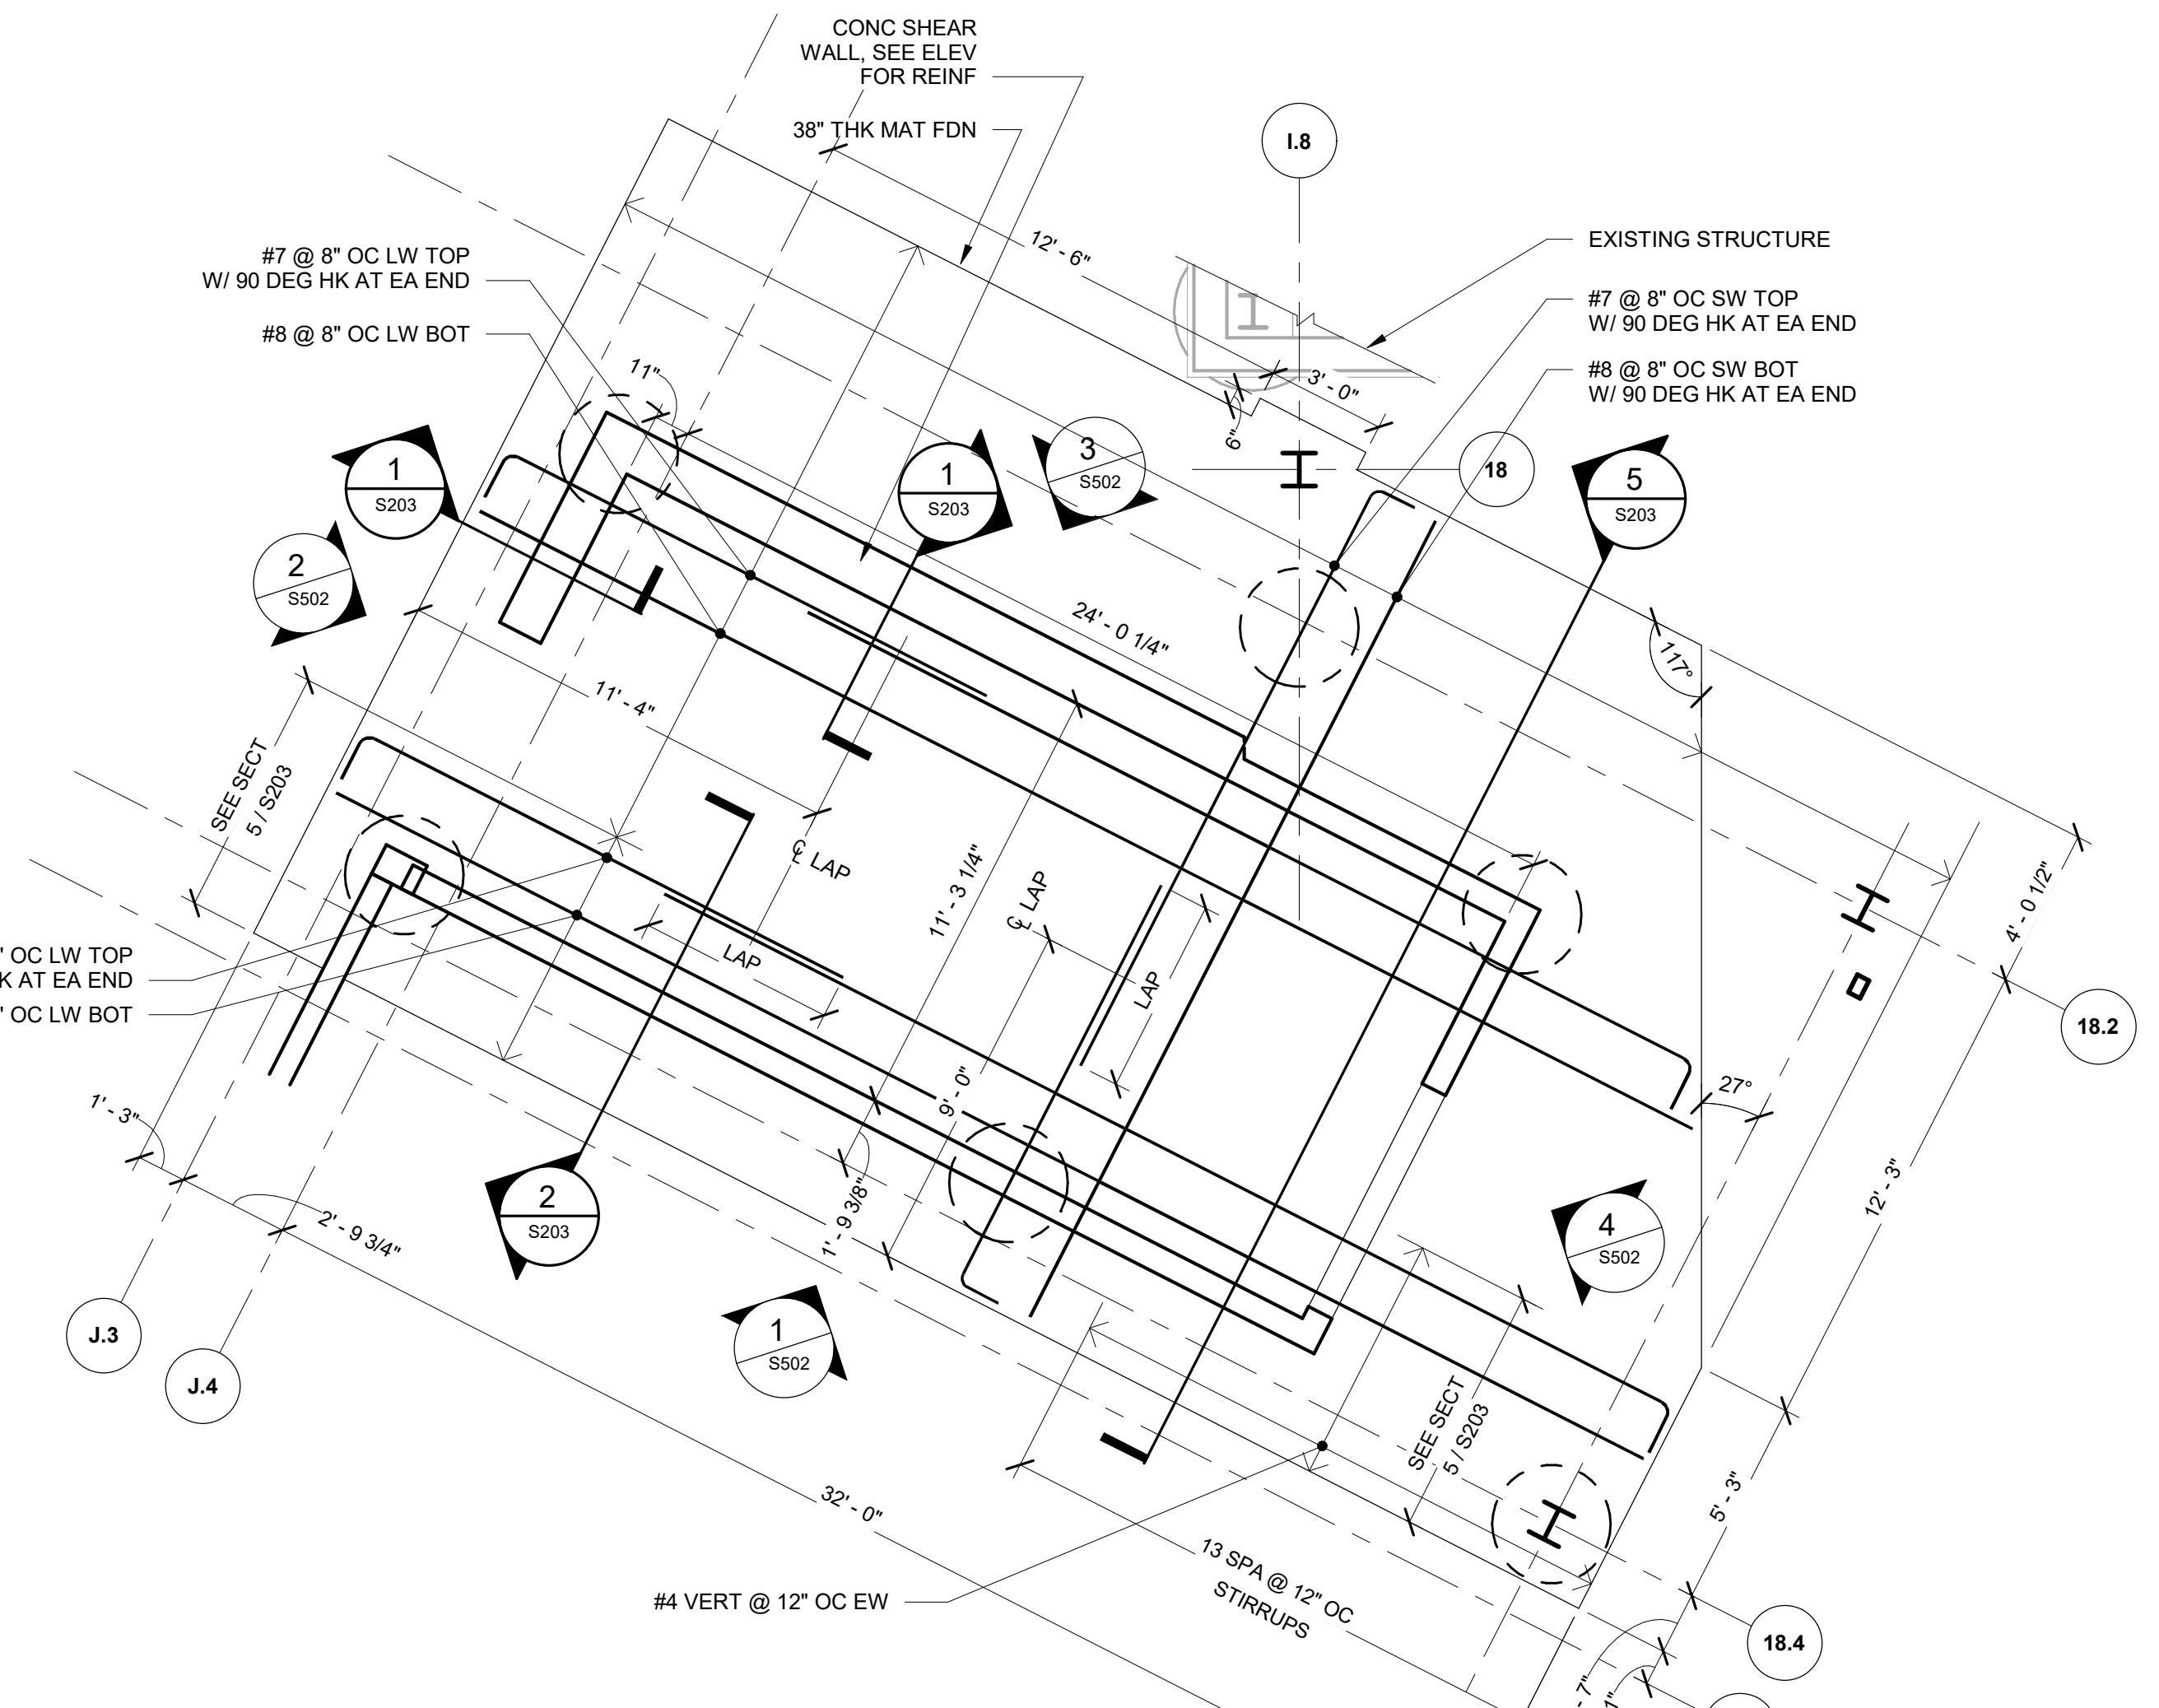

5 PARTIAL FOUNDATION PLAN - RETAINING WALL NEAR GATE
Scale: 3/8" = 1'-0"

- PLAN NOTES:**
- TOP OF MAT ELEVATION = 97'-6". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF CONCRETE AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - COORDINATE WITH CIVIL DRAWINGS FOR DIMENSIONS, LOCATION, AND ADDITIONAL INFORMATION.
 - SEE GENERAL NOTES ON SHEETS S002 AND S003.
 - SEE TYPICAL DETAILS ON SHEETS S004 AND S005.
 - TEMPORARILY BRACE EXISTING LIGHT POLE NEAR RETAINING WALL EXCAVATION PRIOR TO FINAL CONDITION.

3 PARTIAL FOUNDATION PLAN - EAST MAT
Scale: 1/4" = 1'-0"

- PLAN NOTES:**
- TOP OF MAT ELEVATION = 112'-0". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF CONCRETE AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - ONLY THE CAISSONS, CONCRETE SHEAR WALLS, AND MAT FOUNDATION ARE SHOWN ON PLAN FOR CLARITY. REFERENCE S101 FOR ADDITIONAL INFORMATION.
 - NO OPENINGS, SLEEVES, CONDUITS, ETC. SHALL BE PLACED IN THE MAT FOUNDATION WITHOUT REVIEW AND APPROVAL BY THE EOR.
 - SEE GENERAL NOTES ON SHEETS S002 AND S003.
 - SEE TYPICAL DETAILS ON SHEETS S004 AND S005.
 - SEE SHEETS S201, S202, AND S203 FOR PIER, GRADE BEAM, WALL, CAISSON DETAILS, MAT DETAILS AND SCHEDULES.
A. REFERENCE MAT DETAILS FOR BAR LAYERING.
 - SEE SHEAR WALL ELEVATIONS AND DETAILS ON SHEETS S502 AND S503.

4 PARTIAL FOUNDATION PLAN - WEST MAT
Scale: 1/4" = 1'-0"

- PLAN NOTES:**
- TOP OF MAT ELEVATION = 112'-0". ELEVATIONS SHOWN ON PLAN ARE TO TOP OF CONCRETE AND ARE REFERENCED FROM CCD DATUM ELEVATION 27.60' = 100'-0".
 - ONLY THE STEEL COLUMNS, CAISSONS, CONCRETE SHEAR WALLS, AND MAT FOUNDATION ARE SHOWN ON PLAN FOR CLARITY. REFERENCE S101 FOR ADDITIONAL INFORMATION.
 - NO OPENINGS, SLEEVES, CONDUITS, ETC. SHALL BE PLACED IN THE MAT FOUNDATION WITHOUT REVIEW AND APPROVAL BY THE EOR.
 - SEE GENERAL NOTES ON SHEETS S002 AND S003.
 - SEE TYPICAL DETAILS ON SHEETS S004 AND S005.
 - SEE SHEETS S201, S202, AND S203 FOR PIER, GRADE BEAM, WALL, CAISSON DETAILS, MAT DETAILS AND SCHEDULES.
A. REFERENCE MAT DETAILS FOR BAR LAYERING.
 - SEE SHEAR WALL ELEVATIONS AND DETAILS ON SHEETS S502 AND S503.

- NOTE: NOT ALL SYMBOLS MAY BE USED

GENERAL NOTES - REFLECTED CEILING PLANS

- A. REFER TO THE PROJECT GENERAL NOTES FOR GENERAL PROJECT REQUIREMENTS.
- B. THE TYPICAL CEILING HEIGHT SHALL BE 9' - 0" UNLESS OTHERWISE NOTED.
- C. TYPICAL ACOUSTIC CEILING TILE SYSTEM SHALL BE AC-1 UNLESS OTHERWISE NOTED.
- D. ALL CEILING HEIGHTS ARE ABOVE FINISHED FLOOR, UNLESS OTHERWISE NOTED.
- E. THE REFLECTED CEILING PLANS SHALL BE USED FOR LAYOUT OF ALL CEILING DEVICES. CONSULT ARCHITECT IF A CONFLICT ARISES WITH STRUCTURAL OR MEP DRAWINGS.
- F. CENTER CEILING TILES IN ROOM AS SHOWN TO PROVIDE EQUAL TILES AT EACH END WALL IN EACH DIRECTION UNLESS OTHERWISE NOTED OR DIMENSIONED.
- G. CENTER RECESSED LIGHT FIXTURES, ELECTRICAL AND MECHANICAL DEVICES, AND SPRINKLER HEADS WITHIN A CEILING TILE UNLESS OTHERWISE NOTED. COORDINATE LAYOUT WITH ALL OTHER CEILING MOUNTED DEVICES.
- H. ROOMS WITH NO CEILINGS SHALL HAVE EXPOSED STRUCTURE PAINTED.
- I. GYPSUM BOARD SOFFITS ARE SHOWN TO INDENED SIZES. PAINT ALL GYPSUM BOARD SOFFITS AND HEADERS THE TYPICAL GYPSUM CEILING PAINT COLOR UNLESS OTHERWISE NOTED.
- J. AT TOILETS, SHOWERS, AND JANITOR CLOSETS, PROVIDE WATER RESISTANT GYPSUM BOARD AT CEILINGS AND SOFFITS.
- K. CAREFULLY REMOVE CEILINGS AS REQUIRED FOR ABOVE CEILING WORK IN AREAS WITH NO OR LIMITED ARCHITECTURAL DEMOLITION WORK. REINSTALL CEILING AND PATCH TO MATCH EXISTING.
- L. COORDINATE EXACT LOCATIONS OF ACCESS PANELS IN THE FIELD, AND WITH CEILING MOUNTED EQUIPMENT VENDORS OR FOR UTILITY CONTROLS ACCESS, WHERE APPLICABLE. ACCESS PANEL PAINT FINISH SHALL MATCH ADJACENT CEILING COLOR.
- M. NOT ALL CEILING MOUNTED DEVICES ARE SHOWN ON THE ARCHITECTURAL REFLECTED CEILING PLANS. REFER TO PLUMBING, MECHANICAL, AND ELECTRICAL DRAWINGS FOR LOCATIONS OF SPRINKLER HEADS, EXIT SIGNS, AND ADDITIONAL CEILING MOUNTED DEVICES.
- N. NOT ALL SPRINKLER HEADS ARE SHOWN, HOWEVER, ALL AREAS SHALL BE SPRINKLERED AS SPECIFIED. HEADS ARE SHOWN IN SELECTED SPACES TO CONTROL THE LOCATIONS FOR AESTHETIC PURPOSES ONLY. WHEN ADDITIONAL HEADS ARE REQUIRED, COORDINATE LOCATIONS WITH ARCHITECT.
- O. REFER FIRE PROTECTION SPECS FOR PAINTING OF FIRE ALARM INFRASTRUCTURE REQTS. AT EXPOSED CEILINGS.

GENERAL NOTES:
 1. FOR ANY CONDITION WHERE NEW CONSTRUCTION JOINS EXISTING CONDITIONS CONTRACTOR TO PROVIDE AN EXPANSION JOINT.

EXTERIOR WALL TYPES
 WALL SYSTEMS TO MEET NFPA 285 REQUIREMENTS

EXTERIOR WALL TYPE 1 (WT-1)
 VERTICAL METAL PANEL RAINSCREEN WALL SYSTEM
 • 7/8" VERTICAL METAL PANEL
 • RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
 • 3.5" MINERAL WOOL INSULATION (R=15)
 • WATER RESISTIVE SELF-ADHERED AIR BARRIER
 • 5/8" GLASS MAT EXTERIOR SHEATHING BOARD
 • 6" COLD FORMED METAL FRAMING 16" OC. W/ BATT INSUL (R-19)
 • 5/8" GYPSUM WALL BOARD

EXTERIOR WALL TYPE 2 (WT-2)
 VERTICAL METAL PANEL RAINSCREEN WALL SYSTEM W/ CMU BACK UP
 • 7/8" VERTICAL METAL PANEL
 • RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
 • 3" MINERAL WOOL INSULATION (R-12.9)
 • VAPOR RETARDING AIR BARRIER
 • 8" CONCRETE WALL BACK-UP. REFER STRUCTURAL WALL (ABOVE GRADE); R-13 + R-10ci

EXTERIOR WALL TYPE 3 (WT-3)
 CAST-IN-PLACE CONCRETE WALL SYSTEM
 • SPRAY APPLIED DAMPROOFING BELOW GRADE
 • CAST-IN-PLACE CONCRETE STEM WALL @ 3'-0" HT
 • 2" CLOSED CELL SPRAY INSULATION (R-13)
 • 2-1/2" COLD FORMED METAL FRAMING @ 16" OC.
 • 5/8" GYPSUM WALL BOARD

EXTERIOR WALL TYPE 4 (WT-4)
 FORMED PAN METAL PANEL RAINSCREEN WALL SYSTEM
 • 1 3/8" FORMED PAN FLAT METAL PANEL
 • RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
 • 3" MINERAL WOOL INSULATION (R-12.9)
 • WATER RESISTIVE SELF-ADHERED AIR BARRIER
 • 5/8" GLASS MAT EXTERIOR SHEATHING BOARD
 • 6" COLD FORMED METAL FRAMING 16" OC. W/ BATT INSUL (R-19)
 • 5/8" GYPSUM WALL BOARD

GENERAL NOTES:
 1. FOR ANY CONDITION WHERE NEW CONSTRUCTION JOINS EXISTING CONDITIONS CONTRACTOR TO PROVIDE AN EXPANSION JOINT.

EXTERIOR WALL TYPES

WALL SYSTEMS TO MEET NFPA 285 REQUIREMENTS

EXTERIOR WALL TYPE 1 (WT-1)

- VERTICAL METAL PANEL RAINSCREEN WALL SYSTEM
- 7/8" VERTICAL METAL PANEL
- RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
- 3" MINERAL WOOL INSULATION (R=15)
- WATER RESISTIVE SELF-ADHERED AIR BARRIER
- 5/8" GLASS MAT EXTERIOR SHEATHING BOARD
- 6" COLD FORMED METAL FRAMING 16" OC. W/ BATT INSUL (R-19)
- 5/8" GYPSUM WALL BOARD

ENERGY CODE REQUIREMENTS TABLE C402.1.3: METAL FRAMED (ABOVE GRADE): R-13 + R-10ci

EXTERIOR WALL TYPE 2 (WT-2)

- VERTICAL METAL PANEL RAINSCREEN WALL SYSTEM W/ CMU BACK UP
- 7/8" VERTICAL METAL PANEL
- RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
- 3" MINERAL WOOL INSULATION (R=15)
- VAPOR RETARDING AIR BARRIER
- 8" CONCRETE WALL BACK-UP, REFER STRUCTURAL

ENERGY CODE REQUIREMENTS TABLE C402.1.3: MASS WALL (ABOVE GRADE): R-11.4ci

EXTERIOR WALL TYPE 3 (WT-3)

- CAST-IN-PLACE CONCRETE WALL SYSTEM
- SPRAY APPLIED DAMPROOFING BELOW GRADE
- CAST-IN-PLACE CONCRETE STEM WALL @ 3'-0" HT
- 2" CLOSED CELL SPRAY INSULATION (R-13)
- 2-1/2" COLD FORMED METAL FRAMING @16" OC.
- 5/8" GYPSUM WALL BOARD

ENERGY CODE REQUIREMENTS TABLE C402.1.3: MASS WALL (ABOVE GRADE): R-11.4ci

EXTERIOR WALL TYPE 4 (WT-4)

- FORMED PAN METAL PANEL RAINSCREEN WALL SYSTEM
- 1 3/8" FORMED PAN FLAT METAL PANEL
- RAINSCREEN ATTACHMENT SYSTEM: 1" HORIZ. MTL. GIRTS W/ CONTINUOUS VERTICAL SUPPORT SYSTEM SET ON BRACKETS & THERMAL PAD SPACERS
- 3" MINERAL WOOL INSULATION (R=15.9)
- WATER RESISTIVE SELF-ADHERED AIR BARRIER
- 5/8" GLASS MAT EXTERIOR SHEATHING BOARD
- 6" COLD FORMED METAL FRAMING 16" OC. W/ BATT INSUL (R-19)
- 5/8" GYPSUM WALL BOARD

ENERGY CODE REQUIREMENTS TABLE C402.1.3: METAL FRAMED (ABOVE GRADE): R-13 + R-10ci

FINISH FLOOR PLAN LEGEND

FLOOR MATERIAL OR FINISH		ANNOTATIONS	
	CARPET (CPT-1)		ALIGN SYMBOL
	RUBBER TILE (RT-1) RUBBER TILE (RT-2)		FLOOR MATERIAL TRANSITION
	RESILIENT FLOORING (RF-1)		WALL FINISH TYPE REFER TO FINISH SCHEDULE
	SEALED CONCRETE (SC-1)		EXTENT OF WALL FINISH
	EPOXY (EP-1) EPOXY (EP-2)		MATERIAL DIRECTION
	STATIC DISSIPATIVE TILE (SD-1)		

GENERAL NOTES - FINISHES

- GENERAL**
- WALL AND CEILING FINISH REQUIREMENTS, CLASS A FLAME SPREAD INDEX OF 0-25, SMOKE DEVELOPED INDEX 0-450.
 - FLOOR FINISH REQUIREMENTS, CLASS I CRITICAL RADIANT FLUX 0.45 WATTS PER SQUARE CENTIMETER OR GREATER.
 - SEE FINISH PLAN, ELEVATIONS, REFLECTED CEILING PLAN AND DETAILS FOR CLARIFICATION OF EXTENT OF FINISH MATERIALS.
 - NO PAINTING OR INTERIOR FINISHING SHALL BE DONE UNDER CONDITIONS WHICH WILL JEOPARDIZE THE QUALITY OR APPEARANCE OF SUCH WORK. ALL WORKMANSHIP WHICH IS JUDGED LESS THAN FIRST QUALITY BY THE ARCHITECT WILL BE REJECTED.
 - REMOVE ALL WALL MOUNTED FIXTURES, ELECTRICAL DEVICES ETC. PRIOR TO PAINTING VERTICAL SURFACES. REINSTALL AFTER PAINTING IS COMPLETE.
 - INTERIOR GYP. BOARD SURFACES SHALL BE WIPED WITH A DAMP CLOTH JUST PRIOR TO APPLICATION OF THE FIRST COAT OF PAINT IN ORDER TO LAY FLAT ANY NAP WHICH MAY HAVE FORMED IN SANDING PROCESS.
 - EXAMINE ALL FINISH SURFACES AFTER COMPLETION OF WORK AND PROCEED WITH "TOUCH-UP" AS REQUIRED.
 - COORDINATE FINISH OF ALL ELECTRICAL, DATA AND AV DEVICES LOCATED ON WALLS WHICH FINISH IS DESIGNATED OTHER THAN P1 WITH ARCHITECT.
 - ALL CRACKS, HOLES, IMPERFECTIONS IN EXISTING WALLS, PARTITIONS OR GYP BOARD SHALL BE FILLED WITH PATCHING PLASTER AND SMOOTHED OFF TO MATCH ADJOINING SURFACES TRANSITION FLOOR MATERIALS UNDER CENTERLINE OF DOORS/OPENINGS UNLESS NOTED OTHERWISE.

- PROCEDURE**
- THE CONTRACTOR SHALL SUBMIT (2) SAMPLES OF ALL FINISH MATERIALS TO THE ARCHITECT FOR APPROVAL, INCLUDING, BUT NOT LIMITED TO: PAINT, WALL COVERINGS, LAMINATES, FLOORING MATERIALS, ETC. ANY NEW WALL, FLOOR, CEILING OR WINDOW TREATMENTS MUST BE SUBMITTED FOR APPROVAL PRIOR TO ORDERING. FINISHES NOT SUBMITTED IN THE MINIMUM QUANTITY OF (2) SHALL BE REJECTED. SUBMIT SAMPLES TO ARCHITECT PRIOR TO PLACING FULL ORDERS WHERE MATERIALS ARE NOT RETURNABLE.
 - INSTALL ALL FINISH MATERIALS IN ACCORDANCE WITH THE MANUFACTURERS RECOMMENDED SPECIFICATIONS, SURFACE PREPARATION, ADHESIVES AND BACKINGS, INCLUDING WALL COVERINGS, FLOORING MATERIALS, LAMINATES ETC.
 - CONTRACTOR TO BE RESPONSIBLE FOR ALLOWING FOR DELIVERY AND LEAD TIMES FOR ALL FABRICS AND OTHER CUSTOM FINISHES WITHIN THE CONSTRUCTION SCHEDULE. ALL DELIVERY TIMES MUST BE CONFIRMED, AND ANY EXCESSIVE LEAD TIMES MUST BE BROUGHT TO THE ARCHITECT'S ATTENTION IMMEDIATELY TO ALLOW FOR RE-SPECIFICATION IF NECESSARY. SUBMIT FLOORING SEAMING DIAGRAM FOR REVIEW PRIOR TO PURCHASING MATERIALS. SEAMING DIAGRAM SHALL INDICATE TRANSITION LOCATIONS, INSTALLATION METHOD, ORIENTATION FOR ALL FLOORING MATERIALS.
- MATERIALS + FINISHES**
- ALL WALLS AND COLUMN SURFACES TO BE PAINTED PT-1 U.N.O.
 - ALL PAINTED WALLS TO HAVE EGGSHELL FINISH U.N.O.
 - ALL PAINTED CEILING TO HAVE FLAT FINISH.
 - ALL PAINTED WOOD WORK, HOLLOW METAL FRAMES AND DOORS TO HAVE SEMI-GLOSS FINISH.
 - PAINT UNDERCOUNTER SUPPORT BRACKETS TO MATCH WALL COLOR.
 - ALL EXPOSED CEILING AND EXPOSED EQUIPMENT INCLUDING ALL BEAMS, DUCTWORK, CONDUIT, ETC. SHALL BE PAINTED PER SPECIFICATIONS U.N.O. REVIEW ALL MATERIALS TO BE PAINTED AT EXPOSED AREAS AND PROVIDE PROPER PRIMER TO ENSURE PAINT ADHESION.
 - UNDERSIDE OF SOFFITS (WHERE OCCURS) TO RECEIVE A FINISH TO MATCH ADJACENT VERTICAL FINISH, U.N.O.
 - PAINT CEILING ACCESS PANELS WHERE THEY OCCUR TO MATCH ADJACENT CEILING FINISH.
 - PAINT ALL EXPOSED SURFACES U.N.O. INCLUDING HOLLOW METAL DOOR FRAMES, GRILLES, FIRE HOSE OR EXTINGUISHER CABINETS, EXPOSED PIPING, ETC. U.N.O. TO MATCH ADJACENT WALL FINISH. DO NOT PAINT EXTRUDED ALUMINUM FRAMES OR STOREFRONTS. UPON COMPLETION, REMOVE ALL PAINT FROM WHERE IT HAS SPILLED, SPLASHED, OR SPATTERED ON EXPOSED SURFACES.
 - EXISTING DOORS TO REMAIN TO BE PAINTED TO MATCH ADJACENT WALL COLOR.
 - ALL STAINED MATERIALS TO HAVE UNIFORM COLOR.
 - ALL VERTICAL SURFACES U.N.O. SHALL RECEIVE WALL BASE RB-1.
 - SUBMIT TILED GROUT MOCK-UP FOR REVIEW. REFER TO FINISH MATERIAL LEGEND FOR GROUT COLORS REQUIRED.
 - FLOOR FINISHES TO CONTINUE UNDER ALL MILLWORK.
 - ALL OPEN PLASTIC LAMINATE CABINETRY SHALL BE PLASTIC LAMINATE ON ALL EXPOSED SURFACES, U.N.O. APPLY MELAMINE TO INTERIOR OF CABINETRY WITH DOORS AND DRAWERS, U.N.O. SHADE OF MELAMINE TO BEST MATCH PLASTIC LAMINATE. CONFIRM WITH ARCHITECT.
 - PROVIDE SQUARE "EASED" EDGES ON ALL SOLID SURFACE COUNTERTOPS
 - ROLL GOODS WALL BASE TO BE COVE AT HARD SURFACE FLOORING AND STRAIGHT AT CARPET FLOORING. PROVIDE PRE-FORMED BASE AT CORNERS. DO NOT CUT OR BEND BASE TO MAKE CORNERS.
 - ALL WALL AND CEILING REVEALS SHALL BE PAINTED TO MATCH WALL FINISH U.N.O.
 - ALL TILE GROUT JOINTS TO BE 1/8"
 - ALIGN ALL TILE WALL BASE JOINTS WITH FLOOR JOINTS.
